There has been a conſiderable difference of opinion, as to the nature of this *confuſion*, and the manner in which it was effected. Some learned men, prepoſſeſſed with the notion that all the different idioms now in the world did at firſt ariſe from one original language, to which they may be reduced, and that the variety among them is no more than muſt naturally have happened in a long courſe of time by the mere ſeparation of the builders of Babel, have maintained, that there were no new languages formed at the *confuſion*; but that this event was accompliſhed by creating a miſunderſtanding and variance among the builders, without any immediate influence on their language. But this opinion, advanced by Le Clerc, &c. ſeems to be directly contrary to the obvious meaning of the word שִׂפְתָה *ſhaphah*, *lip*, uſed by the ſacred hiſtorian. Others have imagined, that this was brought about by the temporary *confuſion* of their ſpeech, or rather of their apprehenſions, cauſing them, whilſt they continued together and ſpoke the ſame language, to underſtand the words differently: Scaliger is of this opinion. Others again account for this event, by the privation of all language, and by ſuppoſing that mankind were under a neceſſity of aſſociating together, and of impoſing new names on things by common conſent. Another opinion aſcribes the *confuſion* to ſuch an indiſtinct remembrance of the original language which they ſpoke before, as made them ſpeak it very differently; ſo that by the various inflections, terminations, and pronunciations of divers dialects, they could no more underſtand one another, than they who underſtand Latin can underſtand thoſe who ſpeak French, Italian or Spaniſh, though all theſe languages ariſe out of it. This opinion is adopted by Caſaubon, and by biſhop Patrick in his Commentary in loc. and is certainly much more probable than either of the former: and Mr. Shuckford maintains, that the *confuſion* aroſe from ſmall beginnings, by the invention of new words in either of the three families of Shem, Ham, and Japhet; which might contribute to ſeparate them from one another; and that in each family new differences of ſpeech might gradually ariſe, ſo that each of theſe families went on to divide and ſubdiride among themſelves. Others again, as Mr. Joſ. Mede and Dr. Wotton, &c. not ſatisfied with either of the foregoing methods of accounting for the diverſity of languages among mankind, have recourſe to an extraordinary interpoſition of divine power, by which new languages were framed and communicated to different families by a ſupernatural infuſion or inſpiration; which languages have been the roots and originals from which the ſeveral dialects that are, or have been, or will be ſpoken, as long as this earth ſhall laſt, have ariſen, and to which they may with eaſe be reduced. As to the number of languages thus introduced, many opinions have been adopted. If there were no more than there were nations or heads of nations, then the number would be ſeven for Japhet, four for Ham, and five for Shem; but if there were as many as there were families, which is the more probable opinon, their number cannot be certainly aſſigned. However, the Hebrews fancy they were ſeventy, becauſe the deſcendents from the ſons of Noah, enumerated Geneſis x. were juſt ſo many. Allowing then the languages of the chief families to have been fundamentally different from each other, the ſub-languages and dialects within each branch would probably have had a mutual affinity, greater or leſs, as they ſettled nearer or farther from each other. But whichſoever of theſe hypotheſes is adopted, the primary object of the *confuſion* at Babel was the ſeparation and DISPERSION *of mankind*. Cleric. Comm. in Gen. x. 1. Scaliger Exerc. in Cardan. § 1. Caſaubon. Diatrib. de Ling. Heb. Mede's Works, vol. i. p. 276. Wotton's Diſc. and Brett's Eſſ. on the *Confuſion* of Languages. Univerſ. Hiſt. vol. i. part i. chap. 2. § 5. Shuckf. Conn. vol. i. p. 146.

The ingenious and learned Dr. Bryant has lately, in the third volume of his Analyſis of Ancient Mythology, advanced a new and ſingular hypotheſis, both with reſpect to the *confuſion* of tongues and the diſperſion. He ſuppoſes that the *confuſion* of language was local and partial, and limited to Babel only. By כָּל-הָאָרֶץ Gen. xi. 1. and 8. which our tranſlators render *the whole earth*, he underſtands *every region*: and by the ſame words in ver. 9. the *whole region* or province. This *confuſion* was occaſioned, as he ſuppoſes, by a labial failure; ſo that the people could not articulate. Thus their ſpeech was confounded, but not altered; for, as ſoon as they ſeparated, they recovered their true tenor of pronunciation, and the language of the earth continued for ſome ages nearly the ſame. The interviews between the Hebrews and other nations, recorded in Scripture, were conducted without an interpreter; and he farther obſerves, that the various languages which ſubſiſt at this day retain ſufficient relation to ſhew, that they were once dialects from the ſame matrix, and that their variety was the effect of time. See DISPERSION.

CONFUTATION, in *Rhetoric*, &c. a part of an oration, wherein the orator ſeconds his own arguments, and ſtrengthens his cauſe, by refelling and deſtroying the oppoſite arguments of the antagoniſt. This is done by denying what is apparently falſe, by detecting ſome flaw in the reaſoning of the adverſe party, by granting their argument, and ſhewing its invalidity, or retorting it upon the adverſary.

Confutation makes a branch of what we call CONFIRMATION. The confirmation and *confutation* are ſometimes called CONTENTION.

CONGE, in the *French Law*, a licence, or permiſſion, granted by a ſuperior to an inferior, which gives him a diſpenſation from ſome duty to which he was before obliged.

The

The word is French: Menage derives it from the Latin *commutare*, used for *commutatus*, and *commuer*, often used among ancient writers: the Italians *say congeda*.

A monk cannot go out of his convent, without the *congé* of his superiors.

CONGE *d'accorder*, i. e. *leave to accord, or agree*, is used in the statute of fines, anno 18 Edw. I. to the following purpose: *When the original is delivered, in presence of the parties before justices, a parcher shall say the Sire, vostre congé d'accorder: and the justice shall say to him, Welle fait Sir. &c.* and *shall make out of the parties, &c.*

CONGE *d'elire*, is the king's permission royal to a dean and CHAPTER, in time of a vacancy, to choose a bishop. See CANONS, and COLLATION.

Gwyn observes, that the king of England, as sovereign patron of all bishoprics and other benefices, had ancicently the free appointment of all ecclesiastical dignities; invested first, *per traditionem annuli*; and afterwards by letters patent: but that, in process of time, he made the election over to others, under certain forms and conditions; so that they should at every vacancy, before they choose, demand of the king *congé d'elire*, i. e. leave to proceed to election; and after election to crave his royal assent. *&c.* He adds, that king John was the first who granted this; which was afterwards confirmed by stat. Westm. 3 Edw. I. cap. 1. and again in the Articuli Cleri, 25 Edw. II. cap. 1.

CONGE, in *Architecture*, denotes a moulding either in form of a quarter-round, or of a cavetto; which serves to separate two members from one another. See *Tab. Archit. fig. 6.*

Such is that which joins the fhaft of the column to the ftructure, called alſo *apophyge*; which, in Greek, ſignifies *eſcape*; the column ſeeming to ſpring hence: by the Latins it is called *ſcapus*, *the ſhaft of the column*.

The *conge*, originally, *was a ring* or ferril, fixed on the extremities of wooden pillars, to keep them from ſplitting; this, afterwards, came to be imitated in ſtone-work.

CONGEABLE, from the French *congé* (i. e. *leave, licence, or permiſſion*), ſignifies as much as lawful, or lawfully done, or done with leave and permiſſion; *as, there entry is not allowable or congeable.*

CONGELATION, FREEZING, the act of fixing the fluidity of any liquid by cold, or the application of cold bodies. In which it differs from *coagulation*, which is produced by other cauſes. See CONCENTRATION.

Salt-petre *congeals* water in ſummer. See ICE. Metals and minerals are ſaid to be juices *congealed*, in the veins of earth, by their mixing with one another, or with other heterogeneous bodies; or by the conſumption and evaporation of their fineſt parts.

Rock CRYSTAL was by the ancients held to be nothing but water *congealed* in the mountains.

CONGELATION *by artificial cold*. See *Artificial* FREEZING.

CONGELATION *of wine*. See WINES.

CONGENERES *muſcles*, in *Anatomy*, are ſuch muſcles in an animal body, as ſerve together to produce the ſame motion; and they are ſo called becauſe they aſſiſt one another in their action.

CONGER, in *Ichthyology*, a ſpecies of the MURENA; the name of the *ſea* EEL, a very voracious and extremely large fiſh of the eel kind.

The name is derived from γογγρος, which is formed of a duplication of the adjective γγρος, or γγρ. *voracious*, from γγω, *I devour*.

It grows to an enormous ſize, four or five cubits being a common length with it, and its thickneſs that of a man's thigh. It is of a pale grey on the back, and a fine milk white on the belly, and has on each ſide a ſtrait white line, ſomewhat broad, made as it were of a double, ſometimes ſingle row of dots, and running from the head to the tail; the top of its back-fin is black all the way; and in the end of its upper jaw, juſt at the noſe, it has two ſhort tubular horns, out of which a mucous liquor may be expreſſed. Their fleſh is very agreeable, but is not eaſy of digeſtion. Willughby.

Theſe fiſhes form a conſiderable article of commerce in Cornwall; whence they are exported to Spain and Portugal, particularly to Barcelona. They are ſometimes caught by a hook and line; but chiefly by NETS. They are afterwards cured, by ſlitting and hanging them on a frame to dry, that the fat may exude. The dried *congers* are ground into a powder, and uſed by the Portugueſe and Spaniards to thicken and give a reliſh to their ſoups. Pennant's Zoology, vol. iii. p. 140.

CONGERIES, a Latin word, ſometimes uſed in our language for a collection or heap of ſeveral particles, or bodies, united in one maſs, or aggregate.

CONGERIES, *in Rhetoric*. See SYNATHROISMUS.

CONGESTION, in *Medicine*, a maſs, or collection of humours, crouded together, and hardened, in any part of the body; and there forming a preternatural tumor.

Congeſtion is effected by little and little; in which it differs from *obſtruction*, which is more ſudden.

CONGESTIONES, in *Medicine*. See STUFFINGS.

CONGIARIUM, CONGIARY, among *Medalliſts*, a gift, or donative, repreſented on a medal.

The word comes from the Latin CONGIUS; becauſe the firſt preſents made to the people of Rome conſiſted in wine and oil, which were meaſured out to them in *congii*.

The *congiary* was properly a preſent made by the emperors to the people of Rome. Thoſe made to the ſoldiers were not called *congiaria*, but *donativa*.

The legend, on medals repreſenting *congiaria* is, *congiarium, or diſtributio*.

Tiberius gave a *congiary* of three hundred pieces of money to each citizen: Caligula twice gave three hundred SESTERCES a head: Nero, whoſe *congiaries* are the firſt that we find repreſented on medals, gave four hundred.

CONGIUSELLA, in *Antiquity*, half a CONGIUS.

CONGIUS, an ancient Roman meaſure for things liquid; containing ſix ſextaries, or ten Roman pounds; equal to ſeven pints Engliſh wine meaſure.

From the original ſtandard of Veſpaſian extant at Rome, Greaves reduced the value of the Roman pound to be 5256 *Troy* grains. See DYNARION. But Mr. Paper, in an excellent paper on this ſubject, has ſuggeſted ſeveral objections againſt the accuracy of this concluſion. Phil. Tran. vol. lxi. part ii. p. 456.

The *congius* has alſo been uſed in England, as appears by a charter of king Edmund in 940.

CONGLOBATE *glands*, in *Anatomy*, thoſe glands whoſe ſubſtance is not divided, but firm, entire, and continued; and their ſurface ſmooth and uniform.

They are thus called, in oppoſition to *conglomerate* glands.

Conglobate glands have each of them an artery which brings them blood, a vein which carries it back again, after the proper juice has been ſtrained, and ſeveral excretory ducts.

Some of them have a cavity in the middle, with LYMPHATIC veſſels, which diſcharge themſelves into a common reſervoir, or canal.

CONGLOBATE *flowers*, are thoſe with globular heads.

CONGLOMERATE *glands*, are thoſe which are compoſed of ſeveral little ones; or they are ſeveral glandulous bodies joined together under the ſame common membrane. See GLAND.

Such are the ſalival glands, lachrymal glands, the pancreas, *&c.* which ſee under their proper articles.

The *conglomerate* glands, beſides their arteries, veins, and nerves, are alſo furniſhed with an excretory veſſel, ramified throughout their own ſubſtance; by means whereof they diſcharge the liquors they have ſtrained into reſervoirs.

CONGLOMERATE *flowers*, are thoſe which are irregularly crouded together.

CONGLUTINATION, the act of gluing, or faſtening two bodies together, by the intervention of ſome third, whoſe parts are unctuous and tenacious, in the nature of a glue, *gluten*; from whence the word is formed.

In the animal œconomy, the parts of the body are ſaid to be *conglutinated* by means of their natural moiſture; by the help of bandages, as in ſeveral caſes of ſurgery; or by the ſupply of viſcid particles. In which laſt acception, *conglutination* differs little from *accretion* or *nutrition*.

CONGO *money*, or Guinea money, a name given to a peculiar ſpecies of *cauris* or porcelain ſhell, which paſſes by way of money among the natives of thoſe places. It is diſtinguiſhed from the other porcelains by having a dentated mouth, and ſix gibbous protuberances on its ſurface.

CONGREGATION, an aſſembly of ſeveral eccleſiaſtics, united ſo as to conſtitute a body.

The term is principally uſed for aſſemblies of CARDINALS, appointed by the pope, and diſtributed into ſeveral chambers, for the diſcharge of certain functions and juriſdictions, after the manner of our offices and courts.

The firſt is the *congregation* of the holy office, or the INQUISITION: the ſecond, that of juriſdiction over biſhops and regulars: the third, that of councils; this has power to interpret the council of Trent: the fourth, that of cuſtoms, ceremonies, precedences, canonizations, called the *congregation of rites*: the fifth, that of St. Peter's ſubjic, which takes cognizance of all cauſes relating to piety and charity, part whereof is due to the church of St. Peter: the ſixth, that of waters, rivers, roads: the ſeventh, of fountains and ſtreets: the eighth, that of the INDEX, which examines the books to be printed, or corrected: the ninth, that of the council of ſtate, for the management of the territories belonging to the pope and

and church; see CAMERLINGO: the tenth, *de bono regimine*; of which two laſt, the cardinal-nephew is chief: the eleventh, that of money: the twelfth, that of biſhops; wherein thoſe who are to be promoted to biſhopricks in Italy are examined; this is held before the pope: the thirteenth, that of conſiſtorial matters; the chief whereof is the cardinal dean: the fourteenth, a *congregation* for propagating the faith; ſee COLLEGE: and the fifteenth, that of eccleſiaſtical immunity, for ſettling ſuits againſt churchmen. There is alſo a *congregation* of alms, which takes care of every thing that relates to the ſubſiſtence of Rome, and the ſtate of the church.

CONGREGATION is alſo uſed for a company or ſociety of religious, cantoned out of this or that order; and making, as it were, an inferior order, or a ſubdiviſion of the order itſelf.

Such are the *congregations* of the Oratory, and thoſe of CLUNY, &c. among the BENEDICTINES.

The word is alſo uſed for aſſemblies of pious perſons, in manner of fraternities; frequent among the Jeſuits, in honour of the Virgin, &c.

CONGREGATION *of* AIDS, *of* IMMACULATE *Conception, of the* LATERAN, *of* MISSION, *of* PENITENCE, *of Holy* SACRAMENT, *of Holy* TRINITY; ſee AIDS, IMMACULATE, &c.

CONGREGATION, in *Phyſics*, is uſed by Dr. Grew for the leaſt and loweſt degree of mixtion; or that wherein the parts of the mixt do not conſiſt with, or adhere to, each other, but only touch in one point.

That author declares himſelf of opinion, that the particles of all FLUIDS only touch in this manner; or that their COHESION only amounts to a *congregation*.

CONGREGATIONALISTS. See INDEPENDENTS.

CONGRESS, CONGRESSUS, is uſed for an aſſembly of commiſſioners, deputies, envoys, &c. from ſeveral courts or provinces, meeting to concert meaſures for their common good.

The *congreſs* at the Hague, which held during the courſe of the war, terminated in 1697, by the treaty of Ryſwick, was compoſed of the envoys of all the princes in the confederacy againſt France.

CONGRESS is alſo uſed for an eſſay, or trial, made by appointment of a lay, or ſpiritual judge, in the preſence of ſurgeons and matrons, to prove, whether or no a man be or be not impotent; in order to the diſſolution of a marriage. See IMPOTENCE.

Neither the civil nor canon law make any mention of this trial of virility by *congreſs*: it had its origin in France, from the boldneſs of a young fellow, who, in open court, being hard preſſed by his wife, demanded the *congreſs*. The judge, ſurpriſed with the novelty of the demand, found it could not be denied; as being the ſureſt evidence the caſe could admit of.

In time it became a branch in the French juriſprudence, and was authoriſed by decrees and arrets: it obtained for about the ſpace of one hundred and twenty years, and was annulled by an arret of parliament in 1677, as being found precarious; ſome having failed under the experiment out of mere modeſty and ſhame, which is found to have the ſame effect with actual impotency.

CONGRUITY, or CONGRUENCY, in the *Schools*, a ſuitableneſs or relation of agreement between things; whereby we come at the knowledge of what may be expected from them.

The ſyſtem of *congruity* in matters of grace conſiſts in this; that God, who knows perfectly the nature of grace, and the diſpoſitions of the will in all the circumſtances that ſhall befall a man, gives graces, wherewith, by virtue of their *congruity* with the will of a man, conſidered in thoſe circumſtances, man will always infallibly, but not neceſſarily, do, what God would have him do: becauſe the will, in the language of the *congreſſiſts*, does always infallibly, though voluntarily, chooſe what appears beſt.

CONGRUITY, *merit of*. See MERIT.

CONGRUITY, in *Geometry*, is applied to figures, lines, &c. which exactly correſpond when laid over one another; as having the ſame terms, or bounds.

Thoſe things between which there is a *congruity*, are equal, and ſimilar.

Euclid, and, by his example, moſt other geometricians, demonſtrate all their elements from the ſole principle of *congruity*: M. Leibnitz, and after him Wolfius, ſubſtitute the notion of SIMILITUDE in lieu of that of *congruity*.

CONGRUITY, in a lax ſenſe, is uſed to expreſs an aptitude, in ſome bodies, to unite, or incorporate; by reaſon of ſome ſimilitude or fitneſs of their figures: as *incongruity* denotes an unfitneſs of their ſurfaces for joining together.

Thus, quickſilver will unite with gold, and many other metals, but will roll off from wood, ſtone, glaſs, &c. and water, which will wet ſalt, and diſſolve it, will ſlip off from tallow without adhering to it; as alſo from a duſty ſurface, and from the feathers of water-fowl.

Two drops of water, or of mercury, will, on contact, immediately join and coaleſce; but oil of tartar, poured upon quickſilver, and ſpirit of wine and oil of turpentine on that, and air over all, will remain in the ſame veſſel without any manner of union, or mixture with each other. And the cauſe hereof is, that the figures of ſome bodies will not admit other bodies near enough to be within their ſpheres of ATTRACTION, wherein they cannot join, and cohere; but where their ſtreſs of figure will let them approach near enough to feel each other's attractive power, then they cloſe, and hold together. See COHESION.

CONIC *Section*, a curve line ariſing from the ſection of a *cone* by a plane.

The *conic ſections* are three, viz. the *elliptic*, *hyperbolic*, and *parabolic*; beſide the *circle* and the *triangle*, which, though they ariſe from the ſection of a *cone*, are not uſually conſidered in that capacity.

That the triangle is a *conic ſection*, as well as the other four, is ſhewn by Apollon. in Con. lib. 1. p. 3. As to the circle; it ariſes either from the ſection of a *cone* by a plane parallel to the baſis, or from the ſubcontrary ſection of the ſcalene *cone*. Vide Apoll. Con. lib. 1. prop. 5. Though the equations, geneſis, and many of the properties, with the ratios, dimenſions, &c. of each of the *conic ſections*, be ſeparately given under their reſpective articles in this work, ELLIPSIS, HYPERBOLA, and PARABOLA; yet, to make the doctrine of *conics*, which is ſo conſiderable a part of the higher geometry, and of ſuch frequent uſe in the new aſtronomy, the motion of projectiles, &c. more complete, we ſhall here put the whole in a new light, and bring it together into one contracted view.

The common interſection, then, of any plane with a *conic ſuperficies*, we obſerve, is called a *conic ſection*: and this ſection varies, and acquires a different name, according to the different inclinations of the cutting plane. For,

1. If a cone be any way cut by a plane, through the vertex; and again by another plane parallel to the former plane: then the ſections, made in the ſuperficies thereof, is called an *hyperbola*; the plane of which, being produced to meet the oppoſite ſuperficies, will make another ſection, which is likewiſe called an *hyperbola*: and both of theſe, conjunctly, are called *oppoſite ſections*.

2. If through the vertex of a cone a plane paſſes without the ſuperficies thereof, that is, neither cutting nor touching it; and the cone be again cut by another plane parallel to the former; the ſection made in the ſuperficies thereof, is called an *ellipſis*.

3. If a plane touch the ſuperficies of a cone, and the cone be cut by a plane parallel to it, the ſection is a *parabola*.

The more ancient mathematicians, before the time of Apollonius Pergæus, admitted only the right cone into their geometry, and they ſuppoſed the ſection of it to be made by a plane perpendicular to one of its ſides; and as the vertical angle of a right cone may be right, acute, or obtuſe, the ſame method of cutting theſe ſeveral cones, viz. by a plane perpendicular to one ſide, produced the *conic ſections*. The parabola was called the ſection of a right-angled cone; the ellipſe, the ſection of the acute-angled cone; and the hyperbola, the ſection of the obtuſe-angled cone. But Apollonius, who, on account of his writings on this ſubject, obtained the appellation of *Magnus Geometra*, obſerved, that theſe three ſections might be obtained in every cone, both ſcalene and right, and that they depended on the different inclination of the plane of the ſection to the cone itſelf. Apollon. Con. Ed. Hall. lib. 1. p. 9.

But, inſtead of conſidering theſe curves as ariſing by ſection of the cone itſelf, their deſcription, nature, and properties, are found more eaſy of conception, when conſidered as drawn on a *plane*: for which reaſon, after Des Cartes, and moſt of the later writers, we ſhall rather chooſe to lay them down in this ſecond manner.

Geneſis, or conſtruction of the ellipſis. — To conceive the production and nature of an ellipſis, let H and I (*Plate Conics, fig.* 13.) be two points, nails, or little pegs, about which put a thread BHI; then putting your finger to the thread, and keeping the ſame always in an equal tenſion, move the finger round from the point B, till you return to the ſame point B again.

By this revolution of the point B, will be deſcribed the curve line called the *ellipſis*; which differs from the deſcription of a circle only in this, that a circle hath only one centre, but the ellipſis two: though if the points H and I ſhould come together into one, the elliptic curve would become perfectly circular.

But by how much greater the diſtance is betwixt thoſe points, the ſame length of the thread ſtill remaining; by ſo much the farther is this figure removed from the circular: ſo that, according to the different proportion of the

diſtance HI to the ſum of the parts BH, BI of the thread, or to the line DK, which is equal to that ſum, diverſe ſpecies of ellipſes will be deſcribed.

But then, if the length of the thread be increaſed or diminiſhed, in the ſame proportion as the diſtance of the points H and I is increaſed or diminiſhed, there will indeed be deſcribed divers ellipſes, but all of the ſame ſpecies: whence it appears, that ellipſes are not only innumerable in magnitude, but in ſpecies alſo; and reach from a circle to a right line: for, as when the points H and I meet together, the ellipſe becomes a circle; ſo, when they are removed from each other half the length of the thread, it becomes a right line, both ſides meeting together.

Whence alſo it appears, that every ſpecies of ellipſes is no leſs different from any other, than the extremes of them are different on this ſide from a circle, and on that from a right line. It alſo appears from this delineation, that if from a point taken at pleaſure in the elliptic periphery, as the point B, you draw two lines to the two central points; theſe two lines BH and BI, taken together, will be equal to the greateſt diameter DK; and conſequently, that the ſum of them is always given.

In the ellipſe DFKR (*fig.* 14.) the point C is called the *centre*; the points H and I, the *foci*; DK, the *greater axis*, or *tranſverſe axis*, or the *principal diameter*, or *latus tranſverſum*; and FR, the *leſſer axis*: all the right lines paſſing through the centre C, are *diameters*; and all right lines terminated at the periphery, and diviſed into two equal parts by any diameter, are called *ordinates*. That part of every diameter intercepted betwixt the vertex thereof, and the ordinate, as MA, is called the *abſciſs* thereof. A line drawn from the vertex of the diameter, parallel to the ordinates thereof, as *s θ*, is a *tangent* to the ellipſis in that vertex. A diameter parallel to the ordinates of another diameter, is termed a *conjugate diameter*; and the ordinate to the greater axis, which paſſes through either of the foci, as MA (*fig.* 13.), is termed the *principal latus rectum*, or the *parameter* of the greater axis. See AXES, CENTER, DIAMETER, FOCUS, ORDINATE, PARAMETER, &c.

Properties of the ellipſis.—1. The ordinates of every diameter are demonſtrated to be parallel to each other.

2. The ordinates of the principal diameters or axes are perpendicular to the axes themſelves; but the ordinates of the reſt of the diameters are oblique to their diameters; and, in ellipſes of divers ſpecies, are ſo much the more oblique, at equal diſtance from the axis, by how much the proportion of the greater axis to the leſſer is the greater; but in the ſame ellipſis, ſo much the more oblique, by how much the more remote the diameters are from the axes.

3. There are only two conjugate diameters, which are equal to each other; viz. thoſe whoſe vertices are at equal diſtances from the vertices of the axes: that, the diameter VT (*fig.* 14.) is conjugate, and equal to that other GM, where VF is equal to MF, and VD equal to MK.

4. The obtuſe angle VCM of theſe two diameters, which are conjugate and equal, is greater, and the acute angle VCG is leſs, than every other angle contained under the reſt of the diameters that are conjugate to each other.

5. If the lines *n*P and *r*B be ſemiordinates to any diameter, as MG, the ſquare of the ſemiordinate *n*P is to the ſquare of the ſemiordinate *r*B, as is the rectangle M*n* × *n*G, to the rectangle M*r* × *r*G; that is, *n*P ſ is to the rectangle comprehended under the two parts, into which the diameter is diviſed by the ordinate KP, as *r*B *q* is to the rectangle under the parts of the diameter made by the ordinate AB.

6. The parameter, or *latus rectum* of any diameter, is a third proportional to that diameter, and its conjugate: that is (in *fig.* 13.), if the diameter DK is to its conjugate diameter EF, as EF is to Y; then Y is the parameter or *latus rectum* of the diameter DK: whence AM, an ordinate to the axis through the focus, is, as above, equal to the principal parameter, and is a third proportional to the greater and leſſer axis.

7. The ſquare of every ſemiordinate, as MI, is always leſs than the rectangle made by any abſciſs whatever, as IK drawn into the *latus rectum* of its own diameter, or than IK × Y. And in *fig.* 14. *F n q* is leſs than the rectangle made of the abſciſs M*n* and the *latus rectum* of MG: from which deficit, or ἔλλειψις, this ſection hath its name.

8. If from any point, as B, in *fig.* 13. you draw the right lines BH and BI to the foci, the ſum of them will be equal to the greater axis, as was ſhown above: and if the angle IBH, comprehended by thoſe lines, be biſected by the right line *b a*, the line *b a* is perpendicular to the tangent VB in the point B; that is, to the curve in the point of contact.

9. The diſtance of a body turned round in an ellipſis, about the focus H, from the ſame focus, is the greateſt of all in the point K; leaſt of all in the point D; and mean in the points E and F; and that mean diſtance HF is equal to the greater half-axis DC or CK; as is manifeſt, from the production of the ellipſis.

10. The vaniſhing ſubtenſe of the angle of contact, parallel to the diſtance from the focus, is an equal perpendicular interval from that diſtance, always remains given and unvaried in the ſame ellipſis, yea, and in the ſame parabola and hyperbola too. Thus, if *dZ* be always given, *r d* alſo will always remain given in a diſtance infinitely ſmall.

11. The area of the ellipſis is to the area of the circle circumſcribed, as the leſſer axis is to the greater; and ſo are all correſponding parts whatſoever among themſelves, as MIK, *n* IK: and the ordinates to the greater axis, as MI, are diviſed by the elliptic periphery always in the ſame proportion, ſo that MI is to *n* I always in the ſame proportion; to wit, that of the leſſer axis to the greater. And we are to reaſon in the ſame manner concerning a circle inſcribed in an ellipſis. See QUADRATURE.

12. All parallelograms deſcribed about the conjugate diameters of the ellipſis, and comprehending the ellipſis, are equal. Thus, the parallelogram *s θ θ δ*, *fig.* 14. is equal to the other parallelogram *r ζ η θ*: and thus it is every where.

13. If a right line always paſſing through one of the foci be ſo moved, that the elliptic area, deſcribed by the ſame, is proportional to the time; the angular motion of a right line drawn from the other focus to the former line, will be almoſt equable: thus, in *fig.* 13. if the angular motion of the line HB be ſo tempered, that the ſame, being according to the reciprocal proportion of the diſtance accelerated or retarded, deſcribes the area DHB, proportional to the time; the angular motion KIB about the other focus I, will be almoſt proportional to the time, and conſequently without any notable acceleration or retardation, and nearly equable; that is to ſay, where the ellipſis does not differ much from a circle.

Genuſis of the parabola.—Let DI be an infinite right line, and IL another perpendicular to it (*fig.* 15.); then, taking in the line DI, any point, F, let the line FI be biſected in the point T; and let there be taken two threads joined together in the point T, one TI, the other TF; and let a pin fixed to the threads in the point T be moved to the right and left, in ſuch a manner, that when the pin is in any other poſition, as in P, the thread TI, which here becomes PL, be always perpendicular to IL; or, which is the ſame thing, parallel to DI, but equal to the thread TF; which in this caſe becomes PF, ever paſſing through the point F: the curve thus generated by the pin, infinitely produced both ways, is a parabola: in which *r* P i T R *s*, is called the *periphery*; ID, the *axis*, or *principal diameter*; IL, the *directrix*; F, the *focus*; the point T, the *principal vertex*.

An ordinate to the axis through the focus is equal to the principal *latus rectum*: all right lines, as *n s*, &c. parallel to the axis, are diameters, as dividing the lines *r* I, &c. which are parallel to the tangents at their vertices, into two equal parts; and they are called diameters belonging to the vertices in which they terminate, as *s*, and R.

Properties of the parabola.—1. Every diameter, or right line parallel to the axis, biſects all the lines within the figure, which are parallel to the tangent of the vertical point; and theſe biſected lines are called *ordinates*.

2. The ordinates of the axis are perpendicular to it; but the ordinates of the reſt of the diameters are oblique to their diameters; and ſo much the more oblique, by how much the vertex of their diameter is farther removed from the principal vertex of the parabola.

3. The *latus rectum*, or parameter to every diameter, is a third geometrical proportional to any abſciſs, and its ſemiordinate; that is, if the *latus rectum* of the diameter *s n*, or that of the vertex *i*, be *y*; then, as the abſciſs *i q* is to the ſemiordinate *q k*, ſo is that ſemiordinate *q k* to *y*.

4. The principal *latus rectum*, or that belonging to the axis, is equal to the ordinate *kx* paſſing through the focus; and quadruple of FT, the leaſt diſtance of the focus from the principal vertex. See FOCUS.

5. The *latus rectum*, belonging to any vertex or diameter, is alſo quadruple of the diſtance of that vertex from the focus: thus, the *latus rectum* of the vertex *s* is quadruple F *s*, and ſo it is every where: and therefore the parameter of the axis is the leaſt of all parameters.

6. The diſtance of any vertex or point in the parabola whatever, from the focus, is equal to the leaſt diſtance of the ſame from the line LI, which is perpendicular

to

to the axis; and is diſtant from the principal vertex, by a quarter of the principal *latus rectum*.

7. The ſquare of every ſemiordinate, as $q\,k$, is equal to a rectangle made of the *latus rectum*, of the ſame vertex as y, and iq the abſciſs of the diameter of the vertex. And from the equality of the proportion, or compariſon in the figure, betwixt the rectangle and the ſquare of the ſemiordinate, without any excels or defect, the name of the ſection is derived.

8. Since therefore the *latus rectum* in any diameter is given, the abſciſſes will be as the ſquares, or in the duplicate ratio of the ſemiordinates. Thus, TF is to TG as $iF\,q$ is to $g\,G\,q$; and ſo likewiſe is iq to ir, as the ſquare of $q\,T$ is to the ſquare of $r\,t$: and thus every where. From whence, alſo, when the abſciſs of the axis is equal to the principal *latus rectum*, or fourfold of the diſtance from the vertex, it will be equal to its ſemiordinate.

9. The angle, comprehended by any tangent whatever, and a line from the focus, is equal to an angle comprehended by the ſame tangent, and any diameter, or the axis. Thus, the angles $I\,i\,F$, and $p\,i\,n$, are equal: whence, by the way, all the rays of light which fall on the concave part of the ſurface, produced by the convolution of the parabola about the axis, which fall, we ſay, on the ſame, parallel to the axis, will be reflected from a concave paraboloid figure to the focus F, and there beget a moſt vehement burning; from which property, the point F has the name *focus*, and has communicated the ſame to the like points in the hyperbola and ellipſis.

10. A parabola like an hyperbola, does not incloſe a ſpace, but ſtretches out *in infinitum*.

11. A parabolic curve always tends more and more, *in infinitum*, to a parallelism with its diameters; but can never arrive thereat.

12. If two parabolas be deſcribed, with the ſame axis and vertex; the ordinates to the common axis will be cut off by the parabola in a given proportion; and the areas comprehended by the ſame axis and ordinate, and the reſpective curves, will be in the ſame given proportion to one another.

13. Every parabolic ſpace comprehended betwixt the curve and the ordinate, is to the parallelogram made of the ſame baſe and altitude, in a ſeſquialteral proportion, that is, as 2 is to 3; and to the external ſpace in a double proportion, or as 2 is to 1: ſo $q\,T$ is to $q\,I$, as 2 is to 3; and to $r\,T$ as 2 is to 1. From whence it becomes eaſy to ſquare the parabola. See QUADRATURE.

14. The diſtance between the vertex of the axis and the point where any tangent interſects it, as I, is equal to the abſciſs of the axis which belongs to the ordinate applied from the point of contact: ſo T I is equal to TF; and thus it is every where.

15. All parabolas are like, or of the ſame ſpecies; as are alſo all circles.

16. If a diameter be continued through the point of concourſe of two tangents; this diameter will biſect the line that joins the contacts: which property of the parabola may likewiſe be underſtood of the ellipſis, and hyperbola.

Geneſis of the hyperbola.—Suppoſe a ſtaff or rule of a ſufficient length, as I B (*fig.* 16.): let I and H be two central points, anſwering to the foci of an ellipſis, in which let nails be faſtened; then, there being tied to one end of the ſtick a rope or thread as long again as the ſtick, let the other end thereof be bored through, and ſo fixed upon the nail I; and fix the other end of the rope, by a knot, upon the other nail H: which done, laying your finger on the point B, where the rope and ſtaff are tied together, let your finger deſcend ſo long, till you have thereby applied, and joined the whole rope to the ſtaff or rule; the ſtaff having been in the mean while, as it needs muſt, wheeled about the centre I. Thus, with the point B, the vertex of the angle H B I, you will have deſcribed a curve line X B D, which is part of an hyperbola; the whole conſiſting of that curve which will riſe from the curve X B D, which hath added to it the curve Y D, the produce of the rule and work, as turned to the other ſide.

Farther tranſferring the hole, or knot of the rope to the nail I, and faſtening the end of the ſtaff on the nail H, you will deſcribe another hyperbola, vertically oppoſite to the former, which will be altogether like and equal thereto. But if, without changing any thing in the rule and nails, you only apply a longer rope; you will have an hyperbola of a different ſpecies from the former: and if you ſtill lengthen the rope, you will have ſtill other ſorts of hyperbolas; till at length, making the rope double the length of the rule, you will have the hyperbola changed into a right line.

But if you alter the diſtance of the nails, in the very ſame proportion in which you change the difference betwixt the length of the rope, and that of the ſtick; in this caſe you will have hyperbolas marked out, which are altogether of the ſame ſpecies, but have their ſimilar parts differing in magnitude.

Laſtly, If the length of the rope and rule be equally increaſed, their difference in the mean while, and the intervals of the nails, remaining the ſame; not a different hyperbola, either as to ſpecies or magnitude, will be deſcribed, nor any other than a greater part of the ſame hyperbola.

It muſt be owned, however, that many properties of an hyperbola are better known from another manner of generating the figure, which is as follows: let L L and M M (*fig.* 17.) be infinite right lines interſecting each other at any angle whatever, in the point C: from any point whatever, as D or e, let D d, D d be drawn parallel to the firſt lines; or $e\,c$, $e\,d$; which, with the lines firſt drawn, make the parallelograms, as D C D, or $e\,C\,d$. Now, conceive two ſides of the parallelogram, as D d, D d, or $e\,c$, $e\,d$, to be ſo moved, this way and that way, that they always keep the ſame parallelism; and that at the ſame time the areas always remain equal; that is to ſay, that D c and $e\,c$ remain always parallel to M M, and D d or $e\,d$ always parallel to L L; and that the area of every parallelogram be equal to every other, one ſide being increaſed in the ſame proportion wherein the other is diminiſhed: by this means, the point D or e will deſcribe a curve line within the angle comprehended by the firſt lines; which is altogether the ſame as that deſcribed above. So alſo in the angle vertically oppoſite will be deſcribed a like and equal hyperbola; if the parallelogram C r K d, equal to the former, be ſuppoſed to be moved, in the ſame manner as before: which hyperbolas are, as was ſaid before, called *oppoſite ſections*, or *oppoſite hyperbolas*.

In each figure, D K is the *tranſverſe axis*, or *tranſverſe diameter of the hyperbola*, or the *oppoſite ſections*: the point C, the *centre*; H and I, the *foci*. In the latter figure, all the lines paſſing through the centre C, as $i\,k$, are *diameters*: but if hyperbolas be deſcribed in the following angles, as L C M, M C L, thoſe ſections will be called *following ſections*: and if the diſtance of the primary vertex of thoſe hyperbolas from the common centre C, as C g, or C y, be equal to the ſemitangent K u or K u, to the primary vertex of theſe, thoſe ſections are called *conjugate ſections*: and all the figures together form the *hyperbolic ſyſtem*.

Farther, $i\,b$ the ordinate to the axis through the focus, is equal to the principal *latus rectum*, or the parameter of the axis; and an indeterminate diameter, which is parallel to the ordinates of any determinate diameter, is called the *conjugate diameter* of the ſame.

Properties of the hyperbola.—1. Any diameter, or right line paſſing through the centre, biſects all its ordinates; that is, all the right lines which are terminated on both ſides by the hyperbolical periphery.

2. The ordinates of the axis are perpendicular to the ſame; but the ordinates of the reſt of the diameters are oblique to their diameters: and ſo much the more in divers ſpecies, at equal diſtances from the axis, by how much the difference of the angles including the hyperbolas is the greater: and in the ſame hyperbola, ſo much the more oblique, by how much the diameters are farther removed from the axis.

3. If any lines, as H b and Q s, be ſemiordinates to any diameter whatever, as K D; the ſquare of the ſemiordinate H b is to the ſquare of the ſemiordinate Q s, as the rectangle K H $\times$ D H is to the rectangle K Q $\times$ D Q: and ſo $b\,n^2$ is to $s\,k^2$, as the rectangle $i\,b \times b\,k$ is to the rectangle $i\,d \times d\,k$: and thus every where.

4. The *latus rectum*, or parameter of every diameter, is a third geometrical proportional to the diameter, and the conjugate thereof (or its tangent, which is equal to it): that is, if the *latus rectum* of any diameter, as D K, be y; then, as the diameter D K is to its conjugate $k\,y$, or its equal $u\,x$; ſo is that conjugate $k\,y$, or that tangent $u\,x$, to y. And as the ordinate to the axis through the focus is the principal *latus rectum*, ſo it is more than double of the leaſt diſtance of the focus from the vertex.

5. The ſquare of any ſemiordinate, as Q s, is greater than a rectangle made of the abſciſs D Q, drawn into the *latus rectum* of its own diameter, as y: and, in like manner, the ſquare of the ſemiordinate $b\,n$ is greater than the rectangle of the abſciſs $i\,b$, into the *latus rectum* of the diameter ei. From which *exceſs*, or *exceſſ*, this ſection hath its name.

6. If from any point of the hyperbola, as B (*fig.* 16.), there be drawn right lines to both the foci, as B H, B I, the difference of theſe lines will always be equal to the axis D K; as will eaſily appear, from the delineation itſelf.

7. If the angle H B I, comprehended by lines drawn to

the

the foci, be bisected by the right line EB, that right line will be a tangent to the hyperbola in the point B.

8. The right lines L L and M M (*fig.* 17.), which inclose the hyperbolas, are afymptotes of the hyperbolas; that is, they are fuch to which, on both fides, the curve approaches nearer and nearer, but is never able to touch or coincide therewith.

9. The fpecies of hyperbolas are various, according to the different magnitude of the angle L C M, comprehended by the afymptotes; but that angle remaining the fame, the fpecies of the hyperbola remains unchanged: yet, according to the different magnitudes of the parallelograms, by which hyperbolas are defcribed, hyperbolas of divers magnitudes do arife: if the angle contained by the afymptotes be a right angle, the hyperbola is called *equilateral*, or *rectangle*; and the *latus rectum* of all the diameters will (as in a circle) be equal to the diameters.

Laftly, If hyperbolas be defcribed about the fame axis in divers angles of the afymptotes, the right lines perpendicular to the axis will be cut off in a given proportion by them all; and the fpaces likewife inclofed by the right lines, or ordinates, the produced axis, and the curves, will be in the fame given proportion.

10. If the diftances from the centre of the hyperbola, be taken in a geometrical proportion in one of the afymptotes, fo that CI, CII, CIII, CIV, CV, CVI, be in continued geometrical proportion: and if from thofe points there be drawn parallel to the other afymptote the lines I 1, II 2, III 3, IV 4, V 5, VI 6; the fpaces I 2, II 3, III 4, IV 5, V 6, will be equal among themfelves. And conſequently, if that afymptote CM be fuppofed to be divided, according to the proportion of numbers exceeding one another in a natural ſeries, thoſe ſpaces will be proportional to the logarithms of all thoſe numbers.

Common properties of all the CONIC *ſections*.—From the whole it may be gathered, 1. That the *conic ſections* are in themſelves a ſyſtem of regular curves, naturally allied to each other; and that one is changed into another perpetually, when it is either increaſed, or diminiſhed, *in infinitum*. Thus, the circle, the curvature thereof being ever ſo little increaſed or diminiſhed, paſſes into an ellipſis; and the ellipſis, its centre going away infinitely, and the curvature being by that means diminiſhed, is turned into a parabola; and when the curvature of the parabola is ever ſo little changed, there ariſeth the firſt of the hyperbolas; the ſpecies whereof, which are innumerable, will all of them ariſe orderly by a gradual diminution of the curvature; till the curvature vaniſhing away, the laſt hyperbola ends in a right line perpendicular to the axis. From whence it is manifeſt, that every regular curvature, like to that of a circle, from the circle itſelf to a right line, is a conical curvature, and is diſtinguiſhed with its peculiar name, according to the divers degrees of that curvature.

2. That the *latus rectum* of a circle is double to the diſtance from the vertex: that all the *latera recta* of ellipſes are in all proportions to that diſtance betwixt the double and quadruple, according to their different ſpecies: that the *latus rectum* of the parabola is juſt quadruple of that diſtance: and, laſtly, that the *latera recta* of hyperbolas are in all proportions beyond the quadruple, according to their various kinds.

3. That all diameters in a circle and ellipſis interſect one another in the centre of the figure within the ſection; that in the parabola they are all parallel amongſt themſelves, and to the axis; but that in the hyperbola they interſect one another, but this without the ſection, in the common centre of the oppoſite ſections.

4. That the curvature, with reſpect to the focus, in all theſe figures, is increaſed or diminiſhed proportionably. The doctrine of the *conic ſections* is of great uſe in phyſical and geometrical aſtronomy, and the phyſico-mathematical ſciences. This doctrine has been much cultivated by geometers ancient and modern; and we have many good treatiſes on the ſubject; but that publiſhed by Mr. Simpſon, profeſſor of Mathematics at Glaſgow, deſerves to be particularly mentioned not only for its elegance but for its geometrical accuracy, which, as he juſtly remarks in his preface, has not always been ſo well obſerved in treatiſes of this kind, as it ought to be. See alſo Gregorii a St. Vincenti Opus de Quadratura Circuli, & Sectionum Coni; Mydorgius de Sectionibus Conicis: De la Hire de Sectionibus Conicis; Trevigar Elem. Section. Con.; Hamilton's Tract. Geom. de Section. Con.; De l'Hoſpital's Anal. Treat. of Conic Sections; Muller's Treatiſe, &c.; and Halley's edition of Apollonius, &c. Oxon. 1710. fol.

To the properties of the *conic ſections* mentioned above, it may be proper to add the properties of their oſculatory circles, or circles of *curvature*. See CURVATURE.

CONIC *ſections, ſimilar*. See SIMILAR.

CONICS, that part of the higher GEOMETRY, or *geometry of* CURVES, which conſiders the cone, and the ſeveral curve lines ariſing from the ſections thereof.

CONICTHYODONTES, or *Piſtrotuitor*, in *Natural Hiſtory*, one of the three names by which the foſſil teeth of fiſh are known: ſo called, from their ſuppoſed reſemblance to the ſpur of a fighting-cock.

Though authors aſſure us that theſe are the teeth of a fiſh, the jaws having been found with thoſe bodies in them; yet they do not pretend to know to what fiſh they belong. They are generally of an oblong conic figure, broad at the baſe, and narrow at the point, where they are uſually a little crooked: they are hollowed at the root, and are from the tenth of an inch to two inches long, commonly of a chefnut colour, and are found in the ſtrata of clay, but moſt uſually in thoſe of ſtone; and are ſeen more frequently in England than in any other part of the world. Hill's Foſſils, p. 645.

CONIFERA *ſalicis facie*, in *Botany*. See *Silver* PINE-*tree*.

CONIFERA *abiegni folio*, in *Botany*. See *Sprage-leaved* PINE.

CONIFEROUS, a term applied to ſuch trees, ſhrubs, or herbs, as bear a ſquammous or ſcaly fruit, of a woody ſubſtance, and a figure approaching to that of a cone; in which there are uſually many ſeeds; and, when they are ripe, the ſeveral cells or partitions in the cone gape or open, and the ſeeds drop out. Of this kind are the fir, the pine, beech, and the like.

CONJOINT, or CONJUNCT, is applied in *Ancient Muſic*, in the ſame ſenſe as *conſonant*, to two or more ſounds heard at the ſame time. See CONSONANCE.

CONJOINT *degrees*, two notes which immediately follow each other in the order of the ſcale; as *re* and *re*.

CONJOINT *tetrachords*, are two tetrachords, where the ſame CHORD is the higheſt of the one, and the loweſt of the other.

CONIRA, in *Botany*, a name uſed by ſome authors for the *myrtilis*. Gen. Euvac. Ind. 2.

CONISALUS, in *Mythology*, a god of the Athenians mentioned by Strabo, and ſuppoſed to be the ſame with PRIAPUS.

CONISOR. See CONNISOR.

CONISSALÆ, in *Natural Hiſtory*, the name of a claſs of foſſil bodies; the word is derived from *κονιαω, pulvis*; all the ſpecies of bodies of this claſs being found like common ſand, in form of powder, have been uſually confounded together, under the common name of SANDS. The *coniſſale* are defined to be ſtones of a differently debaſed, cryſtalline, or ſparry matter, but always found in form of ſmall and diſunited particles, great numbers of which being amaſſed together, form a kind of *powder*.

Of this claſs of bodies there are two diſtinct and large genera. 1. The SANDS properly ſo called, which are compoſed of particles all appearing to have a tendency to the ſame regular figure, tranſparent, vitrifiable by a ſtrong fire, and not ſoluble in, or effervecking with acids. 2. The SABURRA, or DUST of ſtone found looſe; theſe are found in form of powder, the particles of which, in general, have no tendency to any particular figure, but appear to be rudely broken fragments of larger maſſes. Hill's Hiſt. of Foſſ. p. 543.

CONISTERIUM, in *Antiquity*, that part of the *gymnaſium* where the duſt was kept with which thoſe who had been anointed were ſprinkled. It was alſo called *coniſtra*. Potter Arch.

CONJUGATE *diameter*, or AXIS, in *Conics*, is a right line, biſecting the tranſverſe DIAMETER. See CONIC *ſection*.

CONJUGATE *axis*, of an *ellipſis*, is the ſhorter diameter, or axis, biſecting the longer, or tranſverſe axis. Such is EF, *Tab. Conics, fig.* 31.

It is demonſtrated, 1. That in an ellipſis, the *conjugate* axis is a mean proportional between the tranſverſe axis and the parameter. 2. The ſquare of the *conjugate* axis is to that of the tranſverſe, as the ſquare of the ſemidiſtinate is to the rectangle of the ſegments of the axis. 3. That a right line drawn from the focus to the extremity of the ſemi-*conjugate* axis, is equal to the tranſverſe ſemi-axis.

Hence, the *conjugate* axes being given, the FOCUS is eaſily determined; and the ellipſis thence eaſily deſcribed.

CONJUGATE *axis*, in an *hyperbola*, is a mean proportional between the tranſverſe axis and the parameter.

It is thus called becauſe the *conjugate* axis of an ellipſis has the ſame ratio. In an hyperbola, the ſquare of the *conjugate* axis is to the ſquare of the tranſverſe, as the parameter to the tranſverſe axis.

CONJUGATE *point*, in *Geometry*. See POINT.

CONJUGATE *hyperbola*. See HYPERBOLA.

CONJUGATE, in *Rhetoric*, denote words deduced from the ſame origin with that of the ſubject: e. g. *He who deceiveth, is juſt.*

CONJUGATION, in *Grammar*, an orderly diſtribution of the ſeveral parts or inflexions of verbs, in their different MOODS and TENSES, to diſtinguiſh them from each other.

The Latins have four *conjugations* diſtinguiſhed by the terminations of the infinitive, *are, ere, ere, ire*; and moſt of the French grammarians reduce the *conjugations* of their language to the ſame number, ending in *er, re, ir*, and *oir*. Some have added a fifth Latin *conjugation* called the *mixt*, becauſe it is compoſed of the third and fourth, as *accipere, accipio*.

The Greeks have three kinds of verbs; the firſt called *barytons*, becauſe the laſt ſyllable is pronounced with a grave accent; ſee BARYTONUM: ſuch are *τύπτω, τύπτω*, and *τύπτω, τύπτεις*: the ſecond are circumflex verbs, which admit a contraction in their termination, and are then marked with a circumflex accent; ſuch is *ἀγαπάω, ἀγαπῶ, ἀγαπᾷς*: the third kind comprehends the verbs in *μι*, as *ἵστημι, ἵστης*. Of the firſt ſort there are ſix *conjugations*; of the ſecond three; and of the third, four. But Meſſrs. de Port Royal reduce theſe thirteen *conjugations* to two: viz. one in *ω*, comprehending the barytons and circumflex verbs; and the other, thoſe in *μι*.

In the Hebrew language there are four *conjugations*; viz. *kal* with its paſſive *niphal pihel* with its paſſive *pyhal*, to which alſo may be referred *pohel, hiphil* with its paſſive *hophal*, and *hitpahel*. The third perſon ſingular maſculine of the firſt *conjugation* is the preterite of the theme; the ſecond *conjugation* has a *daguſh forte* in the ſecond radical; the third has the prefix letter ה and the fourth, the ſyllable הת.

In Engliſh, where the verbs have ſcarce any natural inflexions, but derive all their variations from additional particles, pronouns, &c. we have hardly any ſuch thing as ſtrict *conjugations*.

Some grammarians, however, diſtribute Engliſh verbs into three *conjugations*, or claſſes, diſtinguiſhed from one another by a peculiar formation in ſome principal part belonging to each: and they obſerve that the three different terminations of the participles, *d, t, n*, may be conſidered as the characteriſtics of the *conjugations*. Lowth's Introd. to Engliſh Grammar, p. 104. 1772. Others again diſtinguiſh them by the different inflection of the firſt tenſe to each root, and thus make four *conjugations* in the active voice: the firſt has three radicals alike; as *I do reads, I read*, i. e. yeſterday; *I have read*, i. e. juſt now. The ſecond has the firſt and third radical alike; as *I run, I ran, I have ran*. The third *conjugation* has the ſecond and third radical alike; as *I eſteem, I eſteemed, I have eſteemed*. The fourth has the three radicals different; as *I write, I wrote, I have written* or *writ*. The paſſive voice, being made up of the third radical and the auxiliary verb *am*, admits of no difference of *conjugations*. Ward Eſſay's on the Engliſh Language, p. 87.

CONJUGATION, in *Anatomy*, is underſtood of a pair of nerves; or two nerves, aſſiſting together, and ſerving for the ſame operation, ſenſation, or motion; there being ſcarce any NERVE in the body without its fellow.

The ancient phyſicians only knew of ſeven pairs, or *conjugations* of nerves; the moderns have diſcovered thirty new ones.

CONIUM. See HEMLOCK.

CONJUNCT. See CONJOINT.

CONJUNCT *of an arch*. See SUPPLEMENT.

CONJUNCT *ſentence*. See SENTENCE.

CONJUNCTION, in *Aſtronomy*, the meeting of two ſtars, or planets, in the ſame optical point of the heavens, i. e. in the ſame degree of the zodiac; and is either *true* or *apparent*.

If the two bodies meet both in the ſame degree of longitude and latitude, a right line drawn through the centre of the earth through the centre of one of them, paſſes through that of the other; and the *conjunction* is ſaid to be *true* and *central*: and if the lower hides the upper, the *conjunction* is ſaid to be *corporal*.

If the line paſs wide of the centre of the earth, the *conjunction* is ſaid to be *partile*.

If the bodies do not meet preciſely in the ſame degree, but are joined with ſome latitude, the *conjunction* is ſaid to be *apparent*. Thus, when a right line, ſuppoſed to be drawn through the centres of two planets, does not paſs through the centre of the earth, but through the eye of the ſpectator; it is ſaid to be an *apparent conjunction*.

Conjunctions are alſo divided into *great* and *greateſt*: *great conjunctions* are thoſe which only happen at conſiderable diſtances of time from each other: as that of Saturn and Jupiter, which happens every twenty years.

Greateſt conjunctions are thoſe which happen in times very remote; as the *conjunction* of the three ſuperior planets, Mars, Jupiter, and Saturn, which only return once in five hundred years. But this diviſion has little place in aſtronomy; being founded on the notion of the particular influences, &c. of the heavenly bodies in ſuch and ſuch aſpects.

Aſtrologers maintain, that the deluge was owing to a *conjunction* of all the planets in Capricorn; and that the conflagration will be occaſioned by their *conjunction* in Cancer: whence they preſume to foretel the end of the world.

The *conjunction* is the firſt, or the principal, of all the aſpects; and that whence the other aſpects *commence*, as oppoſition is the laſt, where they terminate. See CHARACTER.

The moon is in *conjunction* with the ſun every MONTH.

Her *conjunctions* and oppoſitions are called by a general name, *ſyzygies*.

Eclipſes of the ſun never happen, but when there is a *conjunction* of the ſun and moon in or near the nodes of the ecliptic.

CONJUNCTION, in *Grammar*, a particle which expreſſes a relation or dependence between words, and phraſes; thus called, becauſe ſerving to join or connect the parts or members of a diſcourſe: or, as Mr. Harris defines it, a *conjunction* is a part of ſpeech, void of ſignification itſelf, but ſo formed as to help ſignification, by making two or more ſignificant ſentences to be *one* ſignificant ſentence; and he diſtributes them into ſuch as connect ſentences and their meaning, and ſuch as conjoin the ſentences whilſt they diſjoin the ſenſe. The former are *conjunctive*, and are either *copulative* or *continuative*; and the latter *disjunctive*, ſome of which are ſimple, as, *either* it is day, *or* it is night, and ADVERSATIVE, as, it is not day *but* it is night. Hermes, p. 240, &c.

The *conjunction* is the ſixth of the eight vulgar parts of ſpeech.

Conjunctions render the diſcourſe more ſmooth and fluent; and ſerve very good purpoſes in the argumentative, and narrative ſtyle; but they muſt ever be omitted where a perſon ſpeaks with emotion, as only ſerving to weaken and enervate it. Bullen obſerves, that nothing gives more warmth and life to a diſcourſe, than to drop the *conjunctions* or copulatives: a paſſion, adds he, embarraſſed with *conjunctions*, and uſeleſs particles, loſes all the fire and vehemence it would acquire in its progreſs.

Conjunctions are of various kinds.

CONJUNCTIONS, *copulative, or conjunctive*, are thoſe which expreſs a relation of union or compariſon between things: as, *and, only, as much as, in the ſame manner as, neither more nor leſs, inaſmuch as, not only, but alſo*.

CONJUNCTIONS *adverſative*, thoſe which expreſs a reflection, or contrariety: as, *but, nevertheleſs, although, far from*.

CONJUNCTIONS *cauſal*, thoſe which ſhew, that the reaſon of ſomething is brought: as, *for, becauſe, ſeeing, for rather ſays, inaſmuch as*.

CONJUNCTIONS *concluſive*, thoſe which denote a conſequence drawn: as, *for which reaſon, but then, of conſequence, ſo that*, &c.

CONJUNCTIONS *conditional*, are thoſe which import a condition, as *if, if not, on condition that, provided that*, is *caſe of*.

CONJUNCTIONS *continuative*, thoſe which expreſs a ſucceſſion, or continuation of the diſcourſe: as, *in effect, even, whatever it be*.

CONJUNCTIONS *diſjunctive*, thoſe which expreſs a relation of ſeparation or diviſion: as, *neither, whether, or*.

CONJUNCTIONS *dubitative*, thoſe which expreſs ſome doubt, or ſuſpenſion of opinion: as, *if, that is to ſay*, &c.

CONJUNCTIONS *exceptive*, are, *if it be not, unleſs that*, &c.

CONJUNCTIVA, *tunica, adnata, or albuginea*, in *Anatomy*. See ADNATA.

CONJURATI *fratres*. See FRATRES.

CONJURATION, ſignifies a plot or conſederacy, made by perſons combining together by oath or promiſe, to do ſome public harm.

But it was more particularly uſed, formerly, for having a perſonal converſe with the devil, or ſome evil ſpirit, to know any ſecret, or to effect any purpoſe. Anno 5 Eliz. c. 16.

It is ſaid in ſome of our law-books, that the difference between *conjuration* and *witchcraft* is, that the former endeavours by prayers and invocation of God's powerful name, to compel the devil to ſay or to do what the offender commands him; the latter deals rather by friendly and voluntary converſence or agreement with the devil or familiar, to have the offender's deſires ſerved, in lieu of blood, or other gift offered to the devil, eſpecially of the offender's ſoul. And both theſe differ from *inchantment* or *ſorcerie*; becauſe thoſe are perſonal converſences with the devil, and theſe are but medicines and ceremonious

forms of words (commonly called *charms*) without apparition. Cowel.

The statute of king James I. against *conjuration* and witchcraft, is repealed; and no profecution fhall be commenced on the fame: but where perfons pretend to exercife any kind of witchcraft or *conjuration*, &c. or undertake to tell fortunes, or, from their fkill in any crafty fcience, to difcover where goods ftolen or loft may be found; upon conviction they fhall be imprifoned a year, and ftand in the pillory once in every quarter, in fome market town, and may be ordered to give fecurity for their good behaviour, by ftat. 9 Geo. II. c. 5.

CONN, in *Sea-Language*. See COND.

CONNA, in *Botany*, a name ufed by fome authors for the tree which produces the *caffia fiftula* ufed in medicine. Hort. Manur. vol. i. p. 37.

CONNARUS, in the *Materia Medica*, a name given by fome authors to a large fpecies of jujube. Ger. Emac. Ind. 2. In the Linnæan fyftem, it is a genus of the *monadelphia decandria* claſs; the characters of which are, that it is monogynous, with a fimple ſtigma, and that it has a capſule with two valves, a ſingle cell and one ſeed. There is only one ſpecies.

CONNATA *folia*, among *Botaniſts*. See LEAF.

CONNECTING *oil*. See OIL.

CONNECTION, or CONNEXION, a relation whereby one thing adheres to, or depends on another.

Euclid's propoſitions have ſuch a *connection* among themſelves, that the latter cannot ſubſiſt without the former.

CONNECTION, or *continuity*, in the *Drama*, conſiſts in the joining of the ſeveral ſcenes together.

When the ſcenes of an act ſucceed one another immediately, and are ſo joined as that the ſtage is never left empty, the *connection* is ſaid to be obſerved.

CONNECTIVES, in *Grammar*, one of the four ſpecies under which, according to Mr. Harris, all WORDS may be included. They are of two kinds, and as they connect ſentences or words are called by the different names of CONJUNCTIONS and PREPOSITIONS. Hermes, p. 31, and 237.

CONNER. ALE-CONNER. See ALE-CONNER.

CONNIVENTES *valvulæ*, in *Anatomy*, wrinkles, or corrugations in the inner coat, or membrane, of the two large inteſtines, the *jejunum* and *ileum*.

They are formed as the *rugæ* of the ſtomach, viz. by the inner coat's being larger than the outer.

Theſe folds, or corrugations, ſome anatomiſts imagine in ſome meaſure to do the office of valves; by ſtrengthening the paſſages, and conſequently impeding the motion of their contents: by which means the LACTEALS have the more time to imbibe the CHYLE. See DIGESTION.

CONNOISSEUR, a French term, of late uſed in England: it literally denotes a perſon well verſed in any thing; being formed of the verb *connoitre, to know, underſtand*. Hence it comes to be uſed in our language for a critic, or a perſon who is a thorough judge or maſter in any way; particularly in matters of painting and ſculpture.

CONNAUGHT *worm*. See WORM.

CONOCARPODENDRON. See PINE-*tree*.

CONOCARPUS, in *Botany*. See BUTTON-*tree*.

CONOID, CONOIDES, in *Geometry*, a ſolid body, reſembling a cone, except in this, that, inſtead of a perfect circle for its baſe, it has an ellipſis, or ſome other curve approaching thereto.

The *conoid* is produced by the entire circumvolution of a conic ſection round its axis; and according to the denomination of the ſection from whence it is generated, it is differently denominated: if, v. gr. the ſolid be produced by the motion of a parabola, it is called a *parabolic conoid*; if by that of an hyperbola, an *hyperbolic conoid*; and an *elliptic conoid*, or a *ſpheroid*, when produced by the rotation of an ellipſis round one of its axes.

The famous ſolid of the leaſt reſiſtance, Sir Iſaac Newton, M. Fatio, and the Marquis De l'Hopital, have demonſtrated to be a *conoid*.

CONOIDES, or CONARIUM. See CONARION.

CONONITES, in *Eccleſiaſtical Hiſtory*, the followers of Conon of Alexandria in the ſixth century, reſembling in their opinions the SEVERIANS, THEODOSIANS, and TRITHEITES.

CONOPEUM, in *Antiquity*, a ſort of net-work, made to keep away flies; it comes from κωνωψ, a *fly*.

CONORS, in *Natural Hiſtory*, a genus of the *diptera* order of inſects, with an extended, jointed roſtrum; including thirteen ſpecies.

CONQUASSATION, in *Pharmacy*, a ſpecies of comminution, or a particular operation, by which moiſt concreted ſubſtances, ſuch as recent vegetables, their fruits, lactefcent ſeeds, and the ſofter parts of animals, are contuſed and agitated in a mortar, until partly by their proper ſucculence, or the affuſion of ſome liquor, they are reduced to a ſoft pulp. Metalline inſtruments are not to be uſed for this purpoſe; becauſe not only the manifeſt, but alſo the latent falts of the ſubſtances, ſubjected to this operation, acting on the inſtruments, may derive an adventitious virulent quality from them, which will not only render ſuch ſubſtances unfit for the intended purpoſes, but alſo naufeous and hurtful when exhibited as medicines. James.

CONQUEST, in *Civil Juriſprudence*, is the acquiſition of property in common by a number of perſons.

In ſome countries they confound acquiſition with *conqueſt*; but, according to the moſt general acceptation, acquiſition is the gaining of unappropriated goods before the eſtabliſhment of a community; whereas by the term *conqueſt*, it ordinarily intended whatever is acquired by a number of perſons in community, or by ſome one for all the others.

As it is more eſpecially in the union of perſons by marriage, that a community of property takes place; it is in reference to them that we frequently uſe the word *conqueſt*. There are nevertheleſs *conqueſts* alſo among other perſons who are in a tacit community or ſociety; ſuch as obtain by particular local cuſtoms. Encycl.

According to this ſenſe of the word, it has been contended by ſeveral, that William I. claimed this kingdom; that is, not by right of arms, but by right of *conqueſt* or acquiſt; under promiſe of ſucceſſion made by Edward the Confeſſor, and a contract entered into by Harold to ſupport his pretenſions to that ſucceſſion; and by old writers, *conqueſtus, acquiſitus*, and *perquiſitus*, are frequently uſed as ſynonymous terms. Blackſt. Comm. vol. i. p. 199. and vol. ii. p. 243.

CONQUEST, in the *Law of Nations*, is the acquiſition of ſovereignty by force of arms, by ſome foreign prince; who reduces the vanquiſhed under his empire. The right of *conqueſt* is derived from the laws of *war*; and when a people is ſubjected, the conduct of the conqueror is regulated by four kinds of law. Firſt, the law of nature, which dictates whatever tends to ſelf-preſervation; ſecondly, our *reaſon*, which teaches us to uſe others, as we would be treated ourſelves; thirdly, the laws of political ſociety, to which nature has not aſſigned any preciſe boundary; laſtly, the law which is derived from the particular circumſtances attending the *conqueſt*.

Thus, a ſtate conquered by another, will be treated in one of the four methods following. Either the conqueror will continue it under its own laws, and will only claim the exerciſe of civil and eccleſiaſtical ſovereignty; or he will impoſe a new form of government; or he will deſtroy the frame of their ſociety, and incorporate the inhabitants with others; or he will exterminate them. Encycl.

CONSANGUINITY, the relation of kinſhip, between perſons of the ſame blood, or ſprung from the ſame root. It is either *lineal*, when it ſubſiſts between perſons, of whom one is deſcended, in a direct line from the other; or *collateral*, when relations deſcend from the ſame anceſtor, but do not deſcend from each other. It is eaſy to compute, by the rules of progreſſion, how many lineal anceſtors any man has within a certain number of degrees. Thus, it would appear that a perſon, at the 20th degree, or the diſtance of 20 generations, hath above a million of anceſtors: and if a ſimilar calculation be made of collateral kindred at the diſtance of 20 degrees forward, on the ſuppoſition that each couple of anceſtors leave, one with another, two children, the number will be 2748779069 44: as in the following table.

Blackstone's Commentaries, vol. ii. p. 204, 206.

Marriage is prohibited by the church to the fourth DEGREE of *conſanguinity*, inclusive; but, by the law of nature, *conſanguinity* is no obſtacle to marriage, except it be in the direct line.

Conſanguinity terminates in the ſixth and ſeventh degree, excepting in the ſucceſſion to the crown; in which caſe, *conſanguinity* is continued to infinity.

The civilians call *fratres conſanguinei*, thoſe born of the ſame father; in oppoſition to *fratres uterini*, who are only born of the ſame mother.

According to the common opinion, thoſe were not allowed to complain of an inofficious teſtament, i. e. of being diſinherited without a cauſe, excepting from the turpitude of the perſon appointed heir in their place. But Van Warter endeavours to ſhew the contrary; and urges, that the *conſanguinei* might plead inofficioſity, even where the teſtament was not made in favour of a perſon incapable. See KINDRED.

CONSCIENCE, CONSCIOUSNESS, in *Ethics*, a ſecret teſtimony or judgment of the ſoul, whereby it gives its approbation to things it does that are naturally good; and reprobates itſelf for thoſe that are evil.

Or, *conſcience* is a dictate of the underſtanding power, concerning moral actions; conſidered as it has the knowledge of laws; and conſequently as conſcious of what is to be done, or not done, with regard to the legiſlator.

In the more popular ſenſe of the word, *conſcience* is a judgment, either true or falſe, whereby we pronounce a thing good or evil. This makes what we call the inner *forum*, or tribunal.

Some divines maintain, that *conſcience* is infallible; and hold it to be that immutable law whereby God will judge men: they deny that the underſtanding can be the ſource of errors, and lay them all at the door of the will. A man, ſay they, may ſecure himſelf from error, by forbearing to judge of things till he hath a clear and diſtinct perception of them.

Some of the ſchoolmen diſtinguiſh between the *conſcience* antecedent to an action, and that conſequent to it: the firſt, called *antecedent conſcience*, determines what is good, and what evil; and conſequently preſcribes what is to be done, and what avoided.

Conſequent conſcience is a kind of ſecondary or reflex judgment, with regard to the goodneſs, &c. of things already done or committed.

The *rule of conſcience* is the will of God, ſo far as it is made known to us, either by the light of nature, or by that of revelation.

With reſpect to the knowledge of this rule, *conſcience* is ſaid to be *rightly informed*, or *miſtaken*, *firm*, or *wavering*, or *ſcrupulous*, &c. With reſpect to the conformity of our actions to this rule when known, *conſcience* is ſaid to be *good*, or *evil*, &c.

Philoſophers, in lieu of the word *conſcience*, which ſeems appropriated to theological matters, ordinarily uſe that of *conſciouſneſs*; whereby they mean an inner ſentiment of a thing, whereof one may have a clear and diſtinct notion. In this ſenſe, they ſay, that we do not know our own ſoul, nor are aſſured of the exiſtence of our own thoughts, otherwiſe than by *ſelf-conſciouſneſs*.

CONSCIENCE, *court of*. See COURT.

CONSCRIPT, CONSCRIPTUS, a popular term in the *Roman Hiſtory*, uſed in ſpeaking of ſenators, who were called *conſcript* fathers, *patres conſcripti*; becauſe their names were written in the regiſter, or catalogue of the ſenate.

Livy, lib. i. cap. 1. tells us, that when Brutus filled up the places of the ſenators cut off by Tarquin, with others choſen out of the equeſtrian order, thoſe new ſenators only had the appellation given them of *patres conſcripti*. But it is certain, that in after-times, all the ſenators were called *patres conſcripti* without any diſtinction.

CONSECRATION, the act of converting, or ſetting apart any profane, or common thing, to a pious purpoſe; with certain ceremonies, prayers, benedictions, &c. appropriate thereto.

Conſecration is the reverſe of ſacrilege and profanation, which conſiſt in perverting a thing ſet apart for a pious purpoſe, to a profane and popular one.

The biſhop *conſecrates* a church, or a chalice; the pope *conſecrates* medals, agnus dei's, &c. and grants indulgences to thoſe who bear them about them with devotion.

The *conſecration* or dedication of a church is an epiſcopal ceremony, conſiſting in a great number of benedictions, with aſperſions and unctions of chriſm, &c. on the walls, both within-ſide and without. The form for *conſecrating* churches, chapels, and church-yards, or places of burials, in England, may be ſeen in Wilkins's Concilia Magnæ Britanniæ, &c. vol. iv. p. 668. It directs that the biſhop and clergy, of whom there are to be at leaſt two, ſhall enter the church or chapel in their ſeveral habits, and, as they walk up from the weſt to the eaſt end, repeat alternately the 24th Pſalm; the biſhop beginning, "The earth is the Lord's," &c. with the "Gloria Patri." When they are come to the Lord's table, the biſhop ſitting in his chair ſhall have the inſtrument of dedication, donation, and endowment of the church or chapel, church-yard, or burial place, preſented to him by the founder, or ſome proper perſon, which he ſhall cauſe to be read by his regiſter or other officer; and then the inſtrument ſhall be laid on the table, and he ſhall ſtand on the north ſide of it, and turning to the congregation, deliver an addreſs to them, which is followed by ſuitable prayers. One of the prieſts then reads the ſervice of the day, introducing proper pſalms and leſſons: after which the biſhop proceeds to the communion ſervice, and inſtead of the collect of the day, uſes one proper to the occaſion. When the Epiſtle and Goſpel are read, they are ſucceeded by the Nicene creed and the ſermon; and then the biſhop is to proceed with the ſervice of the communion. When the ſervice in the church is finiſhed, the biſhop and clergy with the people ſhall go into the church-yard, and make uſe of a prayer for the occaſion. See ubi ſupra.

The cuſtom of *conſecrating* perſons, temples, altars, veſtments, utenſils, &c. is very ancient; and all the ceremonies thereof are preſcribed under the old law. When thoſe *conſecrations* relate to men, they are properly called *ordinations*; excepting thoſe performed to BISHOPS and KINGS, which ſtill retain the name of *conſecration*. Thoſe which only conſiſt in a ceremony inſtituted by the church, are more properly called *benedictions*. When they regard churches, altars, veſſels, &c. they are properly called *dedication*.

CONSECRATION is particularly uſed for the benediction of the elements in the euchariſt.

The Romaniſts define it, the converſion of the bread and wine into the real body and blood of Jeſus Chriſt: and that this is the ſentiment of their church, is evident from the prieſt's elevating the hoſt immediately after *conſecration*, for the people to adore it. See ELEVATION, &c. There is a great controverſy between the Latin and Greek churches, touching the words of *conſecration*: the common opinion among the Romaniſts, agreeable to St. Thomas and the ſchoolmen, is, that the *conſecration* of the bread and wine conſiſts in theſe words, *This is my body*; *this is my blood*. The Greeks, on the contrary, attribute the change of the elements to a certain prayer, which they call the *invocation of the Holy Ghoſt*, reheaſed after the words *This is my body*; *this is my blood*: which the Greeks maintain are only neceſſary in the proceſs of the *conſecration*, as they contain the hiſtory of the inſtitution, not as they conſtitute any thing in the change.

CONSECRATION, among *Medaliſts*, is the ceremony of the APOTHEOSIS of an emperor; or his tranſlation into heaven, and reception among the gods.

On medals, the *conſecration* is thus repreſented: on one ſide is the emperor's head, crowned with laurel, ſometimes veiled; and the inſcription gives him the title of *divus*; on the reverſe is the temple, a baſſum, an altar, or an eagle taking its flight towards heaven, either from off the altar, or from a cippus: at other times the emperor is ſeen in the air, borne up by the eagle; the inſcription always, CONSECRATIO.

Theſe are the uſual ſymbols: yet on the reverſe of that of Antonius, is the Antonius column. In the apotheoſis of empreſſes, inſtead of an eagle there is a peacock. As to the honours rendered theſe princes after death, they were explained by the words *conſecratio*, *pater*, *divus*, and *deus*. Sometimes around the temple or altar are put, *memoria felix*, or *memoria æterna*: for princeſſes, *æternitas*,

internitat, and *fibrosus recepta*; on the side of the head, *&c.* or *&c.*

CONSECTARY, a propofition that follows, or is deduced from fome preceding definition, lemmata, axioms, conclufions, or the like. Some rather choofe to call it a *conſequence*; and others a *corollary*, *&c.*

CONSECUTIVELY, CONSECUTIVE, in the *Schoal Philoſophy*, is fometimes ufed in oppofition to *antecedently*, and fometimes to *effentially*, or *cauſally*.

Thus, fay the fchoolmen, the corruption of one thing is the generation of another, not *effentially*, but *conſecutively*: that is, fome matter cannot be without form, it is neceffary, that the generation of one thing follow upon the corruption of another.

CONSENT *of parts*, in the *Animal Oeconomy*, a certain agreement, or fympathy, by means whereof, when one part is immediately affected, another, at a diftance, becomes affected in like manner.

This mutual accord, or *conſent*, is doubtlefs effected by the commerce of the nerves, and their artful diftribution and ramification throughout the body.

The effect is fo fenfible, as even to come under the phyfician's cognizance: thus, the ftone in the bladder, by rellicating the fibres there, will pain and draw them fo much into fpafms, as to affect the coats of the bowels in the fame manner, by the intermediation of nervous threads, and make a colic there; and alfo extend their twitches fometimes as far as the ftomach, and occafion grievous vomitings: the remedy, therefore, in fuch cafes, is to regard the part originally affected, how remote and grievous foever may be the conſequences and fymptoms in other places.

The fifth conjugation of nerves branched to the parts of the eye, the ear, thofe of the mouth, cheeks, præcordia, and parts adjacent, *&c.* is fuppofed by naturalifts to be the inftrument of that particular and extraordinary *conſent* between thofe parts. Hence it is, that a favoury thing feen or fmelled excites the appetite, and affects the glands and parts of the mouth; that a fhameful thing feen or heard affects the cheeks with bluthes; on the contrary, if it pleafe, it affects the præcordia, and excites the mufcles of the mouth and face to laughter; if it grieve, it affects the glands of the eyes, fo as to occafion tears, and the mufcles of the face, putting them into an affect of crying.

Dr. Willis, quoted by Mr. Derham, imputes the pleafure of killing, and its effects, to this pair of nerves; which being branched both to the lips and the genital parts, when the former are affected, an irritation is occafioned in the latter. See SYMPATHY.

CONSENTES, in *Mythology*, derived from the old Latin *enſio*, *to conſult*, denote twelve fuperior deities among the Romans, who were apprehended to belong to the council of Jupiter. Thefe were Jupiter, Neptune, Mars, Apollo, Mercury, Vulcan; and Juno, Vefta, Minerva, Diana, Ceres, and Venus. Varro mentions twelve other deities under the fame denomination, who fuperintended agriculture. Lib. i. De Re Ruſtica.

Thefe *conſentes* had a temple at Pifa in Italy.

CONSENTIA were feafts inſtituted in honour of thefe deities.

CONSEQUENCE, in *Logic*, the conclufion of a reafoning, or argument.

The two premifes of a fyllogifm being granted, the *conſequence* muft alfo be granted.

In a more reſtrained fignification, *conſequence* is ufed for the relation or connection between two propofitions, whereof one follows, or is inferred, from the other.—

Thus: *It is an animal, and therefore feels.*

CONSEQUENT, the laft propofition of an argument; being fomething deduced or gathered from a preceding argumentation. An enthymeme only contains two propofitions, the *antecedent* and *conſequent*: if the *antecedent* be abfurd, the *conſequent* muft be fo too.

CONSEQUENT, in a more precife fenfe, is ufed for the propofition which contains the conclufion, conſidered in itſelf, and without any regard to the *antecedent*: in which fenfe, the *conſequent* may be true, though the *conſequence* be falfe.

CONSEQUENT *of a ratio*, in *Arithmetic*, the latter of the two terms of a RATIO; or that to which the antecedent is referred. See PROPORTION.

Thus, in *a*: *b*, or *a* to *b*, *b* is the *conſequent*, *a* the antecedent.

CONSEQUENTS, in *Rhetoric*, are alfo ufed to fignify fuch things, as being allowed, neceffarily, or very probably, infer their antecedents. Thus with reſpect to a fubftance, it is corruptible, and therefore material.

CONSEQUENTE, CONSEQUENZA, or *in* CONSEQUENZA, in the *Italian Muſic*. A part of a *fugue*, or *canon*, is faid to be *in conſequenza*, when it follows the firft part called the *guide*, imitating its motions, notes, and figures. Broſ. Dict. Muſ. in voc.

CONSEQUENTIA, in *Aſtronomy*, is oppofed to ANTECEDENTIA; and a motion *in conſequentia* is a motion in the order of the figns of the zodiac.

CONSERVATIVE *future*. See FUTURE.

CONSERVATOR, an officer eſtabliſhed for the fecurity and preſervation of the privileges granted fome cities and communities; or, a perfon who has a commiſſion to judge of, and decide, the differences arifing among them.

In moft catholic univerſities, there are two *conſervators*; the *conſervator* of royal privileges, or thofe granted by kings; and the *conſervator* of apoſtolical privileges, or thofe granted by the pope.

The firſt takes cognizance of perſonal and mixed cauſes between the regents, ſtudents, *&c.* and the latter of ſpiritual matters between eccleſiaſtics.

Anciently there were appointed *conſervators* of treaties of peace between princes; which *conſervators* became judges of the infractions made on a treaty, and were charged with procuring ſatisfaction to be made. Thefe were uſually the feudatories of the ſeveral powers.

In lieu of *conſervators*, princes now have recourſe to other indifferent princes to guarantee their treaties. See GUARANTY.

CONSERVATOR *of the peace*, in our *Ancient Conſtitutions*, was a perſon who had an especial charge, by virtue of his office, to fee the king's peace kept.

Till the erection of JUSTICES of the peace by king Edward III. there were ſeveral perſons who by common law were intereſted in keeping the fame: fome having that charge as incident to other offices; and others ſimply, or of itſelf, called *conſtables*, or *conſervators of the peace*.

The chamberlain of Cheſter is ſtill *conſervator* in that county; and petty conſtables are, by the common law, *conſervators*, *&c.* in the firſt ſenſe, within their own juriſdiction: ſo are alſo the coroner and the ſheriff within their own county. The king is the principal *conſervator* of the peace within all his dominions: the lord chancellor, lord treaſurer, lord high ſteward, lord marſhal, lord high conſtable, all the juſtices of the court of king's bench, by their office, and the maſter of the rolls, by preſcription, are general *conſervators* of the peace through the whole kingdom, and may commit breakers of the peace, and bind them in recognizances to keep it.

CONSERVATOR *of the truce, and ſafe conduct*; *conſervator induciarum, & ſalvorum regis conductuum*, was an officer appointed in every ſea-port, under the king's letters patent. His charge was to enquire of all offences committed againſt the king's truce, and ſafe conducts upon the main ſea, out of the franchiſes of the cinque-ports, as the admirals were wont to do, and ſuch other things as are declared anno 3 Hen. V. cap. 6. See alſo ſtat. 4 Hen. V. cap. 7.

CONSERVATORIOS are muſical ſchools eſtabliſhed for the inſtruction of children in the profeſſion of muſic. There are four of theſe at Venice, deſigned for the education of girls, and three at Naples, for the education of boys. It has been ſuggeſted that the operation of caſtration was performed in the *conſervatorios*; but the practice is abſolutely prohibited; and the young caſtrati are brought from Lucia in Puglia: but before the operation is performed, their voices are tried in a *conſervatorio*. The ſcholars of the Venetian *conſervatorios* have been chiefly celebrated for taſte, and neatneſs of execution; and thoſe of Naples have had the reputation of being the firſt *contrapuntiſts*, or compoſers, in Europe.

CONSERVATORY is ſometimes uſed for a place to preſerve SNOW and ICE. See Phil. Tranſ. N° 8. p. 140. See ICE-*Houſe*.

CONSERVE, in *Pharmacy*, a dry confect, or form of medicine, or food, contrived to preſerve the flowers, leaves, roots, peels, or fruits of ſeveral ſimples, as near as poſſible to what they were when freſh gathered; and to give them an agreeable taſte.

Phyſicians, under the name of *conſerves*, commonly comprehend all kinds of confects of flowers, fruits, roots, ſeeds, barks, *&c.* both liquid and dry.

Conſerves are made by beating up the thing to be preſerved with ſugar; viz. a triple quantity thereof to thoſe which are moſt moiſt and corruptible, and a double quantity to ſuch as are leaſt ſo.

Thus, e. gr. to make *conſerve* of roſes, roſemary-flowers, ſage-flowers, or the like; they pound them in a ſtone mortar, and when pounded, put to them fine ſugar, and beat the whole well together. For fruits, as currants, *&c.* they ſet them on the fire to make them yield their juice, then drain and ſtrain them, and thicken what comes from them over the fire, and add to it the ſugar. This laſt ſort of *conſerve* is particularly called a jelly.

CONSIDERATIO *curiæ*, in *Law*, denotes the judgment of the court.

CONSIDERATION, in *Law*, the material cauſe, or *quid pro quo* of any contract, and without which no contract is obligatory or binding.

This *consideration* is either *expressed*; as if a man bargain to give ten guineas for a horse: or *implied*, when the law itself enforces a *consideration*; as if a man coming into an inn, take meat, drink, and lodging for himself and horse, the law presumes he intends to pay for them, though there be no express contract between him and his host; and if he discharge not the house, the host may stop his horse.

There is also a *consideration* of nature and blood; and valuable *consideration* in deeds and conveyances.

Considerations of natural love, affection, marriage, &c. are good to raise uses to a man's family; if the uses are limited to a stranger, then it must be for valuable *consideration*, not for love, affection, &c. 1 Inst. 273. 3 Rep. 176.

CONSIGNMENT, or CONSIGNATION, the depositing any sum of money, bills, papers, or commodities, in sure hands; either by order of a court of justice, in order to their being delivered to the persons to whom they are adjudged; or voluntarily, in order to their being remitted to the persons they belong to, or sent to the places they are destined for.

CONSIGNMENT *of goods*, is the delivering or making them over to another.—Thus, goods are said to be *consigned* to a FACTOR, when they are sent to him to be sold, &c. or when a factor sends goods back to his principal, they are said to be *consigned* to him.

CONSILIUM, *diei consilii*, in *Law*, was a time allowed for one accused to make his defence, and to answer the charge of the accuser. It is now used for a speedy day appointed to argue a demurrer; which the court grants after a demurrer joined on reading the record of the cause. See EMPARLANCE.

CONSIMILI *Casu*. See CASU.

CONSISTENCE, a state of rest, wherein things capable of growth, or decrease, continue for some time at a stand, without either.

This term is particularly used with regard to trees, for the time, or age, beyond which they do not grow, and yet at which they do not decline.

Thus we distinguish three states or stages of a tree; its growth, *consistence*, and return: and these are common to all trees, even fruit trees.

The *consistence* of an oak is from fifty to an hundred and sixty years: some, however, hold that their *consistence* only commences from a hundred years; asserting that they grow till that time, and that they continue in that state of perfection to two hundred years of age.

CONSISTENCY, in *Physics*, is that state of a body wherein its component particles are so connected, or entangled among themselves, as not to separate or recede from each other.

Consistence only differs from *continuity* in this, that *consistence* implies a regard to motion or rest, which continuity does not; it being sufficient to denominate a thing *continuous*, that its parts are contiguous to each other.

When used relative to a disease, it imports the *series* or *acme* thereof: when applied to the humours, excrements, or excretions, it imports their state as to thickness or thinness.

CONSISTENCE is particularly used with regard to bodies considered as they are more soft, or more hard, more liquid, or more dry.

Forms of medicines, as electuaries, lambatives, boluses, syrups, unguents, &c. differ chiefly in *consistence*.

Not only the gratefulness, but also the operation of medicines, depend in some measure on their *consistence*; for medicines of a thick *consistence* are taken into the stomach, and penetrate into the body with greater difficulty, than such as are thin and liquid; and it requires more trouble to swallow a thick than a thin medicine; for this reason thick medicines are generally nauseous and ungrateful; and this is the reason why cathartic boluses are often dissolved in some agreeable liquor, since in this form they are more grateful than to any other: for this reason also ointments are generally clarified by whites of eggs, or a strainer.

On the contrary, a thick *consistence* is on some occasions more to be desired: in ulcers of the aspera arteria, and œsophagus, for instance, where we must give medicines made up with gum tragacanth, or other substances of a like nature, which by their viscidity fix the medicines, as it were longer to be affected.

CONSISTENT *Bodies*, is a term much used by Mr. Boyle for such as we ordinarily call *firm*, or *fixt bodies*; in opposition to *fluid* ones.

That author has a particular essay of the *atmosphere of consistent bodies*; wherein he shews, that all, even solid, hard, ponderous, and fixed bodies, do exhale or emit effluvia to a certain space all around them.

CONSISTENTES, in *Church History*, a kind of penitents, who were allowed to assist at prayers, but could not be admitted to receive the sacrament.

CONSISTORIAL *Advocate*. See ADVOCATE.

CONSISTORY, or *Roman* CONSISTORY, denotes the college of CARDINALS; or the pope's senate, and council, before whom judiciary causes are pleaded.

Du-Cange derives the word from *consistorium*; i. e. *locus ubi consistitur*; used chiefly for a vestible, gallery, or antechamber, where the courtiers wait for admission; and called *à consistente multitudine*.

The *consistory* is the first court or tribunal of Rome: it never meets but when the pope pleases to convoke it: the pope presides in it in person, mounted on a magnificent throne, and habited in his *pontificalia*; on the right are the cardinal-bishops and priests, and on the left the cardinal deacons.

The place where it is held, is a large hall in the apostolical palace, where princes and ambassadors of kings are received. The other prelates, protonotaries, auditors of the rota, and other officers, are seated on the steps of the throne; the courtiers sit on the ground; ambassadors on the right, and *consistorial* and fiscal advocates behind the cardinals.

Besides the public *consistory*, there is also a private one, held in a retired chamber, called the chamber of *papagay*; the pope's throne here being only raised two steps high.

Nobody is here admitted but the cardinals, whose opinions are collected, and called *secretes*. Here are first proposed and passed all bulls for bishopricks, abbeys, &c. Hence bishopricks, and abbeys, are said to be *consistorial benefices*; in regard, they must be proposed in the *consistory*, the annates be paid to the pope, and his bulls taken.

Anciently they were elective; but by the concordat, which abolishes elections, they are appointed to be collated by the pope alone, on the nomination of the prince.

CONSISTORY was also the name of a COURT under Constantine, where he sat in person, and heard causes; the members of this court were called *comites*.

CONSISTORY is also used, among the reformed, for a council or assembly of ministers and elders, to regulate their affairs, discipline, &c.

CONSISTORY, or *Court Christian*, in the *English Laws*, is a council of ecclesiastical persons, or the place of justice in an ecclesiastical or spiritual court.

Every archbishop and bishop has a *consistory-court*, held before his chancellor or commissary, either in his cathedral, in some chapel, aisle, or portico, belonging thereto; or in some other convenient place of his diocese, for ecclesiastical causes. The spiritual court was anciently, in the time of the Saxons, joined with the county or hundred court; and the original of the *consistory* court, as divided from those courts, is found in a law of the Conqueror, quoted by lord Coke.

From this court there lies an appeal to the archbishop of each province respectively.

CONSOLATION, one of the places in *Rhetoric*, wherein the orator endeavours to abate and moderate the grief or concern of another.

In *consolation*, a principal regard is to be had to the circumstances and relations of the parties. Scaliger considers this exceeding well, De Arte Poetica. "The same "*relator*, says he, is either a superior, an inferior, or an "equal; with regard either to preferment, honour, "wealth, wisdom, or age. Livia is therefore to comfort Ovid in a manner very different from that wherein Ovid comforts Livia. Thus, as to authority, a father and son, Cicero and Pompey, are to conduct their *consolations* very differently: so in wealth; as if a client should undertake to comfort Crassus in his misfortune; as when Seneca comforts Polybius and his mother: as to age, there need no examples.

"A superior may interpose his authority, and may even chide; a wife must even dispute; sentences will become him. An inferior is to shew respect and affection, and own he had this from some wife or learned person: an equal to appeal to their common friendship."

CONSOLE, in *Architecture*, a part or member projecting in manner of a bracket, or shoulder-piece; serving to support a cornice, bust, vase, beam, little vault, or the like. See *Tab. Architecture, fig.* 32.

The word is derived from the French *consolider, to reunite, join*, &c. agreeable to the office of this member.

Consoles are also, upon occasion, called *mutules, modillions*, &c. according to their form.

Some of them are striated or fluted; others in form of cartouches; others have drops, in the manner of triglyphs.

Vitruvius calls all those of gates *prothyrides, of thyra*, gate. See PROTHYRIS.—Those made of the end of a plank of wood, cut triangular-wise, are called *ancones*. See ANCON.

Consoles are frequently used as keys of arches, projecting out, to support a vase, or other ornament.

CONSOLIDA, in *Botany*. See BUGLE.

CONSOLIDA *major*. See COMFRY.

CONSOLIDATION, in *Law*, the combining and uniting two benefices into one: ſtat. 37 Hen. VIII. cap. 21. which union is to be by the aſſent of the ordinary, patron, incumbent, &c. and to be of ſmall churches lying near together.

The term is borrowed from the civil law; where it properly ſignifies an union of the poſſeſſion, or occupation, with the property. Thus, if a man hath by legacy *uſumfructum fundi*, and afterwards buys the property, or fee-ſimple, of the heir; this is called a *conſolidation*.

CONSOLIDATION, in *Medicine*, expreſſes the action of uniting broken bones, or the lips of wounds, by means of *conſolidating remedies*, as they are called; which, cleanſing with a moderate heat and force, taking corruption out of the wounds, and preſerving the temperature of the parts, cauſe the nouriſhment to be fitly applied to the parts affected. See WOUND, and FRACTURE.

CONSONANCE, in *Muſic*, is ordinarily uſed in the ſame ſenſe with *concord*, viz. for the union or agreement of two ſounds produced at the ſame time, the one grave, the other acute; which, mingling in the air, in a certain proportion, occaſion an accord agreeable to the ear.

CONSONANCE is ſometimes uſed to ſignify a ſound ariſing from ſeveral others ſounding together, whether agreeable, or diſagreeable to the ear.

In this ſenſe *conſonance* may be divided into CONCORD and DISCORD.

Dr. Holder, on this principle, defines *conſonancy*, "A "paſſage of ſeveral tuneable ſounds through the medium, "frequently mixing and uniting in their undulated mo- "tions, cauſed by the well-proportioned commenſurate "vibrations of the ſonorous bodies, and conſequently "arriving ſmooth and ſweet, and pleaſant to the ear; as, "on the contrary, *diſſonancy* he maintains to ariſe from "diſproportionate motions of ſounds, not mixing, but "jarring and claſhing as they paſs, and arriving in the "ear grating and offenſive."

Which notion of a *conſonance* exactly quadrates with that we have already laid down for a *concord*. Accordingly, moſt authors confound the two together; though ſome of the more accurate diſtinguiſh them; making *conſonance* to be what the word implies, a mere *ſounding of two or more notes together*, or *in the ſame time*; in contradiſtinction to the motion of thoſe ſounds *in ſucceſſion*, or one after the other.

In effect, the two notions coincide; for two notes, thus played in *conſonance*, conſtitute a concord; and two notes that pleaſe the ear in *conſonance*, will likewiſe pleaſe it in ſucceſſion. Notes in *conſonance* conſtitute harmony, as notes in ſucceſſion conſtitute *melody*.

In the popular ſenſe, *conſonances* are either *ſimple* or *compound*, &c. The moſt perfect *conſonance* is uniſon; though many, both among the ancients and moderns, diſcard it from the number of *conſonances*; as conceiving *conſonance* an agreeable mixture of different ſounds, grave and acute; not a repetition of the ſame ſound.

The ſecond *conſonance* is the octave; then the fifth, the fourth, the thirds, and the ſixths: the reſt are multiples, or repetitions of theſe.

CONSONANCE, in *Grammar*, denotes a like cadence, or cloſe of words, periods, &c.

Conſonances are ordinarily faults in diſcourſe, eſpecially in Engliſh proſe: though the ancients make a figure of them, which they call *homœoteleuton*. Too great a *conſonancy* in the rhymes has always an ill effect.

CONSONANT, a letter which produces no ſound alone, or without ſome other letter, either vowel or *conſonant*, joined along with it.

And hence the name *con-ſonant*, q. d. *quæ ſonant cum aliis*.

A *conſonant*, conſidering it philoſophically, is nothing elſe but the modification of a ſound, produced by means of the organs of the voice, not a production of ſound in itſelf: thus, v. gr. the ſounds ſignified by the characters *a*, *e*, *i*, *o*, *u*, &c. are differently modified when we ſay *at*, than when we ſay *at* or *et*, *ad* or *da*; and theſe modifications are called *conſonants*.

The letters of the alphabet are divided into *vowels* and *conſonants*. *Conſonants*, again, are divided into ſingle, as *b*, *c*, *m*, *q*, &c. and *double*, as *x* in *auxiliary*, correſponding to the ξ of the Greeks.

Conſonants, again, are divided into *liquid*, as *l*, *r*, *m*, *n*; and *mute*, as *b*, *d*, and the reſt.

But the moſt natural diviſion of *conſonants* is that of the Hebrew grammarians; who have been imitated therein by the grammarians of other oriental languages: theſe divide the *conſonants* into five claſſes, with regard to the five principal organs of the voice; which all contribute, it is true, but one more notably than the reſt, to certain modifications, which make five general kinds of *conſonants*. Each kind, or claſs, comprehends ſeveral *conſonants*, which reſult from the different degrees of the ſame modification, or from the different motions of the ſame organs.

Theſe organs are the *throat*, *palate*, *tongue*, *teeth*, and *lips*; whence the five claſſes of *conſonants* are denominated *guttural*, *palatal*, *lingual*, *dental*, and *labial*.

We account ſixteen *conſonants* in the Engliſh alphabet, viz. *b*, *c*, *d*, *f*, *g*, *k*, *l*, *m*, *n*, *p*, *q*, *r*, *s*, *t*, *v*, *x*, *z*; to which there are three others to be added, viz. the *h*, and *j conſonants*, and *w conſonant*, which make the whole number of *conſonants* nineteen: one whereof is guttural, viz. the aſpirate *h*; five *palatal*, viz. *c*, as when pronounced before *e*, *o*, and *u*, as in *cover*, *corn*, *curioſity*; *g*, as in *General*; *j conſonant* in *julep*; *k* in *kneel*; and *q* in *quay*.

The four *lingual conſonants* are *d*, *l*, *n*, *t*; the four *dental*, are *r*, *s*, *x*, *z*, the three laſt whereof are hiſſers: and five *labial*, *b*, *f*, *m*, *p*, and *v conſonants*.

With regard to which diviſion, it may be obſerved, that though the *g* be modified in three different manners, as it comes before an *a*, an *e*, or an *u*; yet it is ſtill a *conſonant* of the palate; that the *j conſonant* differs in nothing but its figure from the *g* before *e* or *i*; that *k* has the ſame pronunciation with the *c*; that *x* comprehends the ſound of two letters in its ſound, viz. *c* or *k*, and *ſ* or another *s*, as in *Alexander* and *Alexis*, which we pronounce as if wrote *Alecſander*, and *Alecxis*, or *Alekſis*; and that the *c* before an *e* or *i*, is no *conſonant* of the palate, becauſe in that caſe it loſes its proper ſound, and aſſumes the hiſſing ſound of the *ſ*.

The abbot Dangeau thinks the nature of the diviſion of the Hebrew grammarians to be very reaſonable, but he does not acquieſce in the diſtribution they have made of them: to find a natural and juſt diviſion of the *conſonants*, he obſerves, no regard muſt be had to the characters that repreſent them; nor any thing be conſidered but their ſound, or the modification they give the ſound.

On this principle, the ſame author finds in the French five *labial conſonants*, *b*, *p*, *v*, *f*, and *m*; five *palatal* ones, *d*, *t*, *g*, *k*, *n*; four *hiſſers*, *s*, *x*, *z*, *ch*; two *liquids*, *l* and *r*; two that run into and mix with each other, as *l* and *gn*; which laſt, however, is peculiar to the French language; and the *h* aſpirate.

He adds, 1. That *m* and *n* are properly two naſal *conſonants*; the *m*, as *b* paſſed through the noſe, and the *n*, as *d*, in like manner, pronounced through the noſe; and, in effect, people in a cold pronounce *barbie* for *marbre*, *deed* for *need*, &c.

2. That among the *conſonants*, ſome are weak, others *ſtrong*; their difference conſiſting in this, that the former are preceded with a ſmall emiſſion of the voice, which ſoftens them; which the latter have not. The weak are *b*, *c*, *d*, *g*, *w*, *j*; the ſtrong, *p*, *f*, *t*, *ſ*, *k*, *ch*.

It may be here obſerved, that when we ſpeak of a perſon's talking *through the noſe*, it muſt be underſtood in a ſenſe quite different from what the word ſeems naturally to import: ſince the noſe in this caſe concurs leſs to the pronunciation than when we do not ſpeak through the noſe; in regard the air, not being able to make its way through the noſe, is returned into the mouth, where it forms a dull obtuſe ſound, called *naſal*.

From the whole we may conclude, that the excels of *conſonants* in one language above another only conſiſts in this, that there are more modifications of ſound received and eſtabliſhed in the one than in the other: for all men having the ſame organs, may form the ſame modifications; ſo that it is entirely owing to cuſtom, nothing to nature, that the Engliſh have not the ϑ of the Greeks, the *ain* and *heth* of the Hebrews, the *ch* of the Germans, the *gn* of the French, the *gl* of the Italians, the *ll* of the Welſh, &c.

Alſo, that the Chineſe have no *r*, the Iroquois no labial *conſonants*, the Hurons have abundance of aſpirates, and the Arabs and Georgians abundance of double *conſonants*: which laſt is owing to this, that they make ſeveral organs concur ſtrongly and equally to the modification of a ſound; whereas, in the reſt, only one organ is moved very ſtrongly and ſenſibly, and the reſt weakly.

It is hence alſo viſible, that in all languages the ASPIRATES, or guttural letters, are real *conſonants*; ſince the throat modifies the ſound as much as the palate, tongue, or lips.

Laſtly, to find all the *conſonants* that may be formed in any language, there needs nothing but to obſerve all the modifications that the ſounds of ſpeech will admit of, by which we ſhall have all the *conſonants* practicable.

CONSONANTE, in the *Italian Muſic*, is uſed to ſignify concords, or thoſe intervals which afford pleaſure, be they either perfect, as the fifth and eighth, or imperfect, as the third, ſixth, &c. See OCTAVE, &c.

CONSORT. See QUEEN.

CONSOUND, a name given to ſeveral different plants; thus *ſymphytum* is called the great *conſound*, *bugula* the mid-

dle *confound*, *boils* the leaſt *confound*, and *ſolidago* the Saxons *confound*.

CONSPIRACY, in *Law*, is taken for a combination or CONFEDERACY to do ſomething evil, or illegal: though in the original ſenſe of the word, and in its uſe in other languages, it ſignifies merely an agreement, whether for good, bad, or matters indifferent.

In our ſtatutes and law-books, *conſpiracy*, in a general ſenſe, is frequently confounded with *maintenance*, and *champarty*.

CONSPIRACY, in its ſpecial ſignification, is uſed for a confederacy of two, at leaſt, falſly to indict one, or procure one to be indicted of felony.

The puniſhment of this *conſpiracy*, at the king's ſuit, anciently was, that the party attainted loſe his frank-law; to the end that he may not be impanelled on juries, and the like; that his lands, goods, and chattels, be eſtreated; his trees raſed, and his body committed to priſon.

Even *conſpiracies*, or combinations in caſes of leſs moment, as thoſe of victuallers, touching ſelling of victual, ſhall be grievouſly puniſhed. 37 Hen. VIII.

CONSPIRATIONE, in *Law*, a writ that lies againſt *conſpirators*.

CONSPIRATORS, according to the ſtatute, are thoſe that do confederate, or bind themſelves by oath, covenant, or other alliance, that every of them ſhall aid, and bear the other, falſly and maliciouſly, to indite, or cauſe to indite, or falſly to move, or maintain pleas; and all ſuch as cauſe children, within age, to appeal men of felony, whereby they are impriſoned, and ſore grieved: and ſuch as retain men in the country, with liveries or fees, to maintain their malicious enterprizes: and this extendeth as well to the takers, as the givers: and ſtewards, and bailiffs, of great lords, which, by their feignory, office, or power, undertake to bear, or maintain quarrels, pleas, or debates, that concern other parties than ſuch as touch the eſtate of their lords, or themſelves. Anno 33 Edw. I. ſtat. 2. 2 Inſt. fol. 384 and 562.

CONSPIRING *powers*, in *Mechanics*, all ſuch as act in directions not oppoſite to one another. See POWER, and MOTION.

CONSTABLE. *Lord High* CONSTABLE, is an ancient officer of the crown, now diſuſed in England, except on ſolemn occaſions, as the king's coronation, and the like; and alſo ſuppreſſed in France by Lewis XIII. in 1627; though the office has been exerciſed in the command of the MARSHALS, by the firſt officer in the army.

Some derive the word from the Saxon, and make it originally ſignify the *ſtey*, or hold, of the *king*, or *king*: others, with more probability, derive it from *comes ſtabuli*, the maſter of the ſtables, or perhaps of the hoſts; and ſuppoſe that the dignity, which at firſt was civil, in time became military, and the maſter of the ſtables was made general of the army.

The function of the *conſtable* of England conſiſted in the care of the common peace of the land, in deeds of arms, and matters of war. To the court of the *conſtable*, and that of the marſhals, belonged the cognizance of contracts, deeds of arms without the realm, and combats, blaſonry of arms, &c. within it.

The firſt *conſtable* of England was created by the Conqueror: the office continued hereditary till the thirteenth of Hen. VIII. when it was laid aſide, as being ſo powerful as to become troubleſome to the king. Since that time, the *conſtable* is only created occaſionally.

From thoſe mighty magiſtrates, the *conſtables* of England, are derived thoſe inferior ones, ſince called the *conſtables of hundreds and franchiſes*: theſe were firſt ordained in the thirteenth year of Edward I. by the ſtatute of Wincheſter; which, for the conſervation of the peace, and view of armours, appointed that two *conſtables* ſhould be choſen in every hundred and franchiſe. They are generally choſen and ſworn by the juſtices of the peace in their ſeſſions.

Theſe are what we now call *conſtabularii capitales*, or *high conſtables*; becauſe continuance of time, and increaſe of people, &c. have occaſioned others of like nature, but inferior authority, in every town, called *petty-conſtables*, or *ſub-conſtabularii*, firſt inſtituted about the reign of Edward III. But they are now uſually choſen by the jury at the court-leet; and if no court-leet be held, appointed by two juſtices of the peace; though they are uſually choſen by the pariſhioners, and ſworn by a juſtice of peace. If the perſon elected refuſes to ſerve, a writ of mandamus may be laid to compel him to do it; or they may be bound over to the ſeſſions, indicted, fined, and impriſoned. Phyſicians, apothecaries, ſurgeons, &c. attornies, officers of the courts at Weſtminſter, barriſters at law, &c. qualified diſſenting teachers, and proſecutors of a felon to conviction, are excuſed from ſerving this office. Diſſenters, ſcruples the oaths, may execute the office by deputy. 1 W. and M. cap. 18. Theſe are under the direction of the high *conſtable*, and their charge is very extenſive.

Beſides theſe, we have *conſtables* denominated from particular places, as *conſtable* of the Tower, of Dover-caſtle, of Windſor-caſtle, of the caſtle of Caernarvon, and many other of the caſtles of Wales; whoſe office is the ſame with that of the caſtellani, or governors of caſtles.

CONSTABLES *of London*. The city of London is divided into twenty-ſix wards, and the wards into precincts, in each whereof is a *conſtable*. They are nominated by the inhabitants of each precinct on St. Thomas's day, and confirmed, or otherwiſe, at the court of wardmote. After confirmation, they are ſworn into their offices at a court of aldermen, on the next Monday after Twelfth day.

Such as are choſen into the office, are obliged to place the king's arms, and the arms of the city, over their doors; and if they reſide in alleys, at the ends of ſuch alleys towards the ſtreets, to ſignify that a *conſtable* lives there, and that they may be the more eaſily found when wanted.

CONSTABLE, *bravoſt of the*. See PROVOST.

CONSTANT *winds*. See WIND.

CONSTANT *quantity*, in *Geometry*, that which remains the ſame, while others increaſe or decreaſe. Thus the ſemi-diameter of a circle is a *conſtant quantity*; for while the abſciſſa and ſemi-ordinates increaſe, it remains the ſame.

CONSTAT, in *Law*, the name of a certificate, which the clerk of the pipe, and auditors of the exchequer, make at the requeſt of any perſon, who intends to plead or move in that court for the diſcharge of any thing; and the effect of it is, the certifying what does *conſtare* upon record, touching the matter in queſtion. 3 and 4 Edw. VI. cap. 4. and 13 Eliz. cap. 6.

A *conſtat* is held to be ſuperior to a *certificate*; becauſe this may err or fail in its contents, that cannot, as certifying nothing but what is evident upon record. Alſo the exemplification under the great ſeal of the inrolment of any letters patent, is called a *conſtat*. Coke on Lit. fol. 225. b. The difference between a *conſtat*, *inſpeximus*, and *vidimus*, is treated of at large in Page's caſe, Coke's fifth report.

CONSTELLATION, in *Aſtronomy*, an aſſemblage or ſyſtem of ſeveral ſtars, expreſſed and repreſented under the name and figure of ſome animal, or other thing: this aſſemblage is by ſome called alſo an *aſteriſm*.

The ancients portioned out the firmament into ſeveral parts, or *conſtellations*; reducing a certain number of ſtars under the repreſentation of certain images, in order to aid the imagination, and the memory, to conceive and retain their number, diſpoſition, and even to diſtinguiſh the virtues which they attributed to them: in which ſenſe a man is ſaid to be born *under a happy conſtellation*, i. e. under a happy configuration of the heavenly bodies. The diviſion of the heavens into *conſtellations* is very ancient; and, probably, as old as aſtronomy itſelf; at leaſt, it was known to the moſt ancient authors extant, whether ſacred or profane. In the book of Job, mention is made of the names of ſome of them; witneſs that ſublime expoſtulation, *Canſt thou reſtrain the ſweet influences of the Pleiades, or looſen the bands of* Orion? And the ſame may be obſerved of the oldeſt among the heathen writers, Homer and Heſiod.

The diviſion of the ancients only took in the viſible firmament, or ſo much as came under their notice: this they diſtributed into forty-eight *conſtellations*; twelve whereof took up the zodiac: the names they gave them are, *Aries*, *Taurus*, *Gemini*, *Cancer*, *Leo*, *Virgo*, *Libra*, *Scorpio*, *Sagittarius*, *Capricornus*, *Aquarius*, *Piſces*: from whence the ſigns of the ecliptic and zodiac take their names; though now no longer contiguous to the *conſtellations* which denominate them. See SIGN.

The other ſtars, on the northern ſide of the zodiac, were diſpoſed into twenty-one *conſtellations*; viz. *Urſa major* and *minor*, *Draco*, *Cepheus*, *Bootes*, *Corona Septentrionalis*, *Hercules*, *Lyra*, *Cygnus*, *Caſſiopeia*, *Perſeus*, *Andromeda*, *Triangulum*, *Auriga*, *Pegaſus*, *Equuleus*, *Delphinus*, *Sagitta*, *Aquila*, *Ophiuchus*, or *Serpentarius*, and *Serpens*: to which have been ſince added *Antinous*, and *Coma Berenices*.

The ſtars on the ſouthern ſide of the zodiac were diſtributed into fifteen conſtellations: their names are *Cetus*, *Eridanus fluvius*, *Lepus*, *Orion*, *Canis major* and *minor*, *Argo*, *Hydra*, *Crater*, *Corvus*, *Centaurus*, *Lupus*, *Ara*, *Corona meridionalis*, and *Piſces auſtralis*: to which have been ſince added fourteen others; viz. *Phœnix*, *Grus*, *Indus*, *Pavo*, *Apus*, or *Avis Indica*, *Apis Muſca*, *Chamæleon*, *Triangulum auſtrale*, *Piſces volans*, *Toucan*, *Hydrus*, *Xiphias*, or *Dorado*, *Columba Noachi*, and *Rana Caribæa*. See each *conſtellation*, and the ſtars contained in it, under its proper head, ARIES, TAURUS, &c.

Of theſe *conſtellations*, the eighteen laſt, with the greateſt

part

part of *Argo navis*, *Centaurus*, and *Lupus*, are not visible in our horizon.

The other stars, not comprehended under these *constellations*, yet visible to the naked eye, the ancients called *informes*, or *sporades*, some whereof the modern astronomers have since reduced into new figures, or *constellations*. See INFORMES, and SPORADES.

Thus, Hevelius, v. gr. between *Leo* and *Ursa major*, makes *Leo minor*; and between *Ursa major*, and *Auriga*, over *Gemini*, makes *Lynx*: under the tail of *Ursa major*, *Canes venatici*, *Cerberus*, *Vulpecula*, and *Anser*, *Scutum Sobiesii*, *Lacerta*, *Camelopardalus*, *Monoceros*, and *Sextans*. In these *constellations*, the stars are ordinarily distinguished by that part of the image wherein they are found. Bayer distinguishes them farther by the letters of the Greek alphabet; and many of them, again, have their peculiar names, as *Arcturus*, between the knees of *Bootes*; *Gemina*, or *Lucida*, in the *Cor ursæ septentrionalis*; *Palilicium*, or *Aldebaran*, in the *Bull*'s eye, *Pleiades* in the neck, and *Hyades* in the forehead of the *Bull*, *Castor* and *Pollux* in the heads of *Gemini*; *Capella*, with the *Hœdi*, in the shoulder of *Auriga*; *Regulus*, or *Cor Leonis*; *Spica Virginis*, in the hand, and *Vindemiatrix* in the shoulder of *Virgo*; *Arcturus*, or *Cor Sterophimi*; *Fomahaut*, in the mouth of *Piscis Australis*; *Regel*, in the foot of *Orion*; *Sirius*, in the mouth of *Canis major*; *Procyon*, in the back of *Canis minor*; and the *Polestar*, the last in the tail of *Ursa minor*.

The Greek and Roman poets, from the ancient theology, give us wild and romantic fables about the origin of the *constellations*, probably derived from the hieroglyphics of the Egyptians, and transmitted, with some alterations, from them to the Greeks; which may be seen in Hyginus's Poeticon Astron. and Bicciolus's Almagest. lib. vi. cap. 3, 4, 5; and Sherburne's Notes upon Manilius. Hence, some out of a rash zeal, rather than any love for the science, have been moved to alter either the figures of the *constellations*, or at least their names.

Thus, venerable Bede, instead of the profane names and figures of the twelve *constellations* of the zodiac, substituted those of the twelve apostles; whose example being followed by Julius Schillerius, in 1627, he completed the reformation, and gave scripture names to all the *constellations* in the heavens.

Thus, *Aries*, or the Ram, became converted into St. Peter; *Taurus*, or the Bull, into St. Andrew; *Andromeda* into the sepulchre of Christ; *Lyra* into the manger of Christ; *Hercules* into the Magi coming from the East; *Canis major* into David, &c. Weigelius, professor of mathematics in the university of Jena, made a new order of *constellations*; converting the firmament into a *coelum heraldicum*; and introducing the arms of all the princes in Europe, by way of *constellations*.

Thus, *Ursa major* he transformed into the elephant of the kingdom of Denmark; the *Swan* into the Rota with swords of the house of Saxony; *Ophiuchus* into the cross of Cologne; the *Triangle* into the compasses, which he calls the *symbol of artificers*; and the *Pleiades* into the *Musæ Pythagoricæ*, which he calls that of merchants, &c.

But the more knowing among astronomers never approved of innovations; as serving no purpose but to introduce confusion into astronomy. The old *constellations*, therefore, are still retained; both because better could not be substituted, and likewise to keep up the greater correspondence and uniformity between the old astronomy and the new. See CATALOGUE.

CONSTERNATION is defined by ethical writers to be an excess of HORROR, owing to the ill government of our *admiration* and fear; or such an immoderate degree of *fear* as confounds the faculties, and incapacitates a person for consultation and execution.

CONSTIPATION, in *Medicine*, a hardness of the *alvus*, or belly, with a difficulty of discharging the same; otherwise called *obstipeness*.

Riding post, eating of medlars, of quinces, several preparations of milk, hard-roasted eggs, &c. *constipate* the belly.

A *constipation* of the belly, if it continue long, sometimes degenerates into the iliac passion, or twisting of the guts. Most persons of a hot and dry constitution are afflicted with a costiveness, or *constipation*; but this is seldom attended with any ill consequences.

The proper remedy for a *constipation* is a clyster; if this fail, lenient cathartics; and when they also fail, others must be exhibited of a more drastic or powerful nature.

A *constipation*, or obstinate costiveness, is thought by Dr. Stevenson to be first or last owing to, or attended with, a kind of palsy of the intestines, and may sometimes be cured by fomenting the belly with wine, in which aromatics have been boiled, and drinking a little of the same when the pulse is low, and the body cool. This disorder, though of long continuance, and come to a dangerous height, has been cured by a cold *pediluvium*, and by placing the patient with his bare soles on a cold floor, and dashing his feet, legs, and thighs, with cold water. See Medic. Ess. Edinb. abr. vol. i. p. 249, seq.

CONSTITUENT *parts*, in *Chemistry*. The *constituent parts* of bodies are their dissimilar parts, or principles, into which they may be resolved, by the rules of that art. They are thus called in distinction from the INTEGRANT parts of bodies, which are parts of the same nature and properties with the bodies themselves. Thus quicksilver, dissolved by aqua fortis, may be separated from the dilated menstruum, by means of a copper plate, in its own form; thus therefore was only divided into its integrant parts; but cinnabar resolved by chemistry into sulphur and mercury, is divided into its *constituent* parts, neither of these, nor any particle of them, being cinnabar, or having its properties. Shaw's Lectures, p. 15.

CONSTITUTION, an establishment, ordinance, decision, regulation, or law, made by authority of a prince, or other superior, ecclesiastical or civil.

The *constitutions* of the Roman emperors make a part of the *civil* LAW. The *constitutions* of the church make a part of the CANON *law*. Some of the papal *constitutions* are in form of bulls, others of briefs.

CONSTITUTIONS, *Legatine*, were ecclesiastical laws enacted in national synods, held under the cardinals Otho and Othobon, legates from pope Gregory IX. and pope Clement IV. in the reign of Henry III. about the years 1220, and 1268.

CONSTITUTIONS, *Provincial*, are principally the decrees of provincial synods, held under several archbishops of Canterbury, from Stephen Langton, in the reign of Henry III. to Henry Chicheley, in the reign of Henry V. and adopted also by the province of York in 1463, under Henry VI.

CONSTITUTIONS *of* 1603. See CANON *Law*.

CONSTITUTIONS, *Apostolical*, denote a collection of regulations attributed to the apostles, and supposed to have been collected by St. Clement, whose name they likewise bear.

These are divided into eight books; consisting of a great number of rules and precepts, relating to the duties of Christians, and particularly to the ceremonies and discipline of the church.

Authors are divided about their genuineness: the generality hold them spurious, and endeavour to prove them posterior to the apostolic age; maintaining they were unknown till the fourth century: which, if so, shews St. Clement had no hand in them. It is certain, that no such book is quoted as Scripture by any Christian writer of the three first centuries. The first who cites it is Epiphanius, and yet he speaks of it as of doubtful authority; and some modern writers are of opinion, that the *Constitutions* quoted by Epiphanius were different from the present *Constitutions*; and that the eight books, as we have them, were not composed and finished till after his time, towards the middle, or before the end of the fifth century. They evidently bear many internal characters of spuriousness. See Lardner's Cred. vol. x. p. 326, &c. Mr. Whiston has ventured to oppose the general opinion; and with some reason, much learning, and more warmth, asserted the *Apostolical Constitutions* to be one of the sacred writings, dictated by the apostles in their meetings, written down from their mouths by St. Clement, and intended as a supplement to the New Testament; or, rather, as a scheme and system of Christian faith and polity. See his Essay on the *Apostolical Constitutions*, and his historical preface; wherein the several steps he made in his fancied discovery are traced.

What makes the *Constitutions* more suspected by the orthodox, is, that they seem to favour of Arianism.

CONSTITUTIONS *of Clarendon*. See CLARENDON.

CONSTITUTION is also used, in a physical sense, for the temperament of the body, or for that disposition of the whole which arises from the quality and proportion of its parts.

Physicians consider the *constitution*, as depending chiefly on the humours or juices of the body; and hence, as this or that humour is supposed to predominate, the bile, e. g. or the blood, phlegm, choler, or spirit; the person used to be denominated of a *bilious*, *sanguine*, *phlegmatic*, *choleric*, or *nervous constitution*.

CONSTRICTION, the act of binding, or drawing the parts of a thing close together.

The word is compounded of *cum*, *together*; and *stringere*, *tetus or close up*.

CONSTRICTOR, in *Anatomy*, a name given by Spigelius, and some others, to a muscle now very well known by the name of the *sphincter ani*.

CONSTRICTOR *cunni*, in *Anatomy*, the name given by Albinus to a muscle called by others the SPHINCTER *vaginæ*; by some the *erector is pudendi*, and the *ejector is clitoridis muscularis*.

CONSTRICTOR *labiorum*, or *orbicularis*, a muscle proper to

the LIPS. *See Tab. Anat. (Myol.) fig. 1. n. 8.* Its fibres make a kind of *orbis* ring about the mouth (whence it is alſo called *orbicularis*); and ſerve to conſtringe and draw up the lips, as in kiſſing, &c. whence ſome call it *baſiator*, and *oſculatorius*.

This Verheyen will not have to be one muſcle, but a pair, whoſe fibres meet and join at both corners of the mouth; each acting on one lip only, though concurrently.

Other authors are unanimous in calling it one muſcle: and will have it of the ſphincter kind; though Dr. Drake thinks improperly; in regard, it is not like the other ſphincters in conſtant action, but at the command of the will; the diſtinguiſhing mark between a SPHINCTER and another muſcle.

CONSTRICTOR *palpebrarum*. See ORBICULARIS.

CONSTRICTORES *noſi*, a pair of muſcles common to the *ala* of the noſe, and the upper lip.

They ariſe ſeſhy from the fore part of the ſoforth bone of the upper jaw; and after a ſtraight aſcent, are inſerted into the roots of the *ala noſi*, and ſuperior parts of the upper lip.

Their uſe is to draw the *ala* downwards, nearer each other: and at the ſame time draw the upper lip alſo downwards; an action which we uſe in taking of ſnuff, or in ſmelling at any thing.

CONSTRUCTION, in *Geometry*, the art or manner of drawing, or deſcribing a figure, ſcheme, the lines of a problem, or the like. The equality of the lines of ſuch a triangle, &c. is demonſtrated from their *conſtruction*.

CONSTRUCTION *of equations*, is the method of reducing a known EQUATION into lines and figures; whereby the truth of the rule, canon, or equation, may be demonſtrated geometrically.

The method of *conſtructing* equations is different, according to the diverſity of equations.

To conſtruct a ſimple equation: the whole myſtery conſiſts in this, that the fractions, to which the unknown quantity is equal, be reſolved into proportional terms: the method of which will be better ſhewn by examples than it can be taught by many rules.

1. Suppoſe $x = \frac{ab}{c}$; then will $c : a :: b : x$, to be determined by the method of finding a fourth proportional.

2. Suppoſe $x = \frac{abc}{def}$; let $d : a :: b : \frac{ab}{d}$. This fourth proportional found, being called g; $x = \frac{gc}{e}$, which is therefore found as in the former caſe.

3. Suppoſe $x = \frac{aa-bb}{c}$. Since $aa-bb = (a+b) \times (a-b)$; $c : a+b :: a-b : x$.

4. Suppoſe $x = \frac{a^2b-bcc}{ad}$. By the firſt caſe we find $g = \frac{ab}{d}$, $\frac{a^2b}{ad}$, and $b = \frac{bc}{d}$. Again, by caſe 1. $i = \frac{b^2}{a}$, and $x = g - i$, the difference of the lines g and i.

5. Suppoſe $x = \frac{ab}{c} + \frac{adc}{bc}$. Find, as in the preceding caſe, $g = \frac{ab}{c}$, and $f = \frac{adc}{bc}$. Then will $x = g + f$ be the ſum of the lines g and f.

6. Suppoſe $x = \frac{a^2b+bcd}{af+cg}$. Seek $\frac{cg}{a}$ and let $f + \frac{cg}{a} = b$; then will $af + cg = ab$; conſequently, $x = \frac{a^2b+bcd}{ab}$. Thus is the preſent caſe brought to the preceding one.

7. Suppoſe $x = \frac{a^2b-bad}{af+bc}$. Find $\frac{af}{b}$, and make $\frac{af}{b} + c = b$; then will $af + bc = bb$. Hence, $x = \frac{a^2b-bad}{bb} = \frac{b^2-ad}{b}$. Conſequently, $b : a :: a-d : x$.

8. Suppoſe $x = \frac{a^2+b^2}{c}$. Conſtruct the triangle ABC (*Tab. Algebra, fig.* 1.) whoſe ſide $AB = a$, $BC = b$; then will $AC = \sqrt{a^2+b^2}$. Let $AC = m$; then will $a^2+b^2 = m^2$. And therefore $x = \frac{m^2}{c}$; conſequently, $c : m :: m : x$.

9. Suppoſe $x = \frac{a^2-b^2}{c}$. On AB (*fig.* 2.) $= a$, deſcribe a ſemicircle, and therein ſet off $AC = b$. Since the triangle ABC is rectangular; $CB = \sqrt{a^2-b^2}$. Let $CB = m$: then will $x = \frac{m^2}{c}$; conſequently, $c : m :: m : x$.

10. Suppoſe $x = \frac{a^2b+bcd}{af+bc}$. Say, $b : a :: f : \frac{fa}{b}$; and let $\frac{fa}{b} + c = b$; then will $bx + af = bb$. Hence, $x = \frac{a^2b+bcd}{bb} = \frac{a^2+cd}{b}$. Find betwixt $AC = c$ (*fig.* 3.) and $CB = d$, a mean proportional $CD = \sqrt{cd}$. Let $CE = a$; then will $DE = \sqrt{a^2+cd}$. Call this m; then will $x = \frac{m^2}{b}$; conſequently, $b : m :: m : x$.

To conſtruct a quadratic equation geometrically. Since quadratic equations may be reduced to ſimple ones, theſe may likewiſe be *conſtructed* from the methods already laid down: for if the equation be pure, $x^2 = ab$; then will $a : x :: x : b$; wherefore we ſhall find $x = \sqrt{ab}$; if betwixt $AC = a$, and $BC = b$, we find a mean proportional DC. If the equation be affected, $x^2 + ax = b^2$; then will $x = \frac{1}{2}a \pm \sqrt{\frac{1}{4}a^2 + b^2}$; that is, either $x = \frac{1}{2}a + \sqrt{\frac{1}{4}a^2 + b^2}$; or, $x = \sqrt{\frac{1}{4}a^2 + b^2} - \frac{1}{2}a$, or, $x = \frac{1}{2}a + \sqrt{\frac{1}{4}a^2 - b^2}$, or $x = \frac{1}{2}a - \sqrt{\frac{1}{4}a^2 - b^2}$.

The whole myſtery, therefore, of *conſtructing* quadratics comes to this: that the value of $\sqrt{\frac{1}{4}a^2 + b^2}$, and alſo the value of $\sqrt{\frac{1}{4}a^2 - b^2}$, be found; both of which are ſhewn in the preceding article. For, if in the rectangular triangle (*fig.* 1.) $AB = \frac{1}{2}a$, and $BC = b$; then will $AC = \sqrt{\frac{1}{4}a^2 + b^2}$. But if on $AB = \frac{1}{2}a$ (*fig.* 2.) be deſcribed a ſemicircle; and therein applied $AC = b$; $CB = \sqrt{\frac{1}{4}a^2 - b^2}$, as was ſhewn in the article preceding. See CURVE. See Maclaurin's Algebra, part iii. cap. 2. and Simſon's Alg. p. 269.

To conſtruct cubic and biquadratic equations. The roots of any equation may be determined by the interſections of a ſtraight line with a curve of the ſame dimenſions as the equation; or by the interſections of any two curves whoſe indices multiplied by each other give a product equal to the index of the propoſed equation.

Thus, the roots of a biquadratic equation may be determined by the interſections of two conic ſections; for the equation by which the ordinates from the four points in which theſe conic ſections may cut one another can be determined will ariſe to four dimenſions; and the conic ſections may be aſſumed in ſuch a manner, as to make this equation coincide with any propoſed biquadratic: ſo that the ordinates from theſe four interſections will be equal to the roots of the propoſed biquadratic.

If one of the interſections of the conic ſection falls upon the axis, then one of the ordinates vaniſhes, and the equation by which theſe ordinates are determined will then be of three dimenſions only, or a cubic; to which any propoſed cubic equation may be accommodated. So that the three remaining ordinates will be the three roots of that propoſed cubic. The conic ſections for this purpoſe ſhould be ſuch as are moſt eaſily deſcribed. The circle may be one, and the parabola is uſually aſſumed for the other.

Let APE (*Tab. II. Anniſm, fig.* 40.) be the common Apollonian parabola. Take on its axis the line $AB =$ half of its parameter. Let C be any point in the plane of the parabola, and from it as a centre deſcribe, with any radius CP, a circle meeting the parabola in P. Let PM, CD, be perpendiculars on the axis in M and D and let CN, parallel to the axis, meet PM in N.

Then will always $CP^2 = CN^2 + NP^2$ (47 E. 1.)

Put $CP = a$, the parameter of the parabola $= b$, $AD = x$, $DC = d$, $AM = x$, $PM = y$.

Then $CN = x \mp d$, $NP = y \mp d$, and $x^2 \mp 2dx + y^2 \mp 2dy + d^2 = a^2$. ($+cx$, $+c$ is the difference of x and c indefinitely, which ever of the two is greateſt). That is, $x^2 \pm 2cx + c^2 + y^2 \pm 2dy + d^2 = a^2$. But, from the nature of the parabola, $y^2 = bx$, and $x^2 = \frac{y^4}{b^2}$; ſubſtituting therefore theſe values for x^2 and x, it will be $\frac{y^4}{b^2} \pm \frac{2cy^2}{b} + y^2 \pm 2dy + c^2 + d^2 - a^2 = 0$. Or, multiplying by b^2, $y^4 \pm 2bc + b^2 \times y^2 \pm 2db^2 \times y + c^2 + d^2 - a^2 \times b^2 = 0$. Which may repreſent any biquadratic equation that wants the ſecond term; ſince ſuch values may be found for a, b, c, and d, by comparing this with any propoſed biquadratic, as to make them coincide. And then the ordinates from the points P, P, P, P, on the axis will be equal to the roots of that propoſed biquadratic. And this may be done, though the parameter of the parabola (viz. b) be given; that is, if you have a parabola already made or given, by it alone you may reſolve all biquadratic equations, and you will only need to vary the centre of your circle and its radius.

If the circle deſcribed from the centre C paſs through the vertex A, (*fig.* 41.) then $CP = CA = CD + AD$, that is, $a^2 = d^2 + c^2$; and the laſt term of the biquadratic $(c^2 + d^2 - a^2)$ will vaniſh; therefore, dividing the reſt

by y, there arises the cubic, $y^3 + 2bc + \overline{b^2} \times y + 3d^2 = 0$. Let the cubic equation proposed to be resolved be $y^3 \pm py \pm r = 0$. Compare the terms of these two equations, and you will have $\pm 2bc + b^2 = \pm p$, and $\pm 2d^2 = \pm r$, or, $\frac{b^2}{2} + \frac{p}{3} = c$, and $d = \pm \frac{r}{2d^2}$. From which you have this construction of the cubic $y^3 \pm py \pm r = 0$, by means of any given parabola APE. *From the point* B *take in the axis (forward if the equation has* $-p$, *but backwards, if* p *is positive) the line* $BD = \frac{p}{2d^2}$; *then raise the perpendicular* $DC = \frac{r}{2d^2}$, *and from* C, *describe a circle passing through the vertex* A, *meeting the parabola in* P, *so shall the ordinate* PM *be one of the roots of the cubic* $y^3 \pm py \pm r = 0$.

The ordinates that stand on the same side of the axis with the centre C are negative or affirmative, according as the last term r is *negative* or *affirmative*; and those ordinates have always *contrary* signs that stand on *different* sides of the *axis*. The roots are found of the same value, only they have contrary signs, when r is positive as when it is negative; the second term of the equation being wanting.

For a further account of the *construction* of such equations, see Maclaurin's Algebra, part iii. chap. 4. De la Hire's Constructions des Equations Analytiques, Marquis de l'Hopital Sect. Con. lib. ix. However, the intent of these geometrical *constructions* is more readily answered by the method of extracting roots by APPROXIMATION.

CONSTRUCTION, in *Grammar*, *syntax*; or the arranging and connecting the words of a sentence, according to the rules of the language.

The *construction* is generally more simple, easy, and direct in the modern tongues than in the ancient: we have very few of those inversions which occasion so much embarrassment and obscurity in the Latin; our thoughts are usually delivered in the same order wherein the imagination conceives them; the nominative case, for instance, always precedes the verb, and the verb goes before the oblique cases in general.

The Greeks and Latins, M. St. Evremont observes, usually end their periods, where, in good sense and reason, they should have begun them; and the elegance of their language consists, in some measure, on this capricious arrangement, or rather in this transposal and disorder of the words.

Construction is either *simple* or *figurative*.—*Simple*, is that wherein all the terms, or parts of the discourse, are placed in their natural order.

Figurative construction, is that wherein we recede from this simplicity, and use certain expressions, shorter, and more elegant, than nature affords.

The SYNTAX, or *construction* of words, is distinguished into two parts, CONCORD, and GOVERNMENT or REGIMEN.

CONSTRUCTIVE *treason* was defined by 25 Edw. III. cap. 2. See TREASON.

CONSUALES *ludi*, among the Romans, the same with CIRCENSES *ludi*. See also CIRCUS.

CONSUALIA, in *Antiquity*, feasts which were held among the *ancients*, in honour of the god Consus, i. e. Neptune; different from those other feasts of the same deity called Neptunalia.

They were introduced with a magnificent cavalcade, or procession on horseback; because Neptune was reputed to have first taught men the *use* of horses; whence his surname of *Equestris*.

Evander is said to have first instituted this feast; it was re-established by Romulus, under the name of *Consus*; because it was done god under the denomination of Consus, that suggested to him the rape of the Sabines.

It is said, that it was with a view to this rape, that he made that establishment. This, however, is certain, that it was to this feast all his neighbours were invited; when taking advantage of the solemnities and sacrifices, he seized the women. To draw the greater concourse of people, he gave out, that he had found an altar hid under-ground, which he intended to consecrate, with sacrifices to the god to whom it had been originally erected.

Those who take upon them to explain the mysteries of the heathen theology, say, that the altar hid under ground, is a symbol of the secret design of Romulus to seize his neighbours wives.

The *consualia* were of the number of feasts called *sacred*; as being consecrated to divinity.—Originally they were not distinguished from those of the Circus: whence it is, that Valerius Maximus says, that the rape of the Sabines was effected at the games of the Circus.

Plutarch observes, that during the days of his solemnity, horses and asses were left at rest, and were dressed up with crowns, &c. on account of its being the feast of Neptunus Equestris.—Festus says, the cavalcade was performed with mules; it being an opinion, that this was the first animal used to draw the car.

Servius gives us to understand, that the *consualia* fell on the thirteenth of August; Plutarch, in the life of Romulus, places them on the eighteenth, and the old Roman calendar, on the twenty-first of that month.

CONSUBSTANTIAL, in *Theology*, a term of like import with *co-essential*; denoting something of the same substance with another.

The orthodox believe the Son of God to be *consubstantial* with the father.

The term *homoios*, *consubstantial*, was first adopted by the fathers of the council of Antioch and Nice, to express the orthodox doctrine the more precisely, and to serve as a barrier and precaution against the errors and subtilties of the Arians; who owned every thing excepting the *consubstantiality*.

The Arians declared, that the Word was God, as having been made God; but they denied that he was the same God, and of the same substance, with the Father: accordingly, they exerted themselves to the utmost to abolish the use of the word. The emperor Constantine used all his authority with the bishops to have it expunged out of the symbols; but it still maintained itself, and is at this day, as it was then, the distinguishing criterion between an Athanasian and an Arian.

Sandius, will have it, that the word *consubstantial* was unknown till the time of the council of Nice; but it is certain that it had been before proposed to the council of Antioch, wherein Paulus Samosatenus had been condemned; though it had never the fortune to be rejected. Curcellæus, on the other hand, maintains, that it was an innovation in doctrine in the council of Nice, to admit an expression, the use wherein had been abolished by the council of Antioch.

According to St. Athanasius, the word *consubstantial* was only condemned in the council of Antioch, inasmuch as it implied the idea of a pre-existent matter prior to the things formed thereof; now, in this sense, it is certain the Father and the Son are not *consubstantial*, these having been no pre-existent matter.

CONSUBSTANTIATION, a tenet of the Lutheran church with regard to the manner of the change made in the bread and wine in the eucharist; though the term *consubstantiation* was substituted in the room of transubstantiation, at the close of the thirteenth century, by John surnamed Pungens Asinus, a doctor of the university of Paris.

The divines of that profession maintain, that after consecration, the body and blood of our saviour are substantially present, together with the substance of the bread and wine: which is called *consubstantiation*, or IMPANATION. See also TRANSUBSTANTIATION, and LUTHERANISM.

CONSUETUDINIBUS *& servitiis*, in *Law*, a writ of right, which lies against the tenant that deforceth his lord of the rent, or service, due to him.

CONSUL, the chief magistrate of the Roman commonwealth.

After the Romans had expelled their kings, they were governed by two *consuls*, established in the year of Rome 245, having their name *a consulendo*. Brutus and Collatinus were the first, elected by an assembly of the people: their office was to hold a year; and if either of them died in the course of the year of their *consulate*, a new one was to be elected.

The *consuls* were the head of the senate; they commanded the armies of the republic, and were supreme judges of the differences between the citizens. In regard, however, that they had made some abuse of this power, it was allowed, by the Valerian law, for the party aggrieved to appeal from the tribunal to the people; especially in cases where the life of a Roman citizen was concerned.

In progress of time, the *consuls* being too much taken up with the grand affairs of state, or at the heads of armies, there were other magistrates created for the distribution of justice to the people, in lieu of the *consuls*.

The right of convoking the senate in ancient Rome, on all occasions, belonged of course to the *consuls*, as the supreme magistrates of the city, which in their absence, devolved regularly to the next magistrates in dignity, the prætors and the TRIBUNES.

To be elected *consul*, it was regularly required, that the candidate should be at least forty-three years old: though we meet with some few exceptions from this rule. The election was held in the month of January, in the Campus Martius; and afterwards in the Capitol.

Consuls were even continued under the emperors, after the republic was destroyed; but *consul* was here little

more

more than an honourable title; which, however, the people were fond of keeping up; as esteeming it some remains of their ancient liberty. It dwindled for a long time; and, at laſt, became abſolutely extinct in the time of Juſtinian: after whom, no emperor either created any *conſul*, or aſſumed the dignity himſelf.

Baſil is the laſt in the conſular liſt, for the year 541. By this time, the dignity was depreciated to that degree, that it was conferred on the meaneſt perſons: indeed, Juſtinian endeavoured to retrieve it twenty-five years after, and created himſelf *conſul*, but without effect.

From the eſtabliſhment of the republic, and the *conſulate* under L. Jun. Brutus, and L. Tarq. Collatinus, to the *conſulate* of Baſil, i. e. From the year of Rome 244, or 245. 509 years before Jeſus Chriſt, to the year of Rome 1261, the ſpace of 1049 years, the years were accounted by the *conſuls*; but from the time of Baſil, in the year of Chriſt 541, we find no mention made of *conſuls*, or *conſulates*; but the time was then computed by the years of the emperors reigns, and the indictions.

Indeed, for ſome time after the *conſulate* of Baſil, the years are marked thus; *poſt conſulatum Baſilii*, 1, 2, 3, &c. See the Faſti Conſulares of M. D'Almeloveen. That author reckons 1060 pairs of *conſuls*, beſide the ſubſtitute *conſuls*, *ſuffecti*, elected to ſupply vacancies by death; and yet there were but 1049 years, and conſequently only *ſo many conſulates*.

The perpetual *conſulates* of the eaſtern emperors, which compoſe the faſti Byzantini, commenced in the year of Chriſt 567, and ended in 668, in the laſt year of Conſtans.

Conſtantine Pogonatus would have the *conſulate* inſeparable from the empire; which it continued to be till the time of Conſtantine Porphyrogenetus.

In this form of government, the empire and *conſulate* were ſo cloſely united, that the empreſs Irene would needs aſſume the *conſulate* when ſhe was only regent of the empire.

But the French kings, thoſe of Italy, and the Saracen princes who commanded in Spain, taking on them the title of *conſuls*, as well as emperors of Conſtantinople, theſe laſt deſpiſed it, and laid it aſide: ſo that the name was only continued to the magiſtrates of ſome cities, and certain other officers, as is ſhewn by F. Pagi.

Under the emperors there were *ordinary conſuls*, *honorary conſuls*, and *ſuffecti*; which laſt were alſo on foot in the time of the republic.

In the middle age, we find the word *conſul* uſed for *comes*, COUNT, and proconſul, for VISCOUNT: as is obſerved by Spelman, and De Marca.

And thus *conſul*, in our LAW-*books*, ſignifies an *earl*. Bract. lib. 1. cap. 8. tells us, that as *comes* is derived from *comitatus*, ſo *conſul* is derived from *conſulendo*: and in the laws of Edward the Confeſſor, mention is made of *vicecomites*, and *viceconſules*.

CONSUL, at preſent, is uſed for an officer eſtabliſhed by virtue of a commiſſion from the king, and other princes, in the ports and factories of the Levant, on the coaſts of Africa, Barbary, Spain, and other foreign countries of any conſiderable trade; to facilitate and diſpatch buſineſs, and protect the merchants of the nation.

Theſe commiſſions are never granted to perſons, as *conſuls* of the French nation, under the age of thirty years.

When the *conſulate* is vacant, the moſt ancient of the deputies of the nation are to diſcharge the function thereof, till the vacancy be filled up by the king.

The *conſuls* are to keep up a correſpondence with the miniſters of England reſiding in the courts whereon their *conſulates* depend. Their buſineſs is, to ſupport the commerce and intereſt of the nation; to diſpoſe of the ſums given, and the preſents made, to the lords and principals of places; to obtain their protection, and prevent the inſults of the natives on the merchants of the nation. There are alſo *conſuls* of other nations eſtabliſhed in the Levant, eſpecially French and Dutch.

CONSULS alſo denote judges elected among merchants and dealers, in ports and trading towns, chiefly in France; to terminate, *gratis*, and on the ſpot, without any proceſs, ſuch differences and demands as may ariſe relating to their merchandizes, bills of exchange, and other articles of commerce.

The firſt juriſdiction of *conſuls* eſtabliſhed in France, is that of Thoulouſe; the edict of whoſe eſtabliſhment bears date 1549, under the reign of king Henry II. that of Paris followed fourteen years afterwards. By degrees, they were eſtabliſhed in moſt of the conſiderable trading towns in that kingdom.

CONSULAR *comitia*, and *medals*. See the ſubſtantives.

CONSULTATION, in *Law*, a writ whereby a cauſe, formerly removed by prohibition from the eccleſiaſtical court to the king's court, is returned thither again.

If the judges of the king's court, upon comparing the libel with the ſuggeſtion of the party, find the ſuggeſtion falſe, or not proved; and therefore the cauſe to be wrongfully called from the court-chriſtian; then, upon ſuch deliberation, or *conſultation*, they decree it to be returned again, and the writ obtained hereon is called a *conſultation*.

CONSUMMATION, the end, period, or completion, of any work.—Thus, we ſay, the *conſummation* of all things; meaning the end of the world. By the incarnation, all the prophecies are to be *conſummated*.

Conſummation of marriage denotes the laſt act of marriage, which makes its accompliſhment.

CONSUMPTION, *Taber*, in *Medicine*, a diſeaſe ariſing from a defect of nouriſhment; or a preternatural decay of the body, by a gradual waſte of muſcular fleſh. See ATROPHY.

It is frequently attended with an hectic fever; and is diverſified by phyſicians into ſeveral kinds, according to the variety of its cauſes: as *univerſal* or *ſcorbutic conſumption*, where it ariſes from a cacochymia, or ſcorbutic habit; and *pulmonic conſumption*, or *conſumption of the lungs*, where it ariſes from ſome cauſe in the lungs, properly called a PHTHISIS.

A *conſumption* may either be *accidental*, *natural*, or *hereditary*.—*Accidental conſumptions* may ariſe, 1. From ulcers, chalky ſtones, or polypuſes in the lungs, cauſed by ſomething that obſtructs the circulation in the pulmonary veſſels, or renders the blood viſcid, as a ſuppreſſion of any natural evacuation. 2. From intemperance, occaſioning either a cacochymia, or plethora. 3. From peripneumonies, pleuriſies, aſthmas, coughs, catarrhs, diarrhœas, venereal diſorders, and exceſs of venery. 4. From grief, hard ſtudy, &c.

Natural conſumptions may ariſe from the ſtraitneſs of the thorax, or an ill conformation of the parts.

An *hereditary conſumption* may be communicated from the parents, without any other viſible cauſe.

A *conſumption* uſually begins with flying pains and flitches; a troubleſome pain at the pit of the ſtomach, or in the diaphragm; frequent ſpitting, loſs of appetite, a quick pulſe, a ſweetneſs or ſaltneſs in the ſaliva, heat and fluſhings in the face and palms of the hands after meals, an hectic fever towards the evening, heavineſs, faintneſs, night-ſweats; and, where the lungs are firſt diſordered, a cough, catarrh, or aſthma, uſually precede it. When theſe ſymptoms are violent, it is confirmed; and then comes on an expectoration of purulent or bloody matter, and the vomica pulmonum; at length, the feet ſwell, the expectoration ſtops, a diarrhœa comes on; and then the facies Hippocratica, and death. The cure of an *univerſal*, or *muſcular conſumption*, depends principally upon removal into a proper air, exerciſe, and the uſing of a regular nouriſhing diet, particularly vegetables and milk; the appetite is to be excited by proper bitters, and other ſtomachics.

In a *pulmonary conſumption*, or *phthiſis*, balſamics and oleaginous medicines, are uſually added.

Dr. Wainwright, indeed, takes the particles of oily medicines to be too groſs and viſcid to enter the ſmall orifices of the lacteals; and thinks, that their operation or effect being confined to the firſt paſſages, they are not only of no ſervice in the cure, but are apt to pall the appetite, occaſion obſtructions in the mouths of the lacteals, and diarrhœas.

But this ſeems contrary to common experience: that their particles are ſmall enough to enter the lacteals, is evident, from the ſudden relief nephritic perſons find in violent paroxyſms of the ſtone by the paſſages being relaxed ſoon after their exhibition. That diarrhœas, and blunting the appetite in ſome conſtitutions, will be the conſequence of their continuance, or exhibition in too great quantities, muſt be allowed; but then this is either accidental to ſome kinds of conſtitutions, or ariſes from ſome error in uſing them.

As to the lacteals being obſtructed by their uſe, it ſeems a mere notion, and as much unſupported by experience as that other hypotheſis, which a late author, Dr. Quincy, has been fond of aſſerting: viz. that the uſe of butter is apt to foul the glands.

A *conſumption* is frequently the conſequence of a neglected COLD.

Beſides repeated ſmall bleedings, which is the beſt of all remedies for diminiſhing the hectic fits, the ſaline draughts and a cool diet are to be uſed. Colliquative ſweats may be checked by drinking about a pint of lime-water, ſoftened with a little new milk.

In the advanced ſtate of a *conſumption*, we may diſtinguiſh two kinds of coughs, one cauſed by the ulcers of the lungs, and the other by a thin rheum falling upon the *fauces* and *trachea*. For the firſt of theſe, about ten drops of balſam of Peru or Copaiba may be given twice a day in a bolus of conſerve of roſes; and for the latter, incraſſants,

inebriants, as conserve of roſes and opium; which laſt ought to be given with caution, as being apt to heat the body. See BALSAMS.

CONSUMPTION, in *Farriery*, is alſo a diſeaſe incident to horſes, conſiſting of a waſte of muſcular fleſh, attended with a ſlow fever. In this diſorder bleeding in ſmall quantities is recommended: mercurial purges, and a powder of native cinnabar, gum guaiacum and nitre, of each one pound, in the quantity of an ounce twice a day; ſpring graſs, and ſalt marſhes, are alſo of great ſervice, when there is any proſpect of recovery.

CONSUS. See CONSUALIA.

CONTACT, the relative ſtate of two things that touch each other, or whoſe ſurfaces join to each other without any interſtice. The *contact* of two ſpherical bodies is only in one point; and the ſame holds of a tangent and the circumference of a circle.—Hence, becauſe very few ſurfaces are capable of touching in all points, and the coluſion of bodies is in proportion to their *contacts*; thoſe bodies will ſtick faſter together, which are capable of the greateſt *contact*.

CONTACT, *angle of*, is the angle HLM (*Tab. Geometry, fig.* 10.) formed by the arch of a circle ML, with the tangent HL, at the place of the *contact*.

Euclid demonſtrates, that the right line HL, ſtanding perpendicular to the radius CL, touches the circle only in one point; nor can there be any other right line drawn between the TANGENT and the circle.

Hence, the angle of *contact* is leſs than any rectilinear one; and the angle of the ſemicircle between the radius CL, and the arch ML, is greater than any rectilinear acute angle.

This paradox of Euclid has exerciſed the wits of mathematicians: it was the ſubject of a long controverſy between Peletarius and Clavius; the firſt of whom maintained the angle of *contact* heterogeneous to a rectilinear one; as a line is heterogeneous to a ſurface: the latter maintained the contrary.

Dr. Wallis has a formal treatiſe on the *angle of contact*, and of the ſemicircle; where, with other great mathematicians, he approves of the opinion of Peletarius.

CONTAGION, *infection*, or the communicating, or tranſferring a diſeaſe from one body to another.

Contagion, in ſome diſeaſes, is only effected by an immediate contact, or touch: as the madneſs of a dog, which is communicated by biting: and the poiſon of the pox, which is tranſmitted from the infected perſon in the act of copulation. In others it is conveyed by infected cloaths; as the itch. In others the contagion is tranſmitted through the air to a great diſtance, by means of ſteams or effluvia, exhaling from the ſick; as in the PLAGUE, and other peſtilential diſtempers: in which caſe, the air is even ſaid to be *contagious*, i. e. full of *contagious* particles.

In times of peſtilential *contagion*, the phyſician, and others who attend upon the ſick, are in the moſt imminent danger of falling into the ſame condition, nor have any of the ſo much boaſted preſervatives againſt this been found of any conſequence; on the contrary, the very remedies, many of them at leaſt, which have been contrived on this occaſion, are very dangerous when lodged in imprudent hands, as well as uſeleſs and improper in all. The beſt methods of ſafety are firſt never to viſit a patient in any infectious diſorder when one is faſting, but ſome generous wine ought always to be drank firſt. Some are of opinion that it is proper to eat firſt a piece of bread and butter ſoaked in vinegar, either ſimple, or with rue firſt ſtamped in it. When one is in the patient's apartment, great care is to be taken never to eat or drink there, nor to ſwallow one's ſpittle, and it is no idle cuſtom in thoſe who are continually in the infected room to chew ſeveral myrrh, angelica, cinnamon, or the like warm and aromatic drugs; for all theſe things promote a plentiful diſcharge of ſaliva from the mouth, which it is certain when ſwallowed, cannot but often carry peſtilential particles down with it into the ſtomach, whence they will eaſily find their way into the blood. It may be added as a good rule, that we never ſtay too long in an infected room; for a conſtitution that could have reſiſted the *contagion* for a ſmall time, may eaſily be overpowered by too long a continuance in the way of it.

After one is returned home from a viſit of this kind, it is always proper to waſh ones hands and mouth with vinegar and water; to change cloaths, hanging the former in the air, and then to drink ſome warm liquor, as tea of ſcordium, ſage, or other herbs of that kind, or, in their place, coffee; for this opens the pores: and if any ſmall quantity of the peſtilential virus ſhould have mixed itſelf with the blood, expels it by a gentle perſpiration. It may be alſo of great aſſiſtance to all about the ſick, for preventing them from being infected, to build frequently ſponges dipt in vinegar to their noſes, and frequently to ſprinkle vinegar on a red-hot iron, in the room, to correct and mend the air, and to ſmoak tobacco. Heiſter's Surgery, p. 201. See EPIDEMICAL.

CONTARA, in *Botany*, a name given by ſome authors to the plant which produces the *faba ſancti Ignatii*, or St. Ignatius's bean.

CONTARII, in *Antiquity*, a kind of horſemen, whoſe chief armour was the *contus*, a kind of long ſpear.

CONTEMPLATION, an act of the mind, whereby it applies itſelf to conſider, reflect on, and admire, the wonderful works of God, nature, &c.

Contemplation is the height of perfection of the myſtic divines. See MYSTIC.

CONTEMPORARY, or COTEMPORARY, a perſon, or thing of the ſame time, or that exiſted in the ſame age, with another. *Socrates*, Plato, and Ariſtophanes, were *contemporaries*: the beſt hiſtories are thoſe of *contemporary* authors.

CONTEMPT, in *Law*, is diſobedience to the rules and orders of a court, which hath power to puniſh ſuch offence; and a man may be impriſoned for a *contempt* done in court, and not for a *contempt* out of court, or for private abuſe. Cro. Eliz. 689.

Attachment alſo lies for contempt to the court, to bring in the offender to anſwer to interrogatories, &c. and if he cannot acquit himſelf, he ſhall be fined. 8 Litt. 305.

As the degrees of this crime vary, the puniſhment is leſs or greater; ſometimes a mere fine, and ſometimes impriſonment.

CONTENEMENT, a word, in our *Antient* LAW-*books*, about whoſe ſignification authors are not rightly agreed. According to ſome, it ſhould ſignify the countenance, credit, or reputation, a perſon has, from and by reaſon of his freehold. In which ſenſe it is uſed in the ſtat. 1 Edw. III. &c. where it ſtands as ſynonymous with *countenance*.

Others will have it ſignify what is neceſſary for the ſupport and maintenance of men, according to their ſeveral qualities, conditions, or ſtates of life. Thus, Spelman, *Contenementum eſt eſtimatio, & conditionis forma, quo gaudet in republica ſubſiſtit.* And in this ſenſe it occurs in Magna Charta. cap. 14.

CONTENT, in *Mathematics*, a term frequently uſed for the capacity of a veſſel, or the area of ſpace; or the quantity of any matter, or ſpace, included in certain bounds. The *content* of a ton of round TIMBER is 43 ſolid feet. A load of hewn timber contains 50 cubic feet; in a foot of timber are contained 1728 cubic or ſquare inches, and as often as 1728 inches are contained in a piece of timber, be it round, or ſquare; ſo many feet of timber are contained in the piece.

In gauging, the gallon for beer and ale is allowed to contain 282 cubic inches, and the wine gallon 231; the gallon of dry meaſure 272.

Hence, as oft as 282 cubic inches are contained in any veſſel, round or ſquare; ſo many gallons of ale or beer it holds; and the like may be obſerved of the other meaſures.

Multiply, therefore, one ſide of a ſquare, or oblong, into the other; and divide by one of thoſe numbers, according to the quality of the liquor; the quotient gives the area in gallons, upon an inch deep.

Though the work may be conſiderably ſhortened by only multiplying the ſides of ſquares, or the diameters of rounds into themſelves; the product is the number of gallons and parts, the veſſel contains, upon an inch in depth: and when that receives an augmentation, by being two, three, or four inches deep, it then commences a ſolid body, and contains as many gallons, and parts, as it is inches and parts deep.

A cubic foot contains ſix gallons and almoſt a pint of ale and beer; and ſeven gallons two quarts, of wine. A cubic foot of dry meaſure contains ſix gallons and a half, and ſomething more. A buſhel of ſalt contains 56 pounds avoirdupoiſe. See GAUGING.

CONTENTIOUS *juriſdiction*, in *Law*, denotes a court, or aſſembly, which has a power to judge and determine differences between contending parties.

The lords chief juſtices, judges, &c. have a *contentious juriſdiction*; but the lords of the treaſury, the commiſſioners of cuſtoms, &c. have none; being merely judges of accounts and tranſactions.

CONTESTATIO *Litis*, among *Civilians*, denotes a general aſſertion that the plaintiff hath no ground of action, which aſſertion is afterwards extended and maintained in his plea.

CONTEXT, among *Divines* and *Critics*, that part of ſcripture, or other writing, which lies about the TEXT, before or after it or both.

To take the full and genuine ſenſe of the *text*, the *context* ſhould be regarded.

CONTEXTURE, a word frequently uſed in ſpeaking both of

of the works of nature and art; and denoting the disposition and union of the constituent parts with respect to one another.

CONTIGNATION, in *Architecture*, the art or act of FLOORING, by laying *tigna*, RAFTERS, together.

CONTIGUITY, the relation of bodies touching one another. See CONTINUITY.

CONTIGUOUS, a relative term, understood of things disposed so near each other, that they join their surfaces, or touch.

The houses in ancient Rome were not contiguous as ours are, but all insulated.

CONTIGUOUS *angles*, in *Geometry*, are such as have one leg common to each angle; otherwise called *adjoining angles*. In contradistinction to those produced by continuing their legs through the point of contact, which are called *opposite* or *vertical* ANGLES.

CONTINENCE, in *Ethics*, a moral virtue, by which we resist concupiscence. It should seem that there is this distinction between *chastity* and *continence*, in that it requires no effort to be chaste, which results from constitution; whereas *continence* appears to be the consequence of victory gained over ourselves. The verb *continere*, in the Latin, signifies to *refrain*.

CONTINENT, in *Geography*, a terra firma, main land, or a large extent of country, not interrupted by seas: so called, in opposition to *island*, *peninsula*, &c. See EARTH, OCEAN, &c.

Sicily is said to have been anciently torn from the *continent* of Italy; and it is an old tradition, which some of our antiquaries have still a regard to, that Britain was formerly a part of the *continent* of France.

The world is ordinarily divided into two grand *continents*; the old and the new; the old comprehends Europe, Asia, and Africa; the new the two Americas, north and south.

CONTINENT *cause* of a distemper is that wherein the disease depends so immediately, that it continues so long as that remains and no longer.

Thus a stone in the bladder may be the *continent cause* of a suppression of urine.

CONTINENT *fevers*, a term used by medical writers to express such fevers as continue through their whole course exactly in the same tenor in which they begun, without the least visible intermission. They are thus called in opposition to the *continuous* fevers, which, though they never regularly go off so as to have *intermissions*, yet have frequent *remissions*. Of the number of *continent fevers* are the *ephemera*, whether it be strictly diary, or continues more days; also the *synocha*, which is called the *continent fever*, by way of eminence. Junker's Consp. *Med.* p. 252. See FEVER.

CONTINGENCY *of blood*, in the writers of the laws of Scotland, is used for proximity of blood. Bayne, Crim. Law. p. 48.

CONTINGENT, something casual, uncertain, or dependent upon CHANCE.

CONTINGENT, *future*, in *Logic*, denotes a conditional event which may, or may not, happen, according as circumstances fall out.

CONTINGENT is also a term of relation for the quota that falls to any person upon a division.

Each prince of Germany, in time of war, is to furnish so many men, so much money and munition, for his *contingent*. By the new treaty of Hanover it is stipulated, that in case of a rupture with the emperor, the kings of Great Britain and Prussia may furnish their *contingents*, as fiefs of the empire, at the same time they are at war therewith.

CONTINGENT *use*, in *Law*, is an use limited in a conveyance of land, which may, or may not, happen, to vest, according to the *contingency* expressed in the limitation of such use.

CONTINGENT *legacy*, is a legacy depending on the life of the legatee; if it be left to any person, *when* or *if* he attains the age of twenty-one, and if he dies before that time, it is a lapsed legacy: but if it is left *to be paid* when he attains that age, it is a vested legacy; and if the legatee dies, his representatives shall receive it out of the testator's estate at the time when it would have become payable, had the legatee lived. Blackst. Com. vol. ii. p. 513.

CONTINGENT *remainder*, in *Law*, is where an estate is limited to take place *in future*, upon an uncertain event; as where a particular estate, which doth support a remainder, may or may not determine before the remainder may commence. 10 Rep. 85. See REMAINDER.

CONTINGENT *line*, or *Line of* CONTINGENCY, in DIALLING, is a line that crosses the SUBSTILE at right angles.

CONTINGENTS are sometimes also used by mathematicians in the same sense as TANGENTS.

CONTINUAL *claim*. See CLAIM *continual*.

CONTINUAL *proportionals*: When in a series of quantities the first is to the second as the second to the third, and the third to the fourth, and the fourth to the fifth, &c. they are called *continual proportionals*.

CONTINUANCE, in *Law*, is much the same as *prorogation* among the civilians. See DISCONTINUANCE.

CONTINUANCE *of a writ*, or *action*, is its holding in force from one term to another, in a case where the sheriff has not returned, or executed, a former writ issued out in the same action.

CONTINUANCE *of assize*. If a record in the treasury be alledged by one party, and denied by the other, certiorari shall be sued to the treasury and chamberlain of the exchequer; who, if they certify not that the said record is there, or likely to be in the Tower, the king shall then send to the justices, repeating the certificate, and will them to *continue the assize*.

CONTINUANDA *assisa*. See ASSISA.

CONTINUANDO, in *Law*, a term used where a plaintiff would recover damages for several trespasses in the same action.

To avoid multiplicity of suits, a man may in one action of trespass recover damages for forty, or more, trespasses; laying the first to be done with a *continuance* to the whole time wherein the rest of the trespasses were done; which is done in this form: *continuando transgressionem prædictam, &c. à prædicto die, &c. usque, &c.*

CONTINUANDO *processum*. See PROCESSUM.

CONTINUANS *punctum*. See PUNCTUM.

CONTINUATION *of motion*. See MOTION, and PROJECTILE.

CONTINUATIVE *conjunctions*. See CONJUNCTION.

CONTINUATO, in the *Italian Music*, is used to direct a finger, or player, to continue or hold on a sound, in equal strength or manner; or to continue a movement in an equal degree of time all the way.

CONTINUED, or CONTINUAL *fever*, is such a FEVER as sometimes remits, but never intermits, or goes entirely off, till its period. They are thus called to distinguish them from the CONTINENT fevers.

A *continual fever* may be defined to be the continuance of an increased velocity in the CIRCULATION of the BLOOD beyond what is natural to the constitution.

If this velocity often decreases and rises again to the same height, it is called a *continual periodical fever*.

And if it entirely cease in the space of a day, or two, it is called an *ephemeris*.

A *continual* fever, then, may remit, or abate, and increase again, alternately; but not intermit, which would constitute it an intermitting fever, or ague.

CONTINUED, *Quantity*. } See CONTINUUM, CONTINUITY,
CONTINUED *Body*, &c. } and QUANTITY.

CONTINUED, or *thorough bass*, in *Music*, is that which continues to play constantly, both during the recitatives, and to sustain the choir, or chorus.

CONTINUED *proportion*, in *Arithmetic*, is that wherein the consequent of the first ratio is the same with the antecedent of the second—as, 3 : 6 : : 6 : 12. See PROPORTION.

On the contrary, if the consequent of the first ratio be different from the antecedent of the second, the proportion is said to be *discrete*: as, 3 : 6 : : 4 : 8. See DISCRETE.

CONTINUED *axis*, or *scale*, in *Architecture*. See SCALE.

CONTINU'D *Attic*, *Community*, *Pedestal*. See the substantives.

CONTINUI *solutio*. See SOLUTIO.

CONTINUITY is usually defined among *Schoolmen*, the immediate cohesion of parts in the same *quantum*. Others define it, a mode of body, whereby its extremes become one: and others, a state of body resulting from the mutual implication of its parts.

Continuation relates to *duration*, and *continuity* to *extension*. We say, the *continuation* of a work, or an action; and the *continuity* of space or size; *continuation* of the same conduct; and *continuity* of the same building.

There are two kinds of *continuity*, *mathematical* and *physical*. The first is merely imaginary and fictitious; since it supposes real or physical parts where there are none.

Physical continuity is strictly, that state of two or more parts, or particles, wherein they appear so adhere, or constitute one uninterrupted quantity, or *continuum*; or between which we perceive no intermediate space.

The schoolmen distinguish two other sorts of *continuity*; viz. *homogeneous*, and *heterogeneous*. The first, where our senses do not perceive the bounds, or extremes, of the parts; and thus agrees even to air, water, &c. The second, where our senses indeed perceive the extremes of certain parts, yet at the same time observe the same parts closely linked to each other; either in virtue of their situation or figure, &c. and this is chiefly attributed to the bodies of animals and plants.

The *continuity* of bodies is a ſtate merely relative to our ſight and touch: e. gr. if the diſtance of two ſeparate objects be ſuch, as that the viſual angle they ſubtend is inſenſible to the eye, which it will be if leſs than ſixteen ſeconds, the two ſeparate bodies will then appear *contiguous*. Now, the reſult of ſeveral *contiguous* objects is a *continuity*, to that any number of viſible objects, being placed ſo as that the diſtances ſubtend angles of leſs than ſixteen ſeconds, they will appear to form one *continuum*.

And hence, as we can determine the diſtance at which any given magnitude becomes inviſible; it is eaſy to find at what diſtance any two bodies, however remote from each other, will appear as contiguous; and ſeveral, as forming one *continuum*. For the phyſical cauſe of *continuity*, ſee COHESION.

Leibnitz, an eminent mathematician, has ſuppoſed what he calls a law of *continuity* to obtain in the univerſe, by which law every thing that is executed or done in nature, is done by infinitely ſmall degrees. He urges, that good ſenſe dictates this truth, *natura non operatur per ſaltum*, or that nothing can paſs from one extreme to another, without paſſing through all the intermediate degrees. Bernouilli Opera, tom. iii. p. 9, ſeq.

This law ſeems ſubject to difficulties; rigorouſly taken, it ſuppoſes actual, and yet infinitely ſmall changes, which ſome philoſophers cannot allow; and if we ſuppoſe changes only imperceptible to our ſenſes, but finite, the law of *continuity* is no leſs violated than if the univerſe was ſuddenly to be deſtroyed, as M. Maupertuis juſtly obſerves. Mem. de l'Acad. de Berlin. tom. ii. p. 284.

This law of *continuity* led Mr. Bernouilli to reject all HARD *bodies* as chimeras, and naturally impoſſible.

CONTINUO, in the *Italian Muſic*, is ſometimes applied to *baſſo*, to ſignify the thorough baſs. Thus *baſſo continuo* is the continual, or thorough baſs. It is ſometimes marked in muſic books by the letters B, C.

CONTINUO is alſo uſed for a ſpecies of harmony mentioned by Julius Pollux, and which, ſays Zarlino, anſwers to the perpetual burden of our bag-pipes, which now and then muſt be harmonious.

CONTINUOUS *fevers*. See CONTINUED *fevers*.

CONTINUUM, or CONTINUED *quantity*, in *Phyſics*, denotes a quantity, or co-extenſion, whoſe parts are not divided, but joined and connected together; ſo as to leave no room to determine where one begins, and another ends.

It is controverted, among philoſophers, whether a *continuum* be infinitely diviſible, i. e. diviſible into infinite proportionable parts?

The antients attributed the riſe of water, in pumps, to the love of CONTINUITY, and the abhorrence of a VACUUM; becauſe the weight and preſſure of the air were not then known.

Mathematicians divide QUANTITY into *continued*, and *diſcrete*.

Continued quantity is that expreſſed by lines, and makes the ſubject of *geometry*.

Diſcrete quantities are thoſe expreſſed by numbers which make the ſubject of *arithmetic*.

In medicine and chirurgery, wounds, ulcers, fractures, &c. are expreſſed by the phraſe SOLUTIO *continui*, or *ſolution of continuity*.

In a critical ſenſe, we ſay, there ought to be a *continuity*, i. e. a connexion between the parts of a diſcourſe.

In the epic poem particularly, the action ſhould have a *continuity* in the narration, though the events, or incidents, be not continued. As ſoon as ever the poet has opened his ſubject, and brought his perſons on the ſtage, the action is to be *continued* to the end; every character muſt be at work, and no ſuch thing as an idle perſon to be ſeen.

F. Boſſu obſerves, that, by retrenching dull languiſhing incidents, and intervals void of action, which break the *continuity*, the poem acquires a *continued* force, which makes it run equally throughout.

CONTOBABDITES, a ſect in the ſixth century. Their firſt leader was Severus of Antioch, who was ſucceeded by John the grammarian, ſurnamed Philoponus, and one Theodoſius; whoſe followers were alſo called Theodoſians.

Part of them, who were willing to receive a book compoſed by Theodoſius on the Trinity, made a ſeparate body, and were called *Contobabdites*, from I know not what place, which Nicephorus does not mention, but which muſt apparently have been the place where they held their aſſemblies.

The *Contobabdites* allowed of no biſhops; which is the only circumſtance given us concerning them.

CONTOPÆCTÆ, of *κοντος*, *pos*, and *πηγνυμι*, *compact*, in *Antiquity*, a ſort of artiſts who ſupported a pole on their foreheads ſo firmly, that boys could play, dance, and wreſtle together on it.

CONTOR, or CONTOR, a bird of Peru, ſaid to be the largeſt in the world. With its wings expanded, it meaſures ſixteen feet from the tip of the one to the other; a ſingle feather of it is four feet two inches long: its beak is ſtrong enough to tear off the hide, and rip up the bowels of an ox. Two of them will deſtroy a bull. Phil. Tranſ. N°. 208. p. 61. See CONDOR.

CONTORSION, the action of twiſting, or wreſting, a member of the body out of its natural ſituation.

Rope-dancers accuſtom themſelves to *contorſions* of their limbs from their youth, to render the fibres of their articulations lax and ſupple, for all kinds of poſtures.

CONTORSION, in *Surgery*, has many ſignifications. Firſt, the *diaſtaſis* is thus called; ſecondly, an *incompleta diſlocation* is thus named, when a bone is partly forced from its articulation; thirdly, a diſlocation of the vertebræ of the back ſideways, or crookedneſs of theſe vertebræ, are called *contorſions* of them: fourthly, a diſorder of the head is thus called, in which it is drawn towards one ſide, either by a ſpaſmodic contraction of the muſcles on the ſame ſide, or a palſy of their antagoniſt muſcles on the other. James's Med. Dict.

The *antorſion* of the neck is uſually occaſioned, according to Nuckæ, by a relaxation or *paraliſis*, of one of the maſtoidal muſcles: for hence it happens, that its antagoniſt, whoſe power is now no longer balanced, contracting with its proper force, draws the head towards that ſide.

He adds, that this diſorder cannot be remedied too ſpeedily; and preſcribes, from the beginning, liniments cable of relaxing and ſoftening the fibres, to be uſed, not only to the muſcle in contraction, but alſo, and principally, to the paralytic muſcle, which is the ſeat of the diſorder.

CONTOUR, *outline*; that which terminates and deſines a figure.

A great part of the ſkill of the painter conſiſts in managing the *contours*.

The *contour* of a figure makes what we call the *draught*, or *deſign*. The *contour* of a face, the Italian painters ordinarily call the *lineaments* of it.

CONTOURNE, in *Heraldry*, is uſed when beaſts are repreſented ſtanding, or running, with their faces to the ſiniſter-ſide of the eſcutcheon; they being always ſuppoſed to look to the dexter-ſide, unleſs it be otherwiſe expreſſed.

CONTOURNIATED, a term applied among *Antiquaries*, to a kind of medallions which have a broad riſing rim on each ſide; and figures that have ſcarce any relievo, in compariſon with the true medallions.

They have their name from their edges; which appear as if turned in the lathe. All we have remaining of theſe *contourniated* medals, ſeem to have been ſtruck about the ſame time. F. Hardouin conjectures them not to be earlier than the thirteenth century; other antiquaries go back as far as the fifth; and others find inſtances of them as antient as the time of Nero.

This ſort of work ſeems to have had its origin in Greece, and to have been appropriated to honour the memories of great men; principally, thoſe who had borne away the prize at the ſolemn games; ſuch are thoſe remaining of Homer, Solon, Euclid, Pythagoras, Socrates, Apollonius Tyaneus, and ſeveral athletæ, whoſe victories are expreſſed on them by palms and chariots, either biga, or quadriga.

CONTRA, or COUNTER, in *Compoſition*. See COUNTER.

CONTRA *operture*, in *Surgery*, a counter opening. This is ſometimes very neceſſary in wounds made by puncture or a bullet, in order to diſcharge whatever is contained in the wound, and prevent its growing ſiſtulous. James's Med. Dict.

CONTRA *formam collationis*, is a writ that lies where a man has given lands, in perpetuâ alms, to a religious houſe, hoſpital, ſchool, or the like, and the governor, or managers, have alienated the lands, contrary to the intention of the donor.

This was founded on the ſtatute of Weſtm. 2. cap. 41.

CONTRA *formam feoffamenti*, is a writ for a tenant, who is infeoffed by the lord's charter, to make certain ſuit and ſervice to his court; and is afterwards diſtrained for more than is contained therein. Reg. of Writs, fol. 176. Old Nat. B. ii. fol. 162.

CONTRA *formam ſtatuti*, is the uſual concluſion of every indictment, &c. laid on an offence created by ſtatute.

CONTRABAND, in *Commerce*, a prohibited commodity; or, a merchandize bought or ſold, imported or exported, in preju dice, and contrary to the laws and ordinances of a ſtate, or the public prohibitions of the ſovereign.

The word comes from the Italian *contrabando*, of *contra* and *bando*, q. d. contrary to edict, or publication of prohibition.

Contraband goods are not only liable to confiſcations themſelves,

selves, but do alſo ſubject all other allowed merchandizes found with them in the ſame box, parcel, or bale, together with the horſes, waggons, &c. which conduct them to the ſame.

There are *contraband* goods, which, beſides confiſcation, are prohibited on pain of death; as, v. gr. in France, India and China ſtuffs, ſilkens, &c.

In England there are two principal *contraband* for exportation, wools and live ſheep, which all ſtrangers are prohibited from carrying out, on pain of having the right hand cut off; the other, that of sheep-ſkins and calf-ſkins, which all foreigners are in like manner prohibited from exporting, on pain alſo of having the right hand cut off; yet the ſubjects of England are allowed to tranſport the ſame from France to England.

Other *contrabands* for exportation are raw horns, white aſhes, ſtocking-looms, or any part thereof, fullers earth, and all raw hides, or ſkins.

Of goods *contraband* as to the import, there are above fifty in the liſts made in 1662, and there are twenty-five of them which now ſtand in the tariff; the non-execution of the acts of parliament, whereby they were impoſed, ſeeming to have reſtored them to the freedom of importation.

The chief of thoſe ſtill *contrabanded*, and not tariffed, are woollen caps, woollen cloths, ſaddles and harneſs, dice, billiards, all ſorts of tanned, or dreſſed hides, dreſſed furs, all ſorts of ſhoemaker's ware, locks, and divers ſorts of cutlers ware; all painted goods, except paper; wires, buckles, gold and ſilver leaf, and horns for lanterns.

Since the year 1662, ſeveral other commodities have been made *contraband*; particularly ſilk and galloons, laces, embroidery, fringes, buttons, and other ſilk and thread manufactures; black taffaties, called *alamodes*, or luſtrings. In 1719 and 1720, an attempt was made in parliament to paſs a bill for putting gold and ſilver, whether in coined ſpecies, or otherwiſe, among the number of *contraband* goods for exportation; but in vain, by reaſon of the ſtrong oppoſition made by thoſe who enrich themſelves by the export of theſe metals; which by the laws of the kingdom, are allowed to be ſent away, upon entering them, paying the duty of the export, and making oath of their being foreign, i. e. of their not being the coin or plate of the kingdom, melted down.

CONTRACT, a mutual conſent of two or more parties, who promiſe and oblige themſelves voluntarily, to do ſomething, pay a certain ſum, or the like.

SALES, EXCHANGES, DONATIONS, LEASES, &c. are ſo many different ſpecies of *contracts*.

CONTRACT is particularly uſed, in *Common Law*, for an agreement or covenant between two, with a lawful conſideration, or cauſe.

As, if I ſell my horſe for money; or covenant in conſideration of 20*l.* to make you a leaſe of a farm; theſe are good *contracts*, becauſe there is *quid pro quo*. See SIMPLE and SPECIALTY.

CONTRACT *Nude*, and *Quaſi*. See the adjectives.

CONTRACT, *uſurious*, is a *contract* to pay more intereſt for money than the laws allow.

It is a deviaſavit in executors to pay a debt upon an uſurious *contract*.

CONTRACT. In marriage, the Romaniſts diſtinguiſh the civil *contract*, which is the conſent of the parties, from the *ſacrament*, which is the benediction of the prieſt.

Thoſe *contracts* are ſaid to be *null*, which the law prohibits: ſuch are all *contracts* between perſons incapable of *contracting*, as minors, religious, lunatics, wives without conſent of their huſbands, &c.

CONTRACT is alſo uſed for the inſtrument in writing, which ſerves as a proof of the conſent granted, and the obligation paſſed between the parties.

Among the ancient Romans, *contracts*, and all voluntary acts, were written, either by the parties themſelves, or by one of the witneſſes, or by a domeſtic ſecretary of one of the parties, whom they call a *notary*; but who was no public perſon, as among us.

The *contract*, when finiſhed, was carried to a magiſtrate, who gave it a public authority by receiving it *inter acta*, into the number of the ACTS under his juriſdiction; giving each of the parties a copy thereof, and ſealed with his ſeal. Which practice paſſed into France, where it obtained a long time.

CONTRACTILE *force*, that property, or power, inherent in certain bodies, whereby, when extended, they are enabled to draw themſelves up again to their former dimenſions.

For the cauſe of this property, which is of the utmoſt conſequence to a right underſtanding of the animal œconomy, ſee FIBRE.

CONTRACTION, in *Logic*, a ſpecies of reduction, wherein the thing that reduces does alſo abridge, or bring the thing reduced into a leſſer compaſs.

The deſign of *contraction* is to bring things, which before were too lax and diffuſive, nearer together; that ſo their mutual relation may appear the more clearly, and they may better ſtrengthen and ſupport each other.

To this head are referred the arguments, as they are called, of poems and orations; the titles and ſummaries of chapters, &c.

CONTRACTION, in *Phyſics*, denotes a diminiſhing of the extent, or dimenſions, of a body; or a bringing of its parts cloſer to each other; upon which it becomes heavier, harder, &c. See CONDENSATION.

Contraction, in this ſenſe, ſtands oppoſed to *dilatation*.

All bodies *contract* by cold, and dilate, or rarefy, by HEAT. See RAREFACTION.

CONTRACTION is frequently uſed, by anatomical writers, to expreſs the ſhrinking up of a fibre, or an aſſemblage of fibres, when extended.

Convulſions, and ſpaſms proceed from a preternatural *contraction* of the fibres of the muſcles of the part convulſed.

On the contrary, paralytic diſorders generally proceed from a too great laxneſs of the fibres of the parts affected; or from the want of that degree of *contraction* neceſſary to perform the natural motion or action of the part.

In the firſt, therefore, the animal ſpirits are ſuppoſed to flow either in too great a quantity, or irregularly; and, in the laſt, the animal ſpirits are either denied a free paſſage into the part affected, or the tenſion of the fibrillæ is ſuppoſed inſufficient to promote the circulation.

Contraction evidently appears to be the true natural ſtate of all muſcles; for, if a muſcle be at any time freed from the power of its antagoniſt, it is immediately found to *contract*; and is not, by any action of the will, or the ſpirits, to be reduced to a ſtate of dilatation.

CONTRACTION *of the heart, arteries, lungs, &c.* See SYSTOLE, HEART, ARTERY, PULSE, &c.

CONTRACTION, in *Grammar*, the reduction of two vowels, or ſyllables, into one; as, *mayn't*, for *may not*; *ſhouldſt*, for *ſhouldeſt*, &c.

The Greeks abound with *contractions*, both in their verbs, and their nouns.

CONTRADICENTE. See NEMINE *contradicente*.

CONTRADICTION, a ſpecies of direct oppoſition, wherein one thing is found diametrically oppoſite to another.

The ſchoolmen uſually define it, *oppoſitio inter res & non-entia, medio carentes*: where, by *res*, and *non-res*, are underſtood any two extremes, whereof one affirms, and the other denies; and it is ſaid to be *medio carens*, to diſtinguiſh it from the other ſpecies of compoſition; the extremes, here, neither agreeing in ſubject, as is the caſe in PRIVATION; nor in eſſence and kind, as in CONTRARIETY.

CONTRADICTION, *freedom of*. See FREEDOM.

CONTRADICTION, *imply a*. See IMPLY.

CONTRADICTOR, in a legal ſenſe, a perſon who has a right or title to contradict or gainſay.

An inventory of the effects of a minor ought to be made in preſence of his guardian, or truſtee, who is the legal *contradictor*: a decree againſt a farmer has no effect on the landlord, the firſt not being the legitimate *contradictor*.

CONTRADICTORY *propoſitions*, are oppoſites, one of which imports a mere, and naked denial of the other.

Of theſe, therefore, one muſt be poſitive, and the other negative; as *ſitting*, and *not ſitting*: *white*, and *not white*. *Contradictory* propoſitions mutually deſtroy each other.

To have two propoſitions truly *contradictory*, they muſt be oppoſite, both in quantity and quality, i. e. one muſt be univerſal, and the other particular, which make the oppoſition of quantity; and the one affirmative, and the other negative, which makes the oppoſition in quality. Thus, v. gr. *All uſe of coins and ſilver is evil*; falſe: *Some uſe of coins and ſilver is not evil*; true. To this it is neceſſary, that the one deny and the other affirm, the ſame thing, of the ſame ſubject, conſidered in the ſame circumſtances; unleſs the queſtion be about an eſſential attribute, in which caſe, no regard is had to circumſtances; every thing having always its own eſſence. This the logicians expreſs by *affirmare & negare idem, de eodem, ſecundum idem*.

There may likewiſe be *contradictory* propoſitions on a particular ſubject; e. gr. an individual. Theſe are called *ſingle contradictory propoſitions*; as, *Peter is innocent, Peter is not innocent*, or *is a criminal*. Now to have theſe propoſitions *contradictory*, Peter muſt be conſidered at the ſame time, without which they may be both true: ſince there may be a time wherein Peter was innocent, and another wherein he was a criminal.

CONTRA-FISSURE, in *Medicine*, a term applied to that ſpecies of fracture, or fiſſure, in the ſkull, where

the

the side, opposite to that where the blow was received, it cracked.

This species of fracture is taken notice of by Celsus, lib. viii. cap. 4. yet Ægineta denies the possibility of it; and is herein followed by Gorræus, and many of the moderns. Their chief argument is, that the skull is not one uniform continuous bone, but is divided by several sutures, which prevent the effects of a stroke from being communicated to the opposite part, and confine the mischief to the part struck. Here, say they, if a skull be found cracked on the opposite side, or any where but in the place where the blow is immediately received, this must proceed from a second or third blow, which, perhaps, the patient, being stunned, does not remember. But there are so many cogent instances on the other side of the question, that the reality of *contra-fissures* is now generally allowed.

The usual symptoms attending a *contra-fissure*, are a delirium, sometimes a bleeding at the nose and mouth, lipothymy, and involuntary passing of the urine and excrements, and convulsions. If these happen, and after search made in the part where the injury was received, no fracture or depression of the skull be found, there is a suspicion of a *contra-fissure*; especially if the patient be apt to point to that part.

If the symptoms be by intervals, and not to a great degree, or there be reason to believe the fissure to have reached only through one of the tables, it is sufficient to bare the bone, and use a raspatory; then to fill the rima, or crack, with proper powders, as of iris, gum, myrrh, powder of dispente, &c. and above all apply a pledget, dipped in the tincture of euphorbium, or of equal parts of spirit of wine, and honey of roses. If these fail, the trepan must be had recourse to.

CONTRA-HARMONICAL *proportion*, that relation of three terms, wherein the difference of the first and second is to the difference of the second and third, as the third is to the first.

Thus, e. gr. 3, 5, and 6, are numbers *contra-harmonically* proportional: for 2 : 1 :: 6 : 3.

To find a mean contra-harmonically proportional to two given quantities: the rule is, divide the sum of the two squared numbers by the sum of the roots; the quotient is a *contra-harmonically* mean proportional between the roots.

CONTRA-INDICATION, is an INDICATION which forbids that to be done which the main scope of a disease points out.

Suppose, e. gr. in the cure of a disease a vomit were judged proper: if the patient be subject to a vomiting of blood, it is a sufficient *contra-indication* as to its exhibition.

CONTRALTO, in *Music*. See COUNTER-*Tenor*.

CONTRAMANDATIO *Placiti*, in *Law-Books*, signifies a respiting, or giving the defendant farther time to answer; or an imparlance, or countermanding of what was formerly ordered. See COUNTERMAND.

CONTRAMANDATUM, a lawful excuse which the defendant, by his attorney, alleageth for himself to *shew* that the plaintiff has no cause to complain, *si dies placiti sit contramandatus*. 11 Hen. I. See the article COUNTERMAND.

CONTRAMURE, in *Fortification*, an outwall, built about the main WALL of a city. See RAMPART.

CONTRAMURE, in *Civil Architecture*. See COUNTERMURE.

CONTRA-*Points*, in *Music*. See the article COUNTER-*point*.

CONTRAPOSITION, in *Logic*. See the article CONVERSION.

CONTRARIENTIUM *Rotulus*. See the article ROTULUS.

CONTRARIETY, that which denotes two things *contrary* to each other.

Contrariety consists in this, that one of the terms imports a negation of the other, either mediately or immediately; so that *contrariety* may be said to be the contrast, or opposition of two things, one of which implies the absence of the other.

CONTRARIETY, *freedom of*. See FREEDOM.

CONTRARIES, are positive OPPOSITES; which being of the same kind, or same common nature, and subsisting by turns in the same subject, are as remote from each other as possible, and mutually expel each other. Such are whiteness and blackness, cold and heat, &c.

Hence, properly speaking, only qualities can be *contraries*: *contrariety*, in effect, only agrees to qualities *per se*; to other things it agrees *per accidens*, or *in ordine ad qualitatem*.

CONTRARY, however, is often used in a more extensive signification, viz. for any inconsistence or difference between the nature and qualities of things. It is a popular maxim in Philosophy, that *contraria juxta se posita magis elucescunt*: *contraries* set off one another. In this sense is the word *contrary* used in the schools; and hence an argument *à contrario*.

This method of improving things *à contrario*, is much used, and with good success, by F. Bourdaloue, in his Sermons.

CONTRARY, in *Rhetoric*. F. de Colonia lays down three kinds of *contraries* in rhetoric; viz. *adversatives*, *privatives*, and *contradictories*.

Adversatives are those that differ much in the same thing, as virtue and vice, war and peace: thus Tully, *Si stultitiam fugimus, sapientiam sequamur; & benignitatem, si malitiam*. And Quintilian, *malorum causa bellum est, est emendatio pax*. Instances argues thus in Virgil:

Nulla salus belli: pacem te poscimus omnes.

Privatives are habits and their privations. *Contradictories*, are those, one whereof affirms, and the other denies, the same thing of the same subject.

CONTRARY *propositions*, in *Logic*, universal propositions, one of which affirms, and the other denies, the same predicate of the same subject; *as every square is a parallelogram*, and *no square is a parallelogram*. These propositions differ in quality, but not quantity, and therefore are distinguished from CONTRADICTORY propositions, which differ in quantity and quality.

Contrary propositions cannot be both true, but may both be false; whereas, in *contradictory* propositions one is necessarily true, and the other false.

CONTRARY *point of flexure*. See POINT.

CONTRAST, in *Painting* and *Sculpture*, expresses an opposition or difference of position, attitude, &c. of two or more figures; contrived to make a variety in a painting, &c.

The word comes from the Italian *contrasto*, *to oppose*, or *thwart*; and that, according to M. Huet, from the Latin *contra flatio*.

Thus, when in a group of three figures, one appears in front, another shews his hind-parts, and third is placed sideways, there is said to be a *contrast*.

M. de Piles defines *contrast* an opposition between the lines which form the objects; by means whereof they tend to set off one another.

A *contrast*, well managed, is one of the greatest beauties of a painting. The *contrast* is not only to be observed in the position of several figures, but also in that of the several members of the same figure: thus, if the right arm advance the farthest, the right leg is to be hindmost: if the right eye be directed one way, the right arm is to go the contrary way, &c. The *contrast* must be pursued, even into the drapery.

To CONTRAST, in *Architecture*, is to avoid the repetition of the same thing, in order to please by variety: as is done in the great gallery of the Louvre, where the pediments are, alternately, arched and angular.

CONTRAST-*wheel*, in *Clock-work*. See WHEEL, CLOCK, and WATCH.

CONTRAVALLATION, *line of*, in *Fortification*, is a trench, guarded with a parapet; made by the besiegers, betwixt them and the place besieged, to secure themselves on that side, and stop the sallies of the garrison.

It is without musket-shot of the town, and sometimes goes quite round it, sometimes not, according as the general finds occasion. The army, forming a siege, lies between the line of CIRCUMVALLATION and *contravallation*. It is now seldom used.

CONTRAVENTION, a man's failure of performing or discharging his word, obligation or duty, of the laws and customs of the place. The penalties imposed in cases of *contravention*, only pass for comminatory.

In a more limited sense, *contravention* implies the non-execution of an ordinance, or edict.

Contravention is supposed to be a degree below PREVARICATION; and to be only the effect of negligence or ignorance.

CONTRAYERVA, *Dorstenia*, in *Botany*, a genus of the *tetrandria monogynia* class. Its characters are these: it hath one common involucrum, situated vertically, upon which sit so many small flowers, which have no petals, but four short stamina; in the center is situated a roundish germen, which afterward becomes a single seed inclosed in the common fleshy receptacle. There are three species, which are natives of Spanish America.

These plants are at present very rare in Europe; nor was it known what the plant was whose roots were imported, and had long been used in medicine in England, until the late Dr. Houston informed us: for although F. Plumier had discovered one species of this plant, and had given the name of *Dorstenia* to the genus, yet he seems not to have known that the *contrayerva* was the root of that plant. Miller's Gard. Dict.

The *contrayerva* root was first brought into Europe by sir

Francis Drake, about the year 1581, and from him called *Draxena*. It is eſteemed a very great alexiterial and a ſovereign antidote againſt poiſon.

Its juice is a violent poiſon, ſaid to be uſed by the Peruvians to poiſon their arrows. *Contrayerva* ſignifies *counter-poiſon*, becauſe the root of it is ſaid to be an antidote againſt the poiſon of its juice.

The root is ſmaller than that of the iris, reddiſh without, and white within, knotty and fibrous. To be good, it muſt be new, heavy, and of a duſky red colour. In ſmell it reſembles fig-leaves; its taſte is aromatic, accompanied with ſomewhat of acrimony. It is diaphoretic and antiſeptic, and is uſed in low nervous fevers, and in thoſe of the malignant kind.

There is an officinal compoſition, which takes its name from this root, prepared with it, mixed with the teſtaceous powders, called *lapis contrayerva*. The London college directs it to be made of the compound powder of crab's claws one pound and a half, and of *contrayerva* root five ounces, mixed and powdered. Both the root and lapis are of great efficacy in the ſmall-pox, meaſles, fevers, and in all caſes where either a diaphoreſis or perſpiration is required; its ſucceſs being much more to be depended on than the Gaſcoign powder; which, among the more knowing, is now very much deſpiſed.

It is agreed on by the generality of writers, that the *contrayerva* root is one of the beſt anti-epidemics yet known. Dr. Hodges, in his treatiſe of the laſt London PLAGUE, has a recipe, which he ſays was attended with great ſucceſs, and of which this root was one of the chief ingredients.

There is another kind of *contrayerva* brought from Virginia, more ordinarily called SERPENTARIA; this is very aromatic; it is but ſeldom preſcribed ſingly, though ſaid to have the ſame ſucceſs againſt poiſons and venoms with the *contrayerva* of Peru. Thus is an excellent ſubſtitute for the *contrayerva*. See Lewis's Mat. Med. and Neuman's Chem. Works.

CONTRE-BEND, in *Heraldry*. The bar is called a *contre-bend*, or *counter-bend*, becauſe it cuts the ſhield contrary, and oppoſite ways.

They alſo ſay, *contre-chevron*, *contre-pal*, &c. when there are two ordinaries of the ſame nature oppoſite to each other; ſo as colour be oppoſed to metal, and metal to colour. And the coat is ſaid to be *contre* or *counter-poled*, *counter-bended*, *counter-veſſed*, *counter-ampaled*, or *counter-barred*, when ſo divided.

Counter-quartered is when one of the quarters is quartered again: hence alſo *counter-flowered*, *counter-coloured*, &c.—Animals are ſaid to be *counter-paſſant*, when one paſſes on one ſide, and another on another. See COUNTER-COMPONED, COUNTER-CHANGED, COUNTER-CHEVRONED, ERMINE, COUNTER-QUARTERED, &c.

COUNTER-*Queue d'Hirondo*, in *Fortification*. See QUEUE, &c.

CONTRIBUTION, the payment of each perſon's quota, or the part he is to bear in ſome impoſition, or common expence.

Contributions are either *involuntary*, as thoſe of taxes and impoſts; or *voluntary*, as thoſe of expences for carrying on ſome undertaking for the intereſt of the community.

CONTRIBUTIONS, in a military ſenſe, are impoſitions paid by frontier countries to ſecure themſelves from being plundered, and ruined by the enemy's army.

The peaſants till their ground under the faith of *contributions*, as ſecurely as in time of profound peace.

CONTRIBUTIONE *facienda*, a writ which lies where ſeveral perſons are jointly bound to the ſame thing, and one or more of them refuſe to *contribute* their ſhare.

If tenants in common, or joint, hold a mill *pro indiviſo*, and equally ſhare the profits thereof; the mill falling to decay, and one or more of them refuſing to *contribute* to its reparation, the reſt ſhall have the writ *de contributione faciendo* to compel them. And if there be three coparceners of land that owe ſuit to the lord's court, and the eldeſt performs the whole; then may ſhe have this writ to compel the refuſers to a *contribution*.

CONTRITION, in *Theology*, expreſſes a real ſorrow, reſulting from the thought of having offended God; from the ſole conſideration of his goodneſs; without any regard to the puniſhment the ſin is entitled to.

Some of the Romiſh doctors avow, notwithſtanding the practice of their church, that *contrition* is valid, and carries with it every thing neceſſary to obtain pardon, without the ceremony, or, as they call it, the *ſacrament* of confeſſion and abſolution.

And in this they make the difference between *contrition* and ATTRITION to conſiſt. This doctrine was maintained by F. Seguenot upon St. Auguſtine; but it was cenſured by the faculty of Paris.

CONTROL. See COMPTROL.

CONTROLLER. See COMPTROLLER.

CONTROVER, in *Law*, he who of his own head deviſes or invents falſe, or feigned news.

CONTROVERSIAL *divinity*. See POLEMICAL *divinity*.

CONTUMACY, in *Law*, a refuſal to appear in court when legally ſummoned; a diſobedience to the rules and orders of a court having power to puniſh ſuch offence.

The word is uſed in civil, as well as in criminal matters, but more rarely in the firſt, wherein the words *default* and *contempt*, ordinarily ſupply its place: the refuſing of the charges of a contempt, judged at the hearing, is alſo the penalty of *contumacy*. In a criminal ſenſe, the *contumacious* is condemned, not becauſe the crime is proved on him, but becauſe he is abſent.

By the Roman laws, there was no proceſs in caſe of *contumacy*, during the firſt year of abſence: they only took an inventory of the goods of the fugitive, and, if he died in the year, he died *integri ſtatus*; but, after the year was expired, he was deemed culpable.

In England, *contumacy* is to be proſecuted to outlawry.—In France, all *contumacies* are annulled, if the accuſed make his appearance in five years: if he die in that time, his relations are allowed to purge his memory.

CONTUS, *κοντος*, in *Antiquity*, a long ſpear, chiefly uſed by the horſe.

CONTUSION, *bruiſe*, in *Medicine*, a ſolution of continuity, either in fleſh or bone, occaſioned by a fall, a blow, or a violent preſſure, whereby the fleſh is damaged, but without any external rupture, or any manifeſt loſs of ſubſtance; an effuſion of blood enſues, from ſeveral little broken veſſels, ſo as to diſcolour the ſkin, though it doth not make its way through the pores.

Or, *contuſions* may be defined a particular ſort of tumors, attended with a ſtagnation of the blood in the part affected, and generally with an inflammation, diſcolouration, and pain.

Contuſions are either *internal* or *external*. When from any external injury, there proceeds an internal diſorder, e. gr. an aſthma, ſpitting of blood, or the like, the *contuſion* is ſaid to be *internal*. If only external ſymptoms appear, as a tumor, blackneſs, &c. it is termed *external*.

When the ſmall veſſels and fibres have been broken by a *contuſion*, the fluids that are contained in them will be forced out, and hence will proceed obſtructions, corruptions, inflammation, and ulcers, or even a gangrene, in proportion to the violence of the cauſe, and the nature of the affected part. When a bony part is the ſubject of a *contuſion*, the ſame miſchiefs will enſue from the injury inflicted on the periofteum, as happen to the pericranium in wounds of the head; and when the medullary juice of the bones is affected, very violent diſorders are to be expected, though the bone is not fractured. When *contuſions* happen on the joints, they uſually bring on violent pains and inflammations, convulſions, gangrenes, ſphacelus, rigidity of the limbs, and caries; and the ſame miſchiefs will indeed ſometimes happen from *contuſions* of the muſcular parts. When the internal parts are *contuſed*, great miſchiefs uſually enſue; but theſe entirely depend upon the nature of the injured part: theſe are ſometimes inflammations, ruptures of the veſſels, varices, aneuriſms, hæmorrhages, ſtagnation of the fluids, corruptions, gangrene, and ſuppuration, and very often death is the neceſſary attendant on theſe ſymptoms. When the head receives a conſiderable contuſion, the ſenſes are taken away, the limbs become either convulſed, or rigid, and death preſently follows. In *contuſions* of the thorax, a difficulty of breathing follows, with ſpitting of blood, fainting fits, inflammation, and ulcers of the lungs and death. After *contuſions* of the abdomen we may expect vomitings of blood, inflammations, ſuppurations, or gangrenes of the viſcera, and at length death; but if any large internal veſſel is burſt by the blow, it is no wonder if the patient dies upon the ſpot, even though there be no mark of violence left upon the external parts. Laſtly, if the eye is *contuſed*, tumor and inflammation will ſucceed, and frequently loſs of ſight.

Theſe are the effects of violent *contuſions* on the different parts. In the cure of ſlight *contuſions*, the principal care is to divide the inſpiſſated fluids, and prevent the parts from ſuppurating, or being affected by the gangrene: this may be done by hot wine, ſpirit of wine, ſpirit of wine with camphor, or Hungary water; or by applying cold water, or vinegar mixed with ſalt, to the part; or by clapping a broad piece of money, or a plate of lead, upon the tumor, and faſtening it on with a very tight bandage; or linen rags dipped in freſh warm urine ſhould be applied to the part. Theſe different methods ſucceed very well in tumors of the foreheads of children from falls, or any other ſlight *contuſion* in perſons of a tender make. Larger *contuſions* are to be fomented with decoctions of the warm herbs, as ſcordium, ſaxin, ſouthern-wood, and ſuch like, either alone, or mixed with wine, or with ſalt

water; great benefit alſo ariſes from applying to the parts a ſponge dipped in a decoction of Venice ſoap made in freſh urine, or warm applications of lime-water, ſpirit of wine camphorated, vinegar with litharge, and vinegar, with carraway ſeeds boiled in it. But when the *contuſion* is ſo violent, that it is apparently impoſſible to divide the ſtagnating fluids, and return them into circulation, and the parts are tending towards a gangrene, they muſt be ſcarified without delay, and by this means the ſtagnating fluids will be let out, and all danger of ſuppuration and gangrene prevented. After ſcarification warm fomentations are to be uſed, and the tumor ſhould be well rubbed with warm cloths before it is fomented, which will keep the blood in its fluid ſtate; or, if it is already concreted, will divide it, and make it fit to return to the veſſels, or, at leaſt, to eſcape through the pores of the ſkin. Into all theſe fomentations it is very proper to put wine, or ſpirit of wine, or elſe ſome other ſpirituous liquor; but if theſe are not to be had, ſalt water is to be uſed, which, if you are not near the ſea, may be had by adding a handful of ſalt to a quart of water; attenuating decoctions muſt alſo be taken inwardly; and bleeding, eſpecially in plethoric habits, is extremely neceſſary.

It ſometimes happens, when the *contuſed* parts lie very deep, or when the ſurgeon does not uſe the proper means, or the patient refuſes to ſubmit to proper treatment, that the ſtagnating fluids will corrupt and ſuppurate. When a ſuppuration on theſe occaſions is once begun, it muſt be carried on and forwarded by emollient cataplaſms, made of mallow, marſhmallow, and white lily roots, linſeed, fenugreek ſeed, pellitory, mercury, and other herbs of that kind, with crumbs of bread, and the emollient oils of lilies, chamomile, &c. Theſe muſt be laid on the part as hot as they can be borne; and ſometimes it is neceſſary to add the warm herbs, ſuch as onions, &c. and the gums, as galbanum, ammoniacum, and the others of that kind. Sometimes, in ſmall *contuſions*, a plaſter of diachylon with the gums, without any other application, will anſwer the purpoſe.

When the whiteneſs and ſoftneſs of the tumor evidently ſhew that the matter is formed, and fit to be diſcharged, the part is to be laid open with a knife, and, after the diſcharge of the matter, muſt be healed in the common way. Large *contuſions* are frequently attended with violent inflammations and gangrenes: in this caſe numerous and deep inciſions muſt be made on the part, and the wounds dreſſed with Venice treacle, ſoftened with ſpirit of wine with camphor, applying at the ſame time externally the warm fomentations. And when the parts are from very large and deſperate *contuſions*, abſolutely ſphacelated, the limb muſt be taken off in time.

In caſe of inward *contuſion*, bleeding the patient is always neceſſary, and balſamics muſt be given internally: ſuch are ſpermaceti, powder of rhubarb, Iriſh ſtaſe, oleaginous and pectoral medicines, &c. Externals proper for *contuſions*, are liniments, or ointments of marſh-mallows, oil of ſweet almonds, ſpirit of wine, with camphor; proper fomentations, and ſtrengthning emplaſters, as that of oxycroceum, &c. according as the nature of the *contuſion*, and part *contuſed*, requires.

CONTUSIONS *of the cranium*. When the cranium is violently *contuſed*, it will be diſcovered by the tumor and ſoftneſs of the part, by the ſeparation of the integuments from the cranium, and by the collection of ſtagnating blood which appears to be confined under the ſkin. In this caſe you are to endeavour to divide the confined fluids, by attenuating medicines externally applied, or to diſcharge them by making an opening with a knife; or laſtly, to bring them to a ſuppuration. When the extravaſation of fluids is very conſiderable, it is beſt to diſcharge the greateſt part of them inſtantly by inciſions, and what remains will then eaſily be diſperſed, by applying fomentations, and medicated bags of the warm herbs, rue, wormwood, ſavin, ſcordium, &c. quilted into bags, and boiled in wine, or in water with a mixture of ſpirit of wine, or malt or moliaſſes ſpirit. But where it is found impracticable to divide and attenuate the ſtagnating fluids, the ſuppuration of them muſt be attempted; and if the *contuſion* hath been but ſmall, after the ſuppuration is formed, and the matter diſcharged, the wound will eaſily heal, by the application of a vulnerary balſam.

In violent *contuſions*, when there is no opening, but a very ſmall one, the wound muſt be enlarged with the knife, to prevent the neighbouring parts from being corroded; and by this means the wound will be eaſily cleanſed, and the cure performed by the method before laid down. When the pericranium is wounded, but not in ſo great a degree as to lay the cranium bare, the wound is to be dreſſed with warm balſamic medicines. But where the cranium is expoſed and laid bare, its external lamella being robbed of its nouriſhment, by the deſtruction of the veſſels by which it was conſtantly ſupplied, it will loſe its natural colour, and become yellow, livid, black, and, by degrees, ſeparate from the neighbouring parts, and exfoliate, which will greatly protract the cure of the wound. To haſten this exfoliation, the ſurgeon ought to bore ſeveral holes through the denudated part, as deep as the diploe, with an awl, or ſuch like inſtrument. This operation not only forwards the exfoliation of the part, but makes way alſo for the ſprouting up of new veſſels. The dreſſing, which ought to be repeated each time with great expedition, is to be applied in the following manner: when the wound is well cleaned, pledgits thoroughly ſaturated with the mild balſamics, with the addition of a ſmall quantity of honey of roſes, are to be laid upon the injured part of the cranium; over theſe a ſticking plaſter is to be applied; and over that the proper bolſter and bandage. Theſe applications ſhould be continued till the cranium appears ſound, and the wound in a condition to heal. Heiſter's Surg. p. 84.

CONTUSIONS *of the eye*. See EYE.

CONVALESCENCE, in *Medicine*, the inſenſible recovery of health; or that ſtate in which after the cure of a diſorder, the body, which has been reduced, has not yet regained its vigour, but begins to reſume its powers. Proper aliments conduce to the re-eſtabliſhment of the languid faculties; but as the tone of the bowels is weakened, the digeſtive faculty is not equal to its office, which is ſhewn by light ſweats over the whole body, and the ſmalleſt exceſs in this reſpect, is oftentimes the occaſion of dangerous relapſes. A perſon in this ſtate is like a taper relumined, which the leaſt degree of wind is inſufficient to extinguiſh. Encycl.

CONVALLARIA, in *Botany*. See LILY *of the valley*.

CONVENT, a MONASTERY of religious, of either ſex.

The word comes from the Latin *conventus*, *meeting*, of *convenire*, *to come together*.

CONVENTA *potta*. See PACTA.

CONVENTICLE, a diminutive of *convent*; denoting properly, a cabal, or ſecret aſſembly, of a part of the monks of a *convent*, to make a brigue or party in the election of an abbot.

From the ill uſe of theſe aſſemblies, the word is come into diſrepute; and now ſtands for any miſchievous, ſeditious, or irregular aſſembly. F. Doucine obſerves, the occidentals always eſteemed the fifth general COUNCIL an unlawful *conventicle*. The term *conventicle* is ſaid, by ſome, to have been firſt applied in England to the ſchools of Wickliff, and has been uſed ſince to ſignify the religious aſſemblies of all in this country who do not conform to the eſtabliſhed doctrines and worſhip of the church of England. *Conventicle*, however, in ſtrict propriety, denotes an unlawful aſſembly; and cannot, therefore, be juſtly applied to the legal aſſemblies of Proteſtant Diſſenters.

By 22 Car. II. cap. 1. it is enacted, that if any perſons of the age of ſixteen years, ſubjects of this kingdom, ſhall be preſent at any *conventicle*, where there are five or more aſſembled, they ſhall be fined 5*s.* for the firſt offence, and 10*s.* for the ſecond; and perſons preaching incur a penalty of 20*l.* Alſo ſuffering a meeting to be held in a houſe, &c. is liable to 20*l.* penalty. Juſtices of peace have power to enter ſuch houſes, and ſeize perſons aſſembled, &c. And if they neglect their duty they ſhall forfeit 100*l.* And if any conſtable, &c. know of ſuch meetings, and do not inform a juſtice of peace, or chief magiſtrate, &c. he ſhall forfeit 5*l.* But the 1ſt W. and M. cap. 18. ordains, that proteſtant diſſenters ſhall be exempted from penalties; though if they meet in a houſe with the doors locked, barred, or bolted, ſuch diſſenters ſhall have no benefit from 1 W. and M. Officers of the government, &c. preſent at any *conventicle*, at which there ſhall be ten perſons, if the royal family be not prayed for in expreſs words, ſhall forfeit 40*l.* and be diſabled. Stat. 10 Anne, cap. 2.

CONVENTION, in our Law-*Books*, is uſed when a parliament is called, which ſits and is diſſolved without any act paſſed, or judgment given. It is then ſaid not to be a *ſeſſion* of parliament, but a *convention*.

CONVENTION *of Rouen*, the ſame with SYNOD of Rouen.

CONVENTION, a treaty, CONTRACT, or agreement, between two or more parties.

Every *convention* between men, provided it be not contrary to honeſty, and good manners, produces a natural obligation, and makes the performance a point of conſcience. Every *convention* has either a name, and a cauſe or CONSIDERATION, or it has none: in the firſt caſe, it obliges civilly and naturally; in the latter only naturally.

CONVENTION is much uſed both in ancient and modern pleadings for an agreement, or covenant.

In the book of rolls of the manor of Hatfield in Yorkſhire, we have a record of a pleaſant *convention*, anno 11 Edw. III. between Robert de Roderham and John de Ithen; the latter of whom ſold the devil in a firing for

three pence halfpenny to the former, to be delivered on the fourth day after the *convention*: when the purchaſer making his demand, the ſeller refuſed to give him livery; to the great loſs (as the record repreſents it), of forty ſhillings to the purchaſer, &c. But it appearing to the court, that ſuch a plea does not lie among Chriſtians, the parties were adjourned to hell for judgment.

CONVENTION is alſo the name given to an extraordinary aſſembly of parliament, or of the ſtates of the realm, held without the king's writ. Of this kind was the *convention* parliament which reſtored Charles II. This parliament met above a month before his return, and ſat full ſeven months after his reſtoration, and enacted ſeveral laws ſtill in force, which were confirmed by ſtat. 13 Car. II. c. 7. and c. 14.

The *convention* of eſtates, in 1688, after the retreat of king James II. upon mature deliberation, came to a concluſion, that king James, by his practices here, and his flight hence, had abdicated the kingdom; and that the throne was vacant; and therefore devolved to king William and queen Mary. Upon this their aſſembly expired as a *convention*, and was converted into a parliament. It was declared by ſtat. 1 W. and M. c. 1. that this *convention* formed the two houſes of parliament, notwithſtanding the want of writs and other defects of form. See ABDICATION.

There was a *convention* of the like kind in Scotland, and with the like effect.

CONVENTIONAL *ſubrogation*. See SUBROGATION.

CONVENTIONE *facienda*, in *Law*, is a writ which lies for the breach of any covenant in writing. Fitzherbert calls it a writ of *covenant*.

CONVENTUAL, ſomething belonging to a CONVENT. See CORNOBITE.

CONVENTUAL is particularly uſed, ſince the year 1250, for a religious that actually reſides in a convent: in contradiſtinction to thoſe who are only gueſts, or are entertained there, or are in poſſeſſion of benefices depending on the houſe.

CONVENTUAL likewiſe denotes a claſs of the order of Franciſcans, who adopted the relaxation introduced into that order by pope Innocent IV. which allowed of property and poſſeſſions in their community. They were ſo called in oppoſition to the *Brethren of the Obſervance*. This diviſion took place in the year 1368.

CONVENTUAL *prior*, differs from a *clauſtral prior*, in that the former has the full right and authority of an abbot; the only difference between them being in the name: whereas the clauſtral prior is a dependent of the abbot, and derives all his authority from him.

The *conventual* prior is obliged to take prieſt's orders in a year, or at moſt in two years, from the day of his admiſſion: in default whereof, the benefice becomes vacant. Some priories are actually *conventual*, i. e. they are ſtocked with religious; others are only *conventual in habitu*, v. g. where there have been no religious during the ſpace of forty years: the continuance of one ſingle religious, keeps the priory *conventual actu*; for, in default of one, the priory becomes ſimple. See PRIOR. By a declaration of the king of France, in 1680, it is decided, that a *conventuality* never degenerates, or ceaſes, while there are regular places ſubſiſting in it for twelve religious, with revenues for their ſupport.

CONVENTUAL *auditors*. See AUDITOR.

CONVERGING *ſeries*. See CURVE.

CONVERGING, or CONVERGENT *lines*, in *Geometry*, are thoſe which continually approximate, or whoſe diſtance becomes continually leſs and leſs: in oppoſition to *divergent* lines, whoſe diſtance becomes continually greater.

Lines that *converge* one way, diverge the other.

CONVERGING *rays*, in *Dioptrics*, are thoſe rays which in their paſſage out of one MEDIUM into another, of a different denſity, are refracted towards one another; ſo that, if far enough continued, they will meet in a point, or focus.

All convex lenſes make the rays *converge*, and concave ones diverge, i. e. the one inflects them towards a centre, and the other deflects them from it; and the more, as ſuch lenſes are portions of ſmaller ſpheres. On which properties all the effects of lenſes, microſcopes, teleſcopes, &c. depend.

Rays coming *converging* out of a denſer medium into a rarer, become more *convergent*, and concur ſooner, than if they were to continue their motion through the firſt. Rays coming *converging* out of a rarer into a denſer medium, *converge* leſs, and concur later, than if they had continued their motion through the firſt medium.

Parallel rays, paſſing from a denſer into a rarer medium, v. gr. from glaſs into air, the ſurface of the glaſs being towards the air, will become *convergent*, and concur in a focus.

Diverging rays, or rays coming from a point, under the ſame circumſtances, become *converging*, and meet in a focus; and as the radiant point comes nearer, the focus recedes farther off: if the radiant be near, the focus will be infinitely diſtant; i. e. the rays will be PARALLEL: and if the point be brought nearer ſtill, the rays will diverge.

CONVERGING *ſeries*, in *Mathematics*. See SERIES.

CONVERSATION, DISCOURSE; theſe two words denote an interlocution between two, or among more perſons: with this diſtinction, that *converſation* is uſed for any general intercourſe of ſentiments whatever; whereas a *diſcourſe* means a *converſation* limited to ſome particular ſubject. Thus we ſay a *converſable* man; meaning a man able to *converſe* on a variety of ſubjects, or a man of general knowledge: but we do not ſay a *diſcourſable* man. The word *diſcourſe* is generally uſed when we mention a ſuperior talking to an inferior.

CONVERSE, in *Geometry*, &c. A propoſition is ſaid to be the *converſe* of another, when, after drawing a concluſion from ſomething firſt ſuppoſed, we proceed to ſuppoſe what had been before concluded, and to draw from it what had been ſuppoſed. Thus it is demonſtrated in geometry, that if the two ſides of a triangle be equal, the two angles oppoſite to thoſe ſides are equal alſo: the *converſe* of the propoſition is, that if the two angles of a triangle be equal, the two ſides oppoſite to thoſe angles are equal alſo.

CONVERSE *direction*, in *Aſtrology*, is uſed in oppoſition to *direct* direction, i. e. by the latter, the promoter is carried to the ſignificator, according to the order of the ſigns: by the former it is carried from eaſt to weſt, contrary to the order of the ſigns.

CONVERSION, in a *Moral Senſe*, a return from evil to good; reſulting from a ſenſe, either of the natural deformity of the one, and amiableneſs of the other: or of the advantages and diſadvantages that ſpring from the one and the other, reſpectively.

Or, it is a change of the heart, with regard to the morals, paſſions, deſires, and purſuits; and of the mind, with regard to the ſentiments, &c. See REGENERATION.

CONVERSION, in *Law*, is where a perſon having the goods of another in his poſſeſſion, converts them to his own uſe, without conſent of the owner; for which the proprietor may maintain an action of TROVER and *converſion* againſt him.

CONVERSION, *Converſio*, in *Logic*, a circumſtance or affection of propoſitions, wherein the order of the terms, or extremes, is changed; ſo that the ſubject comes into the place of the predicate, and the predicate into that of the ſubject; without any alteration in the quality of either.

As, *No virtue is vice*; *No vice is virtue*: in which we ſee the ſubject of the former, made the predicate of the latter, and the predicate the ſubject: yet both true.

Converſion is uſually defined a due change of the order of the extremes, i. e. under ſuch a habitude and coherence with reſpect to each other, that the one is rightly inferred from the other.

Hence, in every legitimate *converſion*, two things are required: 1. A communication, or reciprocation of terms; not in reſpect of words, but of order. 2. The inſerence of one propoſition from the other.

Ariſtotle makes two kinds of *converſion*; the one *ſimple*, by others called *univerſal*; wherein nothing is changed beſide the order of extremes, i. e. the terms are tranſpoſed, without altering either the quality or quantity thereof: as, *No mind is body*; *No body is mind*.

The ſecond, *per accidens*, called alſo *particular*; wherein, beſides changing the places of the terms, there is a change of an univerſal ſign into a particular one; as, *Every good man ſtudies the welfare of his country*; *Some man that ſtudies the welfare of his country is good*.

To theſe, ſome of Ariſtotle's followers add a third kind of *converſion*, called *by contrapoſition*: as, *Every man is an animal*; *Every no-animal is no-man*.

CONVERSION, in *Rhetoric*, &c. is underſtood of arguments which are returned, retorted, and ſhewn on oppoſite ſides, by changing the ſubject into the attribute, and the attribute into the ſubject.

There are *converſions* of arguments, from one figure to another, and alſo from general propoſitions to particular ones. Thus Cicero againſt Antony: *Dubitis tres exercitus P. R. interfectos? Interfecit Antonius. Deſideratis clariſſimos cives? Eoſque vobis eripuit Antonius. Auctoritas horum ordinis afflicta eſt? Afflixit Antonius.*

CONVERSION, in *War*, is when the ſoldiers are ordered to preſent their arms to the enemy who attack them in flank, whereas before they were ſuppoſed to be in front: the evolution neceſſary thereto is called *converſion*, or QUARTER WHEELING.

CONVERSION *of equations*, in *Algebra*, is when the quantity ſought, or any part thereof, being in fractions, the whole

whole is reduced to one common denominator; and then, omitting the denominators, the equation is continued in the numerators only.

Thus, suppose $a-b=\frac{ad+cc}{d}+b+b$; multiply all by d, and it will ſtand thus, $ad-db=ad+cc+db+db$.

In ariſtmetic, we uſe the term *proportion by converſion of ratio*, for a compariſon of the antecedent and conſequent, in two equal ratios.

Thus, as there is the ſame ratio between two and three, as between eight and twelve; it is concluded there is the ſame ratio between two and one, as between eight and four.

CONVERSION, *centre of*, in *Mechanics*. See CENTER.

CONVERSOS. See CONVERT.

CONVERT, a perſon who has undergone a CONVERSION.

CONVERT is chiefly uſed in reſpect of changes from one religion, or religious ſect, to another.

Converts with relation to the religion turned to, are denominated *proſelytes* with regard to that they have relinquiſhed.

The Jews, formerly converted to Chriſtianity in England, were called *converſi*. Henry III. built them a houſe in London, and allowed them a competent ſubſiſtence for their lives: which houſe was called *domus converſorum*. But the number afterwards increaſing, they grew a burthen to the crown; upon which they were diſtributed among the monaſteries: and after the expulſion of the Jews under Edward III. the *domus converſorum* was given for keeping the rolls.

CONVERTS, in a *Monaſtic Senſe*, are lay friars, or brothers, admitted for the ſervice of the houſe; without orders, and not allowed to ſing in the choir.

Till the eleventh century, the word was uſed for perſons who embraced the monaſtic life at the age of diſcretion; by which they were diſtinguiſhed from thoſe devoted in their childhood by their parents, called *oblati*.

But in the eleventh century, when they began to receive into monaſteries infirm perſons, incapable of being clerics, and only deſtined for bodily labours, the ſignification of the word was neceſſarily changed. F. Mabillon obſerves, that it was John firſt abbot of Vallombroſa, who firſt introduced theſe *brothers-converts*, diſtinguiſhed by their ſtate from the monks of the choir, who were then either clerks, or capable of becoming ſo.

CONVERTIBILITY, *of ſpirits* into one another. See SPIRITS.

CONVERTIBILITY *of elements* into one another. See ELEMENT.

CONVEX, bending down on every ſide, as the outſide of a globular body.

CONVEX *ſpecies, lens, mirror, ſuperficies*. See the ſubſtantives.

CONVEXITY, the exterior ſurface of a *convex*, i. e. gibbous and globular thing; in oppoſition to *concavity*, or the inner ſurface, when hollow or depreſſed.

The word is of particular import in catoptrics, and dioptrics; where it is applied to mirrors and *lenſes*.

A *convex* MIRROR repreſents its images ſmaller than the objects; as a concave one repreſents them larger: a *convex* mirror reflects the rays from it, diverging; and therefore diſperſes and weakens their effect: as a concave one reflects them converging, ſo as they concur in a point, and have their effect increaſed; and by how much the mirror is a portion of a ſmaller ſphere, by ſo much does it diminiſh the objects, and diſperſe the rays, the more.

A *convex* LENS is either *convex* on both ſides, called a *convexo-convex*; or it is plain on one ſide, and *convex* on the other, called a *plano-convex*: or concave on one ſide, and *convex* on the other, called a *convexo-concave*, or *concavo-convex*, as one or the other ſurface prevails; i. e. as this or that is a portion of a ſmaller ſphere. See REFRACTION.

CONVEYANCE, in *Law*, a DEED, or inſtrument, by which lands, &c. are *conveyed*, or tranſferred by the proprietor, or owner thereof, to ſome other perſon.

A *conveyance* cannot be fraudulent in part, and good as to the reſt; for if it be fraudulent and void in part, it is void in all; and it cannot be divided. 1 Lill. Abr. 321. Fraudulent *conveyances* to deceive creditors, defraud purchaſers, &c. are void, by ſtat. 50 Edw. III. c. 6. 13 Eliz. c. 5. 27 Eliz. c. 4.

Conveyances are ſuch either at common law, or by virtue of the ſtatute of uſes. Of the former ſort ſome are original or primary, which are thoſe by means whereof the benefit of eſtate is created or firſt ariſes: others are ſecondary or DERIVATIVE. Original *conveyances* are thoſe by *feoffment, grant, leaſe, exchange*, and *partition*.

CONVICT, in *Common Law*, one who is found guilty of an offence by the verdict of a jury.

According to Crompton, a perſon is alſo a *convict*, or ſaid to be *convicted*, when, after having been outlawed, he appears and confeſſes it. *Conviction* and ATTAINDER are frequently confounded.

Perſons *convicted* of felony by verdict, &c. are not to be admitted to bail, unleſs there be ſome ſpecial motive for granting it; as where a man is not the ſame perſon, &c. for bail ought to be before trial, when it ſtands indifferent whether the party be guilty or not. 2 Hawk. 99: 114. *Conviction* of felony, and other crimes, diſables a man to be a juror, witneſs, &c.

CONVICT *recuſant*, he who has been legally preſented, indicted, and *convicted*, for refuſing to come to church to hear the common-prayer, according to the ſtatute 35 Eliz. and 3 Jac. I.

This is commonly underſtood to be a popiſh recuſant; though any others who refuſe coming to church on the ſame account are as properly denominated RECUSANTS.

CONVICTION, in *Theology*, expreſſes the firſt degree of repentance; wherein the ſinner becomes ſenſible of his guilt, of the evil nature of ſin, and of the danger of his own ways.

CONVICTION, in *Law*. See CONVICT.

CONVICTION, *ſummary*, is ſuch as is directed by ſeveral acts of parliament for inflicting certain penalties created by thoſe acts without the intervention of a jury: the party accuſed being acquitted or condemned by the ſuffrage of ſuch perſon only, as the ſtatute has appointed to be his judge. Of this kind are all trials of offences contrary to the laws of exciſe, and other branches of the revenue, proceedings before juſtices of the peace, and the method uſed by ſuperior courts of juſtice for puniſhing contempt by ATTACHMENT.

CONVIVIUM, *banquet*, in our *Ancient Cuſtoms*, and *Law Books*, ſignifies the ſame thing among the laity as PROCURATION among the clergy; viz. when the tenant was obliged, in virtue of his tenure, to provide meat and drink for his lord once, or oftener, in the year.

CONULUS, in *Natural Hiſtory*, the name of a genus of the *echinodermata*, of the general claſs of the *ſibulæ*. Theſe are raiſed from a circular baſe into a taller and more pointed, or a ſhorter and more obtuſe cone. The *echinites* of this genus have been called by authors, *ſcheppentiæ, pilæ*, and by ſome *baſonites*; and are generally known in Engliſh by the name of cup-ſtones. Of theſe there are four ſpecies: 1. The *albo-galerus*, or white-hat ſtone, found foſſile in our chalk-pits. 2. The *globulus*. 3. The *nanus*, the ſeries of the lines of which are ſinuous, and make the ſuperficies ſomewhat gibboſe. 4. The *bulla*, the orders of lines in which are ſtraight, and reſemble a button. Klein's Echinod.

CONVOCATION, a general aſſembly of the clergy of a province, ſummoned by the king's writ to conſult of the more weighty affairs of the church, as alſo as a parliament is convoked to conſult of thoſe of the ſtate.

The king's writ is directed to the archbiſhop of each province, requiring him to ſummon all biſhops, deans, archdeacons, cathedral and collegiate churches, &c.

Upon which the archbiſhop directs his mandate to his dean provincial, firſt citing him peremptorily; then willing him in like manner, to cite all the biſhops, deans, &c. and all the clergy of his province; but directing, withal, that one proctor ſent from each cathedral and collegiate church, and two for the body of the inferior clergy of each dioceſe, may ſuffice: which the dean accordingly does.

The place where the convocation of the province of Canterbury has been uſually held, is St. Paul's church; whence, of late, they have been prorogued to St. Peter's in Weſtminſter, in the chapel of Henry VII. or the Jeruſalem Chamber, where there is an upper and lower houſe. Chamberlayne.

The *upper* houſe, in the province of Canterbury, conſiſts of twenty-two biſhops, whereof the archbiſhop is always preſident. All, at the opening of a *convocation*, are in their ſcarlet robes and hoods.

The *lower* houſe conſiſts of twenty-two deans, twenty-four prebendaries, fifty-four archdeacons, and forty-four clerks, repreſenting the dioceſan clergy.

Each houſe hath a prolocutor choſen from among themſelves; and that of the lower houſe is preſented to the biſhops. Things are firſt uſually propoſed in the upper houſe; then communicated to the lower. All the members of both houſes have the ſame privileges for themſelves, and menial ſervants, as the members of parliament have.

The *convocation* exerciſes juriſdiction in making canons with the king's aſſent; and appeal lies from their proceedings to the king in chancery, or to his delegates.

The archbiſhop of York, at the ſame time, holds a *convocation* of the clergy of his province, after the like manner, at York; and, by conſtant correſpondence, debates and concludes on the ſame matters as are debated by that

of Canterbury. Not that the northern province is obliged to follow what the ſouthern one does.

The Engliſh clergy, anciently, had their repreſentatives in the lower houſe of parliament: as appears by the record much prized by lord Coke.

CONVOLVULUS, *bindweed*, in *Botany*; a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flower hath one large bell-ſhaped petal, which ſpreads open. It hath five ſhort ſtamina, and a roundiſh germen. The empalement afterward becomes a roundiſh capſule, with one, two, or three valves, containing ſeveral ſeeds, which are convex on their outſides, but on their inſides angular. Linnæus enumerates forty-ſeven and Miller thirty-two ſpecies, natives of various parts of the world.

To this genus belong ſcammony, mechoacan, jalap, and turbith.

As to the bindweeds properly ſo called, they are cathartic, and ſaid to be good in preventing abortion; a decoction of them is recommended as a mild evacuant of bile.

CONVOLVULUS, *ſcarlet*; *quamoclit*, or *ipomœa*; in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flower hath a ſmall permanent empalement, cut into five parts at the top. The petal is funnel-ſhaped, having a long cylindrical tube, whoſe brim is five pointed, ſpreading open flat. It hath five awl-ſhaped ſtamina. In the bottom of the tube is ſituated a round germen, which afterward becomes a roundiſh capſule with three cells, incloſing three oblong ſeeds. Linnæus reckons nineteen and Miller eight ſpecies.

CONVOLUTION, a winding or turning motion, proper to the trunks of ſome plants; as the *convolvulus*, or bindweeds, and the claſpers of vines, and briony.

Dr. Grew thinks, that all thoſe plants whoſe roots are twiſted, have ſuch a *convolution*: and he aſſigns two great efficient cauſes of this winding motion, the ſun and the moon. It is very eaſy to try whether there be any ſuch *convolution* or not in the trunks of plants; which may be done, as he hints, by tying a little bit of paper to any of the branches which are exactly north, ſouth, &c. and then ſeeing whether it will change its poſition, or not, in reſpect of the point of the compaſs.

CONVOY, from the French *convoyer*, *to conduct*; *eſcort*; a ſea term, ſignifying one or more veſſels of war, entruſted with the conducting of a fleet of merchants; ſerving as a watch, and a ſhelter from the inſults of the enemies of the ſtate, or of pirates. The fleet of merchantſhips bound on a voyage, to ſome particular part, is alſo called a convoy.

CONVOY is alſo uſed in ſpeaking of military affairs by land; where it ſignifies a body of forces ſent to guard a ſupply of proviſions, arms, or ammunition, going to a camp or the like.

CONUSANCE. See COGNISANCE.

CONUSOR. See COGNISOR.

CONVULSION, from *convello*, *to draw together*; *ſpaſmus*; in *Medicine*, a continued involuntary contraction of ſome parts of the body, otherwiſe accuſtomed to move according to the direction of the will.

It owes its origin to a contraction of the muſcles of the part, occaſioned by a too copious and violent influx of the nervous juice: of which there may be infinite cauſes in the blood, arteries, meninges, brain, nerves, muſcles, cranium, &c.

If the *convulſion* be univerſal, attended with violent motions, foaming at the mouth, and periodical; it is uſually called an EPILEPSY.

The uſual evacuations and medicines proper for the cure of *convulſions*, are phlebotomy, emetics, cathartics, epiſpaſtics, and proper cephalics: as *ſal volat. oleoſ.* ſpirit of lavender, ſpirit of hartſhorn, tincture of caſtor, cinnabar of antimony, caſſumunar root, valerian root, volatile ſalt of amber, &c. given in different forms. In periodical univerſal *convulſions*, a ſalivation ſometimes anſwers, after other courſes have failed. Women and children are particularly liable to *convulſions*: women after delivery; as upon a ſtoppage of the *lochia*, or a violent extraction of the *placenta*. See INFANTS, and SPASM.

CONVULSIVE, in *Medicine*, is applied to thoſe motions which, naturally, ſhould depend on the will; but which, by ſome external cauſe, become involuntary.

A *convulſive* motion is a contraction made by fits and intervals; wherein it differs from a *convulſion*, which is a continued contraction.

Convulſive motions ariſe from a diſorder in the origin of the nerves. A *convulſive* tenſion of the ſolids in one of the principal cauſes which deſtroy the equilibrium that ſhould obtain between the ſolids and the fluids.

CONVULSIVE is alſo uſed for any thing that occaſions a *convulſion*, or *convulſive motion*.

Wounds of nerves are ſaid to be *convulſive*; white hellebore is *convulſive*. Children are very liable to *convulſive* diſorders from various cauſes; as repletion, curdling of the blood in the ſtomach or inteſtines, worms, dentition, &c. The CRAMP is a *convulſive* contraction of ſome muſcular part of the body.

CONVULSIVE *aſthma*. See ASTHMA.

CONYZA, in *Botany*. See FLEABANE.

COOK, in *Ichthyology*, a ſpecies of fiſh which is ſometimes taken in great plenty on the coaſts of Cornwall. It is a ſcaly fiſh, and does not grow to any great ſize: the back is purple, the belly yellow, and the tail rounded.

COOK-ROOM, in a *ſhip*, is where the cook and his mate dreſs and deliver out the meat, &c. See *Tab. Shipping*, *fig.* 2. *n.* 22.

COOLER, among *Brewers*, *Diſtillers*, *&c.* a large veſſel, uſually of a ſmall depth and large ſurface, in which liquors are cooled, after having been boiled.

COOLERS, in *Medicine*, remedies ſo called; which may be conſidered under theſe two diviſions. 1. Thoſe which produce an immediate ſenſe of cold; which are ſuch as have their parts in leſs motion than thoſe of the organs of feeling. 2. Such as by a particular viſcidity, or groſſneſs of parts, give a greater conſiſtency to the animal fluids than they had before; whereby they are diſabled from moving ſo faſt, and will therefore have leſs of that inteſtine force on which their heat depends.

Of the former kind are fruits, and all acid liquors. To the latter belong cucumbers, and all ſubſtances producing viſcidity.

COOLNESS, in *Painting*, is a quality of colours relating only to their teint or hue: it is uſually applied to yellow and blue, and denotes a tendency to green, in either colour, by a ſlight admixture of the other. See WARMTH.

COOM, a term for ſoot that gathers over an oven's mouth: alſo for that black greaſy ſubſtance which works out of the wheels of carriages.

Coom, or ſoot, is ſometimes uſed in medicine, infuſed in wine with other ingredients, as an anti-hyſteric, and againſt palpitations of the heart, &c. The ſpirit of ſoot is alſo uſed for the ſame intentions, and in cephalic caſes.

COOMB, or COMB *of corn*. See COMB.

COOMINGS, in *Naval Architecture*. See COAMINGS.

COOP, in *Huſbandry*, a tenement or cart incloſed with boards, and uſed to carry dung, grains, &c.

COOP is alſo the name of a pen, or incloſed place, where lambs, poultry, &c. are ſhut up in order to be ſold.

COOPER, on board a *ſhip*, the perſon that looks to the caſks, and all other veſſels, for beer, water, or any other liquor. He has a mate under him.

CO-OPERATOR, derived from *con* and *opera*, *labour*, denotes any cauſe, natural or ſupernatural, which concurs with another to the production of an *effect*. Thus, nature and medicine *co-operate* in the cure of diſorders: and the will of man concurs with the grace of God in the performance of good works.

CO-OPERIRE *pallio*. See PALLIO.

CO-OPTATION, derived from *co-opto*, *I chooſe*; ſignifies the admiſſion of members into any college or ſociety. Thus it was anciently applied to the choice of the AUGURS and PONTIFFS; and in modern times, to an extraordinary nomination and election of perſons of diſtinguiſhed merit into a learned ſociety.

CO-ORDINATE, ſomething of equal ORDER, rank, or degree, with another.

CO-ORDINATION, in reſpect of cauſes, denotes an order of cauſes, wherein ſeveral of the ſame kind, order, and tendency, concur to the production of the ſame effect.

COOT, *fulica*, in *Ornithology*, the name of a diſtinct genus of birds of the order of the *grallæ*, the diſtinguiſhing character of which is, that the beak is convex, the thighs are half naked, the feet have four toes, the noſtrils oblong, and the forehead wholly naked.

The *fulica* is a water-fowl diſtinguiſhed from the moor-hen kind, by having its toes widened by a membrane, though not joined together by it, or webbed like the ducks. Of this Linnæus enumerates ſeven ſpecies; thoſe moſt known with us are, the common *coot*, and a larger kind called *macroule*, or *diable de mer*, the ſea-devil.

The common *coot* is a conſiderably large bird, weighing uſually a pound and a half; its beak is of a bluiſh white, and is a finger's breadth and half long, ſomewhat flatted and ſharp at the point; its legs are of a yellowiſh green, and above the knee there is a yellow ſpot; it has ſemicircular membranes at the joints of its toes: but what is its moſt obvious diſtinction is, that it has from the beak to the crown of the head a fleſhy excreſcence, which is roundiſh, ſoft, and ſmooth, and is always naked or deſtitute of feathers; and hence the bird is commonly called with us, the bald *coot*. It is all over black above, but of a deeper black about the head than in any other part, and its breaſt and belly are of a ſort of lead-colour; its wing-feathers have a brownneſs, mixed among the black, and ſome of them are tipped with white.

The other species, or *macraule*, called by Belloniue, the *fulica major*, is larger and of a finer black than this, and has a larger white excrescence on its head.

The common *coot* is so plentiful about Peterborough in Northamptonshire, that in the season of its laying, whole hampers full of its eggs are there brought to market, and sold at an inconsiderable price; the people boil them, and the shell is so thin, that they often eat them without taking it off. Ray.

COPAIBA, COPAIFERA, in *Botany*, the balsam of capivi-tree, a genus of the *decandria monogynia* class. Its characters are these: it hath a flower consisting of five leaves, which expands in form of a rose, and has five short stamina. The germen is fixed in the centre of the flower, which afterward becomes a pod containing one or two seeds, which are surrounded with a pulp of a yellow colour. We know but one sort of this tree; which grows near a village called Axapel, in the province of Antiochi, in the Spanish West Indies, about ten days journey from Carthagena. There are great numbers of these trees in the woods about this village, which grow to the height of fifty or sixty feet. Some of these trees do not yield any of the balsam; those which do, are distinguished by a ridge which runs along their trunks. These trees are wounded in their centre, and they place calabash shells, or some other vessels to the wounded part to receive the balsam, which will all flow out in a short time. One of these trees will yield five or six gallons of balsam; but though they will thrive well after being tapped, yet they never afford any more balsam. Miller.

COPAL, in *Natural History*, a shining transparent, citron-coloured substance, of an agreeable smell, resembling that of frankincense. It is brought from New Spain, where it oozes out from incisions made in the bark of a large tree; much after the manner in which the vine yields its sap, when cut in the spring.

Copal is accounted a cephalic, and good for the palsy, and other weaknesses of the nerves; but is not much used. What we in England call *gum copal*, is called *gum anime* in foreign parts: and on the contrary, what is there called *gum anime*, we call *copal*.

The Indians use it to burn on their altars: among the Europeans, it is used against disorders of the breast, having a warming, resolving, and humectating power. It is very rare; when good, it is of a fine transparent yellow; and melts easily, either in the mouth, or on the fire.

In defect of this is brought another kind from the Antilles, which is almost the only one known among the druggists; and its chief consumption is in the making of varnish. By digestion in linseed oil, with a heat very little less than sufficient to boil or decompose the oil, it may be dissolved; and this solution, diluted with spirit of turpentine, forms a beautiful transparent VARNISH, which, when well applied, and slowly dried, becomes very hard and durable. This varnish is used for snuff-boxes, tea-boards, and other utensils. It preserves and gives lustre to paintings, and restores the decayed colours of old pictures, by filling up the cracks and rendering the surfaces capable of reflecting light, more uniformly. It is improperly called *gum copal*, being a hard concrete juice of an American tree, which has neither the solubility in water common to GUMS, nor the solubility in spirit of wine common to RESINS, at least in any considerable degree; by its properties it resembles AMBER.

COPARCENARY, the share, or quota of a COPARCENER.

COPARCENERS, from *con*, and *particeps*, *partner*; or PARCENERS; such as have equal portions in the inheritance of their ancestor.

Coparceners are so either by *law*, or *custom*. *Coparceners by law*, are the issue female; which, in default of a male heir, come equally to the lands of their ancestor.

Coparceners by custom, are those who, by some peculiar custom of the country, challenge equal parts in such lands; as in Kent, by the custom of gavelkind. The crown of England is not subject to *coparcenary*.

COPE, an ecclesiastical ornament, usually worn by chantors and sub-chantors, when they officiate in the church-solemnity. It is also worn by the Romish bishops, and other ordinaries: it reaches from the shoulders to the feet. The ancients called it *pluviale*.

COPE, *St. Martin's*, was a relic formerly in great esteem among the French kings, and was often carried with them to war as their standard.

COPE, among *Miners*, is a duty of six pence for every load of ore, nine dishes making one load.

COPEC, a Muscovite coin. See COIN.

COPERNICAN *sphere*. See SPHERE.

COPERNICAN *system*, is that system of the world, wherein the sun is supposed at rest in the centre; and the planets with the earth, to move in ellipses round him.

The heavens and stars are here supposed at rest, and that diurnal motion which they appear to have from east to west, is imputed to the earth's motion from west to east.

This system was asserted by many of the ancients; and particularly Ecphantus, Seleucus, Aristarchus, Philolaus, Cleanthes Samius, Nicetas, Heraclides Ponticus, Plato, and Pythagoras; from the last of whom it was anciently denominated the *Pythagoric system*.

It was also held by Archimedes, in his book De Granorum Arenæ Numero; but after him it became neglected, and even forgotten, for many ages; till about three hundred years ago, when Copernicus revived it; from whom it took the new name of the *Copernican system*.

Nic. Copernicus, now a name so popular, was born at Thorn, in Polish Prussia, in the year 1472, according to Junctinus, or 1473, according to Mostlinus. After the usual domestic education, he was sent to the university of Cracow; where he applied himself to philosophy and physic, and at length commenced doctor in medicine. In the mean time, having a strong propensity to mathematics, he diligently attended the lectures of Albert Brudzewius, and even learnt of him at home. After he had here attained to the use of the astrolabe, and was entering upon astronomy, he took Regiomontanus for his guide: though he ran through all the mathematics of the age, yet he esteemed most taken with perspective; on occasion whereof he learned painting, in which he is said to have excelled. When twenty-three years of age, being at Bologna, he became acquainted with that eminent mathematician Dom. Maria Ferrariensis; and was admitted to share with him in making astronomical observations. Here, in the year 1497, Copernicus first observed an occultation of Palilicium by the moon. Going on to Rome, he taught publickly, and made some considerable observations; and at his return to Cracow, he was made canon of the church of Wermeland, or Ermeland, and at length vicar-general.

The course he took in prosecuting astronomy, which has rendered his name immortal, was as follows. Observing how the astronomers of those times were perplexed to make the planets move equably in circular orbits, viz. to suppose them to move, not about their own centre, but that of the equant; and that they could no way make out a tolerably regular system, out of all their hypotheses; he resolved to try what he could do. With this view he perused the writings of all the philosophers and astronomers extant; and selected out of each what appeared probable and elegant. In this review he was chiefly taken with two almost similar opinions (the one attributed to Martianus Capella, the other to Apollonius Pergæus): which give a very good account, of the motion of Venus and Mercury; and explain the cause of their directions, stations, and retrogradations, very happily: the latter answering the same purpose with respect to the three superior planets. But then, in both these hypotheses, the earth is supposed the centre: Copernicus chose rather to adopt the opinion of the Pythagoreans; to remove the earth out of the centre of the world; and to give it, not only a diurnal motion round its own axis, but also an annual one round the sun.

On this footing he began to observe, calculate, compare, &c. and at length, after a long solicitous disquisition, found himself in a condition to account for the phenomena and motions of all the planets; and to make an orderly arrangement, or disposition of the whole heavens; wherein nothing could be altered, or displaced, without bringing the utmost confusion into the whole.

These things he began to write down about the year 1507. He then proceeded to furnish himself with some new apparatus; particularly a parallactic instrument, and some Ptolemaic rulers, wherewith to observe the altitude of the stars, and determine the periods of the sun and moon: and without other means, composed his six books De Orbium Cœlestium Revolutionibus; containing the whole of astronomy, delivered after the example of Ptolemy, in a geometrical method. We have already observed, that he began it in 1507; he finished it in 1530. Five years after, he polished and improved it. He died of a dysentery, and a palsy in his right side, in the year 1543; having just lived to see a copy of his book, which was just printed, a few hours before his death. See the order and disposition of the heavenly bodies, as laid down by him, compared with those in the other systems, under the head SYSTEM.

This system has been established by new arguments, advanced by Kepler, Galileo, and Newton, in every succeeding age; and notwithstanding the opposition it met with, from the prejudice of sense against the earth's motion, the authority of Aristotle in the schools, the threats of ignorant bigots, and the terror of the inquisition, it has generally prevailed. Galileo after having

demon-

demonstrated the motion of the earth, was obliged, by the rancour of the Jesuits, to go to Rome, and there solemnly renounce it. Besides which cruel treatment, he was condemned to a year's imprisonment in the inquisition, and the penance of repeating daily some penitential psalms. As a specimen of the authority of the Romish church in opposition to this system, we shall only transcribe the declaration of the excellent commentators, Le Seur and Jacquier, on the Principia, prefixed to the third volume. *Newtonus in hoc tertio libro telluris motæ hypothesin assumit. Autoris propositiones aliter explicari non poterunt, nisi eadem quoque falsa hypothesi. Hinc alienum coactis sumus gerere personam. Cæterum latis a summis pontificibus contra telluris motum decretis nos obsequi profitemur.*

COPERNICUS, is the name of an astronomical instrument, contrived by Mr. Whiston, for the calculation and exhibition of eclipses, and of the motions of the planets, both the primary and secondary ones, &c.

It was so called by the inventor, as being constructed on the Copernican system; or as representing the heavenly bodies agreeable thereto. It consists of several concentrical circles of wood; upon which are inscribed numbers, transferred hither from the astronomical tables: by the various dispositions of these circles, which are made so as to slide within each other, questions are solved; and thus long calculations are saved, and the work of many hours brought into a few minutes.

For the exhibition of eclipses, there is a peculiar apparatus, consisting of a terrestrial globe, so disposed, as that, being turned round its axis, the light of the sun, or a candle, is projected through a glass plane, marked out into concentric circles, expressing digits of the eclipse: and thus is the path of the eclipse, with its degree or quantity in any part of its path, agreeably and accurately represented.

The instrument not being very common, a particular description would be superfluous. The author of it has written a book to explain it.

COPHOSIS, in *Medical Writers*, is used for deafness, whether beginning, or perfect, or from what cause soever.

The word is derived from κωφωσις, *I am deaf.*

COPHTI, Cophts, or Copti, a name given to the Christians of Egypt; who are of the sect of Jacobites.

The critics are extremely divided about the origin and orthography of the word: some write it *Gophti*, others *Cophtites*, *Cophtitæ*, *Copts*, &c. Scaliger derives the name from *Coptos*, an anciently celebrated town of Egypt, the metropolis of the Thebaid. Kircher refutes this opinion, and maintains, that the word originally signifies *east*, and *circumscribed*: and was given these people by the Mahometans, by way of reproach, because of their practice of circumcising: but P. Sollier, another Jesuit, refutes this opinion. Scaliger afterwards changed his opinion, and derived the word from Αιγυπτος, the ancient name of Egypt, by retrenching the first syllable: but this opinion, too, P. Sollier disputes. John de Leo and others say, that the Egyptians anciently called their country *Khibtah*, or *Gibti*, from Gibti their first king, whence *Cophtes*, &c. others fay from Gobim second king of Egypt. Vansleb derives the word *Cophte* from Copt, son of Misraim, grandson of Noah. All these etymologies P. Sollier rejects, on this principle, that were they true, the Egyptians ought all equally to be called *Cophti*; whereas, in effect, none but the Christians, and among those none but the Jacobites, bear the name; the Melchites not being comprehended under it. Hence he chooses to derive the word from the name *Jacobite*, by retrenching the first syllable; whence *Cobite*, *Cabea*, *Copto*, and *Cophta*.

The *Cophts* have a patriarch, who resides at Cairo, but he takes his title from Alexandria: he has no archbishop under him, but eleven or twelve bishops. The rest of the clergy, whether secular or regular, are composed of the orders of St. Antony, St. Paul, and St. Macarius, who have each their monasteries.

Besides the orders of priests, deacons, and subdeacons, the *Cophts* have likewise archimandrites, the dignity whereof they confer with all the prayers and ceremonies of a strict ordination. This makes a considerable difference among the priests; and besides the rank and authority it gives them with regard to the religious, it comprehends the degrees and functions of archpriests. By a custom of six hundred years standing, if a priest elected bishop be not already archimandrite, that dignity must be conferred on him before episcopal ordination.

The second person among the clergy, after the patriarch, is the titular patriarch of Jerusalem, who also resides at Cairo, because of the few *Cophts* at Jerusalem; he is, in effect, little more than the bishop of Cairo: only he goes to Jerusalem every Easter, and visits some other places in Palestine near Egypt, which own his jurisdiction.

To him belongs the government of the *Cophtic* church, during the vacancy of the patriarchal see.

To be elected patriarch, it is necessary the person have lived all his life in continence: it is he confers the bishoprics. To be elected bishop, the person must be in the celibate; or, if he have been married, it must not be above once.

The priests and inferior ministers are allowed to be married before ordination; but are not obliged to it, as Ludolphus erroneously observes. They have a great number of deacons, and even confer the dignity frequently on children. None but the lowest rank among the people commence ecclesiastics; whence arises that excessive ignorance found among them: yet the respect of the laity towards the clergy is very extraordinary. Their office is longer than the Roman office, and never changes in any thing; they have three liturgies, which they vary occasionally.

The monastic life is in great esteem among the *Cophts*: to be admitted into it, there is always required the consent of the bishop. The religious *Cophts* make a vow of perpetual chastity; renounce the world, and live with great austerity in deserts: they are obliged to sleep in their cloaths and their girdle, on a mat stretched on the ground: and to prostrate themselves every evening a hundred and fifty times, with their face and breast on the ground. They are all, both men and women, of the lowest class of the people; and live on alms. The nunneries are properly hospitals; and few enter but widows reduced to beggary.

F. Roderic reduces the errors and opinions of the *Cophts* to the following heads: 1. That they put away their wives, and espouse others while the first are living. 2. That they have seven sacraments; viz. baptism, the eucharist, confirmation, ordination, faith, fasting, and prayer. 3. That they deny the Holy Spirit to proceed from the Son. 4. That they only allow of three œcumenical councils; that of Nice, Constantinople, and Ephesus. 5. That they only allow of one nature, will, and operation, in Jesus Christ, after the union of the humanity with the divinity. For their errors in discipline, they may be reduced, 1. To the practice of circumcising their children before baptism, which has obtained among them from the twelfth century. 2. To their ordaining deacons at five years of age. 3. To their allowing of marriage in the second degree. 4. To their forbearing to eat blood; to which some add their belief of a baptism by fire, which they confer by applying a hot iron to their forehead or cheeks.

Others palliate these errors, and shew that many of them are rather abuses of particular persons, than doctrines of the sect. This seems to be the case with regard to their polygamy, eating of blood, marrying in the second degree, and the baptism of fire: as for circumcision, it is not practised as a ceremony of religion; nor as of any divine appointment, but merely as a custom which they derive from the Ishmaelites; and which, perhaps, may have had its origin from a view to health and decency in those hot countries.

The *Cophts*, at different times, have made several reunions with the Latins; but always in appearance only, and under some necessity of their affairs. In the time of pope Paul IV. a Syrian was dispatched to Rome from the patriarch of Alexandria, with letters to that pope; wherein he acknowledged his authority, and promised obedience; desiring a person might be dispatched to Alexandria, to treat about a re-union of his church to that of Rome: pursuant to which, Pius IV. successor to Paul, chose F. Roderic, a Jesuit, whom he dispatched in 1561, in quality of apostolical nuntio.

But the Jesuit, upon a conference with two *Cophts* deputed for that purpose by the patriarch, was made to know, that the titles of *father of fathers*, *pastor of pastors*, and *master of all churches*, which the patriarch had bestowed on the pope in his letters, were no more than mere matters of civility and compliment; and that it was in this manner the patriarch used to write to his friends: they added, that since the council of Chalcedon, and the establishment of several patriarchs independent of one another, each was chief and master of his own church. This was the answer the patriarch gave the pope, after he had received a sum of money remitted to him from Rome, by the hands of the Venetian consul.

COPHTIC, or Coptic, the language of the Cophts, the ancient language of the Egyptians, mixed with a great deal of Greek; the characters it is written in being all Greek. It has a form and constitution peculiar to itself: it has no inflections of the nouns or verbs; but expresses number, case, gender, *person*, mood, tense, and possessive pronouns, by letters and particles prefixed.

F. Kircher is the first who published a grammar, and vocabulary of the *Cophtic*. There is not known any book

extant in the *Coptic*, except translations of the Holy Scriptures, or of eccleſiaſtical offices; or others that have relation thereto, as dictionaries, &c.

The ancient *Coptic* is now no longer found but in books; the language now uſed throughout the country is Arabic.

The old *Coptic*, which Kircher maintains to be a mother-tongue, and independent of all others, had been much altered by the Greek: for beſides that it has borrowed all its characters from the Greek, with a very little variation, a great number of the words are pure Greek.

Voſſius, indeed, aſſerts, that there was no *Coptic* language till after Egypt became ſubject to the Arabs. The language, according to him, is a miſture of Greek and Arabic: the very name thereof not being in the world till after the Arabs were maſters of the country. But this, M. Simon obſerves, proves nothing; except that what was anciently called *Egyptian*, has ſince by the Arabs been called *Coptic*, by a corruption of ſpeech. There are, it is true, Arabic words in the *Coptic*; yet this by no means proves but that there was a language before that time, either *Coptic* or Egyptian. Pietro de la Valle obſerves, that the Copts have entirely loſt their ancient tongue; that it is now no longer underſtood among them; that they have nothing extant therein but ſome ſacred books; and that they ſtill ſay maſs in it.

All their other books have been tranſlated into Arabic, which is their vulgar tongue; and this has occaſioned the originals to be loſt: it is added, that they rehearſe the epiſtles and goſpels in the maſs, twice; once in Arabic, and once in *Coptic*.

Indeed, if we believe F. Vanſleb, the Copts ſay the maſs in Arabic, all but the epiſtles and goſpels, which they rehearſe both in that and *Coptic*.

COPHTIC *Bible*. See BIBLE.

COPHTIC *Liturgies* are three; one attributed to Baſil, another to St. Gregory, and the third to Cyril: they are tranſlated into Arabic for the uſe of the prieſts and people.

COPIA *libelli deferendi*, a writ which lies in caſe where a man cannot get the copy of a libel at the hands of the eccleſiaſtical judge.

COPIA, *Corn.* See CORNUCOPIA.

COPIATA, under the *Weſtern Empire*, a *grave-digger*. In the firſt ages of the church, there were clerks deſtined for this employment. In the year 357, Conſtantine made a law in favour of the prieſts *copiatæ*, i. e. of thoſe who had the care of interments; whereby he exempts them from the luſtral contribution which all other traders paid.

It was under him alſo that they firſt began to be called *copiatæ*, q. d. clerks deſtined for bodily labour, from κοπτω, *ſcindo, cædo, ferio, I cut, beat*, &c. Before that time they were called *decani* and *lecticarii*; perhaps, becauſe they were divided by decads or tens, each whereof had a bier or litter for the carriage of the dead bodies. Their place among the clerks was the next in order before the chantors.

COPING *of a wall*, the top or cover of a wall, made ſloping to carry off the water.

COPING *ſaw*, in *Carpentry*, a ſort of hanging over, not ſquare to its upright, but bevelling on its under ſide till it end in an edge.

COPIST, in DIPLOMATIC *Science*, ſignifies a tranſcriber or copier of deeds, books, &c.

COPOS, from κοπος, *labour*; in *Medical Writers*, is uſed for a wearineſs of the body, when the muſcles, or their fibres rather, are loaded and obſtructed with viſcous humours, ſo as to render them unfit for motion.

COPPA, in *Law*, a cop or cock of graſs, hay, or corn, divided into titheable portions; as the tenth cock, &c. This word in ſtrictneſs denotes the gathering or laying up the corn in copes or heaps, as the method is for barley or oats, &c. not bound up, that it may be the more fairly and juſtly tithed: and in Kent they ſtill retain the word, a *cop* or *cup* of hay, ſtraw, &c.

COPPEL, COPEL, or CUPPEL, a veſſel uſed by *Chemiſts*, *Refiners*, and *Aſſayers*, to try, and purify their metals. See *Fab. Chemical Furnaces, &c. fig.* 24.

The *coppel of aſſay*, is a little flat veſſel, made of vegetable aſhes, and bones of ſheep's feet, calcined and lixiviated, to ſeparate the ſalts, which would otherwiſe make it crack, and the inflammable principle, which might revivify the vitrified metals, and occaſion an ebullition. At the bottom of the veſſel is a little cavity filled with a kind of white varniſh, compoſed of harthorn, or pike bones, calcined and diluted in water: the uſe of this liquor is, that the gold or ſilver to be aſſayed may be more conveniently lodged, and that the button of the aſſay may be ſeparated the more eaſily.

The hollow of the *coppels*, which is to contain the metal, muſt be a ſpherical ſegment, and not very deep: firſt, that the ſurface of the melted maſs, be it ever ſo ſmall, be diſtinctly viſible to the artificer's eye; and, ſecondly, that the metal left in that cavity, may melt together into one globule. But the outſides of the *coppel* muſt be only a ſmall matter convergent towards the baſis, like a truncated cone, that it may ſtand firmly on its baſe: and that this figure may be regularly given to theſe veſſels, it is convenient to have copper or braſs moulds for the making them.

The *coppel* is uſually formed in a braſs ring from three quarters of an inch to two inches in diameter, and not quite ſo deep, placed on ſome ſmooth ſupport. When the ring is filled with the moiſtened powder, a round-faced peſtle, called the *mont*, is ſtruck down into it, with a few blows of a mallet, by which the maſs is made to cohere, and rendered ſufficiently compact, and a ſhallow cavity formed in the middle: this cavity is made the ſmoother, by ſprinkling a little of the ſame kind of aſhes, levigated into an impalpable powder, through a ſmall fine ſieve, and the monk is again ſtruck down upon it.

Though metals may be tried otherwiſe than by *coppelling*; and though the touchſtone, graver, &c. are of ſome ſervice to the goldſmith in judging of their purity; yet, without the *coppel*, it is difficult, not to ſay impoſſible, to know their preciſe degree of purity.

The *refiner's coppel*, is a large freeſtone veſſel, lined withinſide with a kind of plaiſter made of aſhes well lixiviated, cleanſed, dried, beaten, and ſifted.

In this kind of *coppel* it is that they purify their gold and ſilver, by adding lead to it, and expoſing the whole to a violent fire.

There is ſcarcely any other ſubſtance, which ſo ſtrongly reſiſts vehement fire, which ſo readily imbibes metallic ſcoriæ, and which is ſo little diſpoſed to be vitrified by them, as the aſhes of animal bones. The calcination of theſe bones is to be made in an open fire, for a few hours, according to their ſize; and ſuch ſhould be choſen as have leaſt fat about them. The calcination is known to be perfect, when there is not a black ſpot remaining, either on the outſide of the bone, or within it, when broken. When the bones are perfectly calcined, they muſt be reduced to a very fine powder, either by grinding on a porphyry, or ſifting through a fine ſieve, after beating. This powder muſt be alſo carefully waſhed in warm water; for during the calcination, the bones become almoſt always impregnated with the ſalt of the aſhes of the fewel.

This powder is called by ſome *clar*, and is an excellent ſubſtance for *coppels*. The bones of fiſhes, when ſmall, are yet more eaſily calcined than thoſe of other animals; this may be done with eaſe in an open earthen veſſel, and the powder of theſe is preferable even to the former. Parget, or plaiſter of Paris, made of various kinds of ſpar, though all kinds will not do for this purpoſe, is alſo excellent: but as there are ſome ſorts of ſpar which will not afford a proper plaiſter, it is proper to try in a ſmall quantity firſt. The calcination is to be made in an earthen veſſel, covered with a tile, in an open fire. The ſpar crackles a little with the heat; and when this noiſe is over, the calcination is perfect.

As the preparation of bone aſhes for this uſe, however, is tedious, and the proper ſort of ſpar is not always or every where to be had, the want of them may be ſupplied with the aſhes of vegetables, properly prepared. When a proper powder is obtained, it is moiſtened with juſt ſo much water as is ſufficient to make it hold together, when ſtrongly preſſed between the fingers. Some give a greater tenacity to the powder by mixing it with glutinous liquids, as whites of eggs, or gum water, or with ſtrong waſhed clay: but theſe ſhould be uſed very ſparingly, and with great caution. The calcined ſpar muſt be prepared with a ſolution of vitriol.

Coppels had better be too compact than too looſe in their texture, ſince the latter is always a miſchievous accident, whereas the former, by abſorbing the glaſs more ſlowly, is of no other hurt than the retarding the operation a little.

Coppels made of bone aſhes, or of calcined ſpar, are more valuable than thoſe of wood aſhes, as they require not ſo much caution and regularity in the management of the fire; but if wood aſhes enter the compoſition, the *coppel* muſt be made pretty hot before the metal is put into it, otherwiſe the aqueous vapours, forcing their way out, will cauſe the metal to be thrown out in drops; for *coppels* of this kind can never be perfectly dried by the air alone, there being always ſomething of an alkaline ſalt yet remaining in wood aſhes, which makes them attract the water out of the air, as the dark colour of theſe aſhes, and the ſolution of *ſal ammoniac* poured on them, alſo ſhew: for this reaſon, theſe aſhes are alſo more diſpoſed to vitrification than thoſe of bones, the latter approaching

fined to the providing of hogs, whence they were called *porcii*; and the other were charged with cattle, eſpecially oxen; whence they were called *pecuarii*, or *boarii*. Under each of theſe was a ſubordinate claſs, whoſe office was to kill, prepare, &c. called *lanii*, and ſometimes *carnifices*. Briſſonius, Modeſtus, and others, mention a pleaſant way of ſelling meat, uſed for ſome ages among this people: the buyer was to ſhut his eyes, and the ſeller to hold up ſome of his fingers; if the buyer gueſſed aright, how many it was the other held up, he was to fix the price; if he miſtook, the ſeller was to fix it. This cuſtom was abolished by Aponius, preſect of Rome; who in lieu thereof introduced the method of ſelling by weight.

Some derive the term *butcher* from *bucarius*, of *bucca*, *mouth*; others from *βοῦς*, *βοὸς*, *killer of cattle*.

The French call a place ſet apart either for the ſlaughter of cattle, or expoſing their fleſh to ſale, a *butchery*, *boucherie*. The Engliſh diſtinguiſh, calling the latter a *fleſh-ſhambles*, or *market*, the former a *ſlaughter-houſe*.—Nero built a noble edifice of this kind at Rome; on which occaſion was ſtruck that medal, whoſe reverſe is a building ſupported by columns, and entered by a perſon of four ſteps; the legend, MAC. AVG. S. C. *Macellum Auguſti Senatuſconſulto*.

In London, the furniſhing of the markets with *butchers* meat is cantoned into ſeveral offices. We have cattel-*butchers*, who kill the meat in great quantities, and ſell it out to another ſort called retail *butchers*; diſperſed in all out-parts, villages, and towns, near the city. There are, beſides, cow-jobbers, or *taleſmen*, who buy and ſell cattle, acting between the *butchers* and the breeders, or feeders. Something like this alſo obtains at Paris.

The company of *butchers* was not incorporated until the third year of king James I. when they were made a corporation by the name of maſter, wardens, and commonalty of the art and myſtery of *butchers*; yet the fraternity is ancient. Their arms are azure, two axes ſalter-wiſe argent, between three boars heads couped, attired or, a boars head gules, between two gathes vert.

There are ſome good laws made for the better regulation, and for preventing the abuſes committed by *butchers*. *Butchers*, ſelling ſwine's fleſh meaſled, or dead of the murrain, or that buy fleſh of Jews, and ſell the ſame to Chriſtians, for the firſt time ſhall be grievouſly amerced, the ſecond time ſuffer the pillory, the third time be impriſoned and fined, and the fourth time forfweat the town. 17 Edw. II. cap. 7. vide 51 Hen. III.

Stat. 4 Hen. VII. cap. 3. no *butcher* ſhall ſlay beaſts within the wall of London, upon pain to forfeit for every ox 12*d.* and for every cow and other beaſt, 8*d.* and this law ſhall be obſerved in every city and town walled in England, and in the town of Cambridge; except Berwick and Carliſle.

Stat. 15 Car. II. cap. 8. § 2. no perſon uſing the trade of a *butcher*, ſhall ſell or expoſe to ſale, any fat oxen, ſteers, runts, kine, heifers, calves, ſheep, or lambs alive, on pain to forfeit double the value of the cattle.

Stat. 5 Anne, cap. 4. § 2. no perſon uſing the trade of a *butcher* ſhall ſell, or offer to ſell, within London and Weſtminſter, or within ten miles thereof, to any perſon uſing the trade of a *butcher*, any fat cattle or ſheep, alive or dead, upon pain to forfeit the value.

Stat. 7 Anne, cap. 6. the clauſe 5 Anne, cap. 34. § 32. ſhall not extend to the ſelling of calves, ſheep, or lambs, dead, by one *butcher* to another.

No *butcher* ſhall kill any calf, to ſell, being under five weeks old; nor uſe the craft and myſtery of a tanner.

BUTCHER-*bird*, in *Ornithology*, the Engliſh name of the *lanius*, the ſmalleſt of all the European birds of prey, yet very fierce and deſtructive. Its beak is all the way ſtraight, except juſt at the end, where it is ſlightly hooked, the upper mandible furniſhed with a ſharp proceſs, and its tail faſhioned like that of the ſwallow, the outer feathers being the ſhorteſt, the reſt gradually longer, for which reaſon ſome have called it the *pica*. The ancients called it the *ſtrangus*, and in Engliſh we ſometimes alſo call it the *ſhrike*.

There are ſeveral ſpecies of the *lanius*: the principal are, 1. The common larger kind, called the MATTAGRESS. 2. The ſmaller, called the PLUMBER. And, 3. The *lanius minor*, or grey little *butcher-bird*. See *Tab. of Birds*, N° 5. The *lanius minor cinereus*, or little grey *butcher-bird*, is the name of a very ſmall ſpecies of the *lanius*, common in Italy and elſewhere, and is a very great deſtroyer of the wrens, and other ſmall birds. See WOOD *chat*.

BUTCHER'S-*broom*, *Ruſcus*, in *Botany*, a genus of the *dioecia ſyngeneſia* claſs. Its characters are theſe: it hath male and female flowers in diſtinct plants: the male have erect ſpreading empalements, compoſed of ſix oval convex leaves, whoſe borders are reflexed; they have no petals, but an oval *nectarium* of the ſize of the empalement, which is erect and inflated, opening at the mouth; they have no ſtamina, but each has three ſpreading ſummits ſitting on the top of the *nectarium*, which are joined at their baſe. The female flowers have empalements, but no petals, and *nectariums* like the male; they have no ſtamina, but have an oblong, oval germen, hid within the *nectarium*, ſupporting a cylindrical ſtyle, crowned by an obtuſe ſtigma, ſtanding above the mouth of the *nectarium*: the germen afterward becomes a globular berry, with two or three cells, incloſing two globular ſeeds. Miller enumerates eight, and Linnæus five ſpecies.

The root of *butcher's-broom*, *ruſcus oculeatus* of Linnæus, is one of the five aperient ones, and is ſeldom uſed by authors as a very powerful attenuant and reſolvent. It is good in all chronic caſes, and is frequently preſcribed in diet drinks intended to open obſtructions of the viſcera, or to promote urine. Riverius tells us of an hydropic perſon who was completely cured by uſing a decoction of *butcher's-broom* for his only drink, and taking two purges of ſena. Lewis.

BUTEO. See BUZZARD.

BUTHYSIA, *βυθυσία*, in *Antiquity*, a ſacrifice of the greateſt kind; ſuch were the hecatombs. See SACRIFICE and HECATOMB.

The Greeks frequently preſixed the particle *βυ*, *bu*, to words, to denote things of extraordinary magnitude, as alluding to the bigneſs of oxen.

BUTIGA, is an inflammation of the whole face, otherwiſe called *pottia roſacea*.

BUTLER, or BOTELER, an officer whoſe chief charge is over the cellar and diſhekables. See ARCH-*Butler*.

BUTLERS, *bottelarii*, among the Normans, denote wine-taſters, appointed to examine liquors, and ſee that they be right and legal.

BUTLER *of France*, *bottelarius Franciæ*, was one of the four great officers of the houſhold of the ancient kings of that country who ſigned all the royal patents, or at leaſt was preſent at the diſpatch of them. His ſeat was among the princes, and he even diſputed the precedency of the conſtable of France. He had a right of preſiding at the chamber of accounts; and in the regiſters of that office of the year 1307, mention is made that Jobude Bourbon, grand *butler* of France, was admitted there as firſt preſident. But the title is now aboliſhed, and, inſtead thereof, a new office of *grand echanſon*, or cup-bearer, erected.

BUTLER'S *ale*. See ALE.

BUTLER'S *ſpirit*, a medicinal preparation, of which the ancient chemiſts relate wonders. See Boyle's Works, Abr. vol. i. p. 50.

The inventor, from whom it takes its name, was a Scotchman, in great favour with king James I. and is ſaid to have done wonders with it, not only in the ſpeedy cure of the moſt dangerous diſtempers, but in the making of gold out of lead and quickſilver.

The preparation of this ſtone is given by Morley. Collect. Chym. Loyd. cap. 325.

BUTLERAGE and PRISAGE, theſe were originally the only cuſtom that was payable upon the importation of wines, and were taken and received by virtue of the regal prerogative, for the proper uſe of the crown: but for many years paſt, there having been granted by parliament ſubſidies or aids to the kings of England, and their duties not repealed, but confirmed, they have been pleaſed to grant the ſame away to ſome noblemen, who by virtue of ſuch grant or patent, are to enjoy the full benefit and advantage thereof, and may cauſe the ſame to be levied and collected in the ſame manner as the kings themſelves did, and were formerly wont to do. *Butlerage* is a duty of two ſhillings for every ton of wine imported by merchants ſtrangers; being a compoſition (in lieu of the priſage payable in kind by Engliſh only) in conſideration of the liberties and freedoms granted to them by king John, and king Edward I. by a charter called *Charta Mercatorum*. 31 Edw. I. cap. 1. & 2.—27 Edw. III. cap. 26.

BUTMENTS, in *Architecture*, thoſe ſupporters or props, on or againſt which the feet of arches reſt.

The word comes from the French *bouter*, to abut or *terminate* on any thing; or rather from *butter*, or *prop*.

The name *butment* is alſo given to little plates taken out of the yard, or the ground-plot of a houſe, for batteries, ſculleries, &c.

Buttments of arches are the ſame with butteſſes. They anſwer to what the Romans call *ſolidum*, the French, *corps* and *butées*.

BUTMENTS, or ABUTMENTS of a BRIDGE, denote the two maſſives at the end of a bridge, whereby the two extreme arches are ſuſtained and joined with the ſhore on either ſide.

The *butments* of bridges near the banks ſhould be built more firm and ſolid, as ſerving to ſuſtain the whole ſeries of arches, and hinder them from ſpreading.

BUTOMUS, the *flowering rush*, in *Botany*. See RUSH.

BUTORIUS, in *Zoology*, a name by which ſome have called the *ardea ſtellaris*, or BITTERN.

BUTRO, in *Natural Hiſtory*, the name of a wild bull. See BISON.

BUTT, in our *Ancient Customs*, denotes a place erected for archers to shoot at, and in which a mark or white was fixed.

BUTT is used for a veſſel, or meaſure of wine, containing two hogſheads, or 126 gallons.—Otherwiſe called PIPE.

A *butt* of currants is from fifteen to twenty-two hundred weight.

BUTT, or BUTT-*end*, in the *Sea Language*, denotes the end of any plank, which joins to another on the outſide of a ſhip, under water.

Hence, when a plank is looſe at one end, they call it *ſpringing a butt*; to prevent which, ſhips are uſually bolted at the *butt-heads*, that is, at the plank's end.

BUTTER, a fat, unctuous ſubſtance, prepared, or ſeparated from milk, by beating or churning it.

The word is formed from *βουτυρον*, a compound of *βους cow*, and *τυρος, cheeſe*; q. d. *cow's cheeſe*.—Some authors, out of regard to this etymon, affect to write the word *butter*, and *butyr*.

It was late ere the Greeks appear to have had any notion of *butter*. Homer, Theocritus, Euripides, and the other poets, make no mention of it; and yet are frequently ſpeaking of milk and cheeſe: and Ariſtotle, who has collected abundance of curioſities relating to the other two, is perfectly ſilent on this. Pliny tells us, that *butter* was a delicate diſh among the barbarous nations; and was that which diſtinguiſhed the rich from the poor. Hiſt. Nat. lib. xxviii. cap. 35.

The firſt time the word *βουτυρον* occurs is in Hippocrates, in ſpeaking of the Scythians, from whom the Greeks appear to have firſt learnt the art of making it. In reality what reaſon can be given, why Herodotus ſhould deſcribe the Scythians proceſs of making *butter* with ſo much exactneſs, if the ſame had been in uſe among the Greeks. Herod. Melpom.

It muſt not be forgot, that the ancient Jews appear to have been acquainted with the method of preparing *butter*. Solomon, Iſaiah, and even Moſes, ſpeak of it. The laſt repreſents it as in uſe in Abraham's time, unleſs we ſhould ſuppoſe, with ſome modern writers, that by *butter* in theſe paſſages we are to underſtand CHEESE. See Prov. xxx. 33. Iſa. vii. 15.

The Romans uſed *butter* no otherwiſe than as a medicine, never as a food. Schoolkius obſerves, that it is owing to the induſtry of the Dutch, that there is any ſuch thing as *butter* in the Eaſt Indies: that in Spain, *butter* is only uſed medicinally, for ulcers; and adds, that the beſt opiate for making the teeth white, is the rubbing of them with *butter*.

Cl. Alexandrinus obſerves, that the ancient Chriſtians of Egypt burnt *butter* in the lamps at their altars, inſtead of oil; and the Abyſſinians, according to Godignus, ſtill retain a practice much like it. Clemens finds a religious myſtery in it.—In the Roman churches, it was anciently allowed, during Chriſtmas time, to uſe *butter* inſtead of oil; by reaſon of the great conſumption thereof, in other ways.

In the cathedral of Rouen there is a tower called the BUTTER *tower*, *tour du beurre*, becauſe George d'Amboiſe, archbiſhop of Rouen in 1500, finding the oil fail in his dioceſe during Lent, permitted the uſe of *butter*, on condition that each inhabitant ſhould pay ſix deniers for the liberty, with which ſum this tower was erected. There are other *butter* towers at Notre Dame, Bourges, &c.

Butter is made in the greateſt plenty from cows milk; but ſometimes alſo from goats, and the richeſt from ſheeps milk, as is obſerved by Pliny; though Galen ſeems to doubt it. Inſtances have alſo been known of *butter* made from woman's milk, which is extolled by Hoffman as a ſovereign remedy againſt the *phthiſis*. And, that the ancient Scythians, according to Hippocrates, made *butter* of mares milk; the method of preparing which is deſcribed by that author.

If cows feed on ſhort graſs, they will yield more *butter*, though leſs milk, than if they fed on long rank graſs. The milk of ſome cows, though fed on the ſame graſs, will not yield ſo much *butter* as that of others. In many caſes the *butter* is found to retain the taſte of the plant on which the cows feed.

Writers on the dairy deſcribe the proceſs of making and ordering *butter*. The chief means whereby *butter* is produced, is a long continued agitation of milk, whereby its texture is broken. After the *butter* is come, as they call it, they take it out, waſh it, and beat it, to expreſs the milk. In Bengal, *butter* is eaſily made, by the ſlight turning of a ſtick in milk. Phil. Tranſ. N° 337. p. 227.

In Barbary, *butter* is made by putting the milk or cream into a goat's ſkin, ſuſpended from one ſide of the tent to the other, and preſſing it to and fro in one uniform direction. This quickly occaſions the neceſſary ſeparation of the unctuous and wheyey parts. Shaw's Trav. p. 241.

If the milk be not well wrought out, the *butter* will not keep. When *butter* begins to decay and taſte rank, working it well anew, and waſhing it with water, will reſtore it.

In Bengal, to make *butter* paſs for freſh when old and rank, they melt it, and pour on it four curdly milk; ſome hours after which, they ſtrain it through a cloth for ſale.

BUTTER, *clarified*, and TALLOW, are ſaid to be ſpecifics againſt the *bloody* FLUX, and deſtuxions of the eyes and breaſt. The proceſs of *clarifying butter* is as follows.—Take new-churned *butter*, without ſalt, melt it over a clear fire, and ſkim off the curdy part. Two ſpoonfuls of the clarified remainder are to be given twice or thrice within the day.

This oil of MILK, which is naturally diſtributed through all the ſubſtance of the milk, conſiſts of very ſmall particles, which are interpoſed betwixt the caſeous and the ſerous parts, among which it keeps itſelf ſuſpended, by a light adheſion, but without being diſſolved. It is in the ſame ſtate in which oil is in emulſions; hence, the ſame whiteneſs in MILK and in EMULSIONS; and hence by reſt, the oily parts ſeparate from both theſe liquors to the ſurface, and form a cream. When *butter* is in the ſtate of cream, its proper oily parts are not yet ſufficiently united together to form a homogeneous maſs. They are ſtill half ſeparated by the interpoſition of a pretty large quantity of caſeous and ſerous particles. The *butter* is completely formed by preſſing out theſe heterogeneous parts, by means of continued percuſſion. It then becomes an uniform maſs.

The trade of *butter* is very conſiderable. It is chiefly made within forty miles round the city. Fifty thouſand firkins are ſaid to be ſent yearly from Cambridge and Suffolk alone; each firkin containing 56 pounds. Uxbridge in Staffordſhire is a market famous for good *butter*, inſomuch that the London cheeſemongers have an eſtabliſhed factory here for *butter*. It is bought by the pot, of a long cylindrical form, weighing 14 pounds.

Divers abuſes are practiſed in the packing and ſalting of *butter*, to increaſe its bulk and weight, againſt which we have a ſtatute expreſs. 4 Car. II. cap. 26.

By 13 and 14 Car. II. cap. 26. no *butter* which is old or corrupt, ſhall be mixed or packed with that which is new and ſound.—Nor any whey-BUTTER be mixed or packed with *butter* made of cream.—But each ſort ſhall be packed ſeparately.—No *butter* ſhall be ſalted or ſaved with any great ſalt, but all with ſmall ſalt.

Butter, as a wholeſome aliment, ſhould be freſh and free from rancidity, and not fried or burnt; otherwiſe the acid being diſengaged by age and fermentation, as well as by fire, it will diſorder digeſtion, render it difficult and painful, excite acrid, empyreumatic belchings, and introduce much acrimony into the blood.

Butter is an emollient, and has virtues approaching to thoſe of oil; having a peculiar power of reſiſting poiſon, and obtunding the acrimony thereof. By its ſuppling and relaxing the parts, Dr. Quincy thinks it has a tendency to ſtop in the capillaries and glands, and ſoul the *viſcera*; whence proceed blotches, and cutaneous diſeaſes. Some repreſent it as a diuretic, purgative, and promoter of expectoration.

BUTTER, *May*, BUTYRUM *Majale*, is a medicine in ſome repute among good women, for ſtrains, aches, and wounds. It is made of *butter* churned at that time, and expoſed to the ſun of the whole month, till, by repeated waſhings, it be brought to a whiteneſs. Helmont calls it *magiſtery of graſs*. Quincy allows it is no better than plain lard.

Naturaliſts ſpeak of ſhowers and dews of *butter*. See DEW.

BUTTER-*milk*, the MILK which remains after the *butter* is come by churning.

Butter-milk is eſteemed an excellent food, in the ſpring eſpecially, and is particularly recommended in hectic fevers.

Some make curds of *butter-milk*, by pouring into it a quantity of new milk hot.

BUTTER-*bump*. See BITTERN.

BUTTER-*bur*, *Petaſites*, in *Botany*, an officinal plant, both in figure and virtues reſembling *maſter-wort*. Linnæus has comprehended this plant under the genus of *tuſſilago*, which belongs to the claſs of *ſyngeneſia polygamia ſuperflua*. Its characters are theſe: the flowers is compoſed of ſeveral hermaphrodite florets, which are included in one common cylindrical empalement; they are tubulous or funnel-ſhaped, of one petal, cut into five ſegments at the brim. They have each five ſmall hair-like ſtamina, terminated by cylindrical ſummits, and a ſhort germen, crowned with down, ſupporting a ſlender ſtyle, crowned by a thick ſtigma; the germen afterward becomes an oblong

oblong, compreſſed ſeed, crowned with a hairy down. There are five ſpecies; the firſt of which is the common *butter-bur*, or peſtilent-wort, the *tuſſilago petaſites*, of Linnæus, which grows naturally by the ſides of rivers and ditches in moſt parts of England. It is reputed an alexipharmic and detergent, and uſed in many compoſitions, eſpecially with the firſt of thoſe intentions. There is alſo a compound water denominated from it, though rejected in the laſt college diſpenſatory.

The root is the part principally uſed; and beſide theſe virtues it has thoſe of an aperient and detergent. It is preſcribed in ſuppreſſions of the urine and *menſes*, and in coughs, aſthmas, and other diſeaſes of the breaſt.

BUTTER-*nut*, a fruit in New-England, whoſe kernel yields a great quantity of ſweet oil.

BUTTER-*wort*, *Pinguicula*, in *Botany*, a genus of the *diandria monogynia* claſs. The corolla conſiſts of a ſingle ringent petal; the longer lip is ſtraight, obtuſe, trifid, and ſubine; the ſhorter lip is bifid, more obtuſe, and patent; the *nectarium* is cornicultated, and produced from the baſe of the petal; the fruit is an oval capſule, compreſſed at top, and containing one cell, in which are ſeveral ſmall ſeeds of cylindric figure. There are *four* ſpecies. The common butter-wort or *pinguicula vulgaris* of Linnæus, is found growing on bogs in many parts of England, and flowers in June; but is never cultivated in gardens.

BUTTER, *Butyrum*, is alſo uſed to expreſs ſeveral chemical ſubſtances—as, *butter* of ANTIMONY, of ARSENIC, of BISMUTH, of CACAO, of FLAX, of SATURN, of TIN, of WAX, &c. on account of their form of conſiſtence reſembling that of *butter*.

BUTTER *of ſtone*, a kind of mineral drug found on the higheſt mountains, and hardeſt rocks of Siberia, being drawn by the ſun's heat, in the way of tranſudation, from the dry ſubſtance of the ſtones themſelves, and adhering to the ſurface thereof like a ſort of calx, which, having received its full coction, is ſcraped off by the inhabitants under the name of *kamene maſſe*. The Ruſſians aſcribe many virtues to it. It is much uſed for the dyſentery and venereal diſeaſes; but its operation is ſo violent, however corrected by other ingredients, that none but the Ruſſians dare uſe it.

BUTTER-*fiſh*, a ſmall fiſh, common in Cornwal, ſhaped ſomewhat like an eel, and diſtinguiſhed by two rows of black ſpots along its back, and called *gunellus*.

BUTTER-*fly*, in *Zoology*. See PAPILIO.

BUTTER-*fly fiſh*, the Engliſh name for the fiſh called by authors BLENNUS, or BLENNIUS.

It has its name of the *butter-fly fiſh* from a ſpot in the fin, which reſembles thoſe in the wings of ſome *butter-flies*.

BUTTER-*fly ſhell*. See VOLUTA.

BUTTER-*fly, Satyrion*, in *Botany*. See ORCHIS.

BUTTER-*nuts*, flowers of the wild TARRAGE.

BUTTERY.—Officers in the king's *buttery*, are a gentleman, yeoman, and three grooms of the *buttery*. The *buttery* among us is uſually placed near the cellar; being commonly the room next the top of the cellar ſtairs.

BUTTING, *imbuture*, in *Middle Age Writers*, is uſed for tunning of wine, or putting it into butts.

BUTTING-*pillar*. See PILLAR.

BUTTOCK *of a ſhip* is her full breadth right aſtern from the tuck upwards.—According as a ſhip is built, broad or narrow at the tranſom, ſhe is ſaid to have a *broad* or *narrow buttock*.

BUTTONS make an article in dreſs, whoſe form and uſe are too familiar to need a deſcription.—The matter whereof they are made is various; as metal, ſilk, mohair, &c.

BUTTONS, *metal*, are various; both with regard to the matter and manner of making; beſides thoſe caſt in moulds, much in the manner of other ſmall works (ſee FOUNDERY), there are now made great quantities with thin plates, or leaves of gold, ſilver, and braſs; eſpecially of the two laſt.—The invention of theſe *buttons* being very late, as not having been ſet on foot before the beginning of the eighteenth century; and their ſtructure very ingenious, though but of indifferent uſe, we ſhall here ſubjoin it.

BUTTONS, *manner of making plated*. The metal to be uſed being reduced into thin plates, or leaves, of the thickneſs intended (either by the goldſmith or brazier), is cut into little round pieces, of a diameter proportionable to the wooden mould they are made to cover: this cutting is performed with a ſharp punch, on a leaden block or table.—Each piece of metal thus cut, and taken off from the plate, is reduced to the form of a *button*, by beating it ſucceſſively in ſeveral ſpherical cavities, with a round piece of iron, in form of a puncheon; ſtill beginning with the ſtarteſt cavity, and proceeding to the more ſpherical, till the plate has got all the relievo required; and the better to manage to thin a plate, they form ten or twelve to the cavities at once; and alſo boil the metal to make it more ductile.

The inſide thus formed, they give an impreſſion to the outſide, by working it with the ſame iron puncheon, in a kind of mould like the minter's coins, engraven *in creux*, or indentedly; and faſtened to a block or bench. The cavity of this mould, wherein the impreſſion is to be made, is of a diameter and depth ſuitable to the ſize of *button* to be ſtruck in it; each kind requiring a particular mould. Between the puncheon and the plate is placed ſome lead, which contributes to the better taking off all the ſtrokes of the graving; the lead, by reaſon of its ſoftneſs, eaſily giving way to the parts that have relievo; and as eaſily inſinuating itſelf into the trace, or engraving of the dentures.

The plate thus prepared makes the upper part or ſhell of the *button*. The lower part is formed of another plate, made after the ſame manner, but ſtarter, and without any impreſſion. To this laſt, is ſoldered a hook ere made of wire, of the ſame metal, for the *button* to be faſtened by.

The two plates are ſoldered together with a wooden mould, covered with wax, or other cement, between, in order to render the *button* firm and ſolid; for the wax covering all the cavities formed by the relievo of the other ſide, fulfains it, prevents it flattening, and preſerves its boſſe or deſign. Ordinarily, indeed, they content themſelves to cover the naked mould with the ſhell; and in this caſe, for the faſtening, they paſs a thread or gut acroſs the middle of the mould.

Buttons made of hair, or other foreign *buttons*, ſhall not be imported, on pain of forfeiture, &c. 13 and 14 Car. II. cap 13.—4 W. and M. cap. 10. Alſo *buttons* are not to be made of cloth, ſtuff, or wood, under penalties. Stat. 4 and 5. W. and M.—10. W. III. cap 2. 4 Geo. I. cap. 7.—7 Geo. I. ſtat. 1. cap 12.

BUTTON, in *Botany*, denotes a *flower* or cluſter of leaves not yet expanded; and is much of the ſame import with BUD. The term *button* is chiefly uſed in ſpeaking of vines and roſes; and in other wiſe denominated *eye*, *ſprout*, *bud*, *burgeon*, &c.

BUTTON, in *Building*, denotes a ſlight faſtening for a door or window, made to turn on a nail.

BUTTON *of a lock*, denotes a round head ſerving to move the bolt.

BUTTON, in *Chemiſtry*, ſignifies the metal which is collected generally in a roundiſh maſs at the bottom of a crucible after fuſion, or which remains in the cupels after cupellation.

BUTTON, in *Fencing*, ſignifies the end or tip of a foil, being made roundiſh, and uſually covered with leather, to prevent making contuſions in the body.

BUTTON *of the rein of a bridle*, in the *Manege*, is a ring of leather, with the reins put through it, running all along the length of the reins.

To put a horſe under the *button*, is when he is ſtopt, having no rider on his back, by the reins being laid on his neck, and the button lowered, ſo far as that the horſe's head is brought in by the reins, and fixed to the true poſture or carriage.

BUTTON-*antennæ*, a name given by *Naturaliſts* to thoſe *antennæ* or horns, as they are called of Butterflies, which are ſlender and terminated at the top by a ſort of *button*, in form of an olive, or part of one. The French naturaliſts, from Reaumur, call theſe *antennes à boutons*. See FEELERS.

BUTTON-*ſtone*, in *Natural Hiſtory*, a kind of figured ſtone, ſo denominated from its reſembling the *button* of a garment.

The *button-ſtone* is called by *Naturaliſts*, *porpites*. Some make it a ſpecies of ECHINITES.

Dr. Hook gives the figure of three ſorts of *button-ſtones*, which ſeem to have been nothing elſe but the ſilling up three ſeveral ſorts of ſhells. They are all of them very hard ſtones, and have this in common, that they conſiſt of two bodies, which ſeem to have been the filling up of two holes or vents in the ſhell. Poſth. Works, p. 284.

Dr. Plot deſcribes a new ſpecies of *button-ſtone*, finely ſtriated from the top, after the manner of ſome hair buttons, on which account it may be denominated *porpites*, unleſs we ſhould rather take it for a new ſpecies of ECHINITES. Hiſt. Oxf. chap. 5. § 178.

This name is alſo given to a peculiar ſpecies of ſlate found in the marquiſate of Bareith, in a mountain called Fichtelberg; which is extremely different from the common ſorts of ſlate, in that it runs with great eaſe into glaſs in five or ſix hours time, without the addition of any ſalt, or other foreign ſubſtance, to promote its vitrification, as other ſtones require.

It contains in itſelf all the principles of glaſs, and really has mixed in its ſubſtance, the things neceſſary to be added to promote the fuſion of other ſtony bodies.

The Swedes and Germans make *buttons* of the glaſs produced from it, which is very black and ſhining, and it has hence its name *button-ſtone*. They make ſeveral other things alſo of this glaſs, as the handles of knives, and the

the like, and send a large quantity of it unwrought in round cakes, as it cools from the fusion, into Holland.

BUTTON-*tree*, *Cephalanthus*, in *Botany*, a genus of the *tetrandria monogynia* class. The characters are these: it hath a number of small flowers collected into a spherical head, and each particular flower hath a funnel-shaped empalement, divided into four parts at the top; the flower is funnel-shaped, of one petal, divided at the top into four parts, inclosing four stamina, which are inserted in the petal. The germen is situated under the flower, which becomes a globular hairy capsule, inclosing one or two oblong, angular seeds, those are joined to an axis, and form a round head. Miller mentions two, and Linnæus one species.

BUTTON-*tree of Jamaica*, *Conocarpus*, in *Botany*, a genus of the *pentandria monogynia* class. Its characters are these: the flowers are collected in a globular head, each standing in a scaly empalement. At the bottom is situated a large compressed germen, divided into five parts at the top. The flower has one petal, which is cut into five equal parts, and five slender stamina, which extend beyond the petal. The germen becomes a single seed, inclosed in the scale of the fruit, which is shaped like the cone of the alder-tree. Linnæus enumerates three, and Miller two species.

BUTTON-*wood*. See SPERMACOCE.

BUTTRESS, a *buttment*, or mass of stone, or brick, serving to prop or support the sides of a building, wall, or the like, on the outside; where it is either very high, or has any considerable load to sustain on the other side, as a bank of earth, &c. See ARCH, and ARC-BOUTANT.

The theory and rules of *buttresses*, or props for easing walls, is ranked among the desiderata of architecture. They are usually placed leaning against the offsets they are to sustain. We find them used against the angles of steeples, churches, and other buildings of stone; also along the walls of such buildings as have great and heavy roofs, which would otherwise be subject to thrust the wall out. They are also placed as supports against the feet of arches turned cross great halls, in old palaces, &c. and are much used in fortification.

BUTTRESS, BUTTRICE, or BUTTERIS, likewise denotes a tool, used by farriers, to pierce the sole of a horse's foot, which is overgrown; to pare the hoof; to fit the shoe; and to cut off the skirts of the sole, that overcast the shoe.

BUTYROUS, or BUTYRACEOUS, something that partakes of the nature or qualities of butter.

BUVETTE, or BEUVETTE, in the *French Lawes*, an established place in every court, where the lawyers and counsellors may retire, warm themselves, and take a glass of wine by way of refreshment, at the king's charge.

There is one for each court of parliament, but these are only for persons belonging to that body; there are others in the *palais* whither other persons also resort.

BUXBAUMIA, in *Botany*, a genus of the *cryptogamia musci*.

BUXTON *waters*. See WATERS.

BUXUS, in *Botany*. See BOX-*tree*.

BUYER, *Emptor*. See BUYING and EMPTOR.

BUYING, the act of making a PURCHASE, or of acquiring the property of a thing for a certain price.

Buying stands opposed to selling, and differs from BORROWING or hiring, as in the former the property of the thing is alienated for perpetuity, which in the latter is not. By the civil law, persons are allowed to *buy* hope, *spem pretii emere*, that is, to purchase the event or expectation of any thing. E. gr. The fish or birds a person shall catch, or the money he shall win in gaming.

There are divers species of *buying* in use among traders; as *buying* on one's own account, opposed to *buying* on commission; *buying* for ready money, which is when the purchaser pays in actual specie on the spot; *buying* on credit, or for a time certain, is when the payment is not to be presently made, but, in lieu thereof, an obligation given by the buyer for payment at a time future; *buying* on delivery, is when the goods purchased are only to be delivered at a certain time future.

BUYING *the reversal*, is giving money for the right or liberty of purchasing a thing at a fixed price, in a certain time to come; chiefly used in dealing for shares in stock.

This is sometimes also called by a cant name, *buying the bear*.

BUYING *the small pox*, is an appellation given to a method of procuring that disease by an operation nearly akin to INOCULATION; frequent in South Wales, where it has obtained time out of mind.

It is performed either by rubbing some of the *pus* taken out of a pustule of a virulous person on the skin, or by making a puncture in the skin with a pin dipped in such *pus*. Phil. Trans. N° 375. See INOCULATION and POX.

BUZ, in *Ichthyography*, the name of a fish more commonly known by that of ALBULA, and caught in the German lakes.

BUZIDAN, in the *Materia Medica of the Ancients*, a name given by Avicenna, and others, to a wood produced in Africa, which had the same virtues with the radix ben, or white and red behen, or ben root. We are not acquainted with this medicine at this time, but it appears to have been of the colour of our red saunders; so that it could only serve to adulterate the red ben root; though they lay, in general, that it was used to adulterate the ben when scarce.

BUZZARD, BUTEO, in *Ornithology*, the name of a bird of prey, of the long-winged hawk kind, belonging to the genus of FALCON in the Linnæan system; of which there are several species. 1. The bald *buzzard*, so called from the whiteness of his crown, sometimes called *ospray*. 2. The common *buzzard*, distinguished from the former by the shortness of its wings, and its smaller size. 3. The honey *buzzard*, or apivorous *buzzard*, which feeds its young from the bee-hives. See APIVORUS *Buteo*. 4. The HENHARRIER, the male of which has been usually called the hen-harrier, the female the ring-tail; though by later observations males have been found of this species; and, 5. The moor *buzzard*, common in marshy places, and called BUTEO RADIOSUS by authors.

The common *buzzard* is a bird of the long-winged hawk kind, of the size of a pheasant, or small pullet. It feeds on moles, field-mice, and other small birds, and sometimes will seize on rabbits. In want of better food, it will live on beetles, worms, and the like. Its eggs are white, more or less sprinkled with irregular red spots. In age, or by some other accidents, the head and back in this species, are sometimes found grey.

The *moor buzzard* is a bird of the long-winged hawk kind, smaller than the common *buzzard*, and not so flat on the head. Its beak is large and crooked, covered with a greenish yellow skin near the top, and black in other places. Its mouth is bluish within; its head is of a whitish orange colour, variegated with black streaks; its throat is of the same colour; and all the rest of its body, as well back as belly, is of a dusky ruft colour, only that in each wing there is a yellowish white spot; and the feathers at the root of the tail are yellowish. Its legs are long and slender, and of a yellowish colour. The inside of its wing-feathers are whitish. It is common with us about heaths and marshes.

BYAS is used by Petty for the central point supposed in the middle of each ATOM or CORPUSCLE.

BY-LAWS, BYE-LAWS, or BI-LAWS, private or peculiar orders and regulations for the good government of a city court, or other community, made by general consent of the members thereof; being not repugnant to the general laws of the realm.

By Stat. 9 Hen. VII. cap. 7. *bye laws* made by corporations are to be approved by the lord-chancellor, or chief-justices, under penalty of 40*l*.

The word is formed from the Saxon *by*, *habitation*, *village*, and *laza*, q. d. *lex villæ*, or *town-ball*.—They are also called *burlawes*, *burlawes*, and *burlaws*, *burlagre*, and *hallepleas*. Such is the custom in Kent of deciding controversies among neighbours about boundaries, by the seneschals, or bailiffs.

In Scotland, those are called *laws of burlaw*, or *burlaw*, which are made and determined by neighbours, elected by common consent in burlaw-courts; wherein cognizance is taken of complaints betwixt neighbour and neighbour.—The men thus chosen as judges or arbiters are called *burlaw-men*, or *by-law-men*.

BYRRHUS, in *Natural History*, a genus of insects of the order of *coleoptera*, with elevated, almost solid, and compressed antennæ. There are five species.

BYRSODEPSICON, from βυρσα, *skin*, and δεψω, *I dress*, an epithet given to *sumach*, denoting its use in dying of leather. See SUMACH.

BYSSUS, or BISSUM, a fine sort of thready matter produced in India, Egypt, and about Elis in Achaia, of which the richest apparel was anciently made, especially that wore by the priests both Jewish and Egyptian.

In reality, the ancients seem to have applied the name indifferently to any kind of matter that was spun and wove finer than wool: so that it is probable there were divers sorts of *byssus*. This is certain, that Aristotle gave the name *byssus* to the hair or silken threads of the *pinna marina*; whether it were on account of its resemblance to the *byssus* of which cloths were made, or whether it were that this was the true *byssus* itself. What countenances this latter opinion is, that the *byssus* of the *pinna marina* may be spun, and consequently there is little doubt but that in ages when silk was scarce, it might be used in the cloaths of great men. Add, that this *byssus*, though grossly spun, appears much finer and more beautiful than wool, and comes not much short of silk. Stockings and other such manufactures are still made of it, which would be more valuable if silk were less common.

mon. To spin this *byssus*, they leave it some days in a cellar to moisten and grow soft; after this they comb it to get out the impurities, and, lastly, spin it as they do silk.

Authors usually distinguish two sorts of *byssus*, that of Elis, and that of Judea, which was the finest. Of this latter were the priestly ornaments made. Bonfrerius notes, that there must have been two sorts of *byssus*, one finer than the ordinary, by reason there are two Hebrew words used in Scripture to denote *byssus*, one of which is always used in speaking of the habit of the priests, and the other of that of the Levites. See Luke xvi. 19.

It is probable the *byssus* of the ancients was a very fine sort of cotton, or a mixture of linen and cotton. Forster. De Bysso Antiquorum.

BYSSUS, in *Botany*, a word used to express a genus of mosses, described by some of the ancients under the name of *ulvenium*, and belonging, in the Linnæan system, to the class of *cryptogamia algæ*, the most imperfect of the whole class of vegetables. The characters of this genus are, that the mosses of it are composed of simple and uniform parts, and always appear in form of excrescences, either of a woolly or of a dusty matter. It seems properly a genus of vegetables of a middle kind, between the mushrooms and the mosses, but most approaching to the latter, in that the several species of it are of a longer duration, and want that fleshy texture which distinguishes the *fungus* class, and in that they never produce heads, nor have any thing of the figure or texture of *fungi*. The *byssi* differ from the CONFERVÆ, in that they do not grow in the water, and in their being composed of slenderer and shorter filaments. They have not yet been discovered to have either flower or seed, but appear always in form of threads, or of a light down, or fine powder, on the surfaces of many different bodies but principally such as are liable to putrefaction. Micheli, in his Nova Genera Plantarum, p. 210. mentions the seeds of some of the *byssi*: but later observers, and particularly the indefatigable Dillenius, were never able to observe them. This last author has described twenty species of these small plants. See in the Philosophical Transactions, vol. xlviii. part i. N° 54. an. 1753 an account, with observations, of this *genus* of plants, which in the order of nature comes between the mosses and the *fungi*. This vegetable is found in England, as well as in many parts of Europe, covering the ground like a carpet. See *Tab.* XIII. *Botany*, N° 1.

BYTTNERIA, in *Botany*, a genus of the *pentandria monogynia* class; the corolla is composed of five petals; the capsule has five lobes, and is covered with prickles. There is only one species.

BYZANT. See BEZANT.

BYZANTINA *blatta*. See BLATTA.

C.

C, The third letter, or second conſonant of the alphabet, has two ſounds, one like *ſ*, as in the word *ceſs*; and the other like *s*, as in *Caſar*. It has the former ſound before *a*, *o*, *u*, or a conſonant; and the latter before *e*, *i*, and *y*. C is formed, according to Scaliger, from the *κ* of the Greeks, by retrenching the ſtem or upright line; though others derive it from the ג of the Hebrews, which has in effect the ſame form; allowing only for this, that the Hebrews, reading backwards, and the Latins, &c. forwards, each have turned the letter their own way. However, the C not being the ſame as to ſound with the Hebrew *caph*; and it being certain the Romans did not borrow their letters immediately from the Hebrews, or other Orientals, but from the Greeks; the derivation from the Greek *κ* is the more probable. Add, that F. Montfaucon, in his Paleographia, gives us ſome forms of the Greek *κ*, which come very near that of our C; this, for inſtance, ς: and Suidas calls the C, the Roman kappa. The ſecond ſound of C reſembles that of the Greek Σ; and many inſtances occur of ancient inſcriptions, in which Σ has the ſame form with our C. Gruter, vol. i. p. 31. vol. iii. p. 1020.

All grammarians agree, that the Romans pronounced their Q like our C, and their C like our K. F. Mabillon adds, that Charles the Great was the firſt who wrote his name with a C; whereas all his predeceſſors of the ſame name wrote it with a K; and the ſame difference is obſerved in their coins.

C was alſo a numeral letter of the Romans, ſignifying an hundred: according to the verſe,

Non plus quam centum C littera ſcribere habebit.

Some add, that a daſh over it, made it ſignify an hundred thouſand.

C is alſo an ABBREVIATURE.

In proper names C. is uſed for Caius; as C. Cæſar, &c. Their lawyers uſe it ſingly for *Conſul* or *Conſules*, and doubled, CC. for *Conſuſſhus*.

C was alſo uſed in their courts, as a letter of condemnation, and ſtood for *condemno*; in oppoſition to *A*, which ſignified *abſolvo*.

C, in *Muſic*, denotes the higheſt part in a *thorough bass*; and when placed after the clef, it intimates, that the muſic is in common time.

CAABA, a ſquare ſtone edifice in the temple of Mecca, ſuppoſed to have been built by Abraham and his ſon Iſhmael; being the part principally reverenced by the Mahometans, and to which they always direct themſelves in prayer. See KEBLA.

The word is Arabic, *caaba*, and *caabah*, a denomination which ſome will have given to this building, on account of its height, which ſurpaſſes that of the other buildings in Mecca; but others, with more probability, derive the name from the quadrangular form of this ſtructure.

CAAMINA, in *Botany*, a name given by the Spaniards and others to the fineſt ſort of the Paraguay tea. It is the leaves of a ſhrub which grows on the mountains of Maracayu, and is uſed in Chili and Peru as the tea is with us. The mountains, where the trees which produce this valuable leaf grow naturally, are far from the inhabited parts of Paraguay; but the people of the place know ſo well the value and uſe of it, that they conſtantly furniſh themſelves with great quantities of it from the ſpot. They uſed to go out on theſe expeditions many thouſands together, and their country was left to the inſults of their enemies in the mean time, and many of them periſhed with the fatigue.

To remedy theſe inconveniences, they have of late planted the trees about their habitations; but the leaves of theſe cultivated trees have not the fine flavour or the virtues of the wild ones. The king of Spain has permitted the Indians of Paraguay to bring to the town of Sanſoy, twelve thouſand arobes of the leaves of this tree every year: but they are not able to procure ſo much of the wild leaves annually; about half the quantity is the moſt they bring of this; the other half is made up of the leaves of the trees in their own plantations, and this fells at a lower price, and is called *baber*. The arobe is about five and twenty pounds weight; the general price is four piſtrees for the arobe, and the money is always divided equally among the people of the colony.

CAA-APIA, in *Botany*, the name of a Braſilian plant, deſcribed by Margrave, Piſo, and others; the root of which ſo much reſembles the ipecacuanha in its virtues, that ſome have erroneouſly called it by the ſame name. It is an aſtringent and emetic, as the ipecacuanha, but it poſſeſſes both theſe qualities in a much weaker degree, and is therefore neceſſarily given in a much larger doſe, a dram being the quantity commonly given at once. The Braſilians bruiſe the whole plant, and expreſs the juice, which they take internally, and alſo apply it externally to wounds made by poiſoned arrows, and by the bites of ſerpents. Some have ſuppoſed the root of this plant to be the white ipecacuanha; but this is an error, that being little different from the grey. Mem. Acad. Par. an. 1700. p. 134. hiſt. 69. Geoffroy.

CAAPIBA, in *Botany*, the name given by Plumier to a genus of plants, called afterwards by Linnæus CISSAMPELOS.

CAB, or KAB, denotes a Hebrew meaſure of capacity, equal to the ſixth part of the ſeah, or an eighteenth of the EPHA. Arbuthnot's Tab. Anc. Coins, &c. p. 14. and 15.

The *cab* of wine contained two Engliſh pints; the *cab* of corn, 2¼ pints corn meaſure.

We alſo find mention of the *cab* as a dry meaſure, in Grecian and Roman writers: ſome make it equal to the Grecian CHOENIX, and ſuſpect it to be the quantity of what a labourer eats per day, as aſſigned by Cato.

CABAL, a name given to a ſort of drink made of dried raiſins. The manner in which the Portugueſe make *cabal* is this; they take out the ſtones of about twenty pounds of raiſins, and then bruiſing the raiſins a little, they put them into a barrel of white wine, in the month of January or February, and let them ſtand till about Eaſter. It is then very clear and rich, luſcious and palatable to the taſte. It is recommended to ſtop coughs, and give ſtrength to the ſtomach. It is worth while to try the experiment with the ſame proportion of raiſins to the ſame quantity of our Engliſh cyder, which would probably prove a fine drink. Phil. Tranſ. N° 157.

CABALA *vein*, in *Natural Hiſtory*, a name given by our Suſſex miners to one kind of the iron ore commonly wrought in that country. It is a ſtony ore, of a brownish colour, with a bluſh of red, which is more or leſs conſpicuous in different parts of the ſame maſſes. It is uſually found in thin ſtrata, lying not far from the ſurface, and is not very rich in iron, but it runs very readily in the fire.

CABALATAR, in *Natural Hiſtory*, a name given by ſome of the chemical writers to nitre, called alſo *cerberus chymicus*, and *ſal infernalis*.

CABALISTE, in *Commerce*, a term uſed at Thouloufe, and in the whole province of Languedoc; which ſignifies a merchant who does not trade in his own name, but is concerned in the trade of another merchant in chief. See ANONYMOUS *partnerſhip*.

CABALLEROS, in *Commerce*, wools of *caballero*, or *caballero*, are Spaniſh wools of which there is a conſiderable trade at Bayonne in France.

CABALLI, among *Aſtrologers*, denote the ſhades,

or aſtral bodies of men who died any ſudden or violent death, before the expiration of their predeſtinated term of life.

The *caballi*, called alſo *cabales* and *cabalei*, are ſuppoſed to wander as goblins or ghoſts over the face of the earth, till their deſtined term is accompliſhed; being doomed to live out the time as ſpirits, which they ought to have ſpent in the fleſh.

CABALLINA, *Aloe*, is a denomination given to the coarſeſt and rankeſt kind of ALOES, as being little uſed unleſs for purging horſes. Hiſt. Acad. Scienc. an. 1708. p. 60.

CABALLINUM, *Sulphur*, denotes common brimſtone or SULPHUR.

CABALLINE, CABALLINUS, from the Greek καβαλλος, *a horſe*, ſomething relating to, or partaking of, the nature and qualities of a horſe.

CABBAGES, in *Gardening*; for the characters, ſee BRASSICA. The common ſorts of *cabbages* are largely cultivated about London. The common white, red, flat, and long-ſided ones, are chiefly for winter uſe. The ſeeds of theſe ſorts muſt therefore be ſown in the end of March, and beginning of April, in beds of good freſh earth; and in May, when the young plants will have about eight leaves a-piece, they are to be pricked out into ſhady borders, about three inches ſquare, and, about the beginning of June, they muſt be tranſplanted to the places where they are to remain; and this is commonly between cauliflowers or artichokes, at about two feet and a half diſtance in the rows. They muſt be watered at times, and the earth muſt be hoed up about their roots, and kept clear from weeds.

Theſe *cabbages* will be fit for uſe ſoon after Michaelmas, and will continue till the end of February, if not deſtroyed by bad weather; to prevent which, the gardeners about London pull up their *cabbages* in November, and trench the ground in ridges, laying their *cabbages* againſt the edges, as cloſe as poſſible on one ſide, burying their ſtems in the ground; and in this manner they let them remain till after Chriſtmas, when they cut them for market.

The Germans make great uſe of a preparation of *cabbages*, which they call *ſour kraut*, and CHOUCROUTE.

The Ruſſian *cabbage* is ſmall, and not much cultivated now. It is to be raiſed as the others, but may be planted nearer, as not ſo large. It is fit for uſe in July.

The early and ſugar-loaf *cabbages* are ſown for ſummer uſe, and are commonly called Michaelmas *cabbages*. The ſeaſon for ſowing theſe is the end of July or beginning of Auguſt, in an open ſpot of ground. The plants are pricked out at three inches diſtance, when they have eight leaves. It is common to ſow ſpinach in the ſame beds with theſe, boeing it up from about their ſtalks in ſpring; in May and June theſe begin to turn their leaves for cabbaging, and may be brought to it much ſooner than naturally they would, by tying them about the top with an oſier band.

The Savoy *cabbages* are for winter uſe, and are to be ſown about the middle of April; they are to be treated as the common *cabbage*, and planted out at two feet and a half diſtance, in an open place.

The *borecole* may be cultivated in the ſame manner, but muſt be planted only at one foot diſtance; theſe are not fit to cut till the freſts have nipped them. See BORECOLE and CAULIFLOWER.

The method of getting good *cabbage*-ſeed is this: chooſe out ſome fair plants about the end of November, pull them up, and hang them up three days with the root upward, in a ſhady place; then plant them under a warm hedge, burying the whole ſtalk and half the *cabbage* in the earth; cover them with ſtraw or peaſe haum, if the winter be ſevere, and in ſpring they will ſhoot out many branches. When theſe begin to pod, the ends of the upper ones muſt be cut off, to give ſtrength to the other pods. The ſeed muſt be preſerved from the birds, by fixing ſome lime twigs about the plants, where the catching of one or two will intimidate the reſt. When ripe, it muſt be threſhed out, and kept for uſe. Miller.

The culture of *cabbages* as food for cattle, makes a very conſiderable branch of modern huſbandry. Thoſe in common uſe for this purpoſe are the great Scotch *cabbage*, the turnep *cabbage*, and, on account of its peculiar hardineſs and duration, the turnep-rooted *cabbage*. By proper management, a ſucceſſion of different *cabbage* crops may be obtained through the winter. *Cabbages* afford a wholeſome and nutritive food for cattle, ſheep, horſes, and hogs: and if they are cultivated on good ground, well manured, and horſe-hoed after the method of Mr. Tull, they produce very large crops, from 30 to 60 tons on an acre. An Iriſh acre (which is in proportion to the Engliſh as 156 to 121) was planted with *cabbages* by Mr. Baker in July, at the diſtance of two feet from each other, in the middle of ridges five feet aſunder, and hoed in Mr. Tull's method, and produced by December 52,838lb. weight of *cabbages*, each weighing at an average about 7 lb. 6 oz. The ſame quantity of ground planted with turnep *cabbages*, and treated in the ſame manner, yielded in the whole 57,761 lb each *cabbage* weighing at an average 8 lb. 12 oz. Bore-cole planted in the ſame manner, and on the ſame ſpace of ground, yielded 40,656 lb. each plant at an average weighing 5 lb. 10 oz. Mr. Baker, by ſubſequent trials found, that larger crops might be obtained by planting his *cabbages* on four feet ridges, and eighteen inches diſtant in the rows: and the ſmaller kinds at the diſtance only of one foot.

CABBAGE-*ſprub*, *Aſpius*, or *Colewort*, a plant which has been for ſome time cultivated in France, and lately introduced into England. It is an excellent vegetable for the kitchen, good food for cattle, and greatly increaſes the milk of cows. The *dry ſtalk* of this plant ſerves for fewel. It will grow in any ſoil that is well dunged. The ſeeds are ſown in June; and the plants are to be well watered and kept free from weeds, and tranſplanted into the common field where they are to remain till November. The Marquis de Turbilly, in a letter to Mr. Mills, has given particular directions for the management of them. See COLEWORT.

CABBAGE, *Dog's*, *Teaſtaſwm*, in *Botany*, a genus of the *monœcia polyandria* claſs. Its characters are theſe: it has male and female flowers on the ſame plant; the male flowers have a turbinated empalement of one leaf, cut into two ſegments which turn backward. It has no petal, but ſeveral erect ſtamina of the length of the empalement, terminated by ſingle ſummits. The female flowers have a ſmall bifid empalement of one leaf, which is permanent. It has no petals, but has a globular germen, ſupporting a ſhort ſtyle, crowned by no obſolete ſtigma. The germen afterwards becomes a thick globular capſule with one cell, including one globular ſeed. We have but one ſpecies, which grows naturally in the ſouth of France, in Italy, and Tartary; and is the *cynocrambe*, or *dog's cabbage* of Dioſcorides.

CABBAGE, *Turnep*, is the *Braſſica napiformis orbicularis carnoſa eſculenta* of Linnæus. It is to cated, becauſe the fleſhy ſtem an oblate or bunch near the root, but a ſtale above the ground. This plant has been long known in England as an object of curioſity in botanic gardens, or as an obſcure herb; but the firſt perſon who introduced it into uſe as an article of huſbandry was Mr. Baker, not twenty years ago. It has ſince been cultivated by many others, and found to be an excellent fodder for cattle in ſeverе winters, though not ſo hardy as the ſpecies of *cabbage* deſcribed in the next article.

CABBAGE, *Turnep-rooted*, or *Engliſh ſea-cabbage*, is comprehended in the fifth ſpecies of *braſſica*, denominated by Linnæus *braſſica radice orbiculato carnoſa*. Its root is larger than that of the common turnep, and runs into ſeveral ramifications, which are thicker than a man's thumb at their inſertion; in taſte and conſiſtence it reſembles the kernel of the cocoa-nut, being much ſofter, more oily, and leſs ſucculent than the common turnep. From the root ariſes a ſtalk, ſmooth, round, and branched into ſeveral arms. The leaves near the root are like thoſe of the ſea-*cabbage*, roundiſh and jagged: but thoſe which riſe from the ſtalks are oblong, narrow, and ſinuated. The flowers are large and yellow, of a deeper colour than thoſe of the common kind of *cabbage*: to their ſucceed narrow pods about an inch long. This plant has been long cultivated in the more northern parts of Europe; but it was firſt introduced into England, as an article of agriculture, by Mr. Reynolds, not quite ten years ago. It is a very valuable acquiſition on account of its hardineſs and duration through the whole year: as it may be eaſily raiſed on ground not rich and without manure, and as the produce it affords is very conſiderable, and in quality wholeſome and nutritive.

CABBAGE-*bark tree of Jamaica*, in *Botany*, is a ſpecies of the CONVOLVULUS of Linnæus. The wood of this tree is uſed in building, but it is chiefly valued for its bark which is adminiſtered in different forms, viz. by decoction, ſyrup, powder, and extract, as an anthelmintic medicine. From this medical property it is alſo called the *worm-bark* tree. The decoction made by boiling an ounce of the bark in a quart of water, is moſtly uſed in Jamaica; and it ſeldom fails to periſh every thing that can be expected from an anthelmintic medicine, by deſtroying worms in the inteſtines, and bringing them away in great quantities. The bark is externally of a grey colour, and internally black and furrowed: its taſte when freſh, is mucilaginous and ſweet, and its ſmell, which is retained in the decoction, *diſagreeable*. Dr. Wright of Jamaica recommends it as a very valuable remedy. See his deſcription of the tree, with a drawing, and of the method of preparing and adminiſtering the bark in the Phil. Tranſ. vol. lxvii. pt. ii. art. 28.

CABBAGE-*tree*. See PALM-*tree*.

CAB-

CABBAGING, among *Gardeners*, is sometimes used to denote the knitting or gathering of certain pot-herbs into round bunched heads.

In which sense the word amounts to the same with what Evelyn calls *pruning*, *pommet*, q. d. appling, or growing applewise. Others call it simply heading or bunching.

To make lettuce *cabbage*, they transplant it, taking care, during the great heats, to water it; otherwise, instead of pomming, it runs to seed. To promote the *cabbaging* of cabbage, thole who live on the sea-coall, put sea-weed, with a little urine, under their roots.

Cabbage plants of the early kind begin to turn in their leaves for *cabbaging* in May. The Banstica fort cabbage apace when they once begin, and as soon grow hard and burst open; but the sugar loaf kind is longer before it comes, and is so slow in its *cabbaging*.

CABBALA, a mysterious kind of science, delivered by revelation to the ancient Jews, and transmitted by oral tradition to thole of our times; serving for interpretation of the books both of nature, and Scripture.

The word is also written *Cabbala*, *Cabbalia*, *Kabbala*, *Kabala*, *Cabbalistica*, *Ars Cabala*, and *Cabalia*. It is originally Hebrew, קבלה, *kabbalah*; and properly signifies *reception*; formed from the root קבל, *kibel*, to *receive by tradition*, *or from father to son*, especially in the Chaldee and Rabbinical Hebrew.

Cabbala, then, primarily denotes any sentiment, opinion, usage, or explication of Scripture transmitted from father to son. In this sense, the word *cabbala* is not only applied to the whole art; but also to each operation pertio med according to the rules of that art. Thus it is R. Jac. Ben Aicher, surnamed Baal-Hatturim, is said to have compiled moll of the *cabbala* invented on the books of Moles before his time.

As to the origin of the *cabbala*: the Jews believe, that God gave to Moles on mount Sinai, not only the law, but alio the explication of that law; and that Moles, after his coming down, retiring to his tent, rehearsed to Aaron both the one and the other. When he had done, Aaron standing on the right hand, his sons, Eleazar and Ithamar, were introduced to a second rehearsal: this being over, the seventy elders that compoled the sanhedrim were admitted; and lastly, the people, as many as pleased: to all of whom, Moles again repeated both the law and explanation, as he received them from God. So that Aaron heard it four times, his sons thrice, the elders twice, and the people once. Now, of the two things which Moles taught them, the laws and the explanation, only the first were committed to writing; which is what we have in Exodus, Leviticus, and Numbers: as to the second, or the explication of those laws, they were contented to imprint it well in their memory, to teach it their children; they, to theirs, &c. Hence, the first part they call simply the law, or the written law; the second, the oral law, or *cabbala*. Such is the original notion of the *cabbala*.

Among these explications of the law, which, in reality, are little else but the several interpretations and decisions of the Rabbins on the laws of Moles, some are mystical; consisting of odd arbitrary significations given to a word, or even to the letters whereof it is compoled: whence, by different combinations, they draw meanings from Scripture, very different from those it seems naturally to import. The art of interpreting Scripture after this manner, is called more particularly *cabbala*: and it is in this last sense the word is more ordinarily used among us. This *cabbala*, called alio *scientia cabbala* (to distinguish it from the first kind, or simple tradition), is divided into three sorts. The first, called *gematria*, consists in taking letters as figures, or arithmetical numbers, and explaining each word by the arithmetical value of the letters whereof it is compoled: which is done various ways. The second is called *notaricon*, and consists either in taking each letter of a word for an entire diction, or in making one entire diction out of the initial letters of many. The third kind, called *themurah*, q. d. *changing*, consists in changing and transposing the letters of a word; which is done various ways.

This is by some called the acromatic philosophy of Moles, by way of contradistinction from the exoteric or popular doctrine. See ACROMATIC.

The generality of Jews prefer the *cabbala* to the Scripture; comparing the former to the sparkling lustre of a precious stone, and the latter to the fainter glimmering of a candle.

The *cabbala* only differs from *midrash*, as the latter denotes the science of reading the Scripture, the former of interpreting it. Both are supposed to have been handed down from generation to generation by oral tradition only, till at length the readings were fixed by the *nowels* and accents, as the interpretations were by the *midrash* and *gemara*. Prideaux Conn. p. 1. lib. v. p. 506.

The first author who delivered any thing of the *cabbala* was Jesuhalidei, or Simeon son of Jochai, who publish that famous cabbaliftical work intituled Zohar: Scaliger, he lived about the time of the destruction of Jerusalem by Titus; others, only in the tenth century. Basnage, Hiſt. of the Jews.

Dr. Burnet examines into the merits of the several parts of the *cabbala*, which he finds to be without rational foundation, and not conducing to any real knowledge. But he conjectures, that the moſt ancient *cabbala* before it was confounded and defiled with fables, might contain something of the original of things, and their gradations; particularly, that, before the creation all things had their being in God; that from them they flowed as emanations; that they will all flow back again into him, when they are deſtroyed; and that there will ſucceed other emanations and regenerations, and other deſtructions and abſorptions to all eternity, as they had been from all eternity; that nothing is produced out of nothing; and that the things produced never return to nothing, but always have their ſubſiſtence in God. Burn. Archæol. lib. i. cap. 7. Phil. Trans. N° 201. p. 800.

The *cabbala* hitherto ſpoken of, may be called *ſpeculative cabbala*; in oppoſition to the following, which may be called *practical cabbala*.

CABBALA is alſo applied to the uſe, or rather abuſe, which viſionaries and enthuſiaſts make of Scripture, for diſcovering ſecrets, by the ſtudy and conſideration of the combination of certain words, letters, and numbers, in the ſacred Writings. All the words, terms, magic figures, numbers, letters, charms, &c. uſed in the Jewiſh magic, as alſo in the hermetical ſciences, are comprized under this ſpecies of *cabbala*. But it is only the Chriſtians that call it by this name, on account of the reſemblance this art bears to the explication of the Jewiſh *cabbala*: for the Jews never uſe the word *cabbala* in any ſuch ſenſe, but ever with the utmoſt reſpect and veneration. It is not, however, the magic of the Jews alone which we call *cabbala*, but the word is alſo uſed for any kind of magic.

CABBALIC *art*, *Ars caballica*, is uſed by ſome writers for *ars paleſtrica*, or the art of wreſtling.

CABBALISTIC *art*. See CABBALA, and CABBALIST. D. Franc. Bertrandi, a Theatin of Venice (under the fictitious name of C. Berardo Schinffinni), has publiſhed a *Cabballomachia*, or Refutation of the *Cabbaliſtic* Art.

CABBALISTS, a ſect among the Jews, who follow and practiſe the *cabbala*, or interpret Scripture according to the rules of the literal *cabbala*, above laid down.

The Jews are divided into two general ſects; the Karaites, who refuſe to receive either tradition, or the Talmud, or any thing but the pure text of Scripture: and the Rabbiniſts or Talmudiſts, who, beſide this, receive the traditions of the ancients, and follow the Talmud.

Theſe latter are again divided into two other ſects; pure Rabbiniſts, who explain the Scripture in its natural ſenſe, by grammar, hiſtory, and tradition; and *Cabbaliſts*, who, to diſcover hidden myſtical ſenſes, which they ſuppoſe God to have couched therein, make uſe of the *cabbala*, and the myſtical rules and method above mentioned.

There are viſionaries among the Jews, who believe that Jeſus Chriſt wrought his miracles by virtue of the myſteries of the *cabbala*. Some learned men are of opinion, that Pythagoras and Plato learned the *cabbaliſtic* art of the Jews in Egypt; and fancy they ſee evident footſteps thereof in their philoſophy: others, on the contrary, ſay, it was the philoſophy of Pythagoras and Plato, that firſt furniſhed the Jews with their *cabbala*. Be this as it will, it is certain, that in the firſt ages of the church, moſt of the hereſies gave into the vain notions of the *cabbala*: particularly the Gnoſtics, Valentinians, and Baſilidians. Hence ariſe the *abraxas*, and the multitude of talismans, where with the cabinets of the virtuoſi were ſtocked.

See a particular account of the *cabbaliſtic art*, as practiſed not only by Jews, but by Heathens and Chriſtians, in Baſnage's Hiſt. of the Jews, book iii. chap. 10—28.

GABBIN. See CABIN.

CABEBI, a name given by ſome authors to the ſcales of iron. Rulandus.

CABECA, or CABESSE, in *Commerce*; the Portugueſe who carry on the trade of ſilks in the Eaſt Indies, diſtinguiſh them by the names of *cabeça*, and *bariga*: that is to ſay, head and belly. The *cabeça* ſilks are the fineſt; the *bariga* being from fifteen to twenty *per cent.* inferior to them. The Indian workmen endeavour to mix them together; for which reaſon the more experienced European merchants, who carry on that trade, take care to open the bales, and to examine the ſkains.

CABELOS. See CAVELOS.

CABELIAU, in *Ichthyology*, a name by which ſome authors have called the common COD-*fiſh*, the *merluus* and *aſellus major* of other writers.

CABIN, or CABBIN, is sometimes used for the huts or cottages of savages, and other poor people.

The habitations of the Indians in Virginia are *cabins*, about nine or ten feet high, which are made after this manner: they fix poles into the ground, and bring the tops of them one within another, and so tie them together; the outside of their poles they line with bark, to defend them from the injuries of the weather, but they leave a hole in the top, right in the middle of the *cabin*, for the smoke to go out; round the inside of their *cabins* they have banks of earth cast up, which serve instead of stools and beds. Phil. Trans. N° 126.

CABINS, or CABBINS, in a ship, are small cells, or apartments for the officers of the ship to lie in; very narrow, and in form of armories or presses; used in several parts of the ship, particularly on the quarter-deck, and on each side of the sheerage. The bed-places erected for sailors at the ship's side, in merchantmen, are likewise called *cabins*. The word comes from the French *cabane*, Spanish *cabana*, or Italian *capanna*, *a little straw hut*; and that from the Greek καπανη, *a stall* or *manger*.

CABINET, or CABBINET, the most retired place in the finest apartment of a building; set apart for writing, studying, or preserving any thing very precious.

A complete apartment consists of a hall, anti-chamber, chamber, and *cabinet*; with a gallery on one side.

CABINET is sometimes particularly used for a place at the end of a GALLERY, wherein are preserved the paintings of the best masters, conveniently ranged, and accompanied with busts, and figures of marble and bronze, with other curiosities.

In this sense, *cabinet* amounts to the same with what is called by Vitruvius, *pinacotheca*. Sometimes there are several pieces or rooms destined for this use, which are all together called *cabinet*, or GALLERY.

CABINET also denotes a kind of basket or chest of drawers, partly for the preservation of things of value, and partly as a decoration of a chamber, gallery, or other apartment. In the repository of the Royal Society is a Chinese *cabinet*, filled with the instruments and simples used by the surgeons of that country. The most remarkable are those which are contrived for scratching, picking, and tickling the ears, in which the Chinese take great pleasure. Phil. Trans. N° 240. p. 390, seq.

CABINET, in *Gardening*, is a little insulated building in manner of a summer-house, built in some agreeable form, and open on all sides; serving as a place of retirement, and to take the fresh air under cover.

According to Miller, a *cabinet* is a kind of saloon, placed at the end or in the middle of a long ARBOUR.

It differs from an arbour, which is long, in form of a gallery, and arched over head; whereas the *cabinet* is either square, circular, or in cants, making a kind of saloon.

CABINET is also used in speaking of the more select and secret councils of a prince or administration.

Thus we say, the secrets, the intrigues of a *cabinet*.

To avoid the inconveniencies of a numerous council, the policy of Italy, and practice of France, have introduced *cabinet* councils; a remedy worse than the disease.

King Charles I. is charged with first establishing this usage in England. Besides his privy council, that prince erected a kind of *cabinet* council, or junto, under the denomination of a council of state; composed of archbishop Laud, the earl of Strafford, and lord Collington, with the secretaries of state.

Yet some pretend to find the substance of a *cabinet* council of much greater antiquity, and even allowed by parliament, who anciently settled a quorum of persons most confided in, without whose presence no arduous matter was to be determined; giving them power to act without consulting the rest of the council. As long since as the 28th of Henry III. a charter passed in affirmance of the ancient rights of the kingdom; which provided, that four great men, chosen by common consent, who were to be conservators of the kingdom, among other things, should see to the disposing of moneys given by parliament, and appropriated to particular uses; and parliaments were to be summoned as they should advise. But even of these four, any two made a quorum; and generally the chief justice of England and chancellor were of the number of the conservators. Math. Par. 28 Hen. III.

In the first of Hen. VI. the parliament provides, that the quorum for the privy council be six, or four at least; and that in all weighty considerations, the dukes of Bedford and Gloucester, the king's uncles, should be present; which seems to be erecting a *cabinet* by law.

CABIRI, in *Antiquity*, certain deities worshipped more especially by the Samothracians, and in the isle of Imbros, and some other parts of Greece.

The *Cabiri*, according to Sanchoniathon, were also adored by the Phœnicians. Diodorus Siculus ascribes to them the invention of fire, and the art of working iron. Whence it is that on a medal of Gordian, and another of Furia Sabina Tranquillina, both struck at Carthæ, where the *Cabiri* were worshipped, we find the figure of a *Cabirus* on a column, holding a hammer in his right hand. For the same reason, Herodotus observes, they were represented like Vulcan. Died. Sic. lib. v. Herod. lib. iii.

The word *cabiri*, considered as of Hebrew or Phœnician origin, denotes *great* and *powerful*; and some have supposed that the deities worshipped under this appellation were Ceres, Proserpine, Pluto, and Mercury; whilst others have comprehended under it all the principal heathen deities: though it is disputed who, and how many, the *Cabiri* were, whether they be of Phœnician, Samothracian, or Egyptian origin; and whether the sons of Vulcan or Jupiter.

CABIRI is also used to denote the *Gabri*, or Persian FIRE-*worshippers*. Hyde de Rel. Persarum, cap. 29. See GABRE.

CABIRIA, Καβειρια, religious feasts held by the ancient Greeks of Lemnos and Thebes, in honour of the gods *Cabiri*.

These feasts were very ancient, and prior even to the time of Jupiter; who is said to have restored them: they were held by night. Children above a certain age were here consecrated; which consecration was supposed to be a preservative against all dangers of the sea, &c.

The ceremony of consecration called *Synnesis*, or *Synnesus*, q. d. *contheurizing*, consisted in placing the initiated youth on a throne, the priests dancing round him: the badge of the initiated was a girdle or scarf.

When a person had committed any murder, the *cabiria* gave him an asylum.—Meursius is very particular in the proof of each of these points.

CABLE, a thick, long, three-strand rope, ordinarily of *hemp*, serving to hold ships firm at anchor, and to tow vessels in large rivers. In Europe, the *cables* are commonly made of hemp; in Africa, of long straw or rushes called *lusf*; and in Asia, of a peculiar kind of Indian grass.

The word *cable* comes from the Hebrew word *chobel*, *cord*. Du Cange derives it from the Arabic, *hebl*, *cord*, *or tobaita*, *rope*: Menage, from *capulum*, *or cabulum*; and that from the Greek κωπη, or the Latin *camelus*. The term *cable* is sometimes also applied to the cordage used to raise massy loads, by means of cranes, wheels, and other like engines; though, in strictness, *cable* is not to be applied to ropes of less than three inches circumference. Every *cable*, of whatever thickness it be, is composed of three strands; each strand of three twists; and each twist of a certain number of caburns, or threads of rope yarn, more or less, as the *cable* is to be thicker or smaller.

To make a *cable*: after forming the strands, they use staves: which the first pass between they strands, that they may turn the better, and be interwisted the more regularly together. And to prevent any entangling, a weight is hung at the end of each strand. The *cable*, being properly twisted, neither too much, so as to become stiff, nor too little, so as to be weakened, is untwisted again three or four turns, that the rest may the better retain its state. The usual allowance for the diminution of length by twisting, is one third of the whole; so that for a cable of 120 fathoms, the rope-yarn must be 180 fathoms long.

The number of threads which each kind of *cable* is to be composed of, is always proportioned to its length and thickness; and it is by this number of threads that its weight and value are ascertained. Supposing, then, the lengths to be equal, the number of threads and the weights will be as the areas of their bases, or, which comes to the same, as the squares of their circumferences. Having, then, the weight and number of threads of any one *cable*, we may easily calculate the following table:

Circumference.	Threads.	Weight.
3 Inches	48	192 Pounds
4	77	308
5	121	484
6	174	696
7	238	952
8	311	1244
9	393	1572
10	485	1940
11	598	2392
12	699	2796
13	821	3284
14	952	3808
15	1093	4372
16	1244	4976
17	1404	5616
18	1574	6296
19	1754	7016
20	1943	7772

Every merchant-veſſel, how ſmall ſoever, has three *cables*; viz. the main or maſter-*cable*, which is that of the chief anchor, called the ſheet-*cable*; and the two *bowers*, beſt and ſmall. The ordinary length of the great *cable*, is 120 fathoms or braces.

A long *cable* is not ſo apt to break as a ſhort one, becauſe it draws more horizontally on the anchor than the other; and a ſhip will ride more ſmoothly as well as more ſafely with a long *cable*, becauſe ſhe will not be ſo liable to plunge deep in the water with her fore-part.

By ſtat. 21 Hen. VIII. c. 12. ſect. 2. no perſon dwelling within five miles of the town of Bridport, in the county of Dorſet, ſhall ſell out of the market, holden within the ſaid town, any hemp which ſhall grow within the ſaid five miles, upon pain of forfeiture of the hemp.

Sect. 3. No perſon other than ſuch as ſhall dwell within the ſaid town, ſhall make out of the ſaid town, any *cables*, hauſers, ropes, traces, halters, or other tackle made of hemp, within five miles of the ſaid town; upon pain of forfeiture of the ſaid *cables*, &c.

Sect. 4. Twenty pounds weight ſhall be accounted the ſtone.

Sect. 5. Every perſon dwelling within the ſaid diſtance, may make *cables* and other tackle for their own uſe. This act to endure to the next parliament. Continued indefinitely by 3 Car. I. c. 4. 16 Car. I. c. 4.

Stat. 35 Eliz. c 8. ſect. 3. If any perſon ſhall make *cables* of any old or overworn ſtuff, which ſhall contain above ſeven inches in compaſs; every perſon ſo offending, ſhall forfeit four times the value; and if any perſon ſhall tar any halſers or other cordage made within this realm, of ſuch old and overworn ſtuff, being of leſſer aſſiſe, and not containing in compaſs ſeven inches; and by retail put to ſale the ſame being ſo tarred; every perſon ſo offending, ſhall forfeit treble the value, &c.

Sect. 4. Every perſon who ſhall offend againſt this act, ſhall be impriſoned during her majeſty's pleaſure.

Stat. 6 Ann. c. 10. ſect. 13. Foreign cordage or *cable*-yarn imported, upon exportation, ſhall have no allowance or drawback of duties.

CABLE, *ſtream*, a hauſer, or rope, ſmaller than the *bowers*, uſed to moor a ſhip in a river or haven.

The ſeamen ſay, the *cable is well laid*, when it is well wrought or made.

Serve the cable, or *plat the cable*, i. e. bind it about with ropes, cloots, &c. to keep it from galling in the hawſe.

To *ſplice a cable*, is to make two pieces faſt together, by working the ſeveral ſtrands of the rope one into another.

To *end the cable*, is to roll it up round in a ring; of which, the ſeveral rolls one upon another are called *cable-tiers*.

Pay more cable, pay along the cable, veer more cable, that is let it more out from the ſhip, that the boat which carries the anchor may the more eaſily drop it into the ſea.

Heave in the cable, that is, draw it into the ſhip by winding it about the capſtern or windlaſs.

When two *cables* are ſpliced together, it is called a SHOT *of a cable*.

Bit the cable. See BITS.

CABLE, or CABLE'S-LENGTH, is alſo uſed for a meaſure of 120 fathoms, being the uſual length of the *cable*.

CABLED, in *Heraldry*, is applied to a croſs formed of the two ends of a ſhip's cable: ſometimes alſo to a croſs covered over with rounds of a rope; more properly called a croſs corded.

CABLING, in *Architecture*, the figure of a ſtaff, or reed, either plain or carved, in reſemblance of a rope, or a ruſh, wherewith a third part of the flutings of a column are ſometimes filled up; hence called *cabled flutings*.

There are alſo *cablings* in relievo without fluting, eſpecially on certain pilaſters, as in the church of Sapienza at Rome. See FLUTES.

CABLISH, *Cablicia*, in the *Foreſt Law*, denotes bruſh or browſe wood; though Spelman takes it more properly to ſignify trees, or branches, thrown down by the wind; from the French *chabler* or *bois chablis*, which denotes the ſame.

CABOCHED, CABOSHED, or CABOSSED, in *Heraldry*, is where the head of a beaſt is cut off behind the ears, by a ſection parallel to the face; or by a perpendicular ſection; in contradiſtinction to couped; which is done by a horizontal line; beſides that it is farther from the ears than *caboſſed*.

The word is formed from the obſolete French *caboche*, from *caput*, head.

CABOCLES, a name given in the Weſt Indies by the Portugueſe to thoſe produced between Americans and Negroes.

CABOTE, in *Ichthyology*, the name of a fiſh of the cuculus kind, more uſually known among authors by the name of the CORAX.

CABRUSI, in the *Writings of the Ancients*, a word frequently uſed to expreſs Cyprian, or coming from the iſland of Cyprus. The ancient Greeks had almoſt all their vitriols and ſtyptic minerals from this iſland; they therefore ſometimes called theſe *cabruſi*, without any other. It is very probable that our worm-coppera, the common name of green vitriol, is a falſe pronunciation of this word *cabruſi*.

CABUIA, a Weſt Indian ſpecies of hemp, produced in the province of Panama, from a plant ſomewhat like the *chardon ou tris*; when ripe, they lay it to ſteep in water, and after drying it again, beat it with wooden mallets till nothing but the hemp remains, which they afterwards ſpin, and make thread and ropes of it; the former of which is ſo hard and rough, that with it they ſaw iron, by fitting it on a box, and laying a little fine ſand over the metal as the work proceeds.

CABURE, in *Ornithology*, the name of a ſmall Braſilian bird of the owl-kind; very beautiful, and very eaſily tamed. It is of a brown colour, variegated with white, and is feathered down to the toes. The Braſilians keep it tame for its diverting tricks; it will play with people like a monkey, and is perfectly harmleſs.

CABUREIBA, in *Botany*, a name by which ſome authors have called the tree which affords the black Peruvian balſam of the ſhops.

CABURNS, in *Sea-language*, denote ſmall lines made of ſpun yarn, wherewith to bind cables, ſeize tackles, and the like.

CACABOGA, in *Zoology*, the name of an American ſpecies of ſerpent, by ſome accounted the ſame with the TARBINOIA, or black water-ſnake of that part of the world; but by others deſcribed as yellow in colour, living about houſes, and doing great miſchief among poultry, though not fatal to mankind in its bite.

CACAGOGA, in *Ancient Medicinal Writings*, a word uſed for certain ointments intended for rubbing on the fundament to procure ſtools. The moſt common of theſe was made of alum mixed with honey, and boiled till the whole was of a tawny colour. This anointed on the fundament, procured a great many ſtools, but not without ſome pain.

CACALIA, in *Botany*. See *Foreign* COLT'S-FOOT.

CACAO, in *Botany*, *Theobroma* of Linnæus, the chocolate-nut tree; a genus of the *polyadelphia pentandria* claſs. Its characters are theſe: the flower hath five petals, which are irregularly indented; and hath five erect ſtamina; in the centre is placed the oval germen, which afterward becomes an oblong pod ending in a point, which is divided into five cells, filled with oval, compreſſed, fleſhy ſeeds. We have but one ſpecies of this plant, which is a native of America, and is found in great plenty in ſeveral places between the tropics; but particularly at Carthea, and Carthagena, on the river Amazon, in the iſthmus of Darien, at Honduras, Guatimala, and Nicaragua. At all theſe places it grows naturally without culture; but is cultivated in many of the iſlands poſſeſſed by the French and Spaniards; and was formerly planted in ſome of the iſlands which are in poſſeſſion of the Engliſh.

The native Mexicans call the *cacao-tree*, *cacahua quahuitl*; and the Spaniards, *cacaotal*. It reſembles our cherry-tree; but is ſo very delicate, and the fruit it grows in to hot, that to guard it from the ſun, they always plant it in the ſhade of another tree, called mother of *cacao*.

It is very proper to obſerve, that the chocolate-nut will not retain its vegetative faculty long after they are taken from the trees, ſo that there is no poſſibility of tranſporting them to any great diſtance for planting: nor ſhould they be kept long out of the ground in the natural places of their growth. In order therefore to cultivate this plant for curioſity in Europe, it will be neceſſary to have the nuts planted in boxes of earth, in the countries where they grow, ſoon after they are ripe. Theſe plants muſt be frequently but gently watered, and proteſted from the ſun and the cold, according to the latitudes they paſs through; and when arrived, muſt be carefully preſerved in a hot ſtove.

The fruit is incloſed in a kind of pod, of the ſize and figure of a cucumber; except that it begins and ends in a point. Within the pod, which is half a finger thick, is formed a pleaſus of white fibres, very ſucculent, a little acid, and good to appeaſe thirſt. In the middle of theſe fibres are contained ten, ſometimes twelve, and ſometimes more, as far as forty-ſeeds, of a violet colour, and dry as acorns. Each ſeed, which is covered with a little bark or rind, when ſtripped thereof, ſeparates into five or ſix unequal pieces, in the middle whereof is a kernel having a tender bud, very difficult to preſerve.

Of this ſeed, with the addition of vanilla, and ſome other ingredients, the Spaniards, and after their example, the reſt of Europe, prepare a chocolate confection, or cake; which, diluted in hot water, makes that delicious, wholeſome drink called CHOCOLATE.

It is likewiſe made into a ſweet-meat; and there is an oil

oil extracted from it, to which they give the name of butter. That oil is as sweet as the oil of almonds, and is made after the same manner. It is an extraordinary remedy for the cure of burns and scalds. Some of the Creolian ladies use it as a paint, to render their complexion fresh, and their skins smooth.

In some parts of America, the *cacao* seeds are used by the Indians as money: twelve or fourteen are esteemed equivalent to a Spanish real, or six pence three farthings sterling.

There are two kinds of *cacao*: the most common, which is likewise the best, is of a dark colour, bordering on red and round: the other is called *pattaye*, which is white, larger, thicker, and flatter; its quality is deficative. Some druggists, however, sell four kinds; viz. the great and little *caracas*, and the great and little *cacas* of the islands: these, however, may be properly reduced to the two kinds above mentioned, it being only the greatness and smallness that multiplies the name and kinds. They were procured in great plenty from one of the islands called King George's islands, by commodore Byron, in his late voyage through the South Seas, and found to be an excellent antiscorbutic. Many, he observes, while limbs were become as black as ink, who could not move without the assistance of two men, and who, besides total debility, suffered excruciating pain, were in a few days, by eating these nuts, although at sea, so far recovered as to do their duty, and could go even aloft as well as they did before the distemper seized them. Hawkesworth's Voyages, vol. i. chap. x. p. 134.

Cacao is one of the most oily fruits which nature produces; and has this singular advantage, that it never grows rank, how old so ever it be, as all other fruits do which have any analogy with this: such as walnuts, almonds, kernels of pine apples, pistachio-nuts, olives, &c. The *cacao* nuts are esteemed by the Mexicans an antidote, and used, even now, to advance paint of the bowels.

CACAO TREE, in *Natural History*, the name by which the Brasilians call the ARIMMIXEI, which is very common there as well as with us.

CACATORY *fever*, a denomination given by Sylvius to an intermittent fever, accompanied with a severe looseness, and sometimes gripes.

CACAVATE, in *Botany*, a name given by some authors to the COCOA-*tree*; which is also sometimes called *cauvera*.

CACAVIA, in *Botany*, a name given by the Greek authors and some of the others to the LOTUS or nettle-tree. It obtained this name from the resemblance of its fruit when ripe, to the HALICACCABUM or winter-cherry.

CACCALIA, in *Botany*, a name given by some of the old Greek writers to the *holeacanthum* or *alkekengi*, the winter-cherry; a kind of nightshade or plant allied to that family, but distinguished from all the others by the fruit being covered with a membranaceous bag.

CACCABON, in *Botany*, a name given by some authors to the *water-*LILY or *nymphæa*.

CACEDONIUS *torturum*, is peccant matter in the human body, generated from separations by the secretive faculty, which are not immediately succeeded by the operation of the expultive faculty.

CACHALOT, in *Ichthyology*, a cetaceous fish, with teeth in the lower jaws only; classed by Linnæus under the *physeter*. The blunt-headed *cachalot* is one of the species that yields the *spermaceti*: there are besides the round-headed, and the high-finned *cachalots*. See PHYSETER.

CACHEF, or CACHEFF, in the *Turkish Affairs*, the governor of a city, town, or even a province in Egypt.

The title *cachef* is also given to the captains or commanders of little flying armies, intended to keep the Arabs in obedience.

Egypt is divided by the Turks into thirty-nine *cachefficks*, or governments.

CACHEXY, in *Medicine*, an ill state or disposition of body; wherein the nutrition is depraved throughout the whole habit; accompanied with a swelling, or bloating of the fleshy parts; a flaccid state of the body, easily perceived externally, and arising from a viscosity of the juices, and a remission of the tonic motions of the parts.

The word is formed from κακὸς, *ill*, and ἕξις, *habit* or *disposition*.

The *cachexy* is distinguished from the anasarca by the flesh hanging flaccid and pendulous, and being soft in it; whereas in the anasarca, it is often so distended and hard that the skin shines, and looks as if it would burst. The anasarca also usually forms œdematous tumors in many parts of the body, but the *cachexy* never does this. It differs from the sickies in that this disease only affects the lower parts of the body, but the *cachexy* the whole; but it differs only from the chlorosis as genus from species. Physicians distinguish the *cachexy*, into simple and compound: the first is, when it is combined with no other disease; in the other, it is frequently compounded with the scurvy.

CACHEXY, *fignes of the*. There is no disease more readily known than this, as none has such obvious and distinctive symptoms. The face, hands, feet, and legs, are always bloated, and swelled beyond their natural dimensions; the natural heat of the body decreases, and there is an evident and actual sensation of cold in the parts. This is attended with an universal languor, and anxiety of mind, and a painful weakness in going up stairs, or walking up hill; the appetite is very uncertain, and loathings of food are very frequent: after food, there are all the symptoms of a bad digestion, as tensions and oppressions about the stomach and flatulencies. The bowels are in a very uncertain state, sometimes remaining costive for a long while; and at others, throwing off the food undigested, in the manner of a tenery: the patients have all a great propensity to sleep, but they are not refreshed by it. The urine is but small in quantity, and is sometimes crude and reddish; sometimes limpid, but always has a livid appearance. The pulse is languid and weak; and the blood, if it happens to be seen by any accident, is pale and thin, and abounds in serosities. The patients always complain also of a shortness of the breath, and a difficulty of breathing, especially after the body has been at any time in motion. Heats and flushings come on at times, and the head is always disturbed; always torpid and inclined to sleep, and sometimes vertiginous and violently painful; and œdematous tumors appear in the feet, when the patient is standing up, but disappear again when he lies down.

There is always also a sense of weight and pressure in the abdomen; sometimes in the right hypochondrium, sometimes in the left; and often deeply inward under the navel: sometimes the whole abdomen is inflated and hard, and sometimes it is only partially so; hardnesses and inequalities being feasible to the touch in it.

It most frequently attacks persons of a phlegmatic habit, and is more common among women than men, as well on account of their softer texture, as of the frequent disorders the irregularity of their menstrual discharges throws them into. Women, however, are brought into it through a defect of the menses than by the excess of that discharge.

Causes of it. Among these are to be reckoned, the living in wet and damp rooms; the leading of an idle and sedentary life, and the feeding on viscous things, and drinking great quantities of water. On the contrary, the abuse of spirituous liquors will also occasion it; and the taking of astringent medicines at the times when the blood is in violent emotions, as in hæmorrhages, and acute fevers; the flushing in of cutaneous fevers will also sometimes occasion it; and very often the omission or suppression of habitual discharges of blood, by whatever passages. Great loss of blood is vulgarly supposed to be one of the principal agents in bringing on this disease, but improperly: for when this succeeds such discharges, it is rather owing to their being long continued than violent, and to the improper diet of the patient afterwards, which prevents a proper supply of blood again from the actual loss of it. Improper treatment of the gout, and the abuse of volatile salts in high fevers, are also too often the cause of this disease.

According to Boerhaave, *cachexies* may arise either from a vitiated state of the nutritious juice, from some disorder of the vessels that are to receive it, or from a defect in the faculty that should apply it. The juices, he observes, may be depraved, either from the quality of the food; as if it be farinaceous, leguminous, fat, fulsome, sharp, aqueous, or viscous; from the want of exercise; from the organs being vitiated by too much weakness, or too much strength; and their again may be occasioned by immoderate secretions and evacuations of any kind, the scirrhosity of some of the viscera, or the retention of something that should be secreted: and hence a diminution of the solids, or a repletion of the liquids with things that cannot pass; whence arise two notable ill effects of this evil, viz. a leucophlegmatia, and an anasarcous dropsy. According to the various colour, quantity, tenacity, acrimony, and fluidity of the nutritious liquor, arise also various disorders, as the effects of the *cachexia*; v. g. paleness, yellowness, lividness, greenness, blackness, or redness of the skin; heariness, windiness, palpitation of the heart and arteries increased with the least motion, crude thin urine, spontaneous watery sweats; and, at length, a leucophlegmatia and dropsy. For the vessels that receive the nutritious juice, there cannot well be assigned any universal fault; unless their too great laxity, and the disorders accruing from them, may be admitted as such. Lastly, nutrition is impeded and perverted, by a defect in the faculty that should apply it; as when the circulating force is either too languid or too violent.

Prognostics. When this disease is plenary, and the whole

trafs of the humours is depraved by it, it is very difficult of cure; it is in general more eafily cured in young people than in older; and in thefe laft, it ufually degenerates into a dropfy, and hectic; and when driven back, it often produces a fuffocative catarrh. When the difeafe is not plenary, or in its full ftate, but rather may be called a *cachectic* difpofition than a *cachexy*, as is frequently the cafe with young people; particularly with girls, on account of the fuppreffions of the menfes; then it is in general eafily cured, unlefs the bad regimen of the patient for fome time before has rendered it more than ufually obftinate and violent; in general, the fooner it is undertaken, the more eafily it is cured.

The chlorofis of young girls, which feems to be of a middle nature, between a cachectic difpofition and a confirmed *cachexy*, is a chronic cafe, and feldom admits of a fudden cure, unlefs there be a remarkable change of life in the patient, as by marriage. This chlorofis is in itfelf rather troublefome than dangerous, as it gives an univerfal languor, both of body and mind, a bad colour, palpitations of the heart, and other painful fymptoms; but it fometimes degenerates into a *cachexy*, or a hectic.

Method of cure. The general method muft be by correction of the vitiated humours; a reftoration of the vifcera; an evacuation of the humours, when thus prepared for it; and, finally, a reftitution of the due tone to the folids.

For the firft fortnight, the patient fhould be treated with refolvents and digeftives: fuch as the *tartarum vitriolatum*, and abforbents rated with acids, as crab's eyes with lemon juice; and with aperient decoctions of the woods of guaiacum and faffafras, as the roots of pimpernel, and the like; and either during this time, or afterwards, evacuants are to be given, fuch as fena, jalap, and dwarf-elder. When the improper treatment of a fever has been the occafion of the malady, the mild alexipharmica are to be given at times; and when an obftruction of the menfes is in the cafe, the time they are to be expected is to be carefully regarded, and fomenta, gargles and baths for the feet, are to be ordered at thofe periods. When obftructions of the hæmorrhoidal difcharges are in the cafe, then, after the firft fortnight, leeches fhould be applied to the hæmorrhoidal veins; and if the difeafe has arifen from long continued hæmorrhages, then analeptics are to be trufted to, with very gentle correctives for fear of exciting new commotions in the blood; and in thefe cafes, bleeding in the arm is fometimes found neceffary.

It is of the utmoft confequence in this cafe, that a proper diet be obferved; all coarfe and heavy foods are to be avoided, as alfo all acid and falt things; and much water is as carefully to be guarded *againft*, as an exceffive ufe of fpirituous liquors. Finally, when the difeafe is cured, its return is to be guarded againft, by taking proper purgatives once a month. To this purpofe, Stahl greatly recommends a mixture of gum ammoniacum, galbanum, and myrrh, and fmall quantities of calomel, with the purges. It is too common a practice to give boldly the forcing medicines, as they are called, to young women in *cachectic* complaints; fuch as myrrh, faffron, favin, and the like; but this very often throws them into an *efcites*, or other diforders, worfe than the firft.

CACHEXY, *cachexia*, a term ufed by Hoffman for the *fluor albus*.

CACHLEX, in *Natural Hiftory*, a name ufed by fome authors for the fmall pebbles found on the fea and river fhores, which being heated red-hot, and quenched in whey, are faid to give an aftringent virtue.

CACHORRODOMATO, in *Zoology*, the name by which the Portugueſe in America call the TAITU; a creature in many refpects refembling the OPOSSUM, and fuſpected to be the male of that creature.

CACHRYS, in *Botany*, a genus of the *pentandria digynia* claſs. Its characters are theſe, it hath an umbellated flower, the involucrum compoſed of many narrow ſpear-ſhaped leaves, with five ſpear-ſhaped erect petals; it hath five ſingle ſtamina; the rudimental germen is ſituated under the corolla; the empalement afterward becomes a large, oval, blunt fruit, dividing in two parts, each having one large ſeparate ſeed. Linnæus mentions two, and Miller five ſpecies.

The ſeed of *cachrys*, though not uſed in the preſent pharmacy, was recommended by the ancients for its heating and drying qualities; and therefore judged a proper ingredient in emeſtines. It alſo made a good plaſter for the head in deſluxions upon the eyes, provided it is taken off at the end of three days, and taken with pepper and ſalt, it was ſaid to be good for the epilepſy. James.

CACHRYS, or CANCHRYS, among *Ancient Botaniſts*, denoted a ſcaly tuft, growing like a catkin on certain trees; as the oak, beech, pine, and the like; or, according to others, an unſeaſonable kind of germen or bud, appearing either in the ſpring, or autumn, and which, after the winter is over, ſpreads or ſhoots into branches. The word is ſometimes alſo uſed for the ſeed of roſemary, or even the plant itſelf; ſometimes for barley roaſted in a furnace, to render it more eaſy to grind into flour.

CACHU, CACHOU, or CATECHU. See CATECHU.

CACHUNDE, the name of a medicine, highly celebrated among the Chineſe and Indians, and made of ſeveral aromatic ingredients, the perfumes, medicinal earth, and precious ſtones: they make the whole into a ſtiff paſte, and form out of it ſeveral figures, according to their fancy, which are dried for uſe: theſe are principally uſed in the Eaſt Indies, but are ſometimes brought over to Portugal. In China, the principal perſons uſually carry a ſmall piece in their mouths, which is a continued cordial, and gives their breath a very ſweet ſmell. It is a highly valuable medicine alſo, in all nervous complaints; and is eſteemed a promoter of *life*, and a provocative to venery, the two great intentions of moſt of the medicines in uſe in the Eaſt.

CACHYMIA, in *Metallurgy*, a term uſed by Paracelſus for an imperfect metalline ore, as he expreſſes it, an immature metalline body, which is neither a ſaline ſubſtance nor a metal.

The *cachymia* may be divided into ſulphureous, as marcaſſite; mercurial, as arſenic or orpiment; and ſaline, as all talcs.

CACOCHYMIA, a vicious ſtate of the vital humours, eſpecially of the maſs of blood; ariſing either from a diſorder of the ſecretions or excretions, or from external contagion.

The word is compounded of κακος, *ill*, and χυμος, *juice*.

Gorræus gives this name to the abundance, or exceſs of any ill humour; whether it be bile, *pituita*, or any other; provided there be only one that thus offends in quantity; and *plethora* he calls the abundance, or exceſs, of all the humours together.

CACODES, in the *Ancient Writers of Medicine*, a name given to ſeveral kinds of *matter* diſcharged from the human body, which had an ill ſmell. The offenſive matter voided ſometimes by vomit, has this name, as alſo that evacuated by ſtool, and the diſcharge of foul ulcers.

CACOETHES, or CACORTHIA. See MALIGNANT.

CACOPHONIA, in *Grammar* and *Rhetoric*, the meeting of two letters, or ſyllables, which yields an uncouth, and diſagreeable ſound.

The word is compounded of κακος, *evil*, and φωνη, *voice*.

CACOPHONIA, in *Medicine*, denotes a vice or depravation of the voice, or ſpeech; of which there are two ſpecies, *aphonia*, and *dyſphonia*.

CACTONITES, in *Natural Hiſtory*, a name given by ſome old writers, to a beautiful pale red ſtone, ſuppoſed to be the ſame with our pale *carnelian*.

CACTUS, in *Botany*. See *Melon* THISTLE.

CACULE, in the *Materia Medica*, a name given by Avicenna, Serapio, and all the other Arabian writers, to the *cardamum* ſeeds. They diſtinguiſh two kinds of this fruit, a larger, and a ſmaller. The larger is the grain of paradiſe, and the ſmaller the common cardamom ſeed of theſe times. They alſo called the cardamoms, in general, by the name *hail*, and diſtinguiſhed the ſmall kind, now principally in uſe, by the word *hilburi*, which after-writers corrupted into *hilbate* and *hilbuti*, or *hilbun*.

CADABI, or KADARI, a ſect of Mahometans, who aſſert free-will, attribute the actions of men to men alone, not to any ſecret power determining the will; and deny all abſolute decrees, and predeſtination.

The author of this ſect was Mabed ben Kaled Al Giboni, who ſuffered martyrdom for it.

The word comes from the Arabic, קדר, *cadara*, *power*. Ben Aun calls the *Cadarioni*, the Magi, or Manichees of the Muſſulmen.

CADE, a cag, cask, or barrel; uſed in the book rates for a determinate number of ſome ſorts of fiſh.—Thus a *cade* of herrings is a veſſel containing the quantity of five hundred herrings, and of ſprats one thouſand.

Anciently the *cade* of herrings appears to have contained ſix hundred fiſh, reckoning ſix ſcore to the hundred.

CADE-*lamb*, a young lamb weaned, and brought up by hand, in a houſe; called in the North, *pet-lamb*.

CADE-*oil*, in the *Materia Medica*, a name given to an oil much in uſe in ſome parts of France and Germany. The phyſicians call it *oleum cadæ*, or *oleum de cade*. This is ſuppoſed by ſome to be the *ſpiſſeum* of the ancients, but improperly; it is made of the fruit of the *oxycedrus*, which is called by the people of thoſe places, *cade*.

CADE-*worm*, in *Natural Hiſtory*, a name given by authors to the *phryganea*, a common worm, found in ditches, and uſed as a bait for fiſh. The fly produced from this worm has a long body, four wings, and a forked tail, and is found on the banks of Argall very frequent on waters.

CADENCE, in *Music*, denotes a kind of *close*, or *rest*, either at the end of a song, or some of its parts, into which it is divided as into members, or periods.

The word seems a metaphor drawn from the dancing-school, where it properly signifies a *pause*, or *fall*, from motion to rest. A *cadence* is properly when the parts fall, and terminate on a *chord*, or note, the ear seeming naturally to expect it. Regularly it is to be made on the first or dominant, though sometimes also on the mediant, or middle chord of a mode.

Cadences in singing answer nearly to points or stops in discourse. They are rests contrived to favour the weakness of the performers, as well as the beauty, of a musical composition. Men are not able to sustain their attention, or their voice, beyond the space of two measures; even in this short interval we perceive the song to fall, and tend rapidly to a pause, or rest: the notes which introduce these pauses, are called *cadences*, on the proper conducting and expressing of which a great part of the musician's skill depends. The chief *cadence* or close is the key itself, in which the bass must always conclude; the next in dignity to the first above, and the next to that the third. Or if the bass be sharp, the fourth or second above the key.

In modulation, *cadences* are made on several keys, though still with some relation to the principal one: the harmony must always return to the key appropriated to the piece, and often terminate there by middle as well as final *cadences*.

Cadences usually occur in every two measures, and always in the note which begins the measure they happen in. It requires a nice taste to distinguish the tone upon which the *cadences* essentially fall; because they usually seem to fall on another note presented in the song. It is by the natural progression of the fundamental bass that we are enabled to make the discovery. As often as two bass falls a fifth, or rises a fourth, there is a *cadence*. In reality, this disposition imitates a close so well, that when we come to the first found of this *cadence*, we find ourselves as it were forced to fall on the other. So that it requires an extraordinary effort of the voice to sustain it self on the first, or only to fall a third. Hence it is that the first found which makes its fifth of the tonic, is called its dominant, being in reality the top, or highest part of the harmonical system, and that second from the fundamental found; thus *sol* is the dominant of *ut*; and *re*, of *sol*. In making a *cadence*, the bass must always fall a fifth, or rise a fourth.

CADENCE, among the French *Musicians*, is used to signify a *trill*, or *shake*, but improperly, according to Brossard. In effect, the *cadence* is properly the transition from the note on which the shake is made, to a note which is a tone lower, or a semi-tone major higher, in the treble part. See CADENZA *Staccata*.

CADENCES, in the *Ancient Music*, denotes a series or succession of musical notes, in certain intervals, which strike the ear agreeably; and especially at the close of a song, couplet, or stanza. In which sense, *cadence* amounts to much the same with *rhythmus*.

CADENCE, in *Oratory*, and *Poetry*, denotes the running of verse, or prose; otherwise called the *numbers*, and by the ancients *rhythmus*. See RHYTHM.

CADENCE, in the *Modern Dancing*, is when the several steps and motions follow, or correspond to, the notes or measures of the music.

CADENCE, in the *Manege*, denotes an equal measure, or proportion observed by a horse in all his motions, when he is thoroughly managed, and works justly either at the gallop, *terra à terra*, or the air.

A horse's working in *cadence* imports, that his times or motions are uniform, and that one does not take in more ground than another.

CADENCY, in *Heraldry*, the state, or quality, of a CADET. Nisbet has an essay on the abdominal figures and marks of *cadency*. See DIMINUTION.

CADENZA *Staccata*, in the *Italian Music*, is used when a part instead of ascending or descending the proper interval, to form a *cadence*, proceeds by some other interval. For instance, when the bass, instead of rising a fourth or falling a fifth, ascends only by a tone, or semi-tone major.

Ex. 1. Ex. 2.

Thus, in Ex. 1. where the bass, instead of proceeding to C, the key-note, after G, goes to A. Thus also, in Ex. 2. after E, the bass would naturally expect to rise to A, the key-note; but this is avoided, and F put in its place.

CADETS, the younger brothers of a family: a *term* naturalized in our language from the French.

In Paris, among the citizens, the *cadets* have an equal portion with the eldest: in other places, the eldest has all. According to the custom of Spain, one of the *cadets*, in great families, takes the mother's name.

CADET also denotes a young gentleman soldier, who, to attain to some knowledge in the art of war, and in expectation of preferment, chooses to carry arms as a private man in a company of foot.

Cadets differ from volunteers, as the former takes pay, though only that of a private man, whereas the latter serves without pay.

Formerly there were allowed only two *cadets* in each company. In 1682, the King of France established companies of *cadets*, wherein the young gentry were trained up to war, and taught the arts and exercises belonging thereto, as riding, fencing, mathematics, &c.

CADGE, a round frame or wood, on which falconers carry their hawks when they expose them to sale.

CADI, among the Turks and Saracens, denotes an ordinary judge, who decides in all civil controversies within the district of a town, or city, though subject to appeals to superior judges.

The word is Arabic קדי or קאדי, q. d. *judge*, formed of קדי, *to judge*. D'Herbelot writes it *cadhi*.

The term *cadi*, used absolutely, denotes the judge of a smaller town or village; those of cities being called *molla*, or *mollas*, sometimes *molwadin*, or *great cadis*.

We find numerous complaints of the avarice, extortion and iniquity of the Turkish *cadis*: all justice is here venal: the people bribe the *cadis*; the *cadis* bribe the *moollas*; the *moollas* the *casselebeys*; and the *casselebeys* the *mufti*.

It is usually vain to appeal from the sentences of the *cadi*; since the whole is over heard anew, but judgment is pulled on the *cadi*, as stated by the case. The *cadis*, nevertheless are often cashiered, and punished for notorious iniquities with the bastinado and mulct; but the few forbids them to be put to death. Constantinople has had *cadis* ever since the year 1396, when Bajazet I. obliged Isaac Palæologus, emperor of the Greeks, to receive *cadis* into the city, to judge all controversies happening between the Greeks and the Turks settled there. In some countries of Africa, the *cadis* are also judges of religious matters. Among the Moors, *cadi* is the denomination of their higher order of priests, or doctors, answering to the rabbins among the Jews.

CADIANG, in *Botany*, a kind of lentiscus in Batavia, and the adjacent country, which makes a considerable part of the food of the common people. Dr. Hawkesworth's Account of the Voyages to the South Sea, vol. iii. p. 7.

CADILESCHIER, or CADI-LESKER, a capital officer of justice among the Turks, answering to a chief justice among us.

The word comes from the Arabic *kadi*, *judge*, the particle *al*, *and above*, or *over*; as being at their first institution chiefly judges of the soldiery, of whose causes they have still the sole cognizance. D'Herbelot writes the name *cadi-leskier*, or *cadhi-asker*.

It is said that this authority was originally confined to the soldiery; but that at present it extends itself to the determination of all kinds of law-suits; yet nevertheless subject to appeals.

There are but three *cadileskiers* in all the grand signior's territories; the first is that of Europe; the second, of Natolia; and the third resides at Grand Cairo. This last is the most considerable. They have their seats in the divan next to the grand visir.

The *cadileskiers* have much the same authority in the provinces, that the *muftis* have at Constantinople: they even frequently rise to be *muftis*: their chief study is the Alcoran, which is the code of their civil, as well as canon law. Appeals are sometimes brought to them from the sentences of the *cadis* in civil affairs; and they have the superintendance of all other officers of justice within the empire. They nominate the *cadis*, and *naibs cadis*; but these last only with the consent of the grand signior. On any grievous complaints against the *cadis*, they condemn and depose them. Tournef. Voyage Lev. tom. ii. let. 14. Pococke, Egypt. p. 170.

CADITES, an appellation given by Pliny to a kind of figured stone, resembling a *cadus* or barrel.

The *caditæ* swells in the middle, and goes tapering to both ends, being divided lengthwise, with such roundish lineaments, as are usually made by the staves of a barrel, but without hoops, nor yet hollow.

CADIZADELITES, a sect among the Mussulmen, resembling the ancient Stoics, who avoid all smiling and diversion, and affect an uncommon gravity in all they do

to say. Those of them who inhabit the frontiers of Hungary, &c. agree in many things with the Christians, and drink wine, even in the fast of the Ramazan.

They read the Sclavonic translation of the Bible, as well as the Alcoran. Mahomet, according to them, is the Holy Ghost, which descended on the apostles at the feast of Pentecost.

CADLOCK, in *Botany*. See MUSTARD.

CADMEAN *Letters*, the ancient Greek or Ionic characters, such as they were first brought by Cadmus from Phœnicia; whence Herodotus also calls them, *Phœnician letters*.

According to some writers, Cadmus was not the inventor nor even importer of Greek letters, but only the modeller and reformer thereof; and it was hence they acquired the appellation *Cadmean*, or *Phœnician letters*; whereas before that time they had been called *Pelasgian letters*. See LETTER and WRITING.

CADMIA, in *Pharmacy*, a name which has been variously applied; but it usually denotes a mineral substance, whereof there are two kinds, *natural* and *artificial*.

The *natural cadmia*, again, is of two sorts; the one containing arsenic, and called *cadmia fossilis*, or COBALT: the other containing zinc, called calamine, or *lapis CALAMINARIS*.

The *artificial cadmia*, called *cadmia fornacum*, is prepared from ores containing zinc, when smelted in furnaces of this there are five kinds; the first called *botryitis*, being in form of a bunch of grapes; the second, *placitis*, as resembling a sea-shell; the third, *pisolitis*, becoming resembling stuff; the fourth, *capnitis*, *anthos*; and the fifth *cadmitis*: this last hangs round certain iron rods, wherewith the matter of the copper is stirred in the furnace; which being shaken off, bears the figure of a quill, called in Latin *calamus*.

The *cadmia botryitis* is found in the middle of the furnace; the *placitis* at the bottom; the *pisolitis* at the top; and the *capnites* at the mouth of the furnace.

This *cadmia* is desiccative and detersive; it is generally used in flinking ulcers; which by means hereof are brought to cicatrize. The *botryitis*, and *placitis*, are also good in diseases of the eyes. See TUTTY.

CADMIA is also used by Pliny for copper ore, or the stone of which copper is made. And hence the several appellations, *cadmia fossilis*, *cadmia fornacum*, *cadmia metallica*, *cadmia aeramentaria*, and *cadmia pro caerulea*. Hist. Nat. lib. xxxiv. cap. 10. rum Hard. Not.

CADMITES, in *Natural History*, a kind of gem, nearly resembling the OSTRACITES; from which it only differs in that the latter is sometimes gilt with blue spots.

In some MSS. for *cadmites*, we read *calamites*.

CADRITES, a kind of religious among the Mahometans; whose founder was Abdul Cadri, a great philosopher and lawyer; whence they take their name. *Cadrites*.

They live in common, and in a kind of monasteries; which, however, they are also wont to quit, if they request it, and to marry on condition of their wearing black bonnets on their garments, to distinguish them from the rest of the people.

In their monasteries, they pass the greatest part of every Friday night in running round, holding each other's hand, and crying incessantly, *Hhai, Hhuy*, one of the names of God: one of their number plays all the time on a flute, to animate them in this extravagant dance.

CADUCEATOR, in *Antiquity*, a denomination given to heralds or messengers of peace. See CADUCEUS.

CADUCEUS, or CADUCEUM, Mercury's rod, or sceptre; a wand entwisted with two serpents, worne by that deity as the ensign of his quality and office.

The poets attribute wondrous virtues to the *caduceus*; as that of throwing people into a sleep, raising the dead, &c. It was also used by the ancients as a symbol of peace and concord: the Romans sent the Carthaginians a javelin, and a *caduceus*, offering them their choice, whether of war or peace.

Among that people, those who denounced war were called *fetiales*, and those who went to demand peace, *caduceatores*; because they bore a *caduceus* in their hand.

The *caduceus* found on medals, is a common symbol, signifying good conduct, peace, and prosperity. The rod expresses power, the two serpents prudence, and the two wings diligence.

Wedelius has given a dissertation expressly on *caduceated* medals.

CADUCEUS is also a name given to a staff covered with velvet, and decorated with *fleurs de lys*, which the French heralds of arms bear in their hands on solemn occasions. That borne by the king at arms has a golden *fleur de lys* at the end, and is by some called sceptre.

CADUCUS *morbus*, in *Medicine*. See EPILEPSY.

CADUS, an ancient liquid measure of capacity, containing ten, sometimes twelve *congii*; and sixty, or according to others, seventy-two *sextaries*.

The *cadus* is the same with what is otherwise denominated *metretes*, and *cerameus*, &c. See AMPHORA.

CÆCÆ *Gonduræ*. See GELANOS.

CÆCILIA, in *Zoology*, the name of a genus of serpents: See SLOW-*worm*.

CÆCILIA, in *Ichthyography*, a name used by some authors for the fish more usually known by the name of the ACUS.

CÆCILIANA, in *Botany*, a name used by Pliny and some other authors for the *tussilago*, or *ambrosiacum*. Ger. Emac. Ind. 2.

CÆCUM, in *Anatomy*. See COECUM.

CÆLATURA, or COELATURA, the art of ENGRAVING on metals, stones, woods, or the like, with instruments of steel, diamond, &c. See SCULPTURE.

CÆLESTIANS, the followers of Cœlestius, a monk, who flourished under the empire of Arcadius, about the year 409, and taught much the same doctrines as Pelagius. See PELAGIANS.

CÆMENT, in a general sense, any composition of a glutinous or tenacious nature, proper to bind, unite, or keep things in cohesion.

The word is also written *cement*, and even *ciment*. It is formed from the Latin *cementum*, of *cædo*, *I beat*.—Though M. Felibien observes, what the ancient architects called *cæmentum*, was a very different thing from our *cement*. The name *cement*, with them, signified a kind of masonry, or manner of laying the stones, and even the quality of the stones; as when the walls were built of rude, unequal stones. In reality, the stones were cut for such work, but not squared nor uniform: so that *cementum* stood opposed to *quadratum lapidem*.

CEMENT is particularly used, in *architecture*, for a strong binding sort of mortar, used to bind, or unite bricks or stones together, for some kinds of mouldings; or to make a block of bricks, for the carving of scrolls, capitals, &c.

It is of two sorts; the *hot cement*, which is the most common, is made of resin, bees-wax, brick-dust, and chalk, boiled together. The bricks to be *cemented* are heated, and rubbed one upon another, with *cement* in them.

The *cold cement* is less used; it is made of Cheshire cheese, milk, quick-lime, and whites of eggs.

Mortar, solder, glue, &c. are *cements*. The BITUMEN brought from the Levant is said to have been the *cement* used in the walls of Babylon.

Equal quantities of powdered glass, sea-salt, and iron filings, mixed with loam, make a very hard and durable *cement*.

Mr. Boyle informs us, that the best method to close and repair pipes of subterraneous aqueducts is with tobacco-pipe clay pulverized, and mixed with a large quantity of powdered flocks, and carefully beat up with linseed oil into a stiff paste. See MORTAR and TARRAS.

CEMENT is also used among *Goldsmiths*, *Engravers*, *Jewellers*, &c. for a composition of fine brick-dust, well sifted, resin, and bees-wax; in strewing those artificers to keep the metals to be engraven, or wrought on, firm to the block, &c. as also to fill up what is to be chiselled.

The receiver of an air-pump may be fastened to a metalline plate by means of a *cement* of bees-wax and turpentine, made with equal parts, for the winter; and three parts of the former to two of the latter, for the summer. We have various receipts for making *cements* to mend broken china and glasses: one of the finest, and at the same time strongest, *cements* for this purpose, is the juice of garlick, stamped in a stone mortar; this, if applied with care, will leave little or no mark. Another *cement* for broken glasses, china, or earthen-ware, may be prepared by beating the white of an egg very clear, and mixing it with fine powdered quick-lime; or flint-glass, powdered chalk, and a little lime, may be mixed together, and dissolved in fair water; with which the glasses, &c. are to be *cemented*, and then set in the shade to dry.

Drying oil with white lead is also frequently used for this purpose; but where the vessels are not exposed to heat or moisture, isinglass glue, with a small quantity of tripoli, or chalk, is better.

Some have recommended a *cement* made by tempering quicklime with the curd of milk, till it become of a proper consistence for use; but as cheese has a greater degree of tenacity than milk, the following composition will be preferable. Let the thin shavings of sweet cheese be *steeped* with *boiling* water [illegible] when the tenacious slime has been worked [illegible] fine, let it be mixed, on a hot [illegible] quantity of unslaked lime, into the [illegible] and it will prove a strong and [illegible] wood, stone, earthen-

earthen-ware, and glass; and it has this advantage, that when it is thoroughly dry, it will receive no injury from water.

A *cement* may be prepared for chemical glasses that will bear the fire, by mixing equal quantities of white flour, fine powdered Venice glass, pulverized chalk, with half the quantity of fine brick-dust, and a little scraped lint, in the whites of eggs: this mixture is to be spread upon a linen cloth, and applied to the cracks of the glasses, and should be well dried before they are put into the fire.

Old varnish will likewise answer the same purpose. A very useful *cement* for joining alabaster, marble, porphyry, and other stones, may be prepared in the following manner. Melt two pounds of bees-wax, and one pound of resin; add a pound and a half of the same kind of matter pulverized, as the body to be *cemented* is composed of, and stir them well together; let the mass be kneaded in water, and heated when applied to the heated parts of the body to be *cemented*. The colour of this mass may be adapted to that of the body on which it is employed, by varying the proportion of the powdered matter added to the mass of bees-wax and resin.

The best *cement* for electrical purposes is made with two parts of resin, two of bees-wax, and one of the powder of red ochre. These ingredients are melted, and mixed together in any vessel over the fire, and afterwards kept for use. This adheres well, is less brittle than resin, and insulates as well.

For the manner of preparing a *cement* to bind together the various embellishments of grottos, see GROTTO. See also GLUE, PUTTY, and SOLDER.

CEMENT, in *Chemistry*, is a general name, comprehending all pastes or powders, which, by means of fire, and proper crucibles, are capable of producing changes in any body. See BRASS, STEEL, and PORCELAIN.

It is particularly used to denote a compound mass, or saline powder, used for the purifying of gold and consuming the improper metals mixed therewith.

The principal *cement* used for this purpose is composed of four parts of bricks powdered and sifted, of one part of green vitriol calcined, till it becomes red, and of one part of common, or sea-salt. A paste is made of this mixture, by moistening it with water or urine. This is called *royal cement*, from its use in purifying gold, the king of metals; and because gold, previous to the discovery of platina, was the only metal capable of resisting it. Some writers on this subject recommend a mixture of nitre in substance, with an equal weight of calcined green vitriol, and twice its weight of powdered bricks.

CEMENT *for gilding by*. See GILDING *of Iron*.

CEMENT, or *cement copper*, is copper precipitated from vitriolic waters by iron. The name is derived, it is said, from a vitriolic water in Hungary, called *cement*.

CEMENT-*pots*, in *Assaying*, are vessels made for the *cementation* of metals.

These pots are cylindrical vessels, made of potter's clay, with rules adapted to them, and may be conveniently turned by the potters. The fire of these vessels must be proportioned to the quantity of *cement* to be put in them. It is not prudent, however, to make them of more than eight or ten inches broad, because when they are larger the fire acts but difficultly and unequally upon them, especially on that part of the matter near their centre.

It is to be observed, in the making of these vessels also, that all kinds of clay contract and take up a smaller space in the drying and baking; the purer clay will contract one tenth part of their diameter, but the more sand or other dry powder there is in the mixture, the less it contracts. If a vessel, therefore, of any determinate size is to be made of clay without admixture, it must be made one tenth larger than the expected size; if of clay with these admixtures, experience alone can shew what must be the excess in size, when moist. Cramer.

CEMENTATION, a manner of purifying gold from other metals, by means of *cement*. Or, as it is defined by Stahl, a method of corroding metals in a dry form by the fumes of dry fats.

It is performed thus: thin plates, or lamins, are flattened in a crucible with the royal *cement*; the crucible is covered up, luted with a mixture of clay and sand, and encompassed with fire for twenty-four hours, till being thus calcined, the fats have imbibed and consumed the impurities of the gold.

The crucible is then left to cool, and the gold is to be carefully separated from the *cement*, and boiled at different times in a large quantity of pure water. It is often necessary, for the [illegible] of the gold, to repeat the [illegible] which has obtained the name of [illegible] Dr. Lewis, is incommodious [illegible] or ascertaining its purity, and [illegible] used. Its principal use is for extracting silver or base metals from the surface of gold, and thus giving superficial purity and high colour to alloyed or pale gold. Lewis's Comm. Phil. p. 155. See DEPART, GOLD, REFINING, and SILVER.

CÆRITES, or CERITUM *tabulæ*, in *Antiquity*, denote the censors tables, wherein were entered the names of such persons as, for some misdemeanor, were to lose their right of suffrage in elections at Rome.

The original of the appellation arose hence; that during the captivity of Rome under the Gauls, the *Cærites*, or inhabitants of Cære, a city in Etruria, preserved their sacred books, and other matters belonging to the worship of the gods, in gratitude for which, the Romans dignified the *Cærites* with the appellation of Roman citizens, but without admitting them into any part of the administration.

CÆRULEUS, in *Ornithology*, a name given by authors to a kind of the thrush or blackbird kind, and somewhat resembling that species of blackbird commonly called the solitary sparrow.

CERULEUS is also a name given by Solinus to the great Indian worm described by Pliny and others, as inhabiting the Ganges. It is probable that all the accounts we have of this monstrous animal are only false descriptions of the crocodile.

CÆSALPINIA, in *Botany*, *Brasiletto*, a genus of the *decandria monogynia class*, deriving its name from Cæsalpin, the famous botanist and physician to Pope Clement VIII. The characters are these: the flower has five petals, which are situated like those of the butterfly-flowers; it hath ten declining filamina, which are distinct; it hath an oblong germen; the empalement afterward becomes an oblong compressed pod with one cell, enclosing three or four compressed seeds. There are two species.

The first sort is the tree which affords the brasiletto wood, which is so much used in dying. It grows naturally in the warmest parts of America, from whence the wood is imported for the dyers; and the demand for it has been so great, that there are no large trees left in any of the British colonies; the largest scarcely exceeding eight inches in diameter, and fifteen feet in height. It hath very slender branches, which are armed with recurved thorns.

These plants are propagated by seeds, which should be sown in small pots filled with light rich earth early in the spring, and plunged into a hot-bed of tanner's bark. Being tender, they should always be kept in the bark-stove, and have a moderate share of heat in the winter; and being placed among other tender exotics of the same country, will afford an agreeable variety.

CÆSAR, among the Romans, was a long time used for the heir intended, or presumptive of the empire; as *Heir of the Romans* is now used for that of the German empire.

The *Cæsars* were a kind of assistants or associates of the empire, *partakers imperii*. They were the imperial mantle, purple, and diadem, and walked with other marks of the sovereign dignity: they were created like the emperors, by putting on the purple robe.

The dignity of *Cæsar* continued the second of the empire, till Alexius Comnenus made Nicephorus Melissenus *Cæsar* by contract, and it being necessary to confer some higher dignity on his own brother Isaacius, he created him Sebastocrator, with the precedency over Melissenus, ordering that in all acclamations, &c. Isaacius Sebastocrator should be named the second, and Melissenus *Cæsar* the third.

The title took its rise from the cognomen, or surname of the first emperor, C. Julius *Cæsar*, which by a decree of the senate all the succeeding emperors were to bear. Under his successor, the appellation Augustus being appropriated to the emperors, in compliment to that prince, the title *Cæsar* was given to the second person in the empire, though it still continued also to be given to the first: and hence the difference between *Cæsar* used simply and *Cæsar* with the addition of Imperator Augustus. Authors are divided as to the origin of the word *Cæsar*, the cognomen of the Gens Julia. The more common opinion is, that the word *Cæsar* comes *a cæso matris utero*; because his mother's womb was cut open to give him birth.

Some pretend that the laurel crown on medals is never given to *Cæsars*, but only to *Augusti*; which is overthrown by a medallion of Maximus; but to mention another medal of the lower empire, wherein Crispus *Cæsar* is crowned with laurel.

Card. Norris observes, that the years of the *Cæsars* were frequently marked on their medals; of which we have instances in the medals of Constantine, Chlorus, and divers others, whose years are expressed on their coins, though they were never more than *Cæsars*.

CÆSARIAN

CÆSARIAN *section*, in *Midwifery*, the operation of extracting the *fœtus* from the mother, whether living or dead, by an incision through the *abdomen* into the *uterus*. Those brought into the world in this manner, are called *Cæsones*, and *Cæsones, à cæso matris utero*; as were C. Julius Cæsar, Scipio Africanus, Manlius, and one Edward VI. See DELIVERY.

Many have exclaimed against the cruelty of this operation: and certainly it is too terrible to be used on any but the most emergent occasions: but there seem three cases in which it is justifiable, nay absolutely necessary. The first is, when the mother is dead, either in labour, or by some other accident, and the child is perceived to be alive. The second is, when the mother is living, and the *fœtus* dead, and incapable of being extracted by the common passages by any help of the midwife. And the last, when the mother and child are both living, and there is found an utter impossibility of delivery any other way. In all these cases the *Cæsarian* practice is justifiable to save life, that must otherwise be inevitably lost.

In the first case, the operation must be performed immediately after the death of the mother, otherwise it is to no purpose, for the child can live but a very little time afterwards in the body. The surgeon is, in this case, to make a crucial incision, as in the common dissections; or a longitudinal one on one side, without regard to the course of the fibres or vessels: and if the *fœtus* should have fallen into the cavity of the *abdomen*, through a rupture of the *uterus*, it should then be taken out; or if it be yet in the womb, or in the Fallopian tube, these parts must be carefully opened, and the child being taken out, must have Hungary water, or the like, held at some small distance from its nose to revive it, and the navel-string be tied up as usual. The *fœtus* is not always preserved, or found alive after this operation; but as there is often a probability of it, it is certainly better to open an hundred dead women in vain, than to lose the life of one infant.

In the second case, when a dead *fœtus* is contained in the cavity of the *abdomen*, in the Fallopian tube, or in a kind of hernia or sac without the *abdomen*, of all which cases there are instances recorded; or when, from the particular structure of the parts, as is sometimes the case in crooked women, and others; and when, as in many instances, there is no possibility of the extraction of the infant, even by incision of it: there is no way but the opening of the *abdomen*, and if necessary, the *uterus* of the mother, and taking out the *fœtus*: and this is often the means of preserving the mother, and when in parallel cases the child is also alive, there have been not a few instances of both being preserved.

The *Cæsarian section* is recommended by several authors, and Mr. Hellvetius communicated to the Academy of Sciences at Paris, a well studied history of a woman recovering after the operation had been performed upon her by a midwife. Vide Hist. de l'Acad. des Scienc. 1733.

We have also an account of this operation successfully performed by a midwife in Ireland. See Med. Ess. Edinb. vol. v. art. 37.

There is likewise an account of the *Cæsarian* operation successfully performed by a butcher on a woman in Ireland. Vide Phil. Trans. N° 401. sect. 17.

Cyprianus, professor at Rennekor, gives an extraordinary case of the *Cæsarian* operation, whereby a *fœtus*, which had been dead twenty-one months, was drawn out of the *tuba uteri*, yet the mother preserved. M. Jobert, physician at Chateau Thieri, relates the history of a woman, in the neighbourhood of that place, who was twice delivered of children by the *Cæsarian* operation; the first time in 1682, the second time eleven months after, and recovered from both.

See an account of two cases in which this operation was performed in London, both of which proved fatal to the mothers, with remarks on the history of the operation, in the Medical Observ. and Inq. vol. iv. p. 282. 292. and vol. v. p. 217.—See also enquiries relative to this operation, by Mons. Simon, in the 8th volume of the Memoirs of the Academy of Surgery at Paris.

CÆSARIANS, or CÆSARIENSES, in *Antiquity*, were ministers or officials of the procurator *Cæsaris*, to whom belonged the keeping of the fiscal accounts, and taking possession of effects devolving or escheating to the emperor. These were also called *catholicani*. From the appellation *Cæsariani* some deduce the modern word sergeant. See SERGEANT.

CÆSARIS, *Emplastrum*, among *Physicians*, a name given to a plaster compoſed of aſtringents, to prevent abortion.

CÆSIAS, in *Meteorology*, denotes the north-east wind; called, in the Mediterranean, *vento Greco*, or *Greco levante*.

CÆSTUS, a large leathern gantlet, loaded with lead, uſed in the combats, or exerciſes, of the ancient athletæ. It was called *caſtus, à cædendo*, from *cædo, to ſtrike*, or *beat*.

Caſaubon ſays it was a kind of a club with leaden balls hanging from it, ſuſpended by leathern thongs: but he was miſtaken, it being only a leathern thong ſtudded with nails of lead or iron; part of it was twiſted round the hand and arm, to prevent their being broken or diſlocated. See CESTUS.

CÆSURA, in the *ſublime Poetry*, is when, in the ſcanning of a verſe, a word is divided, ſo that one part remains cut off, and goes in a different foot from the reſt; e. gr.

Mœſti | lo | ca ne | ſcio | quam mœn | dacia profunt.

Where the Syllables *ri, ſi, quam*, and *mœ* are *cæſuræ*.

Or, it denotes a certain agreeable diviſion of the words between the feet of a verſe; whereby the laſt ſyllable of a word becomes the firſt of a foot: as in

Arma virumque cano, Trojæ qui primus ab oris.

Where the ſyllables *ne* and *jæ* are *cæſuræ*.

CÆSURA, in the *Modern Poetry*, denotes a reſt or pauſe towards the middle of a long Alexandrine verſe; by which the voice and pronunciation are aided, and the verſe as it were divided into two hemiſtichs.

CÆTERIS *paribus*, a Latin term, in frequent uſe among mathematical and phyſical writers.

The words literally ſignify, *other things being equal*; which expreſſes pretty nearly their meaning as a term. Thus, we ſay the heavier the bullet, *cæteris paribus*, the greater the range; i. e. by how much the bullet is heavier, if the length and diameter of the piece, and the quantity and ſtrength of the powder, be the ſame, by ſo much will the utmoſt range or diſtance of a piece of ordnance be greater.

Thus alſo in a phyſical way, we ſay, the velocity and quantity of blood circulating in a given time, through any ſection of an artery, will, *cæteris paribus*, be according to its diameter; and recíprocally to, or diſtance from the heart.

CAFFA, in *Commerce*, cotton cloths painted with ſeveral colours, and of divers deſigns; they are manufactured in the Eaſt Indies, and ſold at Bengal. The length and breadth are not the ſame in all pieces.

CAFFACA, in *Natural Hiſtory*, a name given by the Turks and Tartars to a peculiar kind of earth, of a grey colour, having a light call of green in it. It is very ſoft and unctuous, and ſomething reſembles our fullers earth; but is more aſtringent, and adheres very firmly to the tongue: theſe people bathe very frequently, and they uſe this earth on thoſe occaſions.

CAFFILA, a company of merchants or travellers, or both together, who join company, in order to go with more ſecurity through the dominions of the Great Mogul, and through other countries on the continent of the Eaſt Indies. There are alſo ſuch *caffilas*, which croſs ſome parts of the deſerts of Africa, particularly what is called the ſea of ſand, which lies between Morocco, and the kingdoms of Tombut and Gago. This is a journey of four hundred leagues, and takes up two months in going, and as many in coming back; the *caffila* travelling only by night, becauſe of the exceſſive heat of the country. The chief merchandize they bring back conſiſts in gold-duſt.

The *caffila* is properly what is called caravan in the dominions of the grand ſignior, and other parts of the Eaſt. See CARAVAN.

On the coaſt of Guzerat or Cambaya, it ſignifies a ſmall fleet of merchant-ſhips.

CAFRES, according to Ludolf, an opprobrious appellation given by the Arabs to all thoſe who do not profeſs the Mahometan religion. It comes from the Arabic word *cafir*, which ſignifies *infidel*, or *unbeliever*.

CAGADO *de agua*, in *Zoology*, a name by which the Portugueſe in America call a ſpecies of tortoiſe common there, and uſually known among authors by its Braſilian name JURURA.

CAGADO *de terra*, in *Zoology*, the name by which the Portugueſe in America call a remarkable ſpecies of tortoiſe, called by the Braſilians JABOTI.

CAGANUS, or CACANUS, an appellation anciently given by the Huns to their kings.

The word appears alſo to have been formerly applied to the princes of Muſcovy, now called CZAR.

From the ſame alſo, probably, the Tartar title CHAN, or *can*, had its origin.

CAGAO, in *Natural Hiſtory*, the Indian name for a large bird which inhabits the mountains, and feeds on the pitanha nuts, and many other fruits, all which it ſwallows whole: it is very voracious, and its food paſſes off very quickly;

quickly; the piſtachias only looſe their rind in its ſtomach, and the almonds their pulpy covering; the kernel and the ſtone being voided whole: it is of the ſize of a common hen, but has a longer neck.

CAGASTRUM, is uſed by *Paracelſus* to denote a morbific *ſtamen*, not connate or hereditary, but accidental, owing to corruption.

In which ſenſe the word ſtands oppoſed to *diaſtroma*. The plenitude, plethory, fever, &c. are ranked by that author in the number of *cagaſtra* diſtrafts.

CAGE, an incloſure made with wire, wicker, or other matter, interwoven latticewiſe, for the detention of wild beaſts or birds.

The word is French. *cage*, formed from the Italian *gaggia*, of the Latin *cavea*, which ſignifies the ſame: *a cavea theatralibus in quibus includebantur feræ*.

Beaſts were uſually brought to Rome ſhut up in oaken or beechen *cages*, artfully framed, and covered or ſhaded with boughs, that the creatures, deceived with the appearance of a wood, might fancy themſelves in their foreſt. The fierceſt ſort were put in iron *cages*, leſt wooden priſons ſhould be broke through.

In ſome priſons there are iron *cages* for the cloſer confinement of criminals.

The French uſe diſtinguiſh two ſorts of *bird-cages*, viz. high, or ſinging *cages*, and low, or *dumb-cages*; thoſe who expoſe birds to ſale are obliged to put the hens in the latter, and the cocks in the former, that perſons may not be impoſed on, by buying a hen for a cock.

CAGES, *cauſæ*, denote alſo places in the ancient amphitheatres, wherein wild beaſts were kept, ready to be let out for ſport. The *cauſæ* were a ſort of iron *cages* different from dens, which were under ground and dark; whereas the *cauſæ* being airy and light, the beaſts ruſhed out of them with more alacrity and fierceneſs than if they had been pent under ground.

CAGE, in *Carpentry*, ſignifies an outer work of timber, incloſing another within it.

In this ſenſe we ſay, the *cage* of a wind-mill.

The *cage* of a ſhip-caſe denotes the wooden ſides, or walls which incloſe it.

CAGGAW, in *Botany*, a name given by the people of Guinea, to a plant which they boil in water, and uſe the decoction to waſh the mouth with, as a cure for the tooth-ach. The leaves of this are ſmooth and ſhining, like thoſe of the laurel, but they are thin, and bend like thoſe of the bay. Phil. Trans. N° 232.

CAGIT, in *Natural Hiſtory*, a name given by the people of the Philippine iſlands, to a ſpecies of parrot, very common in their woods; it is of a middling ſize, and is all over of a fine green colour.

CAGUI, in *Zoology*, the name of a kind of Braſilian monkey called alſo *pargi*, of which there are two ſpecies, the one larger, the other ſmaller. The large kind is of a grey colour, with a mixture of black, and its hairs are longer than thoſe of the ſmall ſpecies; its face is round, and it has ſomething of the look of a lion; its ears are ſmall, round, black, and naked; its eyes are alſo black, as is its mouth, and its forehead is covered with a mixture of grey and black hairs; its tail is above a foot long, and is covered with hairs of a tawny colour.

The leſſer *cagui* is a ſmall and tender animal, but has the ſame lion-like face with the larger. Its body is not above ſix fingers breadth long; its tail about ten fingers; its head is ſmall, ſcarce ſo large as a ſmall apple; its noſe is ſmall and flat; its eyes very tender, its mouth little, and its teeth extremely ſharp; its ears are round, and ſurrounded with white hairs in a very beautiful order; its hair is all of a reddiſh tawney toward the body, and toward the ends of a mixture of white and brown; and its tail is variegated with circular rings of white and brown; its voice is extremely ſhrill; it is naturally an extremely lively and nimble creature, but cannot bear the leaſt cold. Ray.

CAHELO, in *Ichthyology*, a name given by ſome authors to the fiſh uſually called the LUPUS *marinus*, or wolf-fiſh.

CAIA, in the *Turkiſh Military Orders*, an officer ſerving in the poſt of a deputy or ſteward, and acting for the body of the janizaries.

CAIANI, in *Eccleſiaſtical Antiquity*, a ſort of heretics, thus denominated from one Caianus of Alexandria, their leader, otherwiſe denominated APHTHARTODOCETÆ.

The ſame name is ſometimes alſo given to the ſect of Cainians or Cainites.

CAIC, CAIQUE, CAICA, in *Sea-language*, is uſed to denote the ſkiff, or boop, belonging to a galley.

The Coſſacks give the ſame name, *caic*, to a ſmall kind of bark uſed in the navigation of the Black Sea. It is equipped with ſowy or fifty men, all ſoldiers: their employment is a kind of piracy. The Turks have alſo a ſort of *caics*, which ſome render by *biremes*.

CAJEPUT, an oil brought from the Eaſt Indies. The ſmell of the oil of *cajeput* reſembles that of cardamoms; hence Dr. Trew judges the plant from which it is obtained to be the *elegans malagetæ ſpecies*, deſcribed by Sobelius, or the *gramis paradiſi ſive malagetæ affinis fructus*. Four or five drops of this oil of *cajeput*, in a proper liquor, are recommended as an excellent nervous medicine, and as of great efficacy in the cardialgia.

CAIMACAN, or CAIMACAM, a dignity in the Ottoman empire, anſwering to that of lieutenant, or vicar, amongſt us.

The word is compoſed of the two Arabic words, *Caim maham*, q. d. *he who holds the place*, or *diſcharges the function of another*.

There are uſually two *caimacams*: one reſides at Conſtantinople, who is the governor thereof; the other attends the grand vizir, in quality of his lieutenant. Sometimes there are three *caimacams*; one conſtantly attending the grand ſignior, another the grand vizir, and a third conſtantly at Conſtantinople, who examines affairs of police, and regulates them in great meaſure. The *caimacam* that attends the vizir, only officiates when at a diſtance from the grand ſignior; his function ceaſing, when the vizir is with the ſultan. The *caimacam* of the vizir is his ſecretary of ſtate, and the firſt miniſter of his council.

CAINITES, or CAINIANS, a ſect of ancient Gnoſtics, that ſprung up towards the cloſe of the ſecond century, and paid extraordinary honours to thoſe perſons repreſented in Scripture as the worſt of mankind; as called from Cain, whom they eſteemed their patriarch, and the chief object of their veneration. They held that Cain and Eſau, Lot, and thoſe of Sodoma, were born of a moſt eminent celeſtial virtue; that Abel, on the contrary, was born of a virtue much leſs eminent; to Cain, and others of the ſame order, who, according to them, had a mighty knowledge of all things, they allocated Judas, whom they held in ſo much eſteem, that they had a book among them called the Goſpel of Judas. St. Epiphanius refutes, and at the ſame time refutes, their errors.

CAINITO, in *Botany*, the name given by Plumier, to the *ſtar-apple*.

CAINS, in the iſland of Candia, denote Greeks revolted, and retired to the Venetians, either at Suda, or Spina Longa; who, in time of war, burn, pillage, and commit all manner of cruelties on their ancient brethren under the Turks.

When a *cain* or falſe brother is taken, there is no mercy for him; they either impale him, or put him to the queſtion.

CAJOU, CASHEW, or CASSU. See ANACARDIUM.

CAIRINA, in *Ornithology*, a name by which ſome authors have called the Muſcovy duck.

CAISSON, in the *Military Art*, is ſometimes uſed for a cheſt; and in particular for a BOMB-CHEST.

The *caiſſon* is conſidered as a ſuperficial MINE, or *fourneau*.

CAISSON is alſo a covered waggon to carry bread, or ammunition.

CAISSON is alſo uſed for a kind of cheſt uſed in laying the foundations of the piers of bridges. See BRIDGE.

CAITAIA, in *Zoology*, the name of an American monkey, remarkable for its ſweet ſmell; it has indeed ſomewhat of a ſcent of muſk about it; its hair is long and of a whitiſh yellow colour; its head is round; its forehead depreſſed, and very ſmall; its noſe ſmall and flatted, and its tail arched. It is eaſily tamed and kept about houſes, but is very clamorous and quarrelſome.

CAKE, a finer ſort of BREAD, denominated from its flat, round figure.

We meet with divers compoſitions under the name of *cakes*; as *ſeed-cakes*, made of flour, butter, cream, ſugar, coriander and caraway ſeeds, mace, and other ſpices and perfumes, baked in the oven; *plum-cake*, made much after the ſame manner, only with fewer ſeeds, and the addition of currants; *pan-cakes*, made of a mixture of flour, eggs, &c. fried; *cheeſe-cakes*, made of cream, eggs, and flour, with or without cheeſe curd, butter, almonds, &c. *ſut-cakes*, made of fine oaten flour, mixed with yeaſt, and ſometimes without, rolled thin, and laid on an iron or ſtone to bake over a low fire; *ſugar-cakes*, made of fine ſugar beaten and ſcarced with the fineſt flour, adding butter, roſe-water, and ſpices; *roſe-cakes*, *placentæ roſatæ*, are leaves of roſes dried and preſſed into a maſs, ſold in the ſhops for epithems. See EPITHEM.

CAKE-*mans*, a denomination ſometimes given to the white or virgin WAX.

CAKE-*ſoap*, ſtands diſtinguiſhed from roſe-ſoap, and ball-ſoap. See SOAP.

CLABA, in *Botany*, the name given by Plumier to a genus of plants afterwards called by Linnæus CARYOPHYLLUM.

CALABASH, in *Botany*. See MELOPEPO.

CALABASH-*tree*, *Crescentia*, in *Botany*, a genus of the *didynamia angiospermia* class. Its characters are these: the flower hath one petal which is irregular, having a carved gibbous tube; it hath an empalement of one leaf, cut into two obtuse segments, which are concave; it hath four stamina, two of which are the length of the petal, the other are shorter; with an oval germen, which afterward becomes an oval or bottle-shaped fruit with a hard shell, enclosing many flat, heart shaped seeds. Linnæus mentions one, and Miller two species, the first of which grows naturally in Jamaica, and in all the Leeward Islands; it has a thick trunk, covered with a whitish bark, which rises from twenty to thirty feet high, and at the top divides into many branches, forming a large regular head. From the lower part of the tube of the flower, arises a long slender foot-stalk, supporting an oval germen, which afterward turns to a large fruit of different forms and size, sometimes with a contracted neck like a bottle, and so large that when the pulp and seeds are cleaned out, the shells will contain three pints or two quarts. These fruits are covered with a thin skin of greenish yellow when ripe, which is peeled off, and under it is a large ligneous shell, enclosing a yellowish soft pulp, of a tart unsavoury flavour, surrounded with a great number of seeds. See BAOBAB.

These fruits are seldom eaten, but the shell is converted to many useful purposes when dried; and serves to make cups, ladles, and many other articles of houshold furniture; for cases to put divers kinds of goods in, as pitch rosin, or the like.

The word is Spanish, *calabaça*, which signifies the same. The Indians also, both of the North and South Sea, put the pearls they have fished in *calabaças*; and the Negroes on the coast of Africa do the same by their gold-dust.

The smaller *calabas* are also frequently used by these people as vessels, by which they sell their precious commodities to the Europeans.

CALABRINI, in *Botany*, a name by which some authors call the rough SPLEENWORT, or *hastatis affera*. Ger. Emac. Ind.

CALADE, in the *Manege*, a descent or slope in a riding ground, by which to bring a horse to bend his haunches, and form his slop, with the aids of the calves of the legs, bridle, and cavesson, as formerly given.

The *calade* is also called, by the French, *la pesade*. They say, to ride or gallop down the *calade*.

CALAE, CALAIN, or CALAMUM, denotes a species of Indian tin, which, by force of fire, is transmutable into cerus, like that made of our lead.

Alchemists also pretend, that it may be converted by cementation into silver; and allege it as an argument in behalf of a possibility of the transmutation of other metals into gold.

CALAINUS, in *Natural History*, a name given to the substance otherwise called CALLAIS.

CALAMANCO, in *Commerce*, a woollen stuff manufactured in Brabant and in Flanders, particularly at Antwerp, Lille, Tournay, Torcoin, Roubaix, and Lannoy. There are also a great many made in England.

It is commonly woven wholly of wool; there are some, however, wherein the warp is mixed with silk, and others with goat's hair. There are *calamancos* of all colours, and diversly wrought. Some are quite plain, others have broad stripes adorned with flowers; some with plain broad stripes; some with narrow stripes; and others watered. This is also no inconsiderable branch of the woollen manufacture in England, both for home wear and exportation.

CALAMARIÆ, in *Botany*, an order of plants in the Fragmenta Methodi Naturalis of Linnæus. See CULM.

CALAMBA, or CALAMBAC, in *Commerce*, a kind of wood brought from China, usually sold under the denomination of *lignum* ALOES, or AGALLOCHUM.

Sir Phil. Vernati makes *calambac* and *lignum aloes* synonymous. Others seem to distinguish, restraining *calamba* wood to the best sort of aloes wood, growing chiefly in Malacca and Sumatra; and much used in India for making of beads and crucifixes. *Phil. Transf.* N° 43. p. 864.

CALAMIFEROUS, a denomination given by some to those otherwise called CULMIFEROUS plants.

CALAMINARIS *lapis*, CALAMINE-*stone*, a kind of fossile of some use in medicine, but of more in foundery; being used to make copper yellow, i. e. to convert it into brass. It is either of a brownish colour, as that of Germany and England; or reddish, as that about Liege, and in some parts of France, which is accounted the best, because it turns yellow by calcination. It is dug out of mines, usually in small pieces; having always eyes, sometimes veins, of lead in it, though it be not always found in lead-mines. We have mines of *calamine* at Wrington in Somersetshire, and elsewhere. It is generally dug in barren rocky grounds; its courses running, usually at six o'clock, as they call it, i. e. from east to west; sometimes at nine, and sometimes at twelve; or perpendicular, which is accounted the best.

Dr. Lawson was the first who publicly proved *calamine* to be the ore of ZINC. It consists, says Mr. Kirwan, of a mixture of quartz and argill, with the calces of iron and zinc; its colour is yellow, red, or brown, and it is moderately hard. Elem. Mine. p. 280.

Calamine-stone is a species of *lapis* CADMIA; some even take it for the true cadmia of Galen and the ancients, to which it certainly bears a near resemblance: when burnt, it fumes gathers and grows on the sides of the chimney.

When dug, it is washed, or huddled, as they call it, in a running water, which carries off the impure and earthy parts; leaving the lead, *calamine*, and sparry parts at bottom; they then put it in a fire, and shaking it well in water, the lead mixed with it sinks to the bottom, the sparry parts get to the top, and the *calamine* lies in the middle: thus prepared, they bake it in an oven or reverberatory furnace four or five hours; the flame being so contrived, as to pass over, and so to heat and bake the *calamine*, stirring and turning it all the while with iron rakes. Or, it may be roasted or calcined by setting fire to a conical pile, composed of horizontal layers of *calamine* and of charcoal placed alternately one upon the other, and of a lower stratum consisting of large pieces of wood; in which lower stratum are four horizontal channels, through which the air maintaining the fire passes to the centre, and it thence arises through a chimney or perpendicular empty space, left for that purpose, along the axis of the conical pile. The length of time and degree of heat for this operation, are different according to the qualities of the minerals. This done, they beat it to powder, and sift it; picking out of it what flames they find. And thus it is fit for use.

For the manner of applying *calamine* in the prepatation of brass, see BRASS.

Besides the two natural *calamines*, this and cobalt, there are two artificial ones: the best is that called *pompholyx*, the other *tutty*.

Calamine is of some medicinal virtue, being astringent, desiccative, and detersive; and is much used for taking off films from the eyes of horses, &c.

CALAMINT, in *Botany*, an officinal plant, whose leaves are reputed warm, aperient, and diaphoretic, and enter several alexipharmic compositions. It is enumerated by Miller among the species of *mentha*, or thyme. For its general characters, therefore, see BALM.

There are three sorts of *calamint* in use, viz. the *sylvestris*; the *montana*, or *montana*; and *pulegii*, or *agrestis*; of which the first ought to be the officinal sort, though the scarcity of it among us usually brings the second to market in its stead; the third is taken into the college dispensatory, but rarely used. In the college dispensatory, we find a compound powder denominated from *calamint*. See Phil. Trans. vol. xlix. pt. ii. p. 838.

CALAMISTRUM, in *Natural History*, a name by which Linnæus and some authors have called a small plant, known among us by the name of *pepper-grass*, from its having grassy leaves, and round globules at their insertions, resembling pepper-corns. Mr. Vaillant has more properly named it PILULARIA.

CALAMITA, or CALAMITIS, is used to denote the MAGNET or loadstone.

CALAMITA *alba*, in *Natural History*, the name of an earth dug in Spain and Italy, of a hard texture, a white colour, and flyptic taste, they pretend that this attracts flesh in the same manner as the magnet does iron, and thence call it MAGNES *carneus*.

CALAMITA *fluvia*. See STOBAX.

CALAMITES, in *Natural History*, a name given by some to the ostreocelle, which, when in small pieces, sometimes pretty exactly resembles the barrel of a quill; others have called some of the fossile corallioides by this name, there being frequently in them the resemblance of several quills cemented together in stone.

CALAMITIS is used for a species of artificial *cadmia*, found adhering to the flicks, ladles, and other utensils wherewith they stir the copper when in fusion in the furnace.

It is denominated *calamitis*, from the Latin *calamus*, a *reed*, on account of its resemblance to the figure of a reed cloven in the middle.

CALAMUS, in *Botany*, a genus of the *hexandria monogynia* class of plants: the calyx consists of six leaves; it has no corolla; and the fruit is a single seeded berry. There is one species.

CALAMUS is commonly used to denote the same with *arundo*, a reed, rush, cane, or flag.

CALAMUS, in the *Pastoral*, denotes a simple kind of pipe, or fistula, the musical instrument of the shepherds and herdsmen, usually made either of an oaten stalk, or a reed.

CALAMUS *aromaticus*, in *Pharmacy*, a spicy bitterish root, produced by a peculiar kind of water-plant, growing in the Levant, and even in several parts of England. See ACORUS.

The best is that which is greyish without, and reddish within; its pulp white, and taste somewhat bitter: but its leaves, as well as roots, sweet-scented.

The agreeable flavour and peculiar taste of the root, are owing to an essential oil. Neumann.

CALAMUS *Indicus pseudo-aromaticus*, in the *Natural History of the Ancients*, a name given to a substance found often in the fossile kingdom, usually of about three inches long, half an inch broad, and one third of an inch thick, and covered all over its surface with large round figures, in form of radiated stars within. This very much resembled in external appearance the rest of our common *calamus aromaticus* of the shops turned into stone, and seems to have been vulgarly supposed to be that substance petrified. The more accurate among the early writers, however, have by no means countenanced so wild a conjecture; and Theophrastus, though he records the substance under that name, as it had an other in his time, yet joins it to the canes which, he says, grow in the sea, and are vegetables; and adds, that there, and this fabulous race, are properly the subjects of another treatise, not of a history of stones. See *Tab. of Fossil. Class 7.*

This author's placing it among the CORALS is perfectly right, since the specimens of it now found are plainly no other than corals of the radiated kinds, which have been long buried in the earth.

CALAMUS *odoratus*, in the *Materia Medica*, the name of a reed of the East Indies, of a very sweet smell. Our CALAMUS *aromaticus*, which is the root of a water-plant, is a very different substance.

CALAMUS *scriptorius*, properly denotes a reed or rush to write with, answering the use of the ancient stylus and modern pen.

The ancient Egyptian *calamus* was a sort of *arundo aquatica* growing plentifully about Memphis, and on the banks of the Nile, whence it was also called *calamus Memphiticus, Nilotica*, &c.

CALAMUS *scriptorius*, in *Anatomy*, is a distortion of the fourth ventricle of the BRAIN; so called from its figure, which resembles that of a quill.

CALAMUS *sonorarius*, or *calamus Aristeus*, among *Farriers*, signifies a *hard-CALE*.

CALAMUS also denotes a sort of measure otherwise called CANNA, CANE, or REED.

CALANDRE, in *Natural History*, a name given by the French writers to an insect that does vast mischief in granaries. It is properly of the scarab class.

The female lays a considerable number of eggs, and the increase of these creatures would be very great, but nature has so ordered it, that while in the egg state, and even while in that of the worm, they are subject to be eaten by mites: these little vermin are always very plentiful in granaries, and they destroy the far greater number of their larger animals.

CALANGAY, in *Natural History*, a name given by the people of the Philippine islands to a species of parrot very common there; it is all over white, and has a crest of white feathers on its head; it is of the size of a pigeon, and is easily kept tame, and learnt to talk. It is called also in some of the Philippines *catanai* and *abaay*.

CALASH, or CALESH, a small light kind of chariot, or chair, with very low wheels, used chiefly for taking the air in parks and gardens.

The word is French, *calache*, which Menage derives from the Latin *carrus, carri, carrifex, carrefex, carrefex, calefex, calefex*.

The *calash* is for the most part richly decorated, and open on all sides, for the convenience of the air, and prospects; or at most enclosed with light mantlets of waxed cloth, to be opened and shut at pleasure.

In the Philosophical Transactions, we have a description of a new sort of *calash*, going on two wheels, not hung on traces, yet safer than the common coaches; having this farther advantage, that whereas a common coach will overturn if one wheel goes on a furface a foot and a half higher than that of the other, this will admit of a difference of three feet and one third, without danger of overturning. Add, that it would turn over and over, that is, after being turned fo as that the fpokes are parallel to the horizon, and one wheel ftat over the head of him that rides in it, and the other ftat under him, it will turn once more, by which the wheels are placed in *ftatu quo*, without any diforder to the horfe, or rider. N° 172. p. 1028.

CALASIRIS, or CALASIS, in *Antiquity*, a linen tunic worn by the Phœnician, Ægyptian, Roman, and other priests. We alfo find mention of the *calafiris* as worn by the foldiers and by women. In which laft fenfe it is faid to have been a knot in the women's gown, whereby it was drawn about the neck.

CALATHIANA *gala*, in *Botany*, a name given by many writers to a fpecies of GENTIAN, called alfo by others *pneumonanthe*.

CALATHUS, in *Antiquity*, a kind of hand-basket made of light wood, or rushes; ufed by the women fometimes to gather flowers, but chiefly after the example of Minerva to put their work in.

The figure of the *calathus*, as repreſented on ancient monuments, is narrow at the bottom, and widening upwards like that of a top. Pliny compares it to that of a lily. Hift. Nat. lib. xxi. cap. 5.

The *calathus*, or work basket of Minerva, is fo lefs celebrated among the poets than her ægifas.

CALATHUS is alfo ufed to denote a drinking-cup. Pliny feems likewife to ufe it for the CALYX of a flower. Hift. Nat. lib. xxv. cap. 5.

CALATOR, in *Antiquity*, a crier, or officer appointed to publifh fomething aloud, or call the people together.

The word is formed from *calare*, or *calere*. Such miniſters the pontifices had, whom they ufed to fend before them when they went to ſacrifice on feaſts or holidays to advertiſe the people to leave off work.

The magiſtrates alſo uſed *calatores* to call the people to the COMITIA, both *curiata* and *centuriata*. The officers in the army alſo had *calatores*, as had likewiſe many private families, to invite their guefts to entertainments.

CALATRAVA, a military order, inſtituted in 1158, by Sancho III. king of Caſtile, on the following occaſion. The Moors going to attack the little city *Calatrava*, and the Templars, who held it, ſurrendering it up to the king, on a ſuſpicion of their inability to defend it; Diego Velaſquez, a Ciſtercian monk, but a man of quality, perſuaded Raimond, abbot of Fitero, a monaſtery of Ciſtercians, to beg *Calatrava* of the king. He obtained it; and Raimond and Diego put themſelves in it; being followed by a great number of people who joined them out of zeal for the defence of *Calatrava*. The Moors abandoning the enterprize, many of thoſe, who came to the defence of the city, entered the order of the Ciſtercians; and that under a habit more fit for military than monaſtic exerciſes. Accordingly, they began to make excurſions on the Moors, and this was the riſe of the order of *Calatrava*.

The firſt grand-maſter was Garcias; under whoſe government the order was approved by Alexander III. in 1164, and confirmed by Innocent III. in 1198. In 1483, Ferdinand and Iſabella, with the conſent of pope Innocent VIII. reunited the grand maſterſhip of *Calatrava* to the Spaniſh crown: ſo that the kings of Spain are now become perpetual adminiſtrators thereof.

The knights bear a croſs gules, fleury with green. See. Their rule and habit were originally that of the Ciſtercians, but their dreſs was a little ſhortened, on account of their exerciſes: and in proceſs of time they were permitted a ſecular habit.

Alphonſus IX. having recovered Alcantara from the Moors, in the year 1212, committed the cuſtody and defence thereof, firſt to the knights of *Calatrava*; and two years afterwards to the knights of the Pear-tree, another military order inſtituted in 1170, by Gomez Fernand, and approved by pope Alexander III. under the rule of St. Benedict: upon which they changed their name, and took the denomination of knights of Alcantara.

CALAUDRA, in *Ornithology*, the name of a bird of the lark-kind, and of the ſhape of the common lark, but conſiderably larger. This bird is either the ſame with the common Engliſh bunting, called by authors *emberiza alba*, or very like it.

CALAURITIS, in the *Materia Medica of the Ancients*, a name given to a ſort of litharge. We find the litharge made in the ſame operation will be of different colours, according to the degree of heat it receives; and we have accordingly diſtinguiſhed it with the ſounding names of litharge of gold, and litharge of ſilver: the Greeks went yet farther, and added to theſe a third kind, which they called a litharge of lead, or *molybditis*. All theſe ſorts of litharge were brought in great abundance from Calaurea, a ſmall iſland near Crete, to the Greeks, for their uſe in medicine.

CALCADIS, in the *Materia Medica*, a name given by the Arabians to white vitriol, or to ſome white vitriolic mineral.

CALCAGIUM, in *Middle Age Writers*, a tax or contribution paid by the neighbouring inhabitants towards the making or repairing of a common cauſeway.

CAL-

CALCANEUM, or CALCANEUS, in *Anatomy*, the same as calx, os calcis, calcar, or the heel-bone.

It lies under the *astragalus*, to which it is articulated by *ginglymus*; behind it is a large protuberance, which makes the heel, and into which the *tendo Achillis* is inserted.

CALCANTHUM, in *Mineralogy*. See VITRIOL.

CALCAR, in *Anatomy*, the same with CALCANEUM.

CALCAR, in *Glass-making*, is the name of a small oven, or reverberatory furnace, in which the first calcination of sand and salt of pot-ashes is made, for turning them into what they call FRIT.

CALCAREOUS, something that partakes of the nature and qualities of CALX, or lime.

We say, a *calcareous* earth, *calcareous* stone.

Lister speaks much of a *calcareous* nitre.

Several authors attribute the heat of *thermæ*, or hot springs, to the admixture of a *calcareous* earth or stone, with the water.

Calcareous earths and stones, properly so called, have been found by experiment to consist of the following component parts; viz. quick-lime, or pure *calcareous* earth; fixed air, which, when extricated from them, is permanently elastic; and water. But if the term is more generally applied according to common use, the earths and stones calcined for making quick-lime, are intermixed with various other substances, such as sand, or vitrifiable earth, clay, and metallic calces. These earths acquire causticity, and lose a great part of their weight by calcination, and by dissolution in acids, in consequence of the discharge of a considerable quantity of fixed air. See AIR *fixed*, PRIESTLEY, and *Quick*-LIME.

CALCAREUS *lapis*, the stone of which lime is made.

The *lapis calcareus* is found unfit for the making of glass, by reason of the acid salt it abounds with.

CALCEARIUM, or CALCIARIUM, in *Antiquity*, a donative, or largess, bestowed on the Roman soldiers for buying shoes.

In the monasteries, *calcearium* denoted the daily service of cleaning the shoes of the religious.

CALCEDONIANS, a denomination given by Copt writers to the MELCHITES, on account of their adherence to the council of Calcedon. See COPTI, MONOPHYSITES, &c.

CALCEDONY, *Lapis* CALCEDONIUS, one of the lowest-prized among precious stones; diversified with various colours, partly transparent, and partly opake.

Salmasius derives the word, by corruption, from *carbedonius*; taking the modern *calcedony* to be the same with the *lapis carbedonius* of the ancients.

The *calcedony*, or *calcedony*, nearly resembles the common agate, and is reputed a species thereof: its colour is a *milky grey*, clouded with *blue*, *yellow*, or purple. It is supposed to be the white agate of the ancients; though we sometimes find pieces of it blackish.

It is very fit for the graver; and much used, either to engrave arms, &c. upon, as being harder and preferable to crystal, if good; or to paint them on the backside. In some parts, vases, cups, religious beads, &c. are made thereof. The clearest and best is that with a pale cast of blue.

The Italians make it into beads, and both they and the Germans call these *enfumées*; but they are not determinate in the use of the word, but call beads of several of the agates by the same name.

Many chimerical virtues are attributed to this stone; but its true medicinal virtues seem to consist in its absorbent quality, when reduced to a fine powder, and exhibited like other earthy and absorbent powders. But because apothecaries have other substances of the same virtues, and, at the same time far more easily prepared, it is rarely prescribed by the moderns.

Neri shews how to make artificial *calcedonies* of the colour of agate, and oriental jaspers.

CALCEDONIUS is also a term used by the jewellers for a defect in some precious stones; when, in turning them, they find white spots, or stains, like those of the *calcedony*.

This defect is frequent in granates and rubies. The lapidaries usually remedy it by hollowing the bottom of the stone.

CALCENA, a term used by some medicinal writers to denote a morbid tartareous humour in the body.

CALCEOLUS, in *Botany*. See LADY'S *slipper*.

CALCHACCA, in *Botany*, a name by which some authors have called the tree whose bark is the *cassia lignea*, used in medicine.

CALCHOCRUM, in *Botany*, a name by which some authors call the *fumaria* or *fumitory*.

CALCHOPHONOS *lapis*, among the *Ancients*, a name given to a stone of a black colour, and considerable hardness, which, when cut into thin plates, and struck against by any other hard body, gave a sound like that of brass: it seems to have been one of the hard black marbles.

CALCIFRAGA, in *Botany*, a name given by some authors to samphire.

The ancients also gave the appellation *calcifraga* to the sea-fennel, though on a different account, because of its sprouting up in the middle of stones.

CALCIFRAGUS, *stone-breaking*, an appellation given by some to the *peripneumon*, by others to *pimpernel*, on account of their lithontriptic quality.

CALCINATION, the act of reducing any matter into a CALX, or very subtile white powder, by fire, whereby it is deprived of its volatile or inflammable principles; sometimes also called *thorough calcination*.

Calcining differs from mere burning, as the latter leaves the bodies of a black colour, the former of a white one. If white wine tartar, or the white crystals of such tartars are burnt without being truly *calcined*, the *ashes* remain will be black. But if the *calcination* be continued till the tartar is perfectly reduced to ashes, and kept long enough in a strong fire, the remaining calx will be white. And to we see, that not only other vegetable substances, but even white woods, as the hazel, will yield a black charcoal, and afterwards whitish ashes. Thus also animal substances, as bone, by burning, become white, and egg-shells, grow black upon being burnt, and white again, when perfectly *calcined*.

Hence the rule *adopt negra, purgat alba*; which yet does not hold so universally, but that Mr. Boyle finds several exceptions to it. Lead *calcined* by a strong fire turns to *massicot*; which is of a red colour.

Calcination also differs from mere combustion, or burning, in that the former requires the presence and assistance of the air, whereas the latter may be done without it. Thus a coal kept in a vessel exactly closed, will not be *calcined* though kept ever so long in a strong fire; but when taken out in the open air, readily falls to pure white ashes, without the help of any new *calcination*.

By *calcination*, the parts of bodies are not only much broken, but rarefied and rendered specifically lighter. Thus the gravity of crude lead compared to water, is above eleven to one; of *calcined* lead, only as nine to one. And the like holds of other metals: yet in some bodies *calcination* sometimes increases the absolute gravity, while it diminishes the specific: thus four ounces of regulus of antimony, by being kept in fusion an hour and a half will gain two drams and a half, notwithstanding all that it has lost by evaporation; the reason of which seems difficult to assign.

The increase of weight in minium, which is prepared from *calcined* lead, is said to amount to one fourth the weight of the lead; and the lead recovered from the minium, to be one twentieth less than the original weight of the metal: and the quantity of lead recoverable, is less in proportion to the vehemence and continuance of the *calcination*.

The increase of weight, which the imperfect or calcinable metals acquire by *calcination*, has been long known to the chemists, though, before the modern discoveries with respect to fixed air, they had not been able to assign any probable cause of it. Dr. Pemberton, in his Chemical Lectures, observed, that the air, by acting on the inflammable substance either in metals or other bodies, expels it from them, and unites itself (in part at least) to the remains of the body, and to this he ascribed the additional weight acquired by their calces; that portion of air which loses its elasticity, and seems to be consumed by burning bodies, being absorbed by them in the process of *calcination*. It had not escaped the notice of the ingenious Dr. Hales that the calces of metals contain air of some kind or other, and that this air contributes to their additional weight. Many facts have since been alledged in proof of this observation. Dr. Priestley found, that no weight is either gained or lost by the *calcination* of tin in a close glass vessel; and in an experiment for revivifying the calx of lead, he perceived a considerable generation of air: and he afterwards expelled a quantity of air, by heating a small phial filled with red lead, about four or five times the bulk of the lead, together with a small quantity of water; whence he concluded, that the water and air together must be the cause of the addition of weight in the calx; and this, he apprehends, is, in some instances, owing to a nitrous acid attracted from the common air in which metallic substances are calcined. M. Lavoisier had about the same time made a similar discovery, and he explains the whole process of *calcination* by means of the combination of fixed air with metals converted into calces. He observed, that metals cannot be calcined in vessels that are either closely stopped or exhausted of air; that the facility of *calcination* depends on the extent of surface in the

metal, that is exposed to the air; that the effervescence which takes place, when the metallic substance passes from the state of a calx to that of a metal, is no more than the separation of an elastic fluid which before existed under a fixed form, and at this instant recovers its elasticity; and that whenever a metal passes from its metallic state to that of a calx, there is an absorption of the same fluid, and that the *calcination* is nearly proportionable to this absorption. Dr. Priestley had observed, that a diminution in the volume of air was produced by the *calcination* of metals; and M. Lavoisier adds, that this diminution is nearly answerable to the augmentation of weight in the metal. He concludes, however, from some subsequent experiments, that the air which may be obtained from all metallic calces, is not fixed, but common air, in a state rather more pure than that which we usually breathe; and that the fixed air, which is produced from reductions in the common method, does not proceed from the calx, but from the charcoal employed in the process: whereas Dr. Priestley found, that several of the metallic calces yielded fixed air by heat only, as we have already observed, without any addition of charcoal. See Pemberton's Course of Chemistry, p. 243. Priestley's Exp. and Obf. on Air, vol. ii. p. 194, &c. Lavoisier's Essays Physical and Chemical, vol. i. pt. ii. chap. 5, 6, 7, and Appendix.

CALCINATION, in a more extensive sense, includes also the solution of metalline bodies by corrosive matters.

In this sense, *calcination* is divided into *actual*, and *potential*.

CALCINATION, *actual*, is that effected by actual fire, of wood, coals, or other fewel, raised to a certain heat, according to the nature of the substance to be calcined.

Actual *calcination* is subdivided into *incineration*, and *reverberation*. To this head also belongs the *extinction* of things ignited.

CALCINATION, *potential*, is that procured by potential fire; viz. by salts, sulphurs, and other drugs, which have, as it were, the force of fire; as strong waters, corrosive spirits, &c.

Gold is calcined by a reverberatory fire, with mercury, and *sal ammoniac*; silver with common salt, and alkali salt; copper with salt, and sulphur; iron with *sal ammoniac*, and vinegar; tin, with antimony, lead, and sulphur; mercury, with *aqua fortis*: this salt, also, as well as most other minerals, calcines with fire alone, without any other ingredient.

CALCINATION, *potential, philosophical*, or *chemical*, comprehends AMALGAMATION, PRECIPITATION, EVAPORATION, FUMIGATION, and CEMENTATION; and DETONATION by nitre is also reduced by Libavius to this species of *calcination*.

CALCINATION *by dry corrosion*, is that effected without moisture, by the application of dry corrosive salts; to which head belongs CEMENTATION.

CALCINATION *by vaporous corrosion*, is when metalline bodies, being reduced to thin plates, are exposed to the action of an acrimonious fume or vapour.

There are divers ways of performing this; sometimes the plates are suspended over *aqua fortis*; sometimes over vinegar, or the recruments of pressed grapes; sometimes, especially the nobler metals, over melted lead or quicksilver, &c.

CALCINATION, *humid*, is either by vapour, or immersion. Iron is calcined to a subtile crocus, by a vaporous corrosion over strong *aqua fortis*. Lead is calcined to cerusse over vinegar, copper over the recruments of grapes.

CALCINATION, *humid, by immersion*, is when the body is dipt into the corrosive fluid, and is either performed by amalgamation or precipitation.

CALCINATION, *reverberatory*, properly denotes the solution or reduction of a body into a CALX or impalpable powder; sometimes also denominated ALCOHOL.

CALCINATION *of gold and silver by electricity*, was effected by Mr. Canton, who, by the heat of electrical explosions, produced numberless beautiful globules of transparent gold, and also others tinged with all the varieties of colour from those metals. He made it also probable that the *black soot* discharged from the brass chain, and other pieces of metal in such experiments, is the calx or glass of the metal reduced to smaller particles than the laws of optics require to produce colour. Phil. of Electricity, 1752, vol. ii. p. 290. See ELECTRICAL *Battery*.

CALCINATUM, a CALX or body which has undergone CALCINATION.

CALCINATUM *in ipso*, is used by alchemists for any thing rendered sweet by chemical art, which of its own nature was not so; as *mercurius dulcis*, or *saccharum saturni*.

CALCINATUM *mundi*, denotes a thing which is naturally sweet, as sugar, manna, &c.

CALCIS *Os*. See *Os Calcis*.

CALCITRAPA, in *Botany*. See CENTAURY.

CALCITRAPOIDES, thorny knap-weed, in *Botany*. See CENTAURY.

CALCULARII, in *Antiquity*, a sort of jugglers who practised sleight of hand. Their art consisted in laying several calculi, or counters on the table, then covering them with cups, and shifting and changing them with dexterity, like what is practised by our jugglers.

CALCULARY *of a pear*, a congeries of little stony knots dispersed through the whole parenchyma of the fruit.

The *calculary* is no vital, or essential part of the fruit; the several knots whereof it consists being only so many concretions of precipitations out of the sap, as we see in urines, wines, and other liquors.

CALCULATION, the art of computing several sums, by adding, subtracting, multiplying, or dividing. See ARITHMETIC.

An error in *calculation* is never protected, or secured, by any sentence, decree, &c. In stating a counts, there is always understood, *salvo errore calculi*.

The word *calculus* is used in this sense, in allusion to the practice of the ancients, who used *calculi*, or little stones, in making computations, in taking suffrages, and in keeping accounts, &c. as we now use counters, figures, &c.

A merchant or trader is said to have been mistaken in his *calculation* or accounts, when he has happened to take false measures, and has not succeeded in his undertakings so well as he expected.

CALCULATION is more particularly used to signify the computations in astronomy and geometry, for making tables of logarithms, ephemerides, finding the times of eclipses, &c.

CALCULATION *of clock and watch-work*. See CLOCK and WATCH-WORK.

CALCULATOR, a machine contrived and constructed by Mr. Ferguson, in the shape of an orrery, for exhibiting the motions of the earth and moon, and resolving a variety of astronomical problems. See the construction, figure, and use of this machine, in Ferguson's Astronomy, 4to. p. 265, &c.

CALCULATORES, in *Antiquity*, accomptants who reckoned their sums by *calculi*. There were several servants under this denomination in great families. Children also at school were taught to practise the same.

In the ancient canons we find a sort of diviners, or enchanters, censured under the denomination of *calculatores*.

CALCULUS primarily denotes a little stone, pebble, or counter, anciently used in making computations, taking of suffrages, playing at tables, and the like.

Hence the phrase *ponere calculos*, to denote a series of reasons, and a multitude of others alluding to the use of these *calculi* in accounts. Computists were by the lawyers called *calculones*, when they were either slaves, or newly freed men; those of a better condition were denominated *calculatores*, or *numerarii*: ordinarily there was one of these masters in each family of distinction, the title of whose office was a *calculus*, or a *rationibus*.

The Roman judges anciently gave their opinions by *calculi*, which were white for absolution, and black for condemnation.

Hence *calculus albus*, in ancient writers, denotes a favourable vote, either in behalf of a person to be absolved and acquitted of a charge, or elected to some dignity or post: as *calculus niger* did the contrary.

This usage is said to have been borrowed from the Thracians, who marked their happy or prosperous days by white, and their unhappy, by black pebbles put each night into an urn. Hence also the phrase, *figere, notare albicante calce, nigerrimo lapillo seu calculo*.

Besides the diversity of colour, there were some also which had figures or characters painted or engraven on them; as those which were in use in taking the suffrages both in the senate and at assemblies of the people.

The letters marked upon these *calculi* were U. R. for *uti rogas*, and A. for *antiquo*; the first of which expressed an approbation of the law, the latter a rejection of it.

Afterwards the judges, who sat in capital causes used *calculi* marked with the letter A. for *absolvo*, C. for *condemno*, and N. L. for *non liquet*; signifying a more full information was required.

We may also mention another species of *calculi* used at the public games, whereby the rank and order in which the athletæ were to fight was determined. If for instance they were twenty, then twenty of these pieces were cast into an urn; each ten were marked with numbers from one to ten, and the law was, that each of

those who drew, should fight him who had drawn the same number.

These were called *calculi athletici*.

CALCULUS is also used in *Ancient Grammatic Writers* for a kind of weight equal to two grains of *wheat*. Some make it equivalent to the *scripus*, which is equal to three grains of barley. Two *calculi* make the *ceratium*.

CALCULUS *differentialis* is a method of differencing quantities, or of finding an infinitely small quantity, which, being taken infinite times, shall be equal to a given quantity: or, it is the arithmetic of the infinitely small differences of variable quantities.

The foundation of this *calculus* is an infinitely small quantity, or an infinitesimal, which is a portion of a quantity incomparable to that quantity, or that is less than any assignable one, and therefore accounted as nothing; the error accruing by omitting it being less than any assignable one. Hence two quantities, only differing by an infinitesimal, are reputed equal.

Thus, in *Astronomy*, the diameter of the earth is an infinitesimal, in respect of the distance of the fixed stars; and the same holds in abstract quantities. The term infinitesimal, therefore, is merely respective, and involves a relation to another quantity; and does not denote any real ens, or being.

Now infinitesimals are called *differentials*, or differential quantities, when they are considered as the differences of two quantities. Sir Isaac Newton calls them *moments*; considering them as the momentary increments of quantities; v. g. of a line generated by the flux of a point; or of a surface by the flux of a line. The *differential calculus*, therefore, and the doctrine of FLUXIONS, are the same thing, under different names; the former given by M. Leibnitz, and the latter by Sir Isaac Newton: each of them lay claim to the discovery.

There is, indeed, a difference in the manner of expressing the quantities resulting from the different views wherein the two authors consider the infinitesimals; the one as moments, the other as differences: Leibnitz, and most foreigners, express the differentials of quantities by the same letters as variable ones, only prefixing the letter *d*: thus the differential of *x* is called dx, and that of y, dy: now dx is a positive quantity, if *x* continually increase; negative, if it decrease.

The English, with Sir Isaac Newton, instead of dx, write $\dot{x}$ (with a dot over it); for dy, $\dot{y}$, &c. which foreigners object against, on account of that confusion of points, which they imagine arises, when differentials are again differenced; besides, that the printers are more apt to overlook a point than a letter. Stable quantities being always expressed by the first letters of the alphabet a, b, c, &c. wherefore $d.(a+y-v) = dx+dy$, and $d.(x-y+v) = dx-dy$. So that the differencing of quantities is easily performed, by the addition or subtraction of their compounds.

To difference quantities that multiply each other; the rule is, first, multiply the differential of one factor into the other factor, the sum of the two factors is the differential sought: thus, the quantities being xy, the differential will be $x\dot{y}+\dot{x}y$, *i. e.* $d.(xy) = dy+ydx$. Secondly, if there be three quantities mutually multiplying each other, the factum of the two must then be multiplied into the differential of the third: thus, suppose $v = xy$, let $v = z$, then $vy = zy$; consequently $d.(vy) = d.(zy) = ydz+zdy$; but $dz = vdx+xdv$. These values, therefore, being substituted in the antecedent differential, $ydz+zdy$, the result is, $d.(xyz) = vxdy+vydx+xydv$. Hence it is easy to apprehend how to proceed, where the quantities are more than three.

If one variable quantity increase, while the other y decreases, it is evident $ydx-xdy$ will be the differential of xy.

To difference quantities that mutually divide each other; the rule is, first, multiply the differential of the divisor into the dividend; and, on the contrary, the differential of the dividend into the divisor: subtract the last product from the first and divide the remainder by the square of the divisor: the quotient is the differential of the quantities mutually dividing each other. See FLUXIONS.

CALCULUS *exponentialis*, is a method of differencing exponential quantities, or of finding and summing up the differentials or moments of exponential quantities; or at least bringing them to geometrical constructions.

By exponential quantity, as here understood a power, whose exponent is variable; v. g. x^x, a^x, x^y, where the exponent *x* does not denote the same in all the points of a curve, but in some stands for 2, in others for 3, in others for 5, &c.

To difference an exponential quantity: there is nothing required but to reduce the exponential qualities to logarithmic ones; which done, the differencing is managed as to logarithmic quantities. Thus, suppose the differential of the exponential quality x^x required, let

$$x^x = z$$

Then will $y\,lx = lz$

$$\frac{l\,x\,dy + \frac{y\,dx}{x} = \frac{dz}{z}}{}$$

$$z\,l\,x\,dy + \frac{zy\,dx}{x} = dz$$

That is, $x^x\,l\,x\,dy + yx^{x-1}\,dx = dz$. Bernouilli Opera, tom. i. p. 183. See EXPONENTIAL.

CALCULUS *integralis*, or *summatorius*, is a method of integrating, or summing up moments, or differential quantities; *i. e.* from a differential quantity given, to find the quantity from whose differencing the given differential results.

The *integral calculus*, therefore, is the inverse of the differential one: whence the English, who usually call the differential method, *fluxions*, give this *calculus*, which ascends from the fluxion, to the flowing or variable quantities, or, as foreigners express it, from the differences to the sums, by the name of the *inverse method of* FLUXIONS.

Hence, the integration is known to be justly performed, if the quantity found, according to the rules of the *differential calculus*, being differenced, produce that proposed to be summed.

Suppose f the sign of the sum, or integral quantity; then $\int y\,dx$ will denote the sum, or integral of the differential $y\,dx$.

To integrate, or sum up a differential quantity. It is demonstrated, first, that $\int a\,dx = x$: secondly, $\int (dx+dy) = x+y$: thirdly, $\int (a\,dy+y\,dx) = a\,y$: fourthly, $\int (m\,x^{m-1}\,dx) = x^m$: fifthly, $\int (m:n)\,x^{\frac{m-n}{n}}\,dx = x^{\frac{m}{n}}$: sixthly, $\int (y\,dx - x\,dy) : y^2 = x : y$. Of these, the fourth and fifth cases are the most frequent; wherein the differential quantity is integrated, by adding a variable unity to the exponent, and dividing the sum by the new exponent multiplied into the differential of the root; v. g. the fourth case, by $m-(+1)\,dx$, i. e. by $m\,dx$.

If the differential quantity to be integrated, doth not come under any of these formulas, it must either be reduced to an integral finite, or an infinite series, each of whose terms may be summed.

It may be here observed, that, as in the analysis of finites, any quantity may be raised to any degree of power; but not *vice versa*, the root cannot be extracted out of any number required: so in the analysis of infinites, any variable or flowing quantity may be differenced; but, *vice versa*, any differential cannot be integrated. And as, in the analysis of finites, we are not yet arrived at a method of extracting the roots of all equations; so neither has the *integral calculus* arrived at its perfection: and as, in the former we are obliged to have recourse to approximation; so in the latter we have recourse to infinite series, where we cannot attain to a perfect integration.

CALCULUS *literalis*, or *Literal* CALCULUS, is the same with specious arithmetic, or algebra, so called from its using the letters of the alphabet: in contradistinction to numeral arithmetic, which uses figures.

In the literal *calculus*, given quantities are expressed by the first letters, *a*, *b*, *c*, &c. and quantities sought by the last *x*, *y*, *z*, &c. Equal quantities are denoted by the same letters.

CALCULUS, in *Medicine*, the disease of the stone in the bladder, or kidneys.

The term is Latin, and signifies a *little pebble*.

The *calculus* in the bladder is called *lithontis*; and in the kidneys, *nephritis*. See STONE.

CALCULUS *Minervæ*, among the *Ancient Lawyers*, denoted the decision of a cause, wherein the judges were equally divided. The expression is taken from the history of Orestes, represented by Æschylus and Euripides; at whose trial, before the Areopagites for the murder of his mother, the votes being equally divided for and against him, Minerva interposed, and gave the casting vote, or *calculus*, in his behalf.

M. Cramer, professor at Marpurg, has a dissource expres, De Calculo Minervæ; wherein he maintains, that all the effect an entire equality of voices can have, is to leave the cause *in statu quo*.

CALCULUS *tiburtinus*, a sort of figured stone, formed in great plenty about the cataracts of the Anio, and other rivers in Italy; of a white colour, and in shape oblong, round, or echinated. They are a species of the *silicia lapidea*, and generated like them; and so like sugar-plums in the whole, that it is a common jest at Rome to deceive the unexperienced by serving them up at deserts.

CALDA, or CALDUM, in the *Ancient Diet*, denotes hot water,

water, uſed much among the Romans, anciently, as a drink partly for pleaſure, and partly for health.

The word is formed from *calidus*, *hot*; *aqua* being underſtood; *calda*, q. d. *calida aqua*.

Lipſius, Caſtalio, Mercurialis, Baccius, and Freinſhemius, have treated largely *de potu calda*, or *calde*. Act. Erud. Lipſ. 1721.

CALDARIA *Judiciaria*, the method of trial, or PURGATION by boiling water. See ORDEAL.

CALDARIUM, in the *Ancient Baths*, denoted a brazen veſſel or ciſtern, placed in the hypocauſtum, full of hot water, to be drawn thence into the *piſcina* or BATH, to give it the neceſſary degree of heat.

In this ſenſe, the *caldarium* ſtood contradiſtinguiſhed from the *tepidarium* and *frigidarium*.

CALDARIUM alſo denoted the ſtove, or ſudatory, being a cloſe vaulted room, wherein by hot dry fumes, without water, people were brought to a profuſe ſweat.

In which ſenſe, *caldarium* was the ſame with what was otherwiſe denominated *capnobarium ſudatorium*, and *laconicum*; in the Greek baths, *hypocauſtum*, ὑποκαυστον.

CALDARIUM *æs*, denotes POT-*Metal*.

CALDRON, a large kitchen utenſil, commonly made of copper; having a moveable iron handle, whereby to hang it on the chimney hook.

The word is formed from the French *chaudron*, or rather the Latin *caldarium*.

CALDRON, *boiling in*, *caldarii decoquere*, is a capital puniſhment ſpoken of in the middle age writers, decreed to divers ſorts of criminals, but chiefly to debaſers of the coin.

One of the torments inflicted on the ancient Chriſtian martyrs, was boiling in caldrons of water, oil, &c.

CALE, or KALE, in *Botany*, a ſpecies of the BRASSICA, or *cabbage*. See BORECOLE and COLEWORT.

CALE, *ſea*. See CRAMBE.

CALEA, in *Botany*, a genus of the *ſyngeneſia polygamia æqualis* claſs of plants; the receptacle of which is covered with a hairy down, and the calyx imbricated. There are three ſpecies.

CALEDONIANS, in *Antiquity*, the ancient inhabitants of that part of Britain which lies northward beyond Graham's Dyke, or the wall of Antoninus Pius, afterwards called Picts by the Romans and Provincials. The term *Caledonii* became, in proceſs of time, ſo common among the Roman writers, that they applied it generally to all Britain, and all the foreſts of Britain.

Camden derives the name from the plural *kaledlion*, of the Britiſh word *kaled*, *hard*; whence *Caledonii*, denoting a people *hardy*, *uninvited*, and *ruſtic*. Buchanan derives it from the old Scottiſh word *colden*, *hazle-tree*.

CALEFACIENTIA, in *Medicine*. The *calefacientia* of the Latins are the ſame with the θερμαντικα of the Greeks; and denote no more than what we commonly call warming medicines. That the natures and qualities of the ſeveral medicines coming under this denomination may be the more thoroughly underſtood, it is neceſſary to obſerve, that there may be heat without any external appearance of fire, and that it diſcovers itſelf by numberleſs effects; but in no inſtance more conſpicuouſly than by the diſtation of the air in the thermometer. Boerhaave's Chemiſtry, vol. i.

The means then by which warmth is generated in bodies, are the very ſame with thoſe by which apparent fire is produced. Where there is a heat, there is alſo a proportionable and correſpondent motion and agitation of the parts of the body ſaid to be hot; and, *vice verſa*, where there is an agitation of the parts of a body there is a proportionable heat and warmth.

CALEFACTION, a ſchool term for the action of fire in heating a body; or the impulſe which the particles of a hot body impreſs on other bodies around.

The word is particularly uſed in pharmacy; where *calefaction* is diſtinguiſhed from coction: the firſt being applied, where the thing is only heated, without boiling.

CALENDAR, KALENDARIUM, CALENDARIUM, or KALENDAR, a diſtribution of time, accommodated to the uſes of life; or a table, or ALMANAC, containing the order of days, weeks, months, FEASTS, &c. happening throughout the YEAR. See TIME, MONTH, YEAR, &c.

It is called *calendar* from the word *kalendæ*, anciently wrote in large characters at the head of each month. See CALENDS.

The days in *calendars* were originally divided into octoades, or eighths, but afterwards, in imitation of the Jews into hebdomades, or ſevens; which cuſtom, Scaliger obſerves, was not introduced among the Romans till after the time of Theodoſius.

There are divers *calendars*, according to the different forms of the year, and diſtributions of time, eſtabliſhed in different countries. Hence the Roman, the Jewiſh, the Perſian, the Julian, the Gregorian, &c. *calendars*.

The ancient Roman *calendar* is given by Ricciolus, Stevinus, Danet, and others; by which we ſee the order and number of the Roman holy-days, and work-days.

The three Chriſtian *calendars* are given by Wolfius in his Elements of Chronology.

The Jewiſh *calendar* was fixed by rabbi Hillel, about the year 360, from which time the days of their year may be reduced to thoſe of the Julian *calendar*.

CALENDAR, *the Roman*, owed its origin to Romulus; but it has undergone various reformations ſince his time. That legiſlator diſtributed time in ſeveral periods, for the uſe of the people under his command: but as he was much better verſed in matters of war than of aſtronomy, he only divided the year into ten months, making it begin in the ſpring, on the firſt of March: imagining the ſun made his courſe through all the ſeaſons in three hundred and four days.

Romulus's *calendar* was reformed by Numa, who added two months more, January and February; placing them before March: ſo that his year conſiſted of three hundred fifty-five days, and began on the firſt of January. He diſſe, however, in imitation of the Greeks, to make an intercalation of forty-five days, which he diviſed into two parts, intercalating a month of twenty-two days at the end of each two years; and at the end of each two years more, another month of twenty-three days; which month, thus interpoſed, he called *Mercedonius*, or the intercalary February.

But theſe intercalations being ill obſerved by the pontiffs, to whom Numa committed the care of them, occaſioned great diſorders in the conſtitution of the year; which Cæſar, as ſovereign pontiff, endeavoured to remedy: to this end, he made choice of Soſigenes, a celebrated aſtronomer of thoſe times: who found, that the diſpoſition of time in the *calendar* could never be ſettled on any ſure footing, without having regard to the annual courſe of the ſun. Accordingly, as the ſun's yearly courſe is performed in three hundred ſixty-five days ſix hours, he reduced the year to the ſame number of days: the years of this correction of the *calendar* was a year of confuſion; they being obliged, in order to ſwallow up the ſixty-ſeven days that had been imprudently added, and which occaſioned the confuſion, to add two months beſides the *Mercedonius*, which chanced to fall out that year; ſo that this year conſiſted of fifteen months, or four hundred forty-ſeven days. This reformation was made in the year of Rome 708, forty-two or forty-three years before Chriſt. See YEAR.

The Roman called alſo *Julian calendar*, from its reformer Julius, is diſpoſed into quadriennial periods; whereof the three firſt years, which he called *communes*, conſiſt of three hundred ſixty-five days; and the fourth *biſſextile*, of three hundred ſixty-ſix; by reaſon of the ſix hours, which in four years make a day, or ſomewhat leſs; for in one hundred thirty-four years an intercalary day is to be retrenched. On this account it was, that pope Gregory XIII. with the advice of Clavius and Ciaconius, appointed, that the hundredth year of each century ſhould have no biſſextile, excepting in each fourth century: that is, a ſubſtraction is made of three biſſextile days in the ſpace of four centuries; by reaſon of the eleven minutes wanting in the ſix hours whereof the biſſextile conſiſts. See BISSEXTILE.

This reformation of the *calendar*, or the new ſtyle, as we call it, commenced on the fourth of October 1582, when ten days were thrown out at once; ſo many having been introduced into the computation ſince the time of the council of Nice, in 325, by the defect of eleven minutes.

CALENDAR, *Julian Chriſtian*, is that wherein the days of the week are determined by the letters A, B, C, D, E, F, G, by means of the ſolar cycle; and the new and full moons, eſpecially the paſchal full moon, with the feaſt of Eaſter, and the other moveable feaſts depending thereon, by means of golden numbers, rightly diſpoſed through the Julian year. See CYCLE, and *Golden* NUMBER.

In this *calendar*, the vernal equinox is ſuppoſed to be fixed to the twenty-firſt day of March, and the cycle of nineteen years, or the golden numbers, conſtantly to indicate the places of the new and full moons; yet both are erroneous. And hence ariſe a very great irregularity in the time of Eaſter. To ſhew this error the more apparently, let us apply it to the year 1715. In this year, then, the vernal equinox falls on the tenth of March; and therefore comes too early by eleven days. The paſchal full moon falls on the ſeventh of April; and therefore too late, with regard to the cycle, by three days. Eaſter, therefore, which ſhould have been on the tenth of April, was that year on the ſeventeenth. The error, here, lies only in the metemptoſis, or poſt-poſition of the moon, through the defect of the lunar cycle. If the full moon had fell on the eleventh of March, Eaſter

would have fallen on the thirteenth of March; and therefore the error, arising from the anticipation of the equinox, would have exceedingly augmented that arising from the post-position. These errors, in course of time, were to multiplied, that the *calendar* no longer exhibited any regular Easter. Pope Gregory XIII. therefore, by the advice of Aloysius Lilius, in 1582, threw ten days out of the month of October, to reduce the equinox to its place, viz. the twenty-first of March; and thus introduced the form of the Gregorian year, with such a provision, as that the equinox should be constantly kept to the twenty-first of March. The new moons and full moons, by advice of the same Lilius, were not to be indicated by golden numbers, but by epacts. The *calendar*, however, was still retained in England, without this correction: whence there was a difference of eleven days between our time and that of our neighbours. But by 24 Geo. II. cap. 23. the Gregorian computation is established here, and accordingly took place in 1752. See STYLE.

CALENDAR, *Gregorian*, is that which, by means of epacts, rightly disposed through the several months, determines the new and full moons, and the time of Easter, with the moveable feasts depending thereon, in the Gregorian year. The Gregorian *calendar*, therefore, differs from the Julian, both in the form of the year, and in that epacts are substituted in lieu of golden numbers; for the use and disposition whereof, see EPACT.

Though the Gregorian *calendar* be preferable to the Julian, yet it is not without its defects (perhaps, as Tycho Brahe and Calliui imagine, it is impossible ever to bring the thing to a perfect juliiefs.) For, first, the Gregorian intercalation does not hinder but that the equinox sometimes exceeds the twenty-first of March, as far as the twenty-third; and sometimes anticipates it, falling on the nineteenth; and the full moon, which falls on the twentieth of March, is sometimes the paschal, yet not so accounted by the Gregorians. On the other hand, the Gregorians account the full moon of the twenty-second of March, the paschal; which yet, falling before the equinox, is not paschal. In the first case, therefore, Easter is celebrated in an irregular month; in the latter, there are two Easters in the same ecclesiastical year. In like manner, the cyclical computation being founded on mean full moons, which yet may precede or follow the true ones by some hours, the paschal full moon may fall on Saturday, which is yet referred by the cycle to Sunday; whence, in the first case, Easter is celebrated eight days later than it should be; in the other it is celebrated on the very day of the full moon, with the Jews and Quartodecimian heretics; contrary to the decree of the council of Nice. Scaliger and Calvisius shew other faults in the Gregorian *calendar*, arising from the negligence and inadvertency of the authors: yet is this *calendar* adhered to by the Romanists throughout Europe, &c. and used wherever the Roman lavisury is used.

CALENDAR, *reformed*, or *corrected*, is that which, setting aside all apparatus of golden numbers, epacts, and dominical letters, determines the equinox, with the paschal full moon, and the moveable feasts depending thereon, by arithmetical computation, according to the Rudolphine tables.

This *calendar* was introduced among the protestant states of Germany, in the year 1700, when eleven days were at once thrown out of the month of February; so that in 1700, February had but eighteen days; by this means the corrected style agrees with the Gregorian. This alteration in the form of the year, they admitted for a time; in expectation that, the real quantity of the tropical year being at length more accurately determined by observation, the Romanists would agree with them, on some more convenient intercalation.

CALENDAR, *construction of the almanac*. 1. Compute the sun's and moon's place for each day of the year, or take them from ephemerides. 2. Find the dominical letter, and, by means thereof, distribute the *calendar* into weeks. 3. Compute the time of Easter, and thence fix the other moveable feasts. 4. Add the immoveable feasts, with the names of the martyrs. 5. To every day add the sun's and moon's place, with the rising and setting of each luminary; the length of day and night; the crepuscula, and the aspects of the planets. 6. Add, in the proper places, the chief places of the moon, and the sun's entrance into the cardinal points; i. e. the solstices and equinoxes; together with the rising and the setting, especially heliacal, of the planets, and chief fixed stars: means for each of which will be found under the proper heads.

The duration of the crepuscula, or the end of the evening and beginning of the morning twilight; together with the sun's rising and setting, and the length of days, may be transferred from the *calendars* of one year into those of another; the differences in the several years being too small to be of any consideration in civil life. Hence it appears, that the construction of a *calendar* has nothing in it of mystery, or difficulty; if tables of the heavenly motions be at hand. See ALMANAC.

Some divide *calendars* or *almanacs* into public and private, perfect and imperfect; others into heathen and Christian.

Public *almanacs* are those of a larger size, usually hung up for common or family use; private are those of the smaller kind, to be carried about either in the hand inscribed on a staff, or in the pocket; perfect, those which have the dominical letters as well as primes, and feasts inscribed on them; imperfect, those which have only the primes and immoveable feasts. Till about the fourth century, they all carry the marks of heathenism; from that age to the seventh, they are generally divided between heathenism and Christianity.

Almanacs are of somewhat different composition, some containing more points, others fewer. The essential part is the *calendar* of months and days, with the rising and settings of the sun, age of the moon, &c. To these are added various *paterga*, alluronomical, astrological, meteorological, chronological, and even political, rural, medical, &c. as calculations, and accounts of eclipses, solar ingresses, aspects, and configurations of the heavenly bodies, lunations, heliocentrical and geocentrical motions of the planets, prognostics of the weather, and predictions of other events, tables of the planetary motions, the tides, terms, interest, twilight, equation, kings, &c.

CALENDAR, *Genalean*, or *Jellalean*, is a correction of the Persian *calendar*, made by order of sultan Gelaleddin, in the 479th year of the Hegira; of Christ 1089. See EPOCHA and YEAR.

CALENDAR is also applied to divers other compositions respecting the twelve months of the year.

In this sense, Spencer has given the shepherd's *Calendar*; Evelyn, and Miller, the gardener's *Calendar*, &c.

CALENDAR is used for the catalogue, or table, anciently kept in each church, of the saints, both universal, and those particularly honoured in each church; with their bishops, martyrs, &c. *Calendars* are not to be confounded with martyrologies, for each church had its peculiar *calendar*; whereas the martyrologies regarded the whole church in general; containing the martyrs and confessors of all the churches. From all the several *calendars* were formed one martyrology; so that martyrologies are posterior to *calendars*. See MARTYROLOGY.

CALENDAR is also extended to an orderly table, or enumeration of persons or things.

Lord Bacon wishes for a *calendar* of doubts. A late writer has given a *calendar* of the persons who may inherit estates in fee-simple.

CALENDAR, *Kalendarium*, originally denoted among the Romans a book containing an account of monies at interest, which became due on the calends of January; the usual time when the Roman usurers let out their money. Senec. de Benef. lib. vii. c. 10. Idem. lib. i. c. 2. Ejusd. Epist. 14. Idem, Ep. 87. Fab. Thes. p. 417.

CALENDAR *months*, the solar months as they stand in the calendar, viz. January 31 days, &c.

CALENDAR, *ephemeridis*, an instrument engraved upon copper-plates printed upon paper, and pasted on board, with a brass filder which carries a hair, and the use by inspection, the sun's meridian altitude, right ascension, declination, rising, setting, amplitude, &c. to a greater exactness than our common globes will shew.

CALENDAR *of prisoners*, is a list of all their names, with their separate judgments in the margin, which the judge signs, and the execution of which is committed to the respective sheriff. In the case of a capital felony, the words "hanged by the neck" are annexed to the prisoner's names, instead of "*fac. per collum*," for *pessonabitur per collum*, which was the ancient form. Judge Blackstone well observes, that the execution of a man seems to be too important and terrible a task to depend on a marginal note. Blackst. Com. vol. iv. p. 396.

CALENDAR-*lights*, *virtuous calendars*, a name formerly given by some writers to a thermometer, or graduated tube, whereby to measure the degrees of heat.

CALENDAR-*brothers*, *fraternæ calendarii*, a sort of devout fraternities, composed of ecclesiastics as well as laymen; whose chief business was to procure masses to be said, and alms distributed, for the souls of such members as were deceased. They were also denominated *calends-brothers*, because they usually met on the *calends* of each month, though in some places only once a quarter.

CALENDARIUM *festum*. The Christians retained much of the ceremony and wantonness of the calends of January, which for many ages was held a feast, and celebrated

brated by the clergy with great indecencies, under the names *festum fatuorum*, or *stultorum*, or *hypodiaconorum*, or *fatuorum*, that is, the feaſt of fools; ſometimes alſo *libertas decembria*. The people met maſked in the church, and in a ludicrous way proceeded to the election of a mock pope, or biſhop, who exerciſed a juriſdiction over them ſuitable to the feſtivity of the occaſion: fathers, councils, and popes long laboured to reſtrain this licence, to little purpoſe. We find the feaſt of the calends in uſe as low as the cloſe of the fifteenth century. Du-Cange.

CALENDER, a machine uſed in the manufactories, for preſſing certain ſtuffs, ſilks, and even linens; to make them ſmooth, even and gloſſy. It is alſo uſed for watering, or giving the waves to tabbies and mohairs.

The word is formed from the *French calandre*, of Spaniſh *cazandra*, which ſignify the ſame; and which ſome derive further from the Latin *calendæ*: becauſe the whole effect of the machine depends upon a cylinder. Borel derives the name from that of a little bird, of the ſwallow kind, on account of the agreement between the feathers of the bird, and the impreſſion of the machine.

The *calender* conſiſts of two large wooden rollers, round which the pieces of ſtuff are wound: theſe are put between two large, cloſe, poliſhed planks of wood, or plates of iron, the lower reſting as a fixed baſe, and the upper moveable, by means of a wheel like that of a crane; with a rope, faſtened to a ſpindle which makes its axis: this upper part is of a prodigious weight, ſometimes twenty or thirty thouſand pounds. It is the weight of this part, together with its alternate motion, that gives the poliſh, and makes the waves on the ſtuffs, by cauſing the cylinders on which they are put to roll with great force over the loweſt board. The rollers are taken off and put on again, by inclining the machine.

At Paris they have an extraordinary machine of this kind, called the *royal calender*, made by order of M. Colbert; the lower table or plank of which is made of a block of ſmooth marble, and the upper lined at bottom with a plate of poliſhed copper.

This is called the *great calender*; they have alſo a ſmall one with two tables of poliſhed iron or ſteel.

There are alſo *calenders* without wheels, which are wrought by a horſe harneſſed to a wooden bar, which turns a large arbour placed upright; at the top of which, on a kind of drum, is wound a rope, the two ends of which being faſtened to the two extremities of the upper plank of the engine, give it motion. But the horſe *calender* is no leſs chearful than the wheel kind, as the motion of this latter is more equable and certain.

We read of *calenderers* worſted. To improve linen farther, the drapers get ſeveral ſorts of their cloths *calendered*; whereby their threads are made to lie flatter and ſmoother.

CALENDER alſo denotes the workman who manages the machine above deſcribed; applying the cloth or ſtuff underneath, after having firſt wound it on the rollers.

CALENDERS is alſo the name of a ſect of Derviſes ſpread through Turky and Perſia, whoſe order is not in general eſteem among the Mahometans, as being reputed leſs auſtere and ſtrict in morals than ſome other orders. They derive their name from Calenderi, their founder. See DERVIS.

CALENDS, CALENDÆ, in the *Roman Chronology*, the firſt day of every month.

The word is formed from KARA, *I call*, or *proclaim*; becauſe, before the publication of the Roman faſti, it was one of the offices of the pontifices to watch the appearance of the new moon, and give notice thereof to the *Rex Sacrificulus*; upon which a ſacrifice being offered, the pontif ſummoned the people together in the Capitol, and there, with a loud voice proclaimed the number of *calends*, or the day whereon the nones would be; which he did by repeating this formula, as often as there were days of *calends*: *Calo Jovis Nonas*. Whence the name *calendæ* was given thereto, from *calo*, *calare*. This is the account given by Varro. Plutarch, and after him Gyrac, derive the word from *nium*: *Quia luna calendis nium fit*: but this is far fetched. Others derive the appellation hence: that the people being convened on this day, the pontifex called or proclaimed the ſeveral feaſts or holidays in the month; a cuſtom which continued no longer than the year of Rome 450, when C. Flavius, the curule ædile, ordered the faſti, or calendar, to be ſet up in public places, that every body might know the difference of times, and the return of the feſtivals.

The *calends* were reckoned backwards, or in a retrograde order: thus, v. gr. the firſt of May being the *calends* of May; the laſt, or thirtieth of April, was the *pridie calendarum*, or ſecond of the *calends* of May; the twenty-ninth of April, the third of the *calends*, or before the *calends*: and ſo back to the thirteenth, where the ides commence; which are, likewiſe, numbered invertedly to the fifth, where the nones begin; which are numbered after the ſame manner to the firſt day of the month, which is the *calends* of April. See IDES, and NONES.

The rules of computation by *calends*, are included in the following verſes:

Prima dies menſis cujuſque vocatur dicta calendæ:
Sex Maius tenet, Octobrem, Julius, & Mars;
Quatuor at reliqui: bene ianus quilibet octo.
Inde dies reliquos omnes dic eſſe calendas;
Quas retro numerans dices a menſe ſequente.

To find the day of the *calends* anſwering to any day of the month we are in; ſee how many days there are yet remaining of the month, and to that number add two: for example; ſuppoſe it the twenty-ſecond of April; it is then the tenth of the *calends* of May. For April contains thirty days: and twenty-two taken from thirty, there remains eight; to which two being added, the ſum is ten.

The reaſon of adding *two* is, becauſe the laſt day of the month is called *ſecundo calendas*, the laſt but one *tertio calendas*, &c.

The Roman writers themſelves are at a loſs for the reaſon of this abſurd and whimſical manner of computing the days of the month; yet it is ſtill kept up in the Roman chancery; and by ſome authors, out of a vain affectation of learning, preferred to the common, more natural, and eaſy manner.

CALENDS, *Kalendæ*, are alſo uſed in *Church Hiſtory* to denote conferences anciently held by the clergy of each deanry, on the firſt day of every month, concerning their duty and conduct, eſpecially in what related to the impoſition of penance. Du-Cange.

CALENDS *of January*, in *Roman Antiquity*, was a ſolemn feſtival conſecrated to Juno and Janus; wherein the Romans offered vows and ſacrifices to thoſe deities, and exchanged preſents among themſelves, as a token of friendſhip.

It was only a melancholy day to debtors, who were then obliged to pay their intereſts, &c. Hence Horace calls it *triſtes calendæ*. Lib. 1. Serm. Sat. 3.

CALENDULA, in *Botany*, the herb, or flower popularly called MARYGOLD, uſed in the ſhops as a cardiac and alexipharmic, of like, though inferior virtue to ſaffron.

CALENDULA, in *Ornithology*, a ſpecies of the MOTACILLA in the order *paſſeres*, found in Pennſylvania.

CALENTES, in *Logic*, a mood of ſyllogiſm in the fourth, commonly called *Galenical* FIGURE, wherein the minor propoſition is univerſal and affirmative; and the ſecond or minor, as well as the concluſion, univerſal and negative.

This is intimated by the letters it is compoſed of, where the A ſignifies an univerſal affirmative, and the two E's as many univerſal negatives. E. g.

CA. *Every affliction in this world is only for a time.*
LEN. *No affliction which is only for a time, ought to be diſmaid at.*
TES. *No affliction ought to diſturb us, which happens in this world.*

The Ariſtotelians not allowing the fourth figure of ſyllogiſms, turn this word into CELANTES, and make it only an indirect mood of the firſt figure.

CALENTURE, an inflammatory fever, frequent at ſea, attended with a delirium; wherein the patients imagine the ſea to be green fields; and if not prevented, will leap over-board.

The word *calenture* is Spaniſh, *calentura*, and ſignifies a heat, fever, or ague; from the Latin *calere*, *to be hot*. *Calentures* are chiefly found in ſailing towards the Weſt Indies, as they approach the tropic. Thoſe affected with them have a fierce look, and are very unruly, being ſo eager to get to their imaginary coaſt verdure, and ſo ſtrong, that ſix men ſometimes ſcarce ſuffice to detain them. The diſeaſe chiefly ſeizes the young and ſtrong, eſpecially of a ſanguine complexion; the pulſe is extremely low. When taken in time, it rarely proves mortal.

The ſeat of this diſorder is in the ſtomach, and its principal ſource ſeems to be the eating of ſalt proviſions for a long time together.

The firſt ſtep toward a cure is the giving of a brisk vomit; this has the immediate effect of diſpelling the fancy of the green leaves and trees in the water; after this, ſalt of wormwood, a little diaſcordium, and conſerve of roſes vitriolated are proper, and bleeding in the arm: and if that does not take effect, the opening of the temporal artery is proper: a thin diet and cream of tartar in water-gruel, after theſe things, generally remove the remains of the diſeaſe.

When they are ſeized with this violent heat and diſorder, which for the moſt part happens in the night, they

steal privately over-board into the sea, imagining themselves to be going into the green fields. *Calentures* happen oftener by night than by day, because ships are more closely shut up by night, and are left airy than they are in the day-time. Phil. Trans. abr. vol. iv. by Dr. Oliver.

CALESIAM, in *Botany*, H. M. *Arbor baccifera racemosa, viris floribus actuli oblongis compressis monopyrenis*. It is a very tall and beautiful tree; the wood is of a dark purple colour, smooth and flexible; the flowers grow in clusters at the ends of the boughs, very like the flowers of vines, and are succeeded by berries in clusters, like grapes or currants, full of a succulent and insipid pulp, enclosing a stone having a white insipid kernel.

It grows common in Malabar, bears fruit once a year, and is fruitful from ten years standing to fifty and upward: of the wood they make sheaths for knives and swords.

The bark, pulverized and made into an ointment with butter, cures the *spasmus cynicus*, and convulsions excited by great wounds; it heals also malignant ulcers, and mitigates the pain in the gout. The juice of the bark cures *aphthæ*; and, taken inwardly, is a remedy for the dysentery. The bark of this tree with that of the codampulli reduced into a powder, purges the belly, and carries off pituitous and atrabilious humours. Half a tea-cup full of the decoction of the leaves and bark in water, is usually given to women just before their labour, to promote an easy delivery.

CALF, *vitulus*, in *Zoology*, the young one of a cow, an animal too well known to need a particular description. There are two ways of breeding calves that are intended to be reared; the one is to let the *calf* run with its dam all the year round: this is the method in the cheap breeding countries, and is generally allowed to make the best cattle. The other way is to take them from the dam after they have sucked about a fortnight; they are then to be taught to drink flat milk, which is to be made but just warm for them, it being very dangerous to give it them too hot.

The best time of weaning *calves* is from January to May; they should have milk for twelve weeks after, and a fortnight before that is left off, water should be mixed with the milk in larger and larger quantities. When the *calf* has fed on milk about a month, little whisps of hay should be placed all about him in cleft sticks, to induce him to eat. In the beginning of April they should be turned out to graze; only for a few days they should be taken in for the night, and have milk and water given them; the same may also be given them in a pail sometimes in the field, till they are fo able to feed themselves that they do not regard it. The grass they are turned into muft not be too rank, but short and sweet, that they may like it, and yet get it with some labour.

Calves should be always weaned at grass, for if it be done with hay and water, they often grow big-bellied on it, and are apt to rot. When those among the males are selected which are to be kept as bulls, the reft should be gelt for oxen: the sooner the better. Twenty days old is a very good time, or between that age and ten days. About London, almoft all the *calves* are fatted for the butcher. The reason of this is, that there is a good market for them; and the lands here are not so profitable to breed upon as in cheaper countries. The way to make the *calves* fat and fine is, the keeping of them very clean, giving them fresh litter every day, and the hanging of a large chalk-ftone in some corner where they can eafily get at it to lick it, but where it is out of the way of being fouled by their dung and urine. The cribs are to be so placed as not to have too much fun upon them, and so high above the ground that the urine may run off. They also bleed them once when they are a month old, and a fecond time before they kill them: this is a great addition to the beauty and whiteness of their flesh: the bleeding is by some repeated much oftener; but this is fufficient.

Calves are very apt to be loofe in their bowels: this wastes and very much injures them. The remedy is, to give them chalk fcraped into milk, pouring it down with a horn. If this does not succeed, they give them hole semence in large doses, and use the cold bath every morning. If a cow will not let a ftrange *calf* fuck her, the common method is to rub both her nofe and the *calf*'s with a little brandy: this generally reconciles them, after a few ftrellings.

Calves, befides their flesh, afford two sorts of commodities for trade, namely, the hide and the hair.

CALF-*skin*, in the leather manufacture, are prepared and dreffed by the tanners, fkinners, and curriers, who fell them for the use of the fhoe-makers, faddlers, bookbinders, and other artificers, who employ them in their several manufactures.

CALF-*skin dreffed in jumack*, denotes the skin of this animal curried black on the hair fide, and dyed of an orange colour on the flesh fide by means of fumach, chiefly used in the making of belts.

The *English calf-skin* is much valued abroad, and the commerce thereof very confiderable in France and other countries; where divers attempts have been made to imitate it, but hitherto in vain.

What is like to baffle all endeavours for imitating the *English calf* in *France* is, the fmallnefs and weakneft of the *calves* about *Paris*; which, at fifteen days old, are not fo big as the *English* ones when they come into the world.

Golden-CALF. See GELDING.

CALF, *fea*, in *Zoology*. See SEA-*calf*.

CALF, among *Sportfmen*, is ufed for a male hart or hind of the firft year.

CALF alfo denotes the young of the WHALE.

CALF's *foot*, in *Botany*. See SNAP-DRAGON.

CALI is alfo to denote pot-afhes, or the ait of the plant KALI.

CALIBER, or CALIBRE, in a general fenfe, notes the extent of any round thing in thickneft, or diameter.

In which fenfe we fay, a column is of the fame *caliber* as another, when they are both of the fame diameter.

CALIBER more particularly denotes the bore, or width of a piece of ordnance, or other fire-arms; or the diameter of the mouth thereof; or the ball it carries.

The *caliber* is the rule by which all the parts of a cannon, or mortar, as well as of its carriage, are proportioned.

CALIBER-*compaffes*, a fort of *compaffes* made with arched legs, to take the diameter of convex or concave bodies.

Caliber-compaffes are chiefly ufed by gunners, for taking the diameters of the feveral parts of a piece of ordnance, or of bombs, bullets, &c. Their legs are therefore circular, and more on an arch of brafs, whereon are marked the inches, and half-inches; to fhew how far the points of the *compaffes* are opened afunder.

Some are alfo made for taking the diameter of the bore of a gun or mortar.

The gaugers alfo fometimes ufe *calibers* to embrace the two heads of any cafk, in order to find its length.

The *caliber*, ufed by carpenters and joiners, is a piece of board notched triangular-wife in the middle, for the taking of meafure.

CALIBER, CALIBER-*rule*, or *Gunner's* CALLIPERS, is an inftrument, wherein a right line is fo divided, as that the firft part being equal to the diameter of an iron or leaden ball of one pound weight, the other parts are to the firft as the diameters of balls of two, three, four, &c. pounds, are to the diameter of a ball of one pound. The *caliber* is ufed by engineers, from the weight of the ball given to determine its diameter, or *caliber*; or *vice verfa*.

The gunner's *callipers* confifts of two thin plates of brafs joined by a rivet, fo as to move quite round each other: its length from the centre of the joint is between fix inches and a foot, and its breadth from one to two inches: that of the moft convenient fize is about nine inches long. Many fcales, tables, and proportions, &c. may be introduced on this inftrument; but none are effential to it, except thofe for taking the *caliber* of fhot and cannon, and for meafuring the magnitude of faliant and entering angles. The moft complete *callipers* is exhibited *Tem. Gunnery, fo.* 21. the furniture whereof is of which we fhall now briefly defcribe. Let the four faces of this inftrument be diftinguifhed by the letters A, B, C, D: A and D confift of a circular head and leg; B and C conffft only of a leg.

On the circular head adjoining to the leg of the face A are divifions denominated *fhot diameters*, which fhew the diftance in inches and tenths of an inch of the points of the *callipers* when they are opened: fo that if a ball not exceeding ten inches be introduced between them, the bevil edge E marks its diameter among thefe divifions.

On the circular bevil part E of the face B is a fcale of divifions diftinguifhed by *lb. weight of iron fhot*. When the diameter of any fhot is taken between the points of the *callipers*, the inner edge of the leg A fhews its weight in avoirdupoife pounds, provided it be lb. $\frac{1}{8}$, 1, $1\frac{1}{8}$, 2, 3, 4, 5, 6, 8, 9, 12, 16, 18, 24, 26, 32, 36, or 42: the figures neareft the bevil edge anfwering to the fhort lines in the fcale, and thofe behind them to the longer ftrokes. This fcale is conftructed on the following geometrical theorem, viz. that the weights of fpheres are as the cubes of their diameters.

On the lower part of the circular head of the face A is a fcale of divifions marked *bore of guns*; for the ufe of which, the legs of the *callipers* are flipped acrofs each other, till the fteel points touch the concave furface of the gun in its greateft breadth; then the bevil edge F of the face B will cut a divifion in the fcale fhewing the diameter of the bore in inches and tenths.

Within the fcales of *fhot* and *bore* diameters on the circular part of A, are divifions marked *pounders*: the inner figures $\frac{1}{8}$, $\frac{1}{4}$, 3, $5\frac{1}{2}$, 8, 12, 18, 26, 36, correfpond to the

the longeſt lines; and the figures 1, 2, 4, 8, 16, 24, 32, 42 to the ſhort ſtrokes. When the bore of a gun is taken between the points of the *callipers*, the bevil edge F will either cut or be near one of theſe divisions, and ſhew the weight of iron ſhot proper for that gun.

On the upper half of the circular head of the face A are three concentric ſcales of degrees; the outer ſcale conſiſting of 180 degrees numbered from right to left, 10, 20, &c. the middle numbered the contrary way, and the outer ſcale beginning at the middle with 0, and numbered on each ſide to 90 degrees. Theſe ſcales ſerve to take the quantity of an angle, either entering or falliant. For an entering, or internal angle, apply the legs of the *callipers* ſo that its outward edges coincide with the legs of the given angle, the degree cut by the bevil edge F in the outer ſcale ſhews the meaſure of the angle ſought; for a falliant, or external angle, ſlip the legs of the *callipers* acroſs each other, ſo that their outward edges may coincide with the legs forming the angle, and the degree marked on the middle ſcale by the bevil edge E will ſhew the meaſure of the angle required. The inner ſcale will ſerve to determine the elevation of cannon and mortars, or of any oblique plane. Let one end of a thread be fixed into the centre on that plane B, and any weight tied to the other end: apply the ſtraight ſide of the plate A to the ſide of the body whoſe inclination is ſought; hold it in this poſition, and move the plate B, till the thread falls upon the line near the centre marked *Per.* Then will the bevil edge F cut the degrees on the inner ſcale, ſhewing the inclination of that body to the horizon.

On the face C, near the point of the *callipers*, is a little table ſhewing the proportion of troy and avoirdupoiſe weights, by which one kind of weight may be eaſily reduced into another.

Near the extreme of the face D of the *callipers*, are two tables ſhewing the proportion between the pounds weight of London and Paris, and alſo between the lengths of the foot meaſure of England and France.

Near the extreme of the face A is a table containing four rules of the circle and ſphere; and geometrical figures with numbers annexed to them: the firſt is a circle including the proportion in round numbers of the diameter to its circumference; the ſecond is a circle inſcribed in a ſquare, and a ſquare within that circle and another circle in the inner ſquare: the numbers 28, 22 above this figure exhibit the proportion of the outward ſquare to the area of the inſcribed circle; and the numbers 14, 11 below it, ſhew the proportion between the area of the inſcribed ſquare and the area of its inſcribed circle. The third is a cube inſcribed in a ſphere; and the number 893 ſhews that a cube of iron inſcribed in a ſphere of 12 inches in diameter, weighs 893. The fourth is a ſphere in a cube, and the number 243, expreſſes the weight in pounds of a ſphere inſcribed to the cube whoſe ſide is 12 inches: the fifth repreſents a cylinder and cone of one foot diameter and height: the number in the cylinder ſhews that an iron cylinder of that diameter and height weighs 364 lb. and the number 121.5 in the cone expreſſes the weight of a cone, the diameter of whoſe baſe is 12 inches, and of the ſame height: the ſixth figure ſhews that an iron cube, whoſe ſide is 12 inches, weighs 464 lb. and that a ſquare pyramid of iron, whoſe baſe is a ſquare foot and height 12 inches weighs 154 lb. The numbers which have been hitherto fixed to the four laſt figures were not ſtrictly true; and therefore they have been corrected in the figure here referred to; and by theſe the figures on any inſtrument of this kind ſhould be corrected likewiſe.

On the leg B of the *callipers*, is a table ſhewing the weights of 2 cubic inch or foot of various bodies in pounds avoirdupoiſe.

On the face D of the circular head of the *callipers* is a table contained between five concentric ſegments of rings: the inner one marked *Gun* ſhews the nature of a gun, or the weight of the ball it carries; the two next rings contain the quantity of powder uſed for proof and ſervice in braſs guns; and the two outermoſt rings ſhew the quantity for proof and ſervice in iron cannon.

On the face A is a table exhibiting the method of computing the *number of ſhot or ſhells* in a triangular, *ſquare*, or rectangular pile. Near this is placed a table containing the principal rules relative to the *fall of bodies*, expreſſed in an algebraic manner: nearer the centre we have another table of rules for raiſing water, calculated on the ſuppoſition, that one horſe is equal in this kind of labour to five men, and that one man will raiſe a hogſhead of water to eight feet of height in one minute, and work at that rate for ſome hours. N. B. Hogſheads are reckoned at ſixty gallons.

Some of the leading principles in gunnery, relating to *ſhooting* in cannon and mortars, are expreſſed on the face B of the *callipers*. Beſides the articles already enumerated, the ſcales uſually marked on the SECTOR are laid down on this inſtrument: thus, the line of inches is placed on the edge of the *callipers*, or on the ſtraight borders of the faces C, D: the logarithmic ſcales of numbers, lines, verſed ſines, and tangents are placed along theſe faces, near the ſtraight edges: the line of lines is placed on the ſame faces in an angular poſition, and marked *Lin.* The lines of plane or ſuperficies are alſo exhibited on the faces C and D, tending towards the centre, and marked *Plan.* Finally, the lines of ſolids are laid on the ſame faces, tending towards the centre, and diſtinguiſhed by *Sol.* See farther on the conſtruction and uſe of this inſtrument, Robertſon's Treatiſe of Mathematical Inſtruments, &c. Appendix.

CALICAPHA, in *Botany*, a name uſed by ſome authors for the white thorn.

CALICULARIS, in *Botany*, a name given by ſome authors to the common *hyoſciamus* or HENBANE.

CALIDRIS, *Bellonii, Turd.* in French *Chevalier*, in *Ornithology*, a water-fowl of the bigneſs of a pigeon, well feathered, with a long red bill, blackiſh towards the upper part; its head, neck, wings, and tail of an aſh colour; its belly white; with very long legs.

Becauſe its body is high mounted, and its walk *ſwift*, it is called the *chevalier*; as though it were mounted on horſeback. It lives about meadows, pools, and rivulets; its fleſh is delicious, and of a good ſmell: there are ſeveral ſorts of them, which differ in colour.

They contain much volatile ſalt, with oil ſomewhat exalted, and reſtorative, and corroborative.

CALIDUCTS, from *calor*, *heat*, and *duco*, *I lead*; a kind of pipes, or canals, diſpoſed along the walls of houſes and apartments; uſed by the antients for the conveyance of heat to ſeveral remote parts of the houſe, from one common furnace.

The ancient *calidučti* ſeem both for thrift and uſe preferable to the German ſtoves; and might even challenge the advantage over our own faſhion, were it not that the very ſight of a fire adds ſomething of luſtre to a room.

CALIETA, in *Botany*, a name uſed by ſome authors for a ſort of yellow fungus, common about the roots of trees, as the juniper, &c.

CALIGA, in *Roman Antiquity*, was the proper ſoldier's ſhoe, made in the ſandal faſhion, without upper leather to cover the upper part of the foot, though otherwiſe reaching to the middle of the leg, and faſtened with thongs. The ſole of the *caliga* was of wood, like the ſabot of the French peaſants, and its bottom ſtuck full of nails: which alſo are ſuppoſed to have been very long in the ſhoes of the ſcouts and centinels; whence theſe were called by way of diſtinction, *caligæ ſpeculatoriæ*; as if by mounting the wearer to a higher pitch, they gave a greater advantage to the ſight: though others will have the *caligæ ſpeculatoriæ* to have been made ſoft and woolly, to prevent their making a noiſe. Plin. Nat. Hiſt. lib. ix. cap. 18. lib. xxxiv. cap. 14. Hard. Suet. in Calig. cap. 9. & cap. 52.

From theſe *caligæ* it was that the emperor Caligula took his name, as having been born in the army, and afterwards bred up in the habit of a common ſoldier.

A ſort of *caligæ* was alſo worn by monks and biſhops, when they celebrated maſs pontifically. Du Cange.

CALIGATI, an appellation given by ſome ancient writers to the common ſoldiers in the Roman armies, by reaſon of the *caligæ* which they wore.

The *caligæ* was the badge or ſymbol of a ſoldier: whence to take away the *caligæ* and belt imported a diſmiſſion or caſhiering.

CALIGO, or CALIGATIO, in *Medicine*, an opacity, or cloudineſs of the anterior ſurface of the cryſtalline, cauſing a dimneſs or ſuffuſion of ſight.

The *caligo* is the ſame with what the Greeks call ἀχλυς, ACHLYS.

CALIMUS. See CALLIMUS.

CALIN, the name of a ſort of mixt metal, ſeemingly compoſed of lead and tin. It is prepared by the Chineſe, and they make ſeveral utenſils of it, as candlеſticks, coffee-pots, and the like. In ſome places alſo they cover their houſes with it as we do with lead.

CALIPH, CALIF, KALIPH, denotes a ſucceſſor of Mahomet, in the ſpiritual as well as temporal empire erected by that legiſlator.

The word is originally Arabic, *khalifah*, which properly denotes a *ſucceſſor*, or *heir*.

After the death of Mahomet, Abubeker having been elected by the muſſulmans to ſupply his place, he would take no other title but that of *khalifah reſſul allah*, i. e. *vicar of the prophet*, or *meſſenger of God*. Omar, coming afterwards to ſucceed Abubeker, repreſented to the Mahometan chiefs, that if he took the quality of vicar, or ſucceſſor of Abubeker, the vicar or ſucceſſor of the prophet, the word vicar would, in courſe of time, come to be repeated and multiplied without end: upon which, at

the

the motion of Mogsirah. Omar took the title of *emir mumenin*, that is, *lord, or prince of believers*; an appellation accepted and borne by all the legitimate *caliphs*, or successors of Mahomet, from that time: not but they still retained the title *caliph*, without other addition. The *caliphs* in the Mahometan, bear a near affinity to the popes in the Christian religion.

At one of the windows in the *caliph's* palace, there hung always a piece of black velvet, twenty cubits long, which reached to the ground, and was called the *caliph's* sleeve; which the grandees of his court never failed to kiss, with great respect, every day.

The honours paid the *caliphs* were excessive, and bred a pride in them, of which they ceased not to give marks even when their authority was at the lowest. They affected great splendor and magnificence in every thing. Abulpharagius relates, that the *caliph* Motazem had no less than a hundred women in his seraglio, and three hundred eunuchs to keep them.

But this splendor was much diminished during the reign of the Bonides in Persia, who stript them of every thing, taking from them their vizirs, and leaving them no higher officer than a secretary to take care of their affairs.

The *caliphs* lost their authority, and almost their name, in that deluge of destruction by the Tartars, who over-run all the East. Since the destruction of the *caliphats*, the Mahometan princes have a particular officer appointed in their respective dominions, who sustains the sacred authority of *caliph*. In Turkey he goes under the denomination of *mufti*, and in Persia under that of *sadre*.

CALIPPIC *period*, in *Chronology*, a series of seventy-six years, perpetually recurring; which elapsed, the middle of the new and full moons, as its inventor Calippus, an Athenian, imagined, return to the same day of the solar year.

Meton, a hundred years before, had invented the *period*, or cycle, of nineteen years (*see* ATHENS. CYCLE); assuming the quantity of the solar year 365d. 6h. 18′ 56″ 50‴ 34‴; and the lunar month 29d. 12h. 45′ 47″ 36‴ 48‴ 30‴: but Calippus, considering that the Metonic quantity of the solar year was not exact, multiplied Meton's *period* by 4, and thence made a *period* of 76 years, called the *Calippic*. The *Calippic period*, therefore, contains 27759 days: and since the lunar cycle contains 235 lunations, and the *Calippic period* is quadruple of this, it contains 940 lunations. This period began in the third year of the 112th Olympiad, or the 438th of the Julian period.

It is demonstrated, however, that the *Calippic period* itself is not accurate; that it does not bring the new and full moons precisely to their places: 4h. 3′ 52″ 60‴, being the excess of 940 lunations above 76 solar years; but brings them too late, by a whole day, in 125 years.

CALIX, or CALYX. See CALYX, and CHALICE.

CALIXTINS, a name given to those among the Lutherans, who follow the sentiments of George Calixtus, a celebrated divine, and professor at Helmstadt, in the duchy of Brunswick, who died in 1656: he opposed the opinion of St. Augustine on predestination, grace, and free-will, and endeavoured to form an union among the various members of the Romish, Lutheran, and reformed churches; or, rather, to join them in the bonds of mutual forbearance and charity. See SYNCRETISTS.

The *Calixtins* are allowed a kind of SEMI-PELAGIANS.

CALIXTINS also denote a sect in Bohemia, derived from the Hussites, about the middle of the fifteenth century, who asserted the use of the cup as essential to the eucharist.

And hence their name; which is formed from the Latin *calix*, a *cup*. See CALYX.

The *Calixtins* are not ranked by Romanists in the list of heretics, since in the main they still adhered to the doctrine of Rome. The reformation they aimed at terminated in the four following articles. 1. In restoring the cup to the laity. 2. In subjecting the criminal clerks to the punishment of the civil magistrate. 3. In stripping the clergy of their lands, lordships and all temporal jurisdiction. 4. In granting liberty to all capable priests to preach the word of God. See TABORITES.

CALKING, or CAULKING, in *Sea-language*, &c. See CAULKING.

CALKING, in *Painting*. See CALQUING.

CALKINS, or CALTRES, a part prominent from a horse-shoe, intended to secure the beast from sliding.

The *calkins* are the end or extremity of horse-shoes, turned or bent downwards, and forged to a sort of point, to make the beast step more safe and steady on the ice.

The inconvenience of *calkins* is, that they hinder the horse from treading evenly on the ground, and thus occasion wrenches on the foot, or strains in the sinews; especially in slony ways, where the hardness of the bottom will not suffer the *calkins* to penetrate: add, that they are apt to make a horse cut.

Calkins are either single or double, i. e. at one end of the shoe, or at both; the latter are reputed less hurtful, as they allow the creature to tread more even; some are made large and square; the best are in form of the point of a hare's ear.

CALL, in *Hunting*, a lesson blown upon the horn, to comfort the hounds.

Among *Fowlers*, it means the note or cry of a bird, especially to its young, or its mate in coupling time.

One method of catching partridges, is by the *natural call* of a hen trained for the purpose, which drawing the cocks to her, gives opportunity for entangling them in a net.

Calls are also a sort of artificial pipes, made to catch several sorts of birds, by imitating their notes.

Different birds require different *sorts* of artificial *calls*: but they are most of them composed of a pipe or reed, with a little leathern bag or purse, somewhat in form of a bellows, which, by the motion given thereto, yields a note like that of the species of bird to be taken.

The *call* for partridges is formed like a boot, bored through, and fitted with a pipe, or swan's quill, &c. to be blown with the mouth, to make the noise of the cock partridge, which is very different from the *call* of the hen.

Calls for quails, &c. are made of a leathern purse in shape like a pear, stuffed with horse hair, and fitted at the end with the bone of a cat's, hare's, or coney's leg, formed like a flageolet: they are played by squeezing the purse in the palm of the hand, at the same time striking on the flageolet part with the thumb to counterfeit the *call* of the hen quail.

CALL, in *Sea-language*, a sort of whistle or pipe, of silver or brass, used by the boatswain and his mates to summon the sailors to their duty, and direct them in their several employments. It is founded to various strains, adapted to the different exercises, as hoisting, heaving, &c. and the *piping* of it serves the same purposes among sailors, as the beat of the drum among soldiers.

CALL, among *Bitters*. See TELAUDIA.

CALL *of the house*, in a parliamentary sense, has been sometimes practised, to discover whether there be any in the house not returned by the clerk of the crown; then more frequently to discover what members are absent without leave of the house, or just cause.

In the former case, the names of the members being called over, every person answers to his name, and departs out of the house, in the order wherein he is called. In the latter, each person stands up uncovered, at the mention of his name.

CALL *of the plaintiff, in Law*. See NON-SUIT.

CALLA, *African arum*, in *Botany*, a genus of the *gynandria polyandria* class of plants: the spatha is plain, the spadix is covered with small flowers; it has neither calyx nor petal, and the fruits are berries containing many seeds. There are two species.

CALLAF, in *Botany*, a low, shrubby tree, growing in the East; of smooth wood, and leaves somewhat resembling the cherry-tree, serrated on the edges, and growing out from the extremities of the branches, which are straight, without joints, flexible, and of a yellowish colour. The flowers, which are produced before the leaves, come forth very thick in December, at equal distances; and are a sort of oblong, downy, little bells, of a whitish yellow, or true yellow colour, and of a fragrant smell. It has a place in the gardens of the nobility, on account of its incomparable fragrancy; and is cultivated with great care by the peasants, for the profit they make of its flowers.

An excellent water is prepared from the flowers, especially at Damascus, which is of so strengthening a nature, that we have nothing to compare with it: for by the extraordinary sweetness of its smell, it wonderfully relieves persons under a lipothymy. The Moors use this water both internally and externally, in burning and pestilential fevers; it refrigerates and moistens. An oil also is made of the flowers, which is serviceable for many purposes.

CALLARIAS, by some called *pisces callarias*, in *Ichthyology*, a fish of the cartilaginous kind, called by Aldrovandus *lingua marina*, and by Rondeletius and Gesner *physis*. It usually grows to about a foot in length, and is in shape something flattish; it is covered with small scales, and is of a greyish colour, but somewhat purple on the head; its tail is roundish, not forked; it is a very well tasted fish, and is common in the Mediterranean, and brought to market at Rome, Venice, &c.

CALLENDER, in *Manufactures*. See CALENDER.

CALLIBER, or CALIPER. See CALIBER.

CALLIBLEPHARA, from καλλος, *beauty*, and βλεφαρον, *eye-lid*, in the *Medicinal Writings of the Ancients*, a name given to certain compositions intended to make the eye-lids beautiful; and as the eye-lids are subject to be deformed several ways, there were several different sorts of these medicines.

CALLICARPA, in *Botany*. See JOHNSONIA.

CALLICHTHUS, in *Ichthyology*, a name given by some writers to the *aurita*, a small fish caught in the Adriatic and supposed to be a certain token of there being no voracious fishes near the place where it is found; it is called also *sacer pisces*, the *holy fish*, and is a very beautiful fish.

CALLICO, in *Commerce*, a sort of cloth resembling linen, made of cotton.

This name is taken from that of *Callicut*, a city on the coast of Malabar, being the first place at which the Portuguese landed when they discovered the India trade. The Spaniards still call it *calica*.

Callicoes are of divers kinds, plain, printed, painted, stained, dyed, chintz, muslins and the like, all included under the general denomination of *callicoes*.

A great naturalist has suggested that the Indian *callicoes* is made of the fibres of nettle-stalks; but this is not confirmed: to the contrary, there are *callicoes* made in the island of Candia, which, it is known, are made of cotton.

The printing of *callicoes* was first set on foot in London about the year 1676.

By an act of parliament made in 1722, the use of dyed, painted, or printed *callicoes* is forbid, either in apparel or furniture, on the forfeiture of five pounds to the informer for every offence; and drapers selling such *callicoes* forfeit 20*l*. 7 Geo. I. stat. 1. cap. 7. § 2. but this prohibition does not extend to *callicoes* dyed blue.

The design of this prohibition was to promote the consumption of our own manufactures. But its chief effect has been to promote the use of printed linen. Upon the act's taking place, the *callico*-printers fell to work to imitate the Indian *callicoes*, by making the same stamps and impressions, and with the same beauty of colours upon linen. This sell chiefly on Scots and Irish linen, the manufacture of which has been hereby greatly increased, many hundred thousand ells thereof being yearly imported from those countries, and printed or stamped in England.

CALLIDRYS, in *Ornithology*, a name given by Ballonius and some other authors, to a water-bird, known among us by the name of the REDSHANK.

CALLIDRYS *nigra*, in *Ornithology*, the name of a bird described by *Belloniu*s, and supposed by some to be that bird which we call the KNOT.

CALLIDRYS. See CALIDRIS.

CALLIGONUM, in *Botany*, a genus of the *polyandria digynia* class; the calyx has four leaves; the plant has neither petal nor style; the *fruit* is bristly, with a single seed. There is one species.

CALLIGRAPHUS, anciently denoted a copyist, or scrivener, who transcribed fair, and at length, what the notaries had taken down in notes or minutes.

The word is compounded of καλλος, *beauty*, and γραφω, *I write*. The minutes of acts, &c. were always taken in a kind of cypher, or short-hand; such as the notes of Tyro in Gruter: by which means the notaries, as the Latins called them, or the *exceptores* and ταχυγραφοι, as the Greeks called them, were enabled to keep pace with a speaker or person who dictated. These notes being understood by few, were copied over fair, and at length, by persons who had a good hand, for sale, &c. and these were called *calligraphi*; a name frequently met with in the ancient writers.

CALLIGRAPHY, the art of fair writing.

Callicrates is said to have written an elegant distich on a sesamum seed. Junius speaks of a person, as very extraordinary, who wrote the apostles creed, and beginning of St. John's Gospel, in the compass of a farthing. What would he have said of our famous Peter Bale, who, in 1575, wrote the Lord's prayer, creed, ten commandments, and two short prayers in Latin, with his own name, motto, day of the month, year of the Lord, and reign of the queen, in the compass of a single penny, inchased in a ring and bordure of gold, and covered with a crystal, all so accurately wrought, as to be very legible?

CALLIMUS, in *Physiology*, a stony substance found in the cavity of the ACITES, or eagle stone.

The word is also written *callimus*, and in some copies of Pliny, *calamus*; which latter reading seems to receive

The *calimus* fills the hollow of the *aetites*, much as the yolk does the white of an egg.

The ONOCH, instead of a *calimus*, or solid stone, have a loose, sandy, chalky, or earthy substance, and the ENHYDRI a liquid substance.

CALLION, in *Botany*, a name given by Pliny, and some other authors to the *ofterleaf*, or *wintergreen*.

Some of the Greeks called it also *syllis*.

CALLIONYMUM, in *Botany*, a name given by some authors to the LILY *of the valley*.

CALLIONYMUS, in *Ichthyology*, a name used by Appian, and some other authors, for the fish called the *uranoscopus*, or the star-gazer.

In the Linnæan system, it is a genus of the order of *jugulär* fishes, comprehending three species.

CALLIOPE, the chief of the nine Muses, called by Horace *Regina*. The distinguishing office of this Muse was to record the worthy actions of the living; and accordingly she is represented with tablets in her left hand.

CALLIPÆDIA, the art of getting or breeding fair and beautiful children.

The word is formed from καλλος, *fair*, and παις, *puer*, either boy or girl.

We find divers rules and practices relating to this art, in ancient and modern writers.

The Jews are said to have been so solicitous about the beauty of their children, that care was taken to have some very beautiful child (such as was Jochanan, the disciple of Judah, author of the Mishna) placed at the door of the public baths, that the women at going out, being struck with his appearance, and retaining the idea, might all have children as fine as he.

The Chinese take great care of their breeding women, to prevent unseemly objects of any kind from striking their imagination.

Callipædia, nevertheless, seems to have been first erected into a full art by Claude Quillet de Chinon, a French abbot, who, under the fictitious name of Calvidius Lætus, has published a fine Latin poem, in four books, under the title of *Callipædia, seu de pulchræ prolis habendæ ratione*; wherein are contained all the precepts of the art. Paris, 1656, 8vo. & Lond. 1708, 8vo.

CALLISIA, in *Botany*, a genus of the *triandria monogynia* class, with a three-leaved calyx, three petals, a double anthera, and bilocular capsule. There is one species.

CALLISTIA, in *Antiquity*, a Lesbian festival, wherein the women presented themselves in Juno's temple, and the prize was assigned to the fairest.

The word is formed from καλλος, *beauty*, q. d. beauty's rewards. The like contest of beauty was held at the festival of Ceres Eleusinia, among the Parthasians, first set on foot by Cydelus, whole wife Herodice was honoured with the first prize. Another obtained among the Eliens, where the contest was among the men, the most beautiful of whom was presented with a suit of armour, which he consecrated to Minerva, to whose temple he walked in procession, adorned with ribbons, and crowned with a myrtle garland. Pott. Arch. Græc. lib. ii. cap. 20.

CALLITRICHE, in *Botany*, a genus of the *monandria digynia* class; it has no calyx, two petals, and the capsule has two cells, with four seeds. There are two species.

CALLITRICHUS, in *Zoology*, a species of MONKEY, with a black, flattish face, white hairs on the sides, and black ears, and the upper parts of the body are covered with soft hair, of a yellowish green colour, whence it is called the green monkey; and the lower parts with hair of a silvery colour. It is about the size of a small cat.

CALLOSUM *corpus*, in *Anatomy*, denotes a part in the medulla of the brain of a white colour, and a texture somewhat harder and more compact than the rest; approaching to that of a *callus*.

The *corpus callosum* runs along the whole tract of the *falx*; at the extremity next the cerebellum it sends out two *processus*, whose juncture constitutes the *fornix*; under which lies the *septum lucidum*.

The *corpus callosum* is an assemblage of bundles of fibres springing from the glands, which compass the cineritious part, and serve as excretory ducts thereto: those fibres as descending towards the *medulla oblongata*, all meet there; and serve to connect the lobes of the brain. Signior Lancisi makes the *corpus callosum* to be the immediate seat of the soul. See BRAIN.

CALLOUS, *Callosus*, something of the nature or consistence of a CALLUS.

Physicians speak of *callous* nodes or excrescences, *callous* ulcers, and the like.

CALLOUS *eggs*, *ova callosa*, the longer and better sort, supposed to contain male chicks; having a thicker white, and richer flavour than the rest. See EGG.

CALLUS, or CALLOSITY, in a general sense, denotes any cutaneous, fleshy, or bony hardness, whether natural or preternatural.

In which sense, *shard*, or corns, are a species of *callus*. See CLAVUS.

CALLUS is also frequently used for a kind of node, which joins the extremity of a fractured bone.

The formation of a *callus* seems to be as follows: the juice that feeds the bone, running among its fibres, becomes extravasated in the place where those fibres are broken: so that stopping, and gathering together round the extremities of the fracture, it there dries, knits, and hardens, to a consistence like a strong glue; leaving only a little inequality in the place where it is formed.

But as the new flesh in wounds will frequently sprout up too fast, so will also the *callus* in fractures: and by this means render the limb uneven and deformed. The only methods that can be taken to prevent the *callus* from exceeding its due bounds, are to make the bandage somewhat tighter than ordinary, and wet it with the spirit of

wine; for by this means the *callus* is not only often kept within its due bounds, but the induration of it is also much forwarded; but when once the *callus* is indurated, we have no medicines by which it can be taken down or destroyed. *Heister.*

Callous frequently grow so firm as to supply the place of whole bones. In the Philosophical Transactions, we have an instance of a *callus* supplying the place of the *os femoris*, taken out upon its being carious, by Mr. Fowler; and another of a *callus* supplying the place of the *os femoris*, and the person continued as strong as ever, and walked without any lameness.

CALLUS is also a hard, dense, insensible knob, or substance, rising on the hands, feet, &c. by much friction, and pressure against hard bodies.

Mr. Leewenhoek examining the callus formed on the hands and feet, observed that it was a substance composed of several layers of particles so loosely connected, that it was a wonder they could hang together; on putting a piece of this into fair water, since it had stood a considerable time to steep, he found that the particles of which it was composed, would easily separate from one another with a little touch of a quill, and these separated particles put into a drop of water, and examined before the microscope, were found to be all of the same regular shape, which was like that of a weaver's shuttle, being broad in the middle, and pointed at each end, with a line in the middle like those upon the uppermost, or outside skins of fruits, or of our bodies, but generally irregular. These pieces were thick in proportion to their size; and when they are put into water, and separated again, they naturally form a great number of other particles, all of which are of the same regular figure with the original piece. Phil. Trans. No. 323 p. 1160.

By this we see the reason of the increase in thickness of the skin of the hands of those who labour hard, and of the feet of such people as walk much; which is wholly owing to the addition of vast numbers of these shuttle-like particles, which form combinations together; but these so loosely, that it is no wonder they are so easily separated on mollifying.

The people who labour ever so hard will have no *callus* upon their hands, if they wash them often; the washing of the hands daily rubs off a great quantity of these particles or scales, if they may be so called; but they are quickly renewed.

CALLUS is by some also applied to those knots, or tophaceous BODIES, generated in the joints of gouty patients. See TOPHUS.

CALLUS is also especially used to denote a hardness of the eye-lashes, occasioned by the congestion of an acid, or tartarous juice therein.

Paravicius also gives the denomination *callus* to an abscess or ulcer, caused by the acrimonious, or arsenical quality of the nutritious juice, and exciting a vehement itching.

CALLYCHTHIS, in *Ichthyology*, the name of a broad and flat sea-fish, brought to market at Rome under the name of the *lanigera*, and commonly called BEATRONATRUS; and by the Venetians the *botta*.

In the Linnæan system, it is a species of the ARTURUS.

CALLYONTUS. See CALLIONYMUS.

CALM, in *Sea Language*, that state of the air and water when there is no wind stirring.

They say that *calm*, a dead or stark *calm*. A *calm* is more terrible to a sea-faring man than a storm, if he has a strong ship, and sea-room enough; for under the line extreme heat sometimes produces such dead *calms*, that ships are obliged to stay two or three months without being able to stir one way or other.

Two opposite winds will sometimes make a *calm*. This is frequently observed in the gulf of Mexico, at no great distance from the shore, where some gulf or land-wind will so poise the general easterly wind, so as to produce a perfect *calm*.

Calms are never so great on the ocean as on the Mediterranean, by reason the flux and reflux of the former keep the water in a continual agitation, even where there is no wind; whereas there being no tides in the latter, the *calm* is sometimes so dead, that the face of the water is as clear as a looking glass; but such *calms* are almost constant prefages of an approaching storm. On the coasts about Smyrna, a long *calm* is reputed a prognostic of an earthquake.

When a ship is close under the lee of another, the windward veffel is faid to *become* the leeward.—A ship is alfo faid to be *becalmed* when near the land, which keeps the wind from it.

It is not uncommon for the veffels to be *calmed*, or *becalmed*, as the failors exprefs it, in the road of the conftant levantine winds, in places where they ride near the land. Thus between the two capes of Carthoche toward the main, and cape Antonio in Cuba, the *fea* is narrow, and there is often a *calm* produced by fome gulf of a land-wind, that poifes the levantine wind, and renders the whole perfectly ftill for two or three days.

In this cafe, the current that runs here is of ufe to the veffels, if it fets right; when it fets cafterly, a fhip will have a paffage in three or four days to the Havannah; but if, otherwife, it is often a fortnight or three weeks loft; the fhip being conftrayed in the gulf of Mexico.

When the weather is perfectly *calm*, no wind at all ftirring, the failors try which way the current fets, by means of a boat which they fend out, and which will ride at anchor, though there is no bottom to be found, as vegetables and weeds are obferved by the ftrongeft anchor to the bottom.

The method is this: they row the boat to a little diftance from the fhip, and then throw over their pigmeant, which is about forty pounds weight; then let this fink to about two hundred fathom; and then, though it never reaches the bottom, the boat will turn head againft the current, and ride as firmly as can be.

CALM *Latitudes*, in *Sea Language*, are fituated in the Atlantic ocean, between the tropic of Cancer, and the latitude of 30° N. or they denote the fpace that lies between the trade and variable winds, becaufe it is frequently fubject to *calms* of long duration.

CALOGERI, Καλογεροι, or CALOYERS, monks, or religious in Greece, both male and female; inhabiting particularly mount Athos, but difperminated alfo throughout all the churches of the Eaft. They follow the rule of St. Bafil, and make vows like the weftern religious. Tournefort fays, the females are moft of them only a more moderate fort of Magdalens, who, as they grow old, make a vow to practife thofe virtues they had much neglected in their youth, and retire into convents to lead a life fomewhat lefs fcandalous than before, under the eyes of a fuperior or *hegumena*, who is far from being too fevere.

The *Caloyers*, in fome places, are divided into Cœnobites, Anachorites, and Ascetics, or hermits; the life of which laft is the moft fevere and recluſe.

The Turks alfo ufe the word *Caloyers* for their dervifes, or religious muſſulmen. See DERVIS.

CALOMEL, in *Pharmacy*, a name given to *mercurius dulcis*, fublimated; or, it is a combination of the marine acid with as much mercury as that acid is capable of conceiving and uniting with. The denomination *calomel* rather feems to have firſt belonged to the Æthiops mineral; from καλος, *fulcher*, *fair*; and μελας, *niger*, *black*, becaufe white or pale bodies, rubbed herewith, become black.

Calomel is the *panchymagogum* of Quercetanus. It is an effectual purge, and given not only to adults, but even to children, to carry off the flimy humours from whence the worms arife. *Calomel*, rubbed with fulphur of antimony, is alfo found a powerful alterant. See MERCURY, and PLUMIER'S *Ethiops*.

CALONDRONIUS, a name given by the writers of the middle ages to a ſtone of which they have left us no deſcription, only a large account of its great virtues, in giving clearneſs to the prefent view, warts it, and preventing the power of magic and enchantment.

CALOPHYLLUM, in *Botany*, the name given by Linnæus to a genus of plants of the *polyandria monogynia* claſs, called by Plumier *calaba*, the characters of which are theſe: the cup is coloured and occiduous, and conſiſts of one leaf divided into four acute ſegments; the flower conſiſts of four roundiſh, hollowed, and expanded petals; the ſtamina are numerous capillary filaments, ſhorter than the flower; the antheræ are roundiſh; the germen of the piſtil is roundiſh; the ſtyle is ſimple, and of the length of the ſtamina; the ſtigma is headed; the fruit is a large, globoſe, unilocular drupe; and the ſeed is a large pointed nut, of a roundiſh figure. There are two ſpecies.

CALOTTE, a CAP, or coif of hair, ſattin, or other ſtuff; uſed firſt for neceſſity, but now become an eccleſiaſtical ornament, in France, &c.

It was firſt worn by cardinal Richelieu: the red *calotte* is a badge of a cardinal.

CALOTTE, in *architecture*, a round cavity, or depreſſure, in form of a cup, or cap, lathed and plaiſtered, uſed to diminiſh the *riſe*, or elevation of a chapel, cabinet, alcove, &c. which, without ſuch an expedient, would be too high for other parts of the room.

CALQUING, or CARKING, a term in *Painting*, &c. uſed where the back ſide of any deſign is covered with black lead, red chalk, and the ſtrokes or lines traced through on a waxed plate, wall, or other matter; by paſſing lightly over each ſtroke of the deſign with a point, which leaves an impreſſion of the colour on the plate or wall. This method of *off-tracing* may likewiſe be performed by pricking the original print, or drawing, and tranſmitting a coloured powder through the punctured holes, in order to make the outlines on a new ground; or, by diſſolving part of the printing ink by means of ſoap, and impreſſing it in that ſtate on a freſh ground. See DELINEATION.

CALTHA, in *Botony*. See *Marsh*-MARYGOLD.

CALTROP, or CALTHROP, an instrument with four iron points, each three or four inches long, disposed triangularwise; so that there are always three points bearing on the earth, the fourth being in the air.

Several of these, fixed in the ground, or thrown into breaches where the cavalry is to pass, stick into the horses feet and embarrass them.

CALTROPS, *Tribulus*, in *Botony*, a genus of the *decandria monogynia* class. Its characters are: the empalement of the flower is cut into five acute parts: there are five oblong blunt petals to the flower, which spread open; and ten small awl-shaped stamina, terminated by single summits; and an oblong germen the length of the stamina, having no style, but crowned by a headed stigma: the germen turns to a roundish, prickly fruit, divided into five cupsules, armed with three or four angular thorns on one side, joining together. The cells are transverse, and contain two or three pear-shaped seeds. There are three species, natives of warm countries. It derives its name from the form of its fruit, which resembles those instruments of war that were cast in the enemy's way, to annoy their horses.

The plant, taken inwardly, is a vulnerary; and is said to be of service in diuretics, and the stone.

CALTROPS, *water*. See TRAPA.

CALVARIA, or CALVA, the scalp or upper part of the HEAD; so called from its growing bald first. See BALDNESS.

The external parts of the *calvaria* are the *sinciput*, *occiput*, *vertex*, and temples; all invested with the hair, and the common integuments of the body.

The *calvaria* in adults consists of eight bones, one of the forehead, another of the *occiput*, two of the *sinciput*, two of the temples, and two others common also to the upper jaw, viz. the *cuneiforme* and *spongiosum*.

CALVARY, a term used in catholic countries for a kind of chapel of devotion, raised on a hillock near a city; in memory of the place where Jesus Christ was crucified near Jerusalem.

The word comes from the Latin *calvarium*, and that from *calvus*, *bald*; the top of that hillock was bare, and destitute of verdure; which is also signified by the Hebrew word *golgotha*.

Such is the *Calvary* of St. Valerian, near Paris; which is accompanied with several little chapels, in each whereof is represented in sculpture one of the mysteries of the passion.

CALVARY, in *Heraldry*, a cross so called, because it resembles that on which our Saviour suffered: it is always set upon steps.

CALVINISM, the doctrine and sentiments of Calvin, one of the principal reformers in the fixteenth century, a native of Noyon in France, and afterwards pastor and professor of divinity at Geneva, and of his followers, with regard to matters of religion.

Calvinism subsists in its greatest purity in the city of Geneva; and from thence it was first propagated into Germany, France, the United Provinces, and England. In France it was abolished by the revocation of the edict of Nantes, in 1685. It has been the prevailing religion in the United Provinces ever since the year 1571. The theological system of Calvin was adopted, and made the public rule of faith in England, under the reign of Edward VI. and the church of Scotland was modelled by John Knox, the disciple of Calvin, agreeably to the doctrine, rites, and form of ecclesiastical government, established at Geneva. In England it hath declined since the time of queen Elizabeth; though it still subsists, some say a little allayed, in the articles of the established church; and in its rigour in Scotland. See REFORMATION and *Reformed* CHURCH.

The distinguishing theological tenets of *Calvinism*, as the term is now generally applied, respect the doctrines of PREDESTINATION, or *particular* ELECTION and REPROBATION, *original* SIN, *particular* REDEMPTION of *saints*, or, as some have called it, *irresistible* GRACE in *regeneration*, JUSTIFICATION *by faith*, PERSEVERANCE, and the TRINITY. See each of these articles. See also ARMINIANS.

Besides the doctrinal part of Calvin's system, which, so far as it differs from that of other reformers of the same period, principally regarded the absolute decree of God, whereby the future and eternal condition of the human race was determined out of mere sovereign pleasure and free will; it extended likewise to the discipline and government of the Christian church, the nature of the eucharist, and the qualification of those who were intitled to the participation of it. Calvin considered every church as a separate and independent body, invested with the power of legislation for itself. He proposed that it should be governed by presbyteries and synods, composed of clergy and laity, without bishops, or any clerical subordination; and maintained, that the province of the civil magistrate extended only to its protection and outward accommodation. In order to facilitate an union with the Lutheran church, he acknowledged a real, though spiritual presence of Christ in the eucharist, that Jesus Christians were united to the man Christ in this ordinance, and that divine grace was conferred upon them, and sealed to them, in the celebration of it; and he confined the privilege of communion to pious and regenerate believers. See EUCHARIST, *&c.* and LUTHERANISM.

In France the *Calvinists* are distinguished by the name of *Huguenots*; and, among the common people, by that of *Parpaillots*. In Germany they are confounded with the Lutherans, under the general title *Protestants*, only sometimes distinguished by the name *Reformed*.

CALVINISTS, *Crypto*, a name given to the favourers of *Calvinism* in Saxony, on account of their *secret* attachment to the Genevan doctrine and discipline. Many of them suffered by the decrees of the convocation of Torgaw, held in 1576. See *Form of* CONCORD.

The *Calvinists* in their progress have divided into various branches, or lesser sects.

CALVITIES, or CALVITIUM. See BALDNESS.

CALUMET, among *Travellers*, a mystic kind of pipe used by the American savages as the ensign of peace, and for religious fumigation.

The *calumet* is a sort of tobacco-pipe, made of red, black, or white marble. The shank is decorated with rounds of feathers, and locks of hair, or porcupine's quills: in it they smoke in honour of the sun. P. Lafitau will have it to be the original CADUCEUS of Mercury, of which that used by the Greeks and Romans, with its wings and its serpents, was only the copy.

The *calumet* is the symbol and security of traffic; by it they pronounce life and death, peace and war: they also ascribe to it a power of raising the souls of the dead.

CALUMNY, the crime of accusing another falsely and knowingly of some heinous offence. *Calumnia est malitiosa & mendax infamatio.*

It is an ancient maxim, which experience shews us to be too well founded: *Audacter calumniare, semper aliquid hæret.*

CALUMNY, *oath of*, *juramentum*, or *iuramentum*, or *iusiurandum calumniæ*, among civilians and canonists, was an oath which both parties in a cause were obliged to take; the plaintiff that he did not bring his charge, and the defendant, that he did not deny it, with a design to abuse each other, but because they believed their cause was just and good; that they would not deny the truth, nor create unnecessary delays, nor offer the judge or evidence any gifts or bribes. If the plaintiff refused this oath, the complaint or libel was dismissed; if the defendant, it was taken *pro confesso*.

This custom was taken from the ancient athletæ, who, before they engaged, were to swear they had no malice, nor would use any fraudulent or unfair means for overcoming the other.

The *juramentum calumniæ* is much disused, as a great occasion of perjury.

Anciently the advocates and proctors also took this oath; but of late it is dispensed with, and thought sufficient that they take it once for all at their first admittion to practice.

CALUMNIA *fulsitum*, was an action brought against the plaintiff in a court for a false and malicious accusation.

When an accuser did not prove his charge, nor seemed to have sufficient or probable grounds for bringing any, the judges in pronouncing sentence used the formula *calumniator es*; which gave the defendant a right to bring an action of *calumny*; the penalty of which was *fronti inscribi*, or burning on the forehead.

CALX literally signifies LIME, a sort of stone burnt or calcined in a kiln for that purpose, to be used in the making of mortar, *&c.*

It is also made of the bones of large fishes, and from the shells of huscums, oysters, and the like, burnt. That is more particularly called *calx peregrina*, and *calx* [illegible] *alba*.

CALX, in *Chemistry*, a kind of ashes, or fine friable impalpable powder, which remains of metals, minerals, &c. after CALCINATION by fire, solution by acid menstrua, or DETONATION by nitre; by means of which all metallic substances, except gold, silver, platina, and mercury, may be deprived of their phlogiston, and consequently of their metallic properties, acquiring at the same time an accession of air which becomes fixed in them during the reduction; and thus lose their fusibility, become more fixed, and less soluble in acids.

Calces differ from ashes not only as the former is the effect of calcination, and the latter of mere burning, but as the former is of a more solid consistence than the latter; and that the bodies reduced to a *calx*, as metals and minerals, may frequently be restored out of these *calces*, which can never be done out of the ashes of wood and other bodies consumed by BURNING.

Calces are divided into *reducible* and *irreducible*, *fixed* and *volatile*. Chemists speak of fire retained and fixed in all *calces*,

calces, and of hard salt, procurable from *calces*. Hist. Acad. Scienc. an. 1732. p. 56, seq. Hist. Acad. Scienc. lib. iv. *sect.* 6. c. 3. See FIRE and SALT.

Many metals and some minerals, whole parts are most homogeneous, do not appear to lose their nature with their form. Thus gold, silver, and quicksilver, cannot be so destroyed by CALCINATION, but that they may easily be revived. So out of *cals* of tin, the tin itself may be restored; and the like holds of the *cals* of lead, though the most impure of all metals; and even of antimony, the first substance of which may be extracted either from its *cals*, or even glass. See REVIVIFICATION. Paracelsus calls the boles and argillaceous earths, *calces terræ*. See BOLE and CHALK.

The same author also gives the denomination *calx* to the chalky matter formed in the joints of gouty persons.

CALX *antimonii*, a name given in the late London Dispensatory to the preparation of ANTIMONY, called before *antimonium diaphoreticum*.

CALX *of brass*, is called *AS USTUM*.

CALX *jovis*, the *calx* of TIN, called *PUTTY*.

CALX *lunæ*, the *calx* of SILVER.

CALX *martis*, the crocus or saffron of IRON.

CALX *mercurii*, precipitated MERCURY.

CALX *nativa*, in *Natural History*, a native marly earth which, without burning, has some of the qualities of the artificial lime, and was called by the ancients, *gypsum spontaneum*.

It is hard, dry, and somewhat coarse earth; it never constitutes a fracture of itself, but is sometimes found in the fissures of other strata, and sometimes lying loose upon or among the next strata of gravel, and the like. It is usually found in masses of two, three, or four inches in diameter, of irregular surfaces, and generally flattish. It is found in some parts of England, and appears to have been well known to the ancients, and in common use among them.

CALX *saturni* is cerusse calcined with spirit of vinegar, or in the sun. See CERUSSE.

CALX *saturni*, is also used for MINIUM or *red* LEAD.

CALX *solis*, denotes calcined GOLD.

CALX *veneris*, VERDIGRISE.

CALX *viva*, quick-lime, that on which no water has been cast since its burning, in opposition to *calx extincta*, that slacked by the effusion of water. See LIME.

CALX *vivi plumbi*, denotes that made of quicksilver.

CALX, in *Anatomy*. See CALCANEUM.

CALYBITES, the inhabitant of a cottage, an appellation given to divers hermits on account of their long residence in some hut, by way of mortification.

The word is formed from καλυβη, *tugurium*, *I cover*; whence καλυβιτης, *a hermit*, &c.—The Romish church commemorates St. John the Calybite on the 15th of December.

CALYCANTHEMI, in *Botany*, an order of plants in the Fragmenta Methodi Naturalis of Linnæus.

CALYCISTÆ, among the *Botanical Authors*. See BOTANY.

CALYCULUS, in *Ancient Naturalists*, denotes a SILIQUA or seed-case.

CALYCULATED, an appellation given by some naturalists to the fruits of those trees which have the CALYX of their flower non-deciduous, and whose FRUIT stands as in a cup. Phil. Trans. N°. 204. p. 928. See PLANT, TREE, &c.

CALYPTRA, from καλυπτω, *I hide*, among *Botanists*, a thin membranous involucrum, usually of a conic figure, which covers the parts of fructification. The capsules of most of the MOSSES have *calyptræ*.

CALYX, or CALIX, in a general sense, denotes a cup. See CHALICE.

CALYX, in *Botany*, is sometimes applied to a FLOWER whose body, or even a part of it, is formed in manner of a cup or *chalice*: such is that of a tulip, &c.

Ray defines the *calyx* the cavity in the middle of a flower, wherein the stamina and apices are contained. Ausonius calls it *calathus*.

CALYX is more particularly used for that outward greenish cover, which encompasses and defends the petals and other parts of a flower; serving also as a basis or support to the whole. In which sense, *calyx* is the same with what is otherwise called *perianthium*, and by Dr. Grew, the *empalement* or *flower-cup*.

The *calyx* is that set of leaves which involves the petals, as the petals do the immediate organ of generation.

The *calyx* is in some plants of one entire piece; as in pinks, &c. and in some is divided into several; as in roses, &c.—Saffron has no calyx; its flower comes out of the earth before its leaves.

The cups of flowers are very various in their structure, and are distinguished by the names of *AMENTUM*, *CALYPTRA*, *GLUMA*, *INVOLUCRUM*, *PERIANTHIUM*, *SPATHA*, and *VOLVA*.

Botanists distinguish two sorts of *calyces*, one external, called the *calyx* of the flower, by the ancients *perianthium*, as encompassing the flower and seed; the other internal, called the *calyx* of the fruit, by the ancients *pericarpium*, as being the capsule which encompasses the fruit, and is itself encompassed by the petals.

The external *calyx* may also be divided into two sorts, one which surrounds the flower, another which sustains it, different from the pedicle; in that this latter spreads itself underneath the flower to give room for the nutritious juice to rise more freely; the cavity of the pedicle enlarged, is reputed part of the *calyx* both external and internal.

CALYX, *calix*, in *Botany*, a term used by authors to express one kind of the perianthia of the compound flowers. A cup is that called when it consists of a single and equal series of scales, which are of an oblong figure, and surround the flowers; and another small series of scales, which only surround these, close to the base.

The ancients have often used the word *calyx* to express the rose when in the bud, and not yet shewing its petals, except between the segments of the cup.

CALYX, in *Ancient Agriculture*, denotes a brazen measure or cup, put over a head or cathedon, to which pipes were fitted.

CAMÆA, in *Natural History*, the name of a genus of the semipellucid genus, the characters of which are these: they are obscurely transparent stones approaching to the onyx structure, being composed of zones, and formed on a crystalline base, but having their zones very broad and thick, and laid alternately on one another with no other matter between them.

Of this genus we have four known species.

CAMAHÆ, in the *Modern Medica*, a name given by Avicenna and others to the large truffles found in the deserts of Numidia, and many other parts of Africa, in great abundance. These are white on the outside: the modern Africans call them *terfas*, and are very fond of them; they eat them stewed with milk, water, and spices, and account them wholesome and nutritive.

CAMAIEU, or CAMAYEU, a word used to express a peculiar sort of onyx: also by some to express a stone, whereon are found various figures, and representations of landscapes, &c. formed by a kind of *lusus naturæ*; so as to exhibit pictures without painting.

The word comes from *camahæus*, a name the Orientals give to the onyx, when they find in preparing it, another colour; as who should say, *a second stone*.

It is of these *camiews* Pliny is to be understood when he speaks of the manifold picture of gems, and the party-coloured spots of precious stone; *Gemmarum pictura tam multiplex, lapidumque tam discolores maculæ*. Plin. Hist. Nat. lib. ii. c. 63.

CAMAIEU is also applied by others to those precious stones, as onyxes, cornelians, and agats, wherein the lapidaries employ their art to aid nature, and perfect those representations. See CAMÆA.

CAMAIEU is also frequently applied to any kind of gem, whereon figures may be engraven either indemedly, or in relievo.

In this sense the lapidaries of Paris are called in their statutes, *cutters of camayeux*.

A society of learned men at Florence undertook to procure all the *camaieux* or *camayeux*, and intaglios, in the great duke's gallery to be engraven; and began to draw the heads of divers emperors to *camaieux*.

CAMAIEU is also used for a painting, wherein there is only one colour; and where the lights and shadows are of gold, wrought on a golden, or azure ground.

When the ground is yellow, the French call it *grisaille*; when grey, *grisaille*. This kind of work is chiefly used to represent bass-reliefs: the Greeks call pieces of this sort *monochromata*.

CAMALDULIANS, CAMALDUNIANS, or CAMALDOLITES, an order of religious, founded by Romuald, an Italian fanatic, in 1023, in the horrible desert of Camaldoli, otherwise called Campo Maldoli, situate in the state of Florence, on the Appennines.

Their rule is that of St. Benedict; and their houses, by the statutes, are never to be less than five leagues from cities. The *Camaldulians* have not borne that title from the beginning of their order; till the close of the eleventh century they were called *Romualdins*, from the name of their founder. Till that time, *Camaldulian* was a particular name for those of the desert Camaldoli; and D. Grandi observes, was not given to the whole order, in regard it was in this monastery that the order commenced, but because the regulation was best maintained here.

Guido Grandi, mathematician of the great duke of Tuscany, and a monk of this order, has published *Camaldulian* Dissertations, on the origin and establishment of it. The *Camaldulites* were distinguished into two classes, of which the one were CONVENTUES, and the other ERÆMITES.

CAMARA, a name given by Plumier to an American species of LANTANA.

CAMAROSIS, *from* καμαρόω, *I arch over*, in *Architecture*, denotes an elevation with an arch or vault.

CAMAROSIS, among *Physicians*, denotes a FRACTURE of a bone, wherein the two broken ends rise and form a kind of *camera*, or arch.

This is also called *camurum*, and by modern Latin writers *cumeratio*, sometimes *fornicatio*.—It is commonly restrained to fractures in the skull.

CAMBAYES, in *Commerce*, cotton cloths made at Bengal, Madrafs, and fome other places on the coaft of Coromandel. They are proper for the trade of Marfeilles, whither the Engliſh at Madrafs fend great numbers of them. Many are alſo imported into Holland.

CAMBER-*beam*, in *Building*, a piece of timber cut archwiſe, or with an obtuſe angle in the middle, commonly uſed in platforms; as church-leads, and on other occaſions, where long and ſtrong beams are required. A *camber-beam* is much ſtronger than another of the ſame ſize; ſince being laid with the hollow ſide downwards, as they uſually are, it repreſents a kind of arch.

CAMBERED-*deck*, in *Ship-building*. See DECK.

CAMBIO, an Italian word which ſignifies *exchange*; commonly uſed at Provence, and in ſome other countries, particularly Holland.

CAMBIST, a name given in France to thoſe who trade in notes and bills of exchange. The word *cambiſt*, though a term of antiquity, is even now a technical word, or ſome uſe among merchants, traders, and bankers. Some derive it from the Latin *cambium*, or rather *cambio*.

CAMBLET, or CHAMBLET, a ſtuff ſometimes of wool, ſometimes ſilk, and ſometimes hair, eſpecially that of goats, with wool or ſilk: in ſome, the warp is ſilk and wool twiſted together, and the woof hair.

The true or oriental *camblet* is made of the pure hair of a ſort of goat, frequent about Angora, and which makes the riches of that city, all the inhabitants whereof are employed in the manufacture and commerce of *camblets*. It is certain we find mention in middle age writers of ſtuffs made of camel's hair, under the denominations of *camelotum* and *camelinum*, whence probably the origin of the term; but theſe are repreſented as ſtrangely coarſe, rough and prickly, and ſeem to have been chiefly uſed among the monks by way of mortification, as the hair-ſhirt of later times. Du-Cange, Gloſſ. Lat.

We have no *camblets* made in Europe of the goats hair alone; even at Bruſſels they find it neceſſary to add a mixture of woollen thread.

England, France, Holland, and Flanders, are the chief places of this manufacture. Bruſſels exceeds them all in the beauty and quality of its *camblets*; thoſe of England are reputed the ſecond.

CAMBLETS, *figured*, are thoſe of one colour, whereon are ſtamped various figures, flowers, foliages, &c. by means of *hot irons*, which are a kind of moulds, paſſed together with the ſtuff, under a preſs. Theſe are chiefly brought from Amiens and Flanders: the commerce of theſe was anciently much more conſiderable than at preſent.

CAMBLETS, *water*, thoſe which, after weaving, receive certain preparation with water; and are afterwards paſſed under a hot-preſs, which gives them a ſmoothneſs and luſtre.

CAMBLETS, *waved*, are thoſe whereon waves are impreſſed, as on tabbies; by means of a calender, under which they are paſſed and repaſſed ſeveral times.

The manufacturers, &c. of *cambliets*, are to take care they do not acquire any falſe and needleſs plaits; it being almoſt impoſſible to get them out again. This is notorious, even to a proverb: we ſay, a perſon is like *cambiet*, he has taken his plait.

CAMBNITES *lapis*, a name given by the *Writers of the Middle Ages* to a ſtone, of which they record virtues which appear to favour too much of imaginary ones, ſuch as the curing of the dropſy by being tied to the arm: it ſeems to have been only a cloudy and leſs valuable kind of brown cryſtal.

CAMBOGIA, in *Botany*, a genus of the *polyandria monogynia* claſs; the corolla is made up of four petals, the calyx has four leaves, and the fruit is a kind of apple containing eight cells, with ſingle ſeeds. There is one ſpecies.

CAMBRASINES, in *Commerce*, fine linen made in Egypt, of which there is a conſiderable trade at Cairo, Alexandria, and Roſetta or Raſchit. They are called *cambraſines*, from their reſemblance to cambrics.

CAMBRIC, in *Commerce*, a ſpecies of linen made of flax, very fine and white; the name of which was originally derived from the city of Cambray, where they were firſt manufactured. They are now made at other places in France.

The manufacture of *cambrics* hath long ſince proved of extraordinary advantage to France. For many years it appeared that England did not in this article contribute leſs than 200,000 *l.* per annum to the intereſt of France. This proved motive ſufficient to induce the parliament of Great-Britain to enact many ſalutary laws to prevent this great loſs of our wealth. *See* 18 Geo. II. c. 36. and 21 Geo. II. c. 26. See alſo that, 32 Geo. II. c. 32. and 4 Geo. III. c. 37. which regulates the *cambric* manufactory now long ſince introduced into Wincheſter in Suſſex; but very ſoon aboliſhed. The *cambrics* now allowed in this country are manufactured in Scotland and Ireland. Any perſons convicted of wearing, ſelling (except for exportation), or making up for hire any *cambrics* or French lawns, are liable to a penalty of 5*l.* by the two firſt ſtatutes cited as above.

CAMBRIDGE *Manuſcript*, a copy of the Goſpels and Acts of the Apoſtles in Greek and Latin. It was found in the monaſtery of Irenæus, at Lyons, in the year 1562, and gave it to the univerſity of Cambridge in 1568. It is a quarto ſize, and written on vellum; but ſeveral leaves of it are much torn and mutilated, ten of which are ſupplied by a later tranſcriber. Beza conjectures that this *manuſcript* might have exiſted as early as the time of Irenæus: Weſtein apprehends, that it either returned or was firſt brought from Egypt into France; that it is the ſame copy which Druthmar, an ancient expoſitor who lived about the year 840, had ſeen, and which, he obſerves, was aſcribed to St. Hilary; and that R. Stephanus had given a particular account of it in his edition of the New Teſtament in 1550. It is uſually called Stephen's ſecond manuſcript. Mill agrees with F. Simon in opinion that it was written in the weſtern part of the world by a Latin ſcribe, and that it is to a great degree interpolated and corrupted: he obſerves, that it agrees ſo much with the Latin Vulgate, as to afford reaſon for concluding, that it was corrected or formed upon a corrupt and faulty copy of that tranſlation. From this and the CLERMONT copy of St. Paul's Epiſtles, Beza publiſhed his larger Annotations in 1589. See Weſtein's Prolegomena to his folio edition of the New Teſt. vol. i. p. 28. Kuſter's edition of Mill's Teſtament, Proleg. p. 132. Mill. Prolor. in New Teſt. Amſt. 1735.

CAMEA. See CAMMA.

CAMEHUIA. See CAMAIEU.

CAMEL, *Camelus*, in the Linnæan ſyſtem of *Zoology*. This is a diſtinct genus of animals; of the order of *pecora*; the great character of which is the want of horns, which all the other genuſes of the *pecora* have: they have ſix cutting teeth in the lower jaw and none in the upper; and the upper lip is divided like that of hare. The hoofs are ſmall.

The word is formed from the Greek καμηλος, which ſignifies the ſame; and, according to Nicod, from the Hebrew *gamel*; but according to others from καμπτω, on account of the bunch on its back.

There are four ſpecies of *camels*: 1. The *camel*, with one bunch on its back, called the DROMEDARY. 2. The Bactrian *camel*, with two bunches. 3. The Peruvian *camel*, called GUANA, and by ſome *alpaka-camels*, with a pectoral bunch. And, 4. The PACO, uſually called the Indian or Peruvian ſheep, without any bunch at all.

The dromedary is chiefly uſed for riding; the Bactrian *camel*, or that with two bunches on its back, for travelling with loads.

The *camel* is a domeſtic beaſt of burden, of gentle diſpoſition, much uſed for carriage in divers parts of Aſia; and making the chief riches of the Arabs.

In Perſia they only diſtinguiſh two ſorts of *camels*, viz. the ſouthern, which are ſmaller, and not fit to carry above ſeven hundred weight; and the northern, which are bigger, and able to carry twelve or thirteen hundred weight.

The name *camel*, among us, is vulgarly reſtrained to that ſort which has but one bunch on the back; the appellation *dromedary* being given to thoſe which have two. In this we follow the example of Solinus, contrary to Pliny, Ariſtotle, and the generality of ancient naturaliſts. The bunch on the *camel*'s back is not formed by the cavity of the *ſpina dorſi*, but is uſually ſaid to be a callous ſort of fleſh. The academiſts of Paris found it mere hair; and that when this was preſſed cloſe down, the creature appeared no more bunch-backed than a ſwine. Pliny affirms, that the *camel* can endure four days without drink; whence Perſius gives it the appellation *ſitiens*. They can live on the little ſhrubs which the deſerts produce, and are ſatisfied for a whole day with half a gallon of beans and barley, or balls made of the flour. The fleſhy foot of the *camel* is formed for travelling on the hot lands, which would parch and deſtroy the hoof. Pococke's Deſcript. of the Eaſt, vol. i. p. 208. Shaw's Travels, p. 239.

Camel's milk is ſaid to be ſovereign againſt the dropſy, for which purpoſe the Arabs drink a pint per day for three weeks.

Native *ſal* AMMONIAC is commonly ſuppoſed to be the urine of camels.

The Turks reckon the flesh of the young *camel* delicious food; but prohibit the use of it to Christians, lest the breed should be destroyed.

Camels call their hair in the spring, which is gathered up with great care, on account of the traffic thereof, which is very considerable. When left bare of hair they pitch them over to defend them from the flies.

They spin the *camel's* hair and weave it into stuffs: it is sometimes also used with other hairs in making of hats. The belt hair is that from the *camel's* back.

Camels are chiefly used in CARAVANS; and they travel for fifteen or sixteen hours without stopping, at the rate of two miles and a half an hour. They are very apt to slide; for which reason, in passing slippery ways, their leaders strew carpets under them, sometimes to the number of a hundred, one before another.

The *camel* that carries Mahomet's standard, which the caravan of pilgrims offer yearly on the tomb of their prophet, is exempted the rest of its life from all services. It is even pretended that this happy beast will rise again at the general resurrection, and enjoy the pleasures of paradise.

On medals the *camel* is the symbol of Arabia, when found on the coins of any other nations. Thus, on a medal of the gens Plautia, we find a woman's head with a mural crown, *L. Plautius Ædil. Cur. S. C.* and on the reverse, *Judæa*; and on the exergue, *Bacchius*; the device, a man on his knees, holding with his right hand a *camel* by the bridle, and with the left, a branch of palm. It also denotes alliance with Arabia.

CAMEL, in *Mechanics*, a kind of machine used in Holland for raising or lifting ships.

The *camel* was invented by a burgomaster of Amsterdam, towards the close of the last century. It took the denomination from its heaviness or strength.

Its use is to raise vessels, in order to bring them over the Pampus, which is at the mouth of the river Y, where the shallowness of the water hinders large ships from passing.

CAMELS *hay*, *fœnum cameli*num, an appellation given to the plant *tragacantha*, or *juncus odoratus*. See SCAMANTH, and ICHLEMUM.

CAMELEON, CHAMÆLEON, in *Natural History*, a little animal, famous among the ancient and modern writers, for a faculty it is supposed to have, of changing its colour, and assuming those of the objects near it.

It is a species of the LIZARD, with a short, round, incurvated tail, and two or three toes joined together.

There are four distinct varieties of this animal: 1. The Arabian kind, which is small, and hardly exceeding the green lizard in size: this is of a whitish colour, variegated with yellow and reddish spots. 2. The Ægyptian, which is twice as large as the Arabian, and is of a middle colour, between the whitish hue of the Arabian and a fair green: this changes its colour to a paler or deeper yellow. 3. The Mexican. And, 4. a kind sometimes shewn about as a sight, and met with by J. Faber Lynceus at Rome, which differed from all the others. The Arabian and Mexican *cameleons* seldom exceed six inches in length: the Ægyptian is nine or more. The head is very like that of some fishes, and is joined almost immediately to the breast, the neck being extremely short, and having at the sides two cartilaginous eminences, in the manner of fishes. It has a creft standing up in the middle of the forehead, and two others over the eyes, and between the creft there are two remarkable depressions; the nose and mouth, running from the eyes with a double edge to the end of the snout, resemble those of a finger at the extremity of the nose there are two perforations, which seem to serve as nostrils; the mouth being always kept close shut, and the creature appearing to have no power of respiring but by means of these. Its mouth is furnished with teeth, or rather with continued denticulated bones. These are of no service to the creature in eating, since it preys on flies, and swallows them whole; but may serve for its defence for holding fast a stick in its mouth, which, according to Ælian, this creature does, placing the stick cross-ways, to prevent its being swallowed by serpents.

The structure and motion of this creature's eyes are very surprising; they are very large, and set in large cavities, appearing to be large spheres, of which one half stands out of the head, and is covered with a thin skin, perforated with a small hole at the top, through which is seen a very vivid and bright pupil, surrounded with a yellow iris; this hole is properly a longitudinal slit, which the creature opens more or less wide at pleasure, and the eye seems fixed to this eye-lid, so as to follow all its motions, not turning round within it, as in other creatures. The motion of the eyes of this creature is not less singular than their structure, since it can turn them so as to see what passes either far backward, on either side, or directly behind it, without at all moving the head, which is fixed to the shoulders; and the creature can give one eye all these motions, while the other is perfectly still. The trunk of the body is properly all great, for the creature has no belly, its ribs being confined to the *thighs*; the feet have all five toes, two behind, and three before, the hinder ones being as large as the others. This creature moves as slow as the tortoise, which appears very singular, as its legs are sufficiently long, and it has no great weight of body to carry; but it is said, that on trees, in its wild state, it moves very nimbly. Its tail, when inflated, is round as that of a rat or snake; when empty, it is very flat, and has three longitudinal ridges running along it, which are owing to the apophyses of the spine. This tail is a great safety to the creature on trees, as it twists it round the branches when in any danger of falling. See *Tab. of Serpents*.

The accounts given by the ancients, and later writers, of the long hollow tongue of the *cameleon*, which it can dart with such celerity to take flies, by means of a fringy nodule at the end, is found, on experience of those who have kept the creature alive, to be true. M. de la Hire thinks that it is provided with two kinds of muscles, the one circular and the other longitudinal, by the action of the former of which it is extended, and contracted by that of the latter. Those among the fostner, therefore, who suppose the *cameleon* lived on the air only, were greatly mistaken; some, of late, have also favoured this opinion, because of the long time the creature will live without food; but this is the case with all the serpent kind also, which yet we know to eat solid food when they can get it.

The tongue is half the length of the animal; consisting of a white flesh, round as far as the tip, which is flat and hollow; somewhat like an *elephant's proboscis*, or trunk; and accordingly, some call it a *trunk*.

The thickness of its body is not to be determined, as the creature alters that at pleasure, whilst it more or less inflates its body; and this inflation not only goes through the whole body, but into the legs and tail. This inflation is not at all like the breathing of other animals, for the body, when thus puffed out, will remain to two hours, only gradually and insensibly sinking all the time, and afterwards will be inflated again, but much more quickly than it subsided. It is also a long time to continue either of these states, but more frequently remains empty for a considerable space, in which time, though it appeared before in good case, it looks miserably lean and lank, and its back-bone may be clearly seen, its ribs counted, and even the large tendons of the feet distinctly observed by the naked eye through the skin. The back-bone, however, is not serrated, as many have affirmed, but makes, in this its lean state, a *plain sharp* ridge, and the whole animal looks so *miserably meagre*, that it has not unaptly been called a *living skin*.

Naturalists are very little agreed, as to the *reason* or manner of its change of colour: some, as Seneca, maintain it done by *suffusion*; others, as Solinus, by *reflection*; others, as the Cartesians, by the *different disposition* of the parts that compose the skin, which give a different modification to the rays of light. Kircher ascribes the change of colour in the *cameleon* to the power of imagination in the animal, because it lasts it when dead: others, as Dr. Goddard, ascribe the change to the grains of the skin; which in the several postures, he thinks may shew several colours; and, when the creature is in full vigour, may have, as he terms it, *rainbow spots*; that is, the effect of mirrors, and reflect the colours of bodies adjacent.

The animal having it in its power to fill the skin more or less, has it so in its power not only to alter the tone and texture of the fibres, upon which their reflective quality, in a great measure, depends; but also to bring parts into sight which before lay concealed, or to conceal such as before lay open: and it is more than probable, that the parts which are ordinarily covered, are of a somewhat different colour from those constantly open to the air.

On these principles, probably, all the phenomena in the *cameleon's* colour may be solved. The animal, it is evident, has a power to reflect different-coloured rays from the same parts; also to make certain parts reflect; and to prevent others reflecting; and hence that variety, that medley of colours.

See an account of a particular species of *cameleon*, by Dr. Parson's, Phil. Trans. vol. xvii. N° 29. an. 1568.

Matthiolus relates several superstitious notions of the ancients touching the *cameleon*. Pliny affures us, that Democritus had composed a whole book of such follies. This is not the only animal poffeffed of the property of changing its colour; Gron mentions another sort of lizard, which, when he swells with anger, changes his colour from green to a kind of ruffet. The like is faid of the *major musciel*, or lizard in the island of Nevis.

CAMELEON, CHAMALEON, in *Astronomy*, one of the constellations of the southern hemisphere, near the pole, and invisible to us.

The stars in this constellation, according to Sharp's Catalogue, are ten; their magnitude, situation, longitude, and latitude are as follow.

Situation of the stars.	Sign.	Longitud.		Latitude.		Magnitudes.
		°	′	°	′	
In the fore-foot.	♑	1	31	33	43	5

CAMELITA, *bos*, in *Natural History*. See BISON.

CAMELLIA, in *Botany*, a name given by Linnæus to a genus of plants mentioned in Kempfer's Japan, under the name of *tsubaki*. It belongs to the class of *monadelphia polyandria*. The characters of the genus are these: the perianthium is composed of several leaves, and is of a roundish figure, and imbricated, being formed of a number of roundish scales, the internal ones growing gradually larger than the others, and all of them hollowed and deciduous; the flower is composed of five petals of an oval figure, and growing together at the base; the filamina are a great number of filamenta that stand erect, and are formed in the lower part into a sort of cocoon, which is larger than the style. They are free at the top, and are shorter than the flower; the antheræ are simple; the pistil has a roundish germen; the style is pointed, and of the same length with the filamina; and the stigma is acute and bent; the fruit is a turbinated woody capsule, with some furrows on its surface. There is one species.

CAMELOPARDAL, in *Zoology*, an animal of a very singular kind, and seeming properly to belong to no known genus of animals, but to be perfectly *sui generis*. It is called *camelopardalis* by Latin authors, *giraffa* and *zurnapa* by eastern nations. Linnæus makes it a species of the *cervus*, or *stag* kind, with simple horns, and fore-legs very long. See a letter concerning a species of this animal found about the Cape of Good Hope, by captain Carteret, in the Philosophical Transactions, vol. lx. N° 3. an. 1770.

It is not certainly known whether it chews the cud or not; but as its hoofs are cloven, as it has horns on its forehead, as it wants the fore-teeth in its upper jaw, and feeds on vegetables, it is probable that it does.

It is a singular, elegant, and beautiful creature, and is very remarkably tame and tractable, even scarce less so than a sheep, and seems intended by nature for a domestic, not a savage animal. Its head is wholly of the make of a stag's, but differs in sex, and has two little obtuse horns, which are not more than six fingers-breadth long, and are hairy: the male and female both have these, and the latter is distinguished by having them shorter than the former. Its ears are long, and like those of the ox kind; its tongue is also like that of an ox, and it wants the fore-teeth in the upper-jaw. Its neck is remarkably long, straight, and slender, in a grown animal. The neck is usually seven feet long, and the measure from the tail to the top of the head eighteen feet; and when it stands erect, its head is sixteen feet from the ground; it has a small mane; its legs are very slender, and the fore-legs very long; the hinder ones very short, so that the creature seems always to stand upright.

Its hoofs are cloven exactly like those of the ox, its tail reaches down to its hams, and is rounded and covered with very thick hairs; the middle of its body is slender: it is very like the camel in all its natural properties: when it runs it holds the two fore-feet together, it lies down on the belly, and claps its neck down on the thighs and breast in the manner of the camel. As it stands it can scarce reach to eat the grass, unless its fore-legs are very far expanded, and that is a posture of great pain to it; so that nature seems to have allotted it to feed in its wild state on the leaves of trees, which its long neck will very well enable it to get at. It is very beautifully spotted all over its body in the manner of the leopard.

The velvety covering of its horns seems to make it of the stag kind, but its shape is wholly different from those of that genus.

It is found in Ethiopia, and other parts of Africa. The horns and hoofs rasped, pulverised, and taken inwardly, are good for the epilepsy, stop a looseness, and resist poison.

CAMELOPARDALUS, in *Astronomy*, a new constellation of the northern hemisphere, formed by Hevelius, consisting of 32 stars still observed by him, situate between Cepheus, Cassiopeia, Perseus, the two Bears, and Draco, and containing 58 stars in the British Catalogue.

CAMERA *Lucida*, a contrivance for blowing the fire, for the fusion of ores, without BELLOWS; by means of water falling through a funnel into a close vessel, which forces from it so much air or vapour, as continually blows the fire: if there be the space of another vessel for it to evaporate in by the way, it there lets fall its humidity, which otherwise might hinder the work.

The contrivance was named *camera Æolia* by Kircher. Hook, Phil. Coll, N° 3. p. 80.

CAMERA *lucida*, a contrivance of Dr. Hook for making the image of any thing appear on a wall in a light room, either by day or night.

Opposite to the place or wall where the appearance is to be, make a hole of at least a foot in diameter, or if there

there be a high window with a casement of this dimension in it, this will do much better without such hole, or casement opened. At a convenient distance, to present its being perceived by the company in the room, place the object or picture intended to be represented, but in an inverted situation. If the picture be transparent, reflect the sun's rays by means of a looking-glass, so as that they may pass through it towards the place of representation; and to prevent any rays from passing aside it, let the picture be encompassed with some board, or cloth. If the object be a statue, or a living creature, it must be much enlightened by casting the sun's rays on it, either by reflection, refraction, or both. Between this object and the place of representation put a broad convex glass, ground to such a convexity, as that it may represent the object distinctly in such place. The nearer this is situate to the object, the more will the image be magnified on the wall, and the farther the less; such diversity depending on the difference of the spheres of the glasses. If the object cannot be conveniently inverted, there must be two large glasses of proper spheres, situate at suitable distances, easily found by trial, to make the representations erect. This whole apparatus of object, *glasses, &c.* with the persons employed in the management of them, are to be placed without the window or hole, so that they may not be perceived by the spectators in the room, and the operation itself will be easily performed. Phil. Trans. N° 38. p. 741, seq.

CAMERA *obscura, or dark chamber*, in *Optics*, a machine, or apparatus, representing an artificial eye; wherein the images of external objects, received through a double convex glass, are exhibited distinctly, and in their native colours, on a white matter placed within the machine, in the focus of the glass.

The first invention of the *camera obscura* is ascribed to Baptista Porta. See his Magia Naturalis, lib. xvii. cap. 6. first published at Frankfort, about the year 1589, or 1591. The first four books of this work were published at Antwerp in 1560.

CAMERA *obscura, the use of the*, is manifold: it serves to very good purposes in explaining the nature of vision; and hereof in that some call it the *artificial eye*. It affords very diverting spectacles; both by exhibiting images perfectly like their objects, and each clothed in their native colours; and by expressing, at the same time, all their motions; which latter, no other art can imitate. By means of this instrument, especially by the third contrivance under mentioned, a person unacquainted with designing, will be able to delineate objects with the greatest accuracy and justness; and another well versed in painting, will find many things herein to perfect his art.

CAMERA *obscura, the theory of the*, is contained in the following proposition.

If an object A B (*Tab. Optics, fig.* 16.) radiate through a small aperture C, upon a white wall opposite to it; and the place of radiation behind the aperture *d C a* be dark; the image of the object will be painted on the wall, in an inverted situation.

For the aperture C being very small, the rays issuing from the point B will fall on *b*, those from the points A and D will fall on *a* and *d*, wherefore since the rays issuing from the several points are not confounded, they will by reflection exhibit its appearance on the wall. But since the rays A C and B C intersect each other in the aperture, and the rays from the lowest points fall on the highest, the situation of the object will of necessity be inverted.

Hence, since the angles at D and *d* are right, and the vertical ones at C are equal; B and *b*, and A and *a*, will be also equal; consequently, if the wall, where the object is delineated, be parallel to it, *a b*: A B :: *d* C : D C. That is, the height of the image will be to the height of the object, as the distance of the image from the aperture is to the distance of the object from the same.

CAMERA *obscura, construction of a*, wherein the images of external objects shall be represented distinctly, and in their genuine colours, either in an inverted, or an erect situation. 1. Darken a chamber, one of whose windows looks into a place set with various objects; leaving only a little aperture open in the one shutter. 2. In this aperture fit a lens, either plano-convex, or convex on both sides: so as to be a portion of a large sphere. 3. At a due distance, to be determined by experience, spread a paper, or white cloth, unless there be a white wall for the purpose; for on this the images of the desired objects will be delineated invertedly. 4. If it be rather desired to have them appear erect, it is done either by means of a concave lens placed between the centre and the focus of the first lens, or by receiving the image on a plane speculum inclined to the horizon under an angle of 45°, or by means of two lenses included in a draw-tube, in lieu of one.—Note, if the aperture does not exceed the bignets of a pea, the objects will be represented, even though there be no lens at all used.

To render the images clear and distinct, it is necessary the objects be illuminated by the sun's light coming on the objects from the opposite quarter; so that, if the prospect is western, the phenomena will be best in the forenoon; if eastern, in the afternoon: if northern, when they are the brightest, about noon: a southern aspect is the least eligible of any: they will be still brighter, if the spectator first stay a quarter of an hour in the dark. Care must likewise be taken, that no light escape through any chinks; and that the wall be not too much illuminated. Farther, the greater distance there is between the aperture and the wall, the larger and more distinct will the images be; but the rays becoming, thus, too much dilated, the brightness of the image is weakened, till at length it becomes invisible.

CAMERA *obscura, construction of a portable*. 1. Provide a little chest, or box of dry wood (*Tab. Optics, fig.* 17.) of the figure of a parallelepiped; its breadth about ten inches, and its length two or more feet, according to the different magnitude of the diameters of the lenses. 2. In the plane B D fit a sliding tube, E F with two lenses; or, to let the image at a less distance from the tube, with three lenses convex on both sides; the diameter of the two outer, or forwarder, to be $\frac{7}{8}$ of a foot; that of the inner less, v. gr. $\frac{3}{4}$. 3. Within the chest, at a proper distance from the tube, let up an oiled paper, perpendicularly, G H, so as images thrown upon it may be seen through. Lastly, in I make a round hole, so that a person may look conveniently through it with both eyes.

If then the tube be turned towards the objects (the lenses being at their proper distance, to be determined by experiment), the objects will be delineated on the paper G H, erect as before.

If the machine be to contrived, that a looking-glass may pass from G to C, the image will be reflected upon a rough glass plane placed horizontally at A B, with its unpolished side upwards, and a copy of it may be sketched out with a black-lead pencil. The horizontal glass plane rests on two grooves in the sides of the box, and this, as well as the looking-glass, may be lodged in a drawer at the bottom of the machine. This box is covered with an horizontal lid, under which are two wings, which open to right angles at each side of it, in order to shade the image upon the rough glass: oiled paper strained in a frame is sometimes used instead of the rough glass; a metalline speculum is preferable to the looking-glass.

CAMERA, *another portable*, may be thus made. 1. In the middle of a cistula, or chest (*Tab. Optics, fig.* 18.) raise a little turret, either round or square H I, open towards the object A B. 2. Behind the aperture, incline a little plain mirror *a b*, to an angle of 45°; which may reflect the rays. A *a* and B *b*, upon a lens convex on both sides G, included in a tube G L; or the lens may be fixed in the aperture. 3. At the distance of the focus thereof, place a table covered with a white paper E F, to receive the image *n d*. Lastly, in N M make an oblong aperture to look through, and an opening may be made in the side of the box for the convenience of drawing.

This kind of *camera* may easily be converted into a *show-box*, for viewing prints. Place the print at the bottom of the box, with its upper part inwards, where it is enlightened through the front left open for this purpose, either by day or candle-light; and the print may be viewed through the aperture in H I: the lens used in this show-box should be large enough to admit both eyes, to see the print or picture at once; and it would be convenient to have it moveable, in order to suit different eyes. See a variety of contrivances for this purpose described by Mr. Harris, in his Optics, b. ii. § 2. A considerable improvement in the *camera obscura* has been lately made by Mr. Storer, for which he has obtained a patent; this instrument, which he calls a *delineator*, is formed of two double convex lenses and a plane mirror, fitted into a proper box. One lens is placed close to the plane mirror, and making with it an angle of 45°: the other lens is placed at right angles to the former, and is fixed in a moveable tube: if the moveable lens be directed towards the object to be viewed or copied, and moved nearer to or farther from the plane mirror, till the image is distinctly formed on a ground glass, laid upon that surface of the upper lens which is next the eye, it will be found more sharp and vivid than those formed in the common *camera*; because the image is taken up by near the upper lens: by increasing the diameter of the lenses, and using those of a short focus, the effect will be much heightened.

CAMERARIA, in *Botany*, a genus of *the pentandria monogynia* class; so called by Plumier, in honour of Camerarius, a celebrated botanist of Nuremberg. Its characters are these: the flower is of one leaf, salver-shaped, and divided at the top into five acute segments; it hath five

five short inflexed stamina. In the bottom of the tube are situated two roundish germina, which afterward become two long, taper, leafy capsules, filled with oblong cylindrical seeds. There are two species, which are natives of the West Indies, and must therefore be kept in a bark stove, but in warm weather should have plenty of fresh air.

CAMERARIUS, or *Chamberlain*, an officer who had the care of the DORMITORY in ancient religious houses.

CAMERLINGO, or CAMARLINGO, the chamberlain of the pope's court or the person who has the administration of the apostolical chamber.

The word imports as much as keeper of the chamber, or treasurer; though the *camerlingo* has divers other jurisdictions which have no relation to the office of treasurer. The name anciently denoted a *cubicularius*, or gentleman of the bed-chamber; but this is now expressed by *camerario*. The *camerlingo* is the most conspicuous officer in the court of Rome; because all the revenues of the holy see are managed by the chamber of which he is president.

This office was anciently performed by the archdeacon of Rome, a dignity which was suppressed by pope Gregory VII. as of too great power and interest; insomuch that he could often controul the pontiff himself, and generally by his intrigues raised himself to the papacy. In his stead was placed a cardinal, under the title of *camerlingo*, who is assisted in his function by twelve prelates called clerks of the chamber, *clerici de camera*.

The cardinal *camerlingo*, on the death of a pope, does not enter the conclave with the rest, to assist at the election of a new one, but stays without, keeps possession of the pope's apartment in the Vatican, and whenever he goes abroad is attended by the Swiss guards, like the pope himself. He even coins money in his own name, and with his own arms; and, in fine, is a kind of vice-pope, governing the ecclesiastical state during the vacancy of the holy see.

The cardinals have also their *camerlingo*, or treasurer of their college, distinct from that of the pope: the former is elected every year, whereas the latter is for life. The person chose to this office has the receipt of all the revenues belonging to the college, which he is to distribute at the end of the year in equal portions to the cardinals then at Rome; those who are absent having no share therein after they have been six months from court.

CAMERONIANS, a sect or party in Scotland, who separated from the Presbyterians in 1666, and continued to hold their religious assemblies in the fields.

The *Cameronians* took their denomination from Richard Cameron, a famous field-preacher, who refusing to accept the indulgence to tender consciences granted by king Charles II. as such an acceptance seemed an acknowledgment of the king's supremacy, and that he had before a right to silence them, made a defection from his brethren, and even headed a rebellion, in which he was killed. His followers were never entirely reduced till the Revolution, when they voluntarily submitted to king William.

The *Cameronians* adhered rigidly to the form of government established in 1648.

CAMERONIANS, or CAMERONITES, is also the denomination of a party of Calvinists in France, who asserted, that the cause of men's doing good or evil proceeds from the knowledge which God infuses into them; and that God does not move the will physically, but only morally, in virtue of its dependence on the judgment of the mind.

They had this name from John Cameron, a famous professor, first at Glasgow, where he was born 1580, and afterwards at Bourdeaux, Sedan, and Saumur; at which last place he broached his new doctrine of grace and free-will, which was followed by Amyraut, Cappel, Bocan, Dallie, and others of the most learned among the reformed ministers, who judged Calvin's doctrine on these heads too harsh.

The Cameronians are a sort of mitigated Calvinists, and approach to the opinion of the ARMINIANS. See UNIVERSALISTS, *Arminians*.

CAMES, a name given to the small slender rods of cast-lead, of which the glaziers make their turned lead.

Their lead being cast into slender rods of twelve or fourteen inches long each, is called the *cames*; sometimes also they call each of these rods a *came*, which being afterwards drawn through their vice, makes their turned lead.

CAMILLI and CAMILLÆ, in *Antiquity*, boys and girls of ingenuous birth, who ministered in the sacrifices of the gods; and especially those who attended the *flamen dialis*, or priest of Jupiter.

The word seems borrowed from the language of the ancient Etrurians, where it signified minister, and was changed from *cernibus*.

The Tuscans also gave the appellation *Camillus* to Mercury in quality of minister of the gods.

CAMINI, or *yerva* CAMINI; an American herb, the same with what is otherwise called PARAGUAY, or *yerva conpalti*.

CAMIS, or KAMIS, in the *Japanese Theology*, denote deified souls of ancient heroes, who are supposed still to interest themselves in the welfare of the people over whom they anciently commanded.

The *camis* answer to the heroes in the ancient Greek and Roman theology, and are venerated like the saints in the modern Romish church.

Besides the heroes or *camis* beatified by the consent of antiquity, the *mikadoes*, or pontiffs, have deified many others, and continue still to grant the apotheosis to new worthies; so that they swarm with *camis*: the principal one is *Tensio Dai Sin*, the common father of Japan, to whom are paid devotions and pilgrimages extraordinary.

CAMISADE, in the *Art of War*, an attack by surprize, in the night, or at the point of day; when the enemy are supposed in bed.

The word is said to have taken its rise from an attack of this kind; wherein, as a badge, or signal to know one another by, they bore a shirt, in French called *chemise*, or *camise*, over their arms.

CAMISARDS, or CAMISARS, an appellation given by the French to the Calvinists of the Cevennes, who formed a league, and took up arms, in their own defence, in the year 1688. The etymology of the name is disputed; but it is most probably formed from *camisat*. See the preceding article.

CAMLET. See CAMELET.

CAMMOCK, in *Botany*. See REST-*harrow*.

CAMMOROS, in *Botany*, a name given by some of the old writers to the poisonous plant called by the Romans *cicuta*, or hemlock.

Cammaros was a common name among the Greeks for hemlock; and this *cammaros* is the same word, only spoke according to the Doric dialect.

As hemlock was a poisonous plant, it soon became a custom to call other poisonous plants also by its name; and *cammaros* became hence a name for the mandrake, and some of the nightshades, with some authors. Dioscorides has called one kind of aconite or wolf's-bane by this name, and others have adapted it to other such plants; but the more judicious have only given it as an additional epithet to these, expressing their being poisonous, and have added the peculiar name of the plant before it.

Many of the moderns, and even some among the ancients, have erred greatly in confounding the *cammaros* with the *cammaros*, which is an insect in figure resembling the root of this aconite.

CAMOCLADIA, in *Botany*, a genus of the *triandria monogynia* class: the calyx and corolla are divided into three parts: the drupe is oblong, with a two-lobed nucleus. There are two species.

CAMOMILE. See CHAMOMILE.

CAMP, a spacious post, or spot of ground, where an army rests, intrenches itself, or plants a picquet watch, to lodge secure either in tents, or barracks.

The *camp* is sometimes covered by an intrenchment; sometimes only by the advantages of its post: sometimes it is inclosed by *chevaux de frise* laid across each other, the ordinary practice of the old prince of Orange.

The chief skill of a general lies in the art of encamping well; this the Romans were unacquainted with, till the war with Pyrrhus; from whose camp they learned to model their own. Till then, they knew not how to post themselves to advantage, nor with any order in their *camps*.

An *encampment*, or *standing camp*, is always to have the advantage of water, forage, and fuel; with the means of covering and retrenching itself.

Where the grounds are equally dry, those *camps* are always most healthful which are pitched on the banks of large rivers; because in the hot feafon fituations of this kind have a ſtream of freſh air from the water, ſerving to carry off the moiſt and putrid exhalations. On the other hand, next to marſhes, the worſt *encampments* are on low grounds cloſe beſet with trees: for then the air is not only moiſt and hurtful in itſelf, but, by ſtagnating, becomes more ſuſceptible of corruption. However, let the ſituation be ever ſo good, *camps* are frequently rendered infectious by the putrid effluvia of rotten ſtraw, and the privies of the army; more eſpecially if the bloody flux prevails, in which caſe the beſt method of preventing a general infection is to leave the ground with the privies, foul ſtraw, and other filth of the *camp* behind. This is to be frequently done, if conſiſtent with the military operations; but when theſe render it improper to change the ground often, the privies ſhould be made deeper than uſual, and once a day a thick layer of earth thrown into them till the pits are near full, and then they are to be well covered, and ſupplied by others. It may alſo be a proper caution, to order the pits to be

made either in the front or rear, as the then ſtationary winds may beſt carry off their effluvia from the *camp*. Moreover, it will be neceſſary to change the ſtraw frequently, as being not only apt to rot, but to retain the inſect-ious ſteams of the ſick; but if freſh ſtraw cannot be procured, more care muſt be taken in airing the tents as well as the old ſtraw.

An army always encamps fronting the enemy, and generally in two parallel lines, about five hundred yards diſtant: the horſe and dragoons on the wings, and the foot in the centre; ſometimes three or four brigades encamp between the two lines, and are called the body of RESERVE. The artillery and bread-waggons are in the rear of the two lines. See PARK *of Artillery*.

A regiment of foot, conſiſting of ten companies, is allowed for encampment, one hundred and fifty yards in front, viz. five yards for pitching the tents of the two flank companies, twenty yards for four double rows of tents, thirty-five for the grand ſtreet, and ninety for four ſmaller ſtreets; but when the flank companies are detached, the right battalion companies require an extent of an hundred and twenty yards, viz. five for two ſingle rows of tents, fifteen for three double rows, and an hundred for four ſtreets: the depth of the *camp* is two hundred and ninety yards: the quarter-GUARD tents are placed in a line with thoſe of the two centre companies, fronting each other, and about the diſtance of a hundred yards from the front of the regiment: the officers tents front outwards towards the beſt of arms: the bells of arms of the regiment front the poles of the ſerjeants tents; the colours are placed in the centre of the grand ſtreet, in a line with the bells of arms: captains and lieutenants pitch in the rear of the reſpective companies: the captain-lieutenant as captain in the rear of the colonel's company: the field officers front the centres of the two ſtreets on the right and left of the battalion: the colonel fronts the colours, at the diſtance of about a hundred yards: the ſtaff-officers front the ſtreets on the right and left of the grand ſtreet; the hut-men's tents front their horſes; the grand-maſter is placed in the rear of the colonel at the diſtance of about fifty yards: the kitchens ſtand ſingly or in pairs behind their reſpective companies: and the front poles of the tents or huts of the petit-maſters are in a line with the centres of the kitchens; and the rear-GUARD's tents front outwards: when circumſtances admit, the neceſſaries ſhould be an hundred paces behind the rear-guard. If field pieces with artillery-men are attached to the battalions, the intervals are thirty yards. This diſpoſition of encampment is taken from the grand *camp* at Cox-Heath in 1778.

A ſquadron of horſe is allowed thirty paces *for* its *camp*, and thirty for an interval, or more, if the ground will admit of it. See *Standard*, and *Grand*-GUARD.

The order and contrivance of the Roman *camp* was admirable. Its figure was a ſquare, diviſed into two principal parts: in the upper part were the general's pavilion, or *prætorium*, and the tents of the chief officers; in the lower, thoſe of the inferior degree were placed.

On one ſide the *prætorium* ſtood the *quæſtorium*, or apartment of the treaſurer of the army; and near this the *forum*, both for the market-place, and the aſſembling of councils. On the other ſide of the *prætorium* were lodged the *legati*; and below it, the tribunes had their quarters oppoſite to their reſpective legions. Aſide of the tribunes were the *præfecti* of the foreign troops, over-againſt their reſpective wings; and behind theſe were the lodgments of the *equitati*, then thoſe of the *extraordinarii* and *alacri equites*, which concluded the higher part of the *camp*.

Between the two partitions was a ſpot of ground called *principia*, for the altars and images of the gods, and probably alſo the chief enſigns.

The middle of the lower partition was aſſigned to the Roman horſe; next to whom were quartered the *triarii*, then the *principes*, and cloſe by them the *haſtati*: afterwards the foreign horſe, and, laſtly, the foreign foot.

They fortified their *camp* with a ditch and parapet, which they termed *foſſa* and *vallum*: in the latter, ſome diſtinguiſh two parts, viz. the agger or earth, and the ſudes or wooden ſtakes driven in to ſecure it.

The *camps* were ſometimes ſurrounded with walls made of brown ſtone; and the tents themſelves formed of the ſame matter.

The Roman *camps* ſometimes gave the origin to cities, which were formed of them, and often took their denomination from thoſe whoſe *camps* they had been. This chiefly happened when any army continued long in a place, eſpecially in the winter, where they were obliged to build many works, and fortify themſelves exactly. Thus the Caſtra Cornelia, a city of Africa, not far from Utica, was originally the *camp* of Cornelius Scipio. Liv. lib. xxix. cap. 35.

Antiquaries obſerve, that all the modern towns among us, whoſe names end in *cester* or *chyſter*, were originally theſe *caſtra hyberna* of the Romans.

In the Grecian *camps*, the moſt valiant of the ſoldiers were placed at the extremities; the reſt in the middle, that the ſtronger might be as a guard to the weaker, and ſuſtain the firſt onſets. Thus Achilles and Ajax are poſted by Homer at the ends of the Grecian *camp* before Troy, as bulwarks on each ſide. Il. b. ver. 806.

In *camps* for continuance, they erected altars to their gods, places for public aſſemblies, courts of juſtice, and the like.

According to Plutarch, the Lacedæmonians alone had no ſtage-players, buffoons, dancers, or ſongſtreſſes in their *camps*. Yet the Spartan law never allowed his people greater liberty in the *camp* than in the city, to allure them to ſtrive with more delight in the wars. Hence their exerciſes were more moderate, their fare leſs hard, and their actions leſs ſeverely noted when in the field than at home; ſo that they were the only people in the world to whom war gave repoſe. Plut. in Cleom. & in Lycurg.

The Spartan *camp* was of a circular figure, which was preferibed by Lycurgus as the beſt fitted for defence, contrary to the Roman rule, whoſe *camps* were always quadrangular. All angular forms were rejected by Lycurgus, by reaſon the angles are neither ſo for ſervice, nor defenſible, unleſs guarded by a river, mountain, wall, or other work.

The magnificence of the Turkiſh court appears more in the *camp* than in the ſeraglio: the tents of the great officers appear ſo many palaces, both for extent, ornament, and coſtly furniture; having all the accommodations both of city and country; each grandee has two ſets of tents; one of which is advanced a conce, or day's journey, before the other; ſo that leaving one tent in the morning, they find another ready furniſhed in the evening.

In the front of the Turkiſh *camp* are quartered the janizaries, and other foot, whoſe tents encompaſs their aga. In the rear are the quarters of the ſpahis and other horſemen. The body of the *camp* is poſſeſſed by the ſtately tents or pavilions of the vizier or general, *tent ofjendi* or chancellor, *bahrja* or ſteward, the *teſterdar kaſeha* or lord treaſurer, and *kapiſſer kahiſſe* or maſter of the ceremonies.

In the middle of theſe tents is a ſpacious field, wherein are erected a building for the *divan*, and a *boſſon* or treaſury.

When the ground is marked out for a *camp*, all wait for the pitching of the tent *ioſier*, the place where the courts of juſtice are held; it being the ſituation of this that is to regulate the diſpoſition of all the reſt.

CAMP, *city*, *caſtra urbana*, was a place near the city-wall, not far from the *Via Nomentana*, where the prætorian guards were encamped; whence it was alſo called the *prætorian camp*, *caſtra prætoria*, or *prætorium*. The like we alſo read of at Jeruſalem, called by St. Luke abſolutely the *camp*, παρεμβολη. By which we are doubtleſs to underſtand the *caſtra Antonia*, which, Joſephus tells us, was afterwards uſed as a caſtle.

CAMP, *moveable*, *caſtra lunata*, thoſe made in figure of a half-moon.

CAMP, *naval*, *caſtra navalia*, or *navalia*, denoted a ſtation of ſhips.

CAMP, *flanding*, *caſtra ſtativa*, was that wherein they deſigned to continue longer in a place; and therefore more pains were taken to fortify and regulate it.

The Roman *camps*, in a march, were alſo called in the middle age *manſiones*.

CAMP, *ſummer*, *caſtra æſtiva*, among the Romans, was ordinarily light and moveable; ſo that they might be ſet up or taken down, and removed in a night. To which caſe it was alſo called ſimply *caſtra*.

CAMP, *winter*, *caſtra hyberna*, or winter-quarters, were uſually taken up in ſome city or town; or elſe to contrived as to make almoſt a town of themſelves.

CAMP, *tertiated*, *caſtra tertiata*, thoſe which were a third part longer than broad, which Hyginus repreſents as the Roman model. *Caſtra in quantum fieri poterit tertiata eſſe debebunt—ut pauo in longum duo millia quadringenti, in latum mille ſexcenti pedes.*

CAMP, *flying*, is a ſtrong body of horſe or dragoons, to which are ſometimes added foot, commanded uſually by a lieutenant-general.

This always keeps the field, making frequent motions both to cover the garriſons in poſſeſſion, and to inſult and keep the adverſary in continual alarm, and oblige him to make diverſions.

CAMP is alſo uſed among the Siamoſe and Eaſt Indians, for a quarter of a town aſſigned to foreigners, wherein to carry on their commerce.

In thoſe *camps*, each nation forms itſelf a kind of city apart,

apart, in which their store-houses and shops are, and the factors and their families reside.

The Europeans at Siam, and in most other cities of the East, are exempted from this restraint, and allowed to live in the cities or suburbs, as they find them most commodious.

CAMP *colour-men*, are soldiers appointed to attend and assist the quarter-master general, in marking out, and keeping the *camp* clean, receiving and distributing provisions, &c.

The *camp colour-men* are drawn a man out of a company, and are exempt from all other duty during the campaign: each carries either a spade or a hatchet.

CAMP, *disease*, *Morbi castrenses*, those chiefly prevalent in armies. Under *camp*, or *field diseases*, come the plague, malignant fever, scurvy, flux, &c. Willius, physician to the king of Denmark, has a treatise on *camp diseases*. See DISEASE and SOLDIER.

The *camp disease*, *morbus castrensis*, absolutely so called, is a malignant fever. Dudley Digges died of the *camp* DISEASE, which raged in the garrison at Oxford, in 1643. On which Ed. Greaves, physician to king Charles II. has a treatise expressly under the title of Morbus Epidemicus, or the New Disease.

The *camp fever* is the same with what is otherwise called the Hungarian FEVER, and bears a near affinity to the petechial fever. See BILIOUS *fever*.

CAMP *flux*, a name frequently given to the dysentery; not as if it were of a different kind in armies, but because it is more usual there than elsewhere.

CAMP *duty*, in its utmost extent, includes every part of the service performed by the troops during the campaign. But in a more particular sense, denotes the guards ordinary and extraordinary kept in *camps*.

A great part of the *camp duty* is performed in the same manner as that of a garrison.

CAMP *fight*, or CAMP *fight*, in *Law Writers*, denotes the trial of a cause by duel, or a legal combat of two champions in the field, for decision of some controversy.

In the trial by *camp fight*, the accuser was, with the peril of his own body, to prove the accused guilty; and by offering him his glove, to challenge him to this trial, which the other must either accept of, or acknowledge himself guilty of the crime whereof he was accused.

If it were a crime deserving death, the *camp fight* was for life and death: if the offence deserved only imprisonment, the *camp fight* was accomplished, when one combatant had subdued the other, so as either to make him yield or take him prisoner. The accused had liberty to chuse another to fight in his stead, but the accuser was obliged to perform it in his own person, and with equality of weapons.

No women were permitted to be spectators, nor men under the age of thirteen. The priest and the people, who looked on, were engaged silently in prayer, that the victory might fall on him who had right. None might cry, strike, or give the least sign; which in some places was executed with so much strictness, that the executioner stood ready with an axe to cut off the right hand or foot of the party that should offend herein.

He that, being wounded, yielded himself, was at the other's mercy either to be killed or suffered to live. But if life were granted him, he was declared infamous by the judge, and disabled from ever bearing arms, or riding on horseback. Verstег. Rest. Dec. Intell. cap. iii. p. 51.

CAMP *hospital*. See HOSPITAL.

CAMP *law*, a method of deciding controversies by duel or CAMP *fight*.

CAMPAIGN, a military term, signifying the space of time during which armies are maintained, yearly, in the field.

The Germans begin their *campaign* very late; usually waiting for harvest: the French are always early, and begin sometimes in winter, by which they have reaped great advantages.

The beginning of every *campaign* is considerably more unhealthy than if the men were to remain in quarters. After the first forming of three weeks encampment, the sickness increases daily; the most infirm being by that time in the hospitals, the rest more hardened, and the weather growing daily warmer. This healthy state continues throughout the summer, unless the men get wet cloaths or wet beds; in which case a greater or lesser degree of the dysentery will appear, in proportion to the preceding heats. But the most sickly part of the *campaign* begins about the middle or end of August, whilst the days are still hot, but the nights cool and damp, with fogs and dews: then, if not sooner, the dysentery prevails: and though its violence is over by the beginning of October, yet the remitting fever, gaining ground, continues throughout the rest of the *campaign*, and never entirely ceases, even in winter-quarters, till the frosts begin.

At the beginning of a *campaign* the sickness is so uniform, that the number may be nearly predicted; but, for the rest of the season, as the diseases are then of a contagious nature, and depend so much upon the heats of summer, it is impossible to foresee how many may fall sick from the beginning to the end of autumn. It is also observed, that the last fortnight of a *campaign*, if protracted till the beginning of November, is attended with more sickness than the first two months of the encampment: so that it is better to take the field a fortnight sooner, in order to return into winter-quarters so much the earlier.

As to winter-expeditions, though severe in appearance, they are attended with little sickness, if the men have strong shoes, quarters, fuel, and provisions.

Long marches in summer are not without danger, unless made in the night, or so early in the morning as to be over before the heat of the day.

CAMPANA *Flora*, in *Botany*, a name given by Helwing, and some other of the German authors, to the plant we call *pulsatilla*, or the *passe fleur*. It was named *campana Floræ*, or Flora's bell, by Helwing, because of its being the signal of the approach of spring. In the Linnæan system, this is a species of the ANEMONE. Its characters, according to Miller, are as follow: the flower has a leafy involucrum, ending in many points; it hath two orders of petals, three in each, and a great number of slender stamina, about half the length of the petals, terminated by erect twin summits; and a great number of germina collected in a head: the germina afterward become so many seeds, having long hairy tails sitting upon the oblong receptacle. There are four species.

We generally find the *pulsatilla* on dry and barren places, as sandy hills, sterile downs, and the like; but in Prussia it is most frequent in woods, and among pines and firs, and often is found in a loose, spungy, and wet soil. There is in Prussia, a very remarkable species of it, which has a white flower; the leaves are of the jagged kind, and resemble those of the anemone; and the back part of the petals is tinged with a faint blue.

The whole genus of the *pulsatilla*, are of an acrid and caustic quality, approaching to that of the ranunculus; and, if they are given internally, without proper correctors, are poisonous; but, like the colchicum root, and some other of those caustic plants, when given with proper mixtures, and in proper doses, it proves a very valuable alexipharmic: externally it is of great service in cleansing foul ulcers.

CAMPANACEÆ, in *Botany*, an order of plants in the Fragmenta Methodi Naturalis of Linnæus.

CAMPANIAN *disease*, *Morbus campanus*, in *Antiquity*, is variously explained by modern writers. Some will have it only a sort of tubercles, or warts, on the face, to which the people of Campania were liable. Others maintain it to be the venereal disease; and hence draw an argument against the supposed novelty of that malady. Dacier will have it to be something still worse; the Campanians, it seems, were addicted to a sort of commerce too abominable to be named, *ære merigeri erant*. Whence it is, Plautus represents them as more pathic or passive than the Syrians themselves. Her. Sat. v. lib. i. ver. 62. cum not. Dacier.

CAMPANIFORMIS *flos*, in *Botany*, the term used for a flower resembling a bell in shape, and making the character of one of M. Tournefort's genuses. See BOTANY.

CAMPARCIUM. See CHAMPART.

CAMPANOLOGIA, from *campana*, *bell*, and λογος, *science*, the art or science of ringing of bells.

CAMPANULA, in *Botany*, the bell-flower, a genus of the *pentandria monogynia* class. Its characters are these: the flower is of one leaf, shaped like a bell, spreading at the base; in the bottom is situated a five-cornered nectarium, which is joined to the top of the receptacle; it hath five short stamina; below the receptacle is situated the angular germen; the empalement afterward becomes a roundish angular capsule, which in some species have three, in others five cells; each having a hole toward the top, through which the seeds are scattered when ripe. There are forty-three species.

The different sorts of this plant make beautiful ornaments for chimnies, and other places, being very tall, very much branched, and full of large and beautiful flowers, which retain their beauty a long time.

They are propagated by sowing their seeds in March, in a bed of light and unchanged soil, or by parting the roots; but the latter method, being the more expeditious, is most practised. Almost every slip, taken from the roots in September, and in March, will thrive; but the plants raised from seeds are seen to produce the finest flowers: they are very tedious, however, this way, being three or four years before they flower. They

should

should, therefore, be transplanted the September after their sowing into nursery-beds, which should be of a light soil and not wet; they should be set here at 6x inches square; and, in frosty weather, the whole beds should be covered with mats, which will greatly strengthen the roots. In the September of the third year, they should be removed into pots, and sheltered, during the severe weather, in glass frames; or else in wet weather, the pots must be turned sideways; and in very cold, they must be set under a warm wall, and covered with haum, and surrounded with a little thing on the outside of the pots, to preserve the roots from the frosts. These plants will often succeed without this care, but with it they produce their flowers in such beauty and plenty, as amply to reward it.

CAMPANULA *bifrondes*. See CONVOLVULUS.

CAMPANULATA cortex, in *Botany*, denotes bell-shaped *flowers*.

CAMPEACHY-WOOD, a *kind* of wood brought from Yucatan, a province in America, and used in dying.

The heart of the tree, which alone is used, is at first red; *after* it has been *felled* some time, it becomes black; and, if steeped in water, gives a black tincture, which may be used in writing.

It is very heavy, and burns admirably, and gives a clear lasting flame. See LOGWOOD.

Campeachy wood seems to be the same with what is otherwise called BRASIL. It takes the former denomination from the city Campeachy, about which it grows in greatest plenty.

CAMPESTRE, in *Antiquity*, a sort of cover for the privities, worn by the Romans soldiers in their field exercises; being girt under the navel, and hanging down to the knees.

The name is *supposed* to be formed from *campus*, the field or place where the Roman soldiers performed their exercises.

CAMPHOR, or CAMPHIRE, a vegetable, concrete, transparent, friable, inflammable, odoriferous, volatile substance, of an acrid, aromatic taste, easily soluble in spirit of wine; procured from a kind of laurel called *laurus camphorifera*, frequent in the islands of Borneo, and Japan, and the neighbouring mountainous coasts of India; resembling a walnut-tree. See BAY-*tree*.

The word comes from the Arabic *cafur*, or *cephur*; which signify the same thing.

All the parts of the tree are impregnated with *camphor*; but it is principally extracted from the roots by distillation. Newmann says, that it is obtained by distilling the roots, and sometimes the wood, and leaves, with water, in large iron pots, filled with earthen heads stuffed with straw: the *camphor* concretes among the straw in its crystalline form: this is called *rough camphor*, and looks like East Indian saltpetre, or common bay-salt. In this state it is imported into Europe, in canisters; and the Dutch take care that it comes all refined by sublimation, and prepared to our hands.

CAMPHOR, *manner of refining crude*. It is sublimed in low flat-bottomed glasses placed in sand: the *camphor* concretes, in the upper part of the belly of the glass, into a solid cake, which, after the vessel has been broke, is pared with a knife, and is the refined *camphor* of the shops. *Rough camphor* may be commodiously and effectually purified by distilling it in rectified spirit of wine: the spirit is recoverable by distillation, and the remaining *camphor* may be melted into a cake in the bottom of the vessel, or of another glass. Newmann's Chemical Works by Lewis, p. 316. 320.

Camphor is neither a salt nor a gum, since it is not soluble in water; nor is it a resin, since it does not yield by distillation either a phlegm, or oil, or an acid spirit, as all resins do; much less does it leave a *coal* or *caput mortuum* like those bodies. It totally vanishes and evaporates in the open air; in hot water it first runs and then evaporates; and in spirit of wine, or spirit of nitre, it wholly dissolves. It is no oil, because it is not unctuous to the touch, but is a firm, dry, crystallized matter; in its evaporation in the air, it leaves no remainder; and in close vessels over the fire, it rises entire without distillation, and appears at the top of the vessel in a dry form. It is subject to no separation of parts, and takes no empyreumatic smell; in mixing with concentrated spirit of nitre, it makes no ebullition, but placidly resolves into a sort of oil. This is extremely different from the effect of all vegetable oils, which are known to effervesce violently with this acid, and some even to take fire, and are finally converted by it into a dry resin. When broken, it appears bright, smooth, and saponaceous, but not unctuous to the touch; it consists of a copious inflammable principle, a small portion of water, and yet less of very fine and subtle earth, mixt intimately together. *Act. Eruditor.* 1727. p. 534.

The common ways of keeping it from evaporation, are by burying it in linseed, millet, pepper, or the like; but the rational way is, by keeping it from the external air; this is best done by wrapping it up in a paper or bladder, and then putting it into a leaden box, or an earthen or glass vessel set in a cool place. Or it may be preserved in large quantities, only by papering it up carefully, and putting it in wooden vessels in a cellar. Notwithstanding that it is a body so nicely and intimately combined in its own texture, yet it is ready of all vines for medicinal use; and as it is not easy to give it any preparation, so it needs none. In its natural state, it readily mixes with all oils and inflammable spirits, and this without fear of evaporation; it has no change of colour in solution with spirit of nitre, but, when dissolved with oil of vitriol, it becomes brown, and finally red; and if water be added to either of the solutions, the *camphor* is precipitated in its proper and solid form: it may, however, be absolutely dissolved, by long maceration, and frequent drawing over by the retort, with either of these menstruums.

Camphor has various uses in fire-works; in making varnish, which proves an excellent preservative of animal and vegetable bodies, as it resists worms and other insects. The substance of it also laid among cloaths, will preserve them from moths. In the courts of the eastern princes, it is burnt, together with wax, to illumine the night. It is exceedingly inflammable, so as to burn and preserve its flame in water; and in burning it consumes wholly, leaving no *feces* behind: but its principal use is in medicine.

Camphor is used in medicine as sedative and antiseptic: it succeeds well in many convulsions and other nervous affections. It is successfully used as a powerful antiseptic. The two medicinal preparations of *camphor*, in use now in the shops, are the solution of it in wine and in oils: the one called camphorated spirit of wine, the other oil of *camphor*.

The preparation of the first is by bare mixture, and requires no distillation, whether salt of tartar be or be not added to it.

The oil of *camphor* is either prepared by solution, or sublimation: the first is, either by dissolving *camphor* in the nitrous acid, or in some expressed vegetable oil, or by separating the oil which swims upon the surface of a strong solution of *camphor* in spirit of wine. To prepare the other, one part of *camphor* is to be mixed with three parts of bole Armenic, and put over the fire in a retort. The sublimed *camphor* is to be again mixed with fresh bole, and this to often repeated till no more *camphor* is found to be sublimed in the process; from this, the liquid matter, separated by distillation, is to be separated, and the oil preserved.

Camphor may also be dissolved in oil of turpentine, or mixed with Venice soap, and thus distilled, and, finally, rectified. All these oils are strongly antipruriantic, and therefore the *camphor*, in its natural state, is greatly preferable to them all. *Camphor* water, and the *flowers* of *camphor*, are also greatly inferior to the crude substance. When *camphor* is to be mixed with powders it should be gently moistened, in the rubbing, with spirit of wine; when it is to be mixed with aqueous menstruums, it should be rubbed with blanched almonds, or incorporated with the yolk of an egg.

Dr. Shaw recommends a mixture of nitre and *camphor*, as a quieter, indeed *opium*.

The learned Fr. Hoffman extols the virtues of *camphor*, given internally, as a most excellent discutient, resisting putrefactions, and as the chief alexipharmic. He adviseth it in malignant fevers, and in the venereal disease in inflammations he adds nitre. See his Dissertation, de *Camphora* Usu interno recordatione et præstantissimo.

Camphor is the most efficacious diaphoretic known: its great subtilty diffusing itself through the substance of the parts, almost as soon as the warmth of the stomach has let it in motion. It is used also in excess of the humors, as a detergent in wounds, to refill gangrene, &c. When mixed with the subtile parts of cantharides, it prevents their injuring the bladder: its exquisite fumes resisting it to follow them into all the meanders of the veins, and so thereby check aphrodisia.

Dr. Quincy observes, that *camphor* begins to be mixed, and that to good purpose, with mercurials, to guard against their stimulating properties, and to send them into the finest passages, to operate by fusion, and the force of impulse. For not only *nervina acria*, or calomel, may be hereby refrained from manifest operation in the glands about the mouth; but also the mineral turbith, which of itself acts very languidly by stool and vomit, when mixed with *camphor*, will be much less felt in those respects; and will go into the farthest circuit of motion, and promote the cutaneous discharge, in a more efficacious manner than any medicine of less specific gravity.

M. Le-

M. Lemery endeavoured at a chemical analysis of *camphor*, but in vain; either its parts were too fine and volatile to be carried to any greater degree of purity or subtilty by any chemical process; or it was owing to the close union of its principles, which led him to suspect that it must be an oil, and a volatile salt, that they could not be separated.

He found that *camphor* was heavier than spirit of wine, of the same specific gravity with oil of turpentine, and lighter than oil of olives. Mem. Acad. Paris, 1708.

Camphor, he observes, does not diffolve in aqueous or phlegmatic liquors, but in fulphureous ones it does; not in alkalines, nor even in fome acids, but in fpirit of nitre. It diffolves perfectly, and without commotion. This diffolution is ordinarily called oil of *camphor*; and it is to this the medicinal virtue of *camphor* in wounds, gangrenes, and caries, is afcribed. It is not taken internally, for fear of its fharpnefs and corrofivenefs; though M. Lemery has found good effects from two or three drops by the mouth, in obftructions and fits of the mother: in thefe cafes, indeed, he generally mixed it with as much oil of amber.

There is a common verfe to the difcredit of *camphor*, as if its fmell emafculated:

Camphora *per nares caftrat odore mares.*

But the proverb, according to Scaliger and Tulpius, is falfe.

Camphor, being boiled in *aqua vitæ*, in a clofe place, till the whole be evaporated; if a lighted torch or candle be introduced, the air in the whole place will immediately catch fire, and appear in a flame, without doing any damage to the place or fpectators.

It has been found in Ceylon, that the root of the tree which yields cinnamon, yields, by infition, a matter that has a ftrong fmell of *camphor*, and many of its virtues; whence naturalifts, by miftake, have fuppofed that all *camphor* came from that tree.

Modern chemifts have difcovered, that many aromatic plants, as thyme, rofemary, fage, and almoft all the labiated kinds yield a fubftance of the nature of *camphor*, which may be extracted, although in fmall quantities.

What is called *artificial camphor*, is prepared with gum fandarach, and white vinegar diftilled, kept twenty days in horfe-dung, and afterwards expofed a month to the fun to dry; or the end of which the *camphor* is found, in form of the cruft of a white loaf.—This is alfo called *juniper gum*, *white varnifh*, and *maftic*.

CAMPHOR-*julep*. See JULEP.

CAMPHORA, the *camphor-tree*, is a fpecies of the *laurus* or BAY, which grows naturally in Japan, and feveral parts of India. It is a tree of middling ftature, with oval, fpear-fhaped leaves, having three longitudinal veins which unite above the bafe. Thefe are male and female on different trees. The *camphor-tree* requires no artificial heat in winter, but will thrive very well in a warm, dry green-houfe.

CAMPHORATA, a medicinal plant, the *camphorofma* of Linnæus; called, in Englifh, ftinking ground-pine; reputed cephalic and nervine; though little ufed in the modern practice.

It takes the name from its fmell, which bears fome refemblance to that of camphor.

The *camphorata Montpelienfis*, growing by the road-fides in Languedoc, and efpecially about Montpelier, has been lately produced as a fpecific for the dropfy, and aſthma. Mr. Bartlet has given its hiſtory, analyſis, and an account of its virtues. A. D. S. an. 1703. p. 65. H. 55. For its characters fee CAMPHOROSMA.

CAMPHORATED, denotes a thing tinctured, or impregnated with CAMPHOR.

Spirit of wine *camphorated*, is a remedy frequently applied externally in cafes of inflammations, &c.

CAMPHOROSMA, in *Botany*, a genus of the *tetrandria monogynia* claſs: the calyx is pitcher-fhaped and indentedly three; there is no corolla; and the capſule contains a ſingle ſeed. There are four ſpecies. See CAMPHORATA.

CAMPICURSIO, in the *Ancient Military Art*, a march of armed men for ſeveral miles, from and back again to the camp, to inſtruct them in the military uſes. This exerciſe was nearly akin to the *decurſio*, from which it only differed, in that the latter was performed by horſemen, the former alſo by foot.

CAMPIDOCTORES, or CAMPIDUCTORES, in the *Roman Army*, were officers who inſtructed the ſoldiery in the diſcipline and exerciſes of war, and the art of handling their weapons to advantage. Theſe are alſo ſometimes called *campiones*, and *campidactores*.

CAMPIDUCTOR, in *Middle Age Writers*, ſignifies the leader or commander of an army, or party.

CAMPION, *Lychnis*, in *Botany*, a genus of the *decandria pentagynia* claſs. Its characters are theſe: the flower has five petals, whoſe tails are the length of the empalement. It has ten ſtamina, which are alternately ranged, and faſtened to the tails of the petals. In the centre is ſituated an almoſt oval pyramis: the empalement afterward becomes an oval capſule with one cell, opening with five valves, filled with roundiſh ſeeds. Linnæus enumerates ſeven, and Miller eight ſpecies of this plant, which, for the beauty of their flowers, are cultivated in our gardens; they are very hardy plants, and are eaſily propagated, either by parting the roots, or by the ſeed.

The roots ſhould be parted in the latter end of Auguſt, or beginning of September, and planted in a light dry ſoil.

If they are to be raiſed from ſeed, they ſhould be ſown in March upon a bed of light freſh earth, and in May the young plants ſhould be removed into another bed of the like earth, at about ſix inches diſtance from each other, and watered and ſhaded till they have taken root; after which they will require no farther care, but to be kept clear from weeds; at the end of the September following they may be removed, for the laſt time, into the borders where they are to ſtand, and they will flower in the June and July following; when, if their ſeeds are ſuffered to ripen, they will ſow themſelves, and come up without any farther trouble.

CAMPION, *wild*. See AGROSTEMA.

CAMPIPARS. See CHASSERET.

CAMPITÆ, in *Church Hiſtory*, an appellation given to the DONATISTS on account of their aſſembling in the fields for want of churches.

For a ſimilar reaſon, they were alſo denominated *Montenſes*, and *Rupitani*.

CAMPUSA, in *Botany*, a name given by Myreplus and others to the plant we call SCABIOUS.

CAMPODES, in *Botany*, a name given by Rivinus to a plant comprized by Linnæus under the genus of *ſonchus*, the *lerpidoles* of other authors. See CATERPILLARS.

CAMPUS, in *Antiquity*, a field or vacant plain in a city not built on, left vacant either upon account of ſhews, combats, exerciſes, or other uſes of the citizens.

CAMPUS *Aluii*, in *Antient Cuſtoms*, an anniverſary aſſembly of our anceſtors, held on May-day; where they confederated together for defence of the kingdom againſt all its enemies.

CAMPUS *Martius*, a large plain field in the ſuburbs of antient Rome, lying between the Quirinal and Capitoline mounts, and the Tyber; thus called becauſe conſecrated to the god Mars, and ſet apart for military ſports and exerciſes, to which the Roman youth were trained; as the uſe and handling of arms, and all manner of feats of activity.

Here the races were run, either with chariots or ſingle horſes; here alſo ſtood the *villa publica*, or palace for the reception of ambaſſadors, who were not permitted to enter the city. Many of the public *comitia* were held in the ſame field, part of which, for that purpoſe, was encloſed with rails.

The place was alſo nobly decorated with ſtatues, arches, columns, porticos, and the like ſtructures.

CAMPUS *Martius* is alſo uſed in a more general ſenſe by *Middle Age Writers*, for any large plain open place near a great city, wherein the inhabitants were trained to the exerciſe of arms. Of ſuch we find mention at Verona, Tyers, Dornic, and even Conſtantinople.

Among the French, *campus martius* was an appellation given to the yearly aſſemblies of the people called by the kings, either for enacting new laws, or deliberating on the great affairs of the nation. They were thus denominated, either becauſe uſually held in the month of March, or in imitation of the *campus martius* of the Romans, which was allotted for the like uſe. In after-times they were called *campus majus*, and, by corruption, *campus madius*, and *magius*, becauſe the time of holding them was altered by Pepin to the month of May.

Under the third line of kings, their aſſemblies took the denomination of ſtates general, *ſtati generales*.

CAMERIA *Scelerates*, a place without the walls of ancient Rome, where the Veſtals, who had violated their vow of virginity, were buried alive. Kennet.

CAMSHALL, a word uſed in Zetland, to denote the *os ſepiæ*, which is ſometimes found on the ſhores of that iſland. Phil. Tranſ. N° 473. ſect. 8. See CUTTLE-*fiſh bone*.

CAMURI, in *Ichthyology*, the name of a ſea-fiſh of the *lupus* or *baſſe* kind, common in the ſeas and large rivers of America. It grows to about two feet long, and a foot thick.

Its head is monſtrouſly large, and its mouth extremely wide; it has a large and ſtrong fin on its back, which is armed with ſharp prickles, and has a furrow in the back behind it, into which the fiſh can lay it down upon occaſion; its ſides are yellowiſh, and its belly white; its fins of a brownith yellow; and its ſide-lines, which run from the gills to the tail, broad and of a fine black. Willoughby.

CAMUS, probably derived from *καμπτω*, *I bend*, a perſon with a low, flat noſe, hollowed or ſunk in the middle. The Tartars are great admirers of *camus* beauties. Rubruquis obſerves, that the wife of the great Genghis Kan, a celebrated beauty, had only two holes for a noſe.

CAN, in *Sea Language*.—A pump's *can*, is a ſort of wooden jug or pitcher, wherewith ſeamen pour water into pumps to make them work.

CAN-*hoys*. See BUOY.

CAN *hook*, an inſtrument uſed to ſling a cask by the ends of the ſtaves: it conſiſts of a broad and flat hook fixed to each end of a ſhort rope, and the tackle which ſerves to hoiſt or lower it is faſtened to the middle of the rope.

CANADA *flag*, *Cornu Canadenſe*, the ſame with the *Virginian* DEER. See MOOSE.

CANAL, *Canalis*, in general, denotes a long, round, hollow inſtrument, through which a fluid matter may be conveyed.

In which ſenſe it amounts to the ſame with what we otherwiſe call a pipe, tube, channel, &c. Thus the *canal* of an aqueduct, is the part through which the water paſſes; which, in the ancient edifices of this kind, is lined with a coat of maſtic of a peculiar compoſition.

CANAL more particularly denotes a kind of artificial river, often furniſhed with locks and ſluices, and ſuſtained by banks or mounds. They are contrived for divers purpoſes; ſome for forming a communication between one place and another, as the *canal* between Bruges and Ghent, or between Bruſſels and Antwerp; others for the decoration of a garden, or houſe of pleaſure, as the *canals* of Verſailles, Fontainbleau, St. James's Park, &c. others are made for draining wet and marſhy lands; which laſt, however, are more properly called water-gangs, ditches, drains, &c.

Egypt is full of *canals*, dug to receive and diſtribute the waters of the Nile at the time of its inundation. They are dry the reſt of the year, except the *canal* of Joſeph, and four or five others, which may be ranked as conſiderable rivers.

There were alſo ſubterraneous *canals*, dug by an ancient king of Egypt, whereby thoſe lakes formed by the inundations of the Nile, were conveyed into the Mediterranean.

The *canal of Egypt*, for a communication between the Nile and the Red Sea, was begun, according to Herodotus, by Necus ſon of Pſammeticus, who deſiſted from the attempt on an anſwer from the oracle, after having loſt ſix ſcore thouſand men in the enterprize. It was reſumed and completed by Darius ſon of Hyſtaſpes, or, according to Diodorus and Strabo, by Ptoleiny Philadelphus; who relate, that Darius relinquiſhed the work on a repreſentation made to him by unſkilful engineers, that the Red Sea being higher than the land of Egypt, would overwhelm and drown the whole country. It was wide enough for two galleys to paſs a-breaſt; its length was four days ſailing. Diodorus adds, that it was alſo called *Ptolemy's river*; that this prince built a city at its mouth on the Red Sea, which he called *Arſinoe*, from the name of his favourite ſiſter; and that the *canal* might be either opened or ſhut, as occaſion required: policy probably had ſome ſhare in the diſuſe to which it afterwards fell. Died. Sic. Bibl. lib. i. Strab. Rer. Geog. lib. xvii. Herodot. Hiſt. lib. ii.

It ſeems to have been opened afreſh about the year 635, under the caliph Omar. Elmacin indeed ſays, that a new *canal* was then made for the conveyance of the corn of Egypt to Arabia; but this is more naturally underſtood of a renewal of the ancient one, the navigation of which, towards the decline of the Roman empire, had been much neglected. The ſame author adds, that it was ſtopped again on the ſide next the Red Sea by the caliph Abugidar Almanzor II. of the family of Abbas, in the year of the Hegira 150, anſwering to the year of Chriſt 775. There are ſome traces of it ſtill ſubſiſting: M. Boutier, in 1703, diſcovered the end which unites out of the moſt eaſterly branch of the Nile. Hiſt. Acad. Scienc. ann. 1703. p. 109, ſeq.

A new *canal* for conveying the waters of the Nile from Æthiopia into the Red Sea without paſſing into Egypt, was projected by Albuquerque, viceroy of India, for the Portugueſe, in order to render Egypt barren and unproſitable to the Turks.

M. Gaudereau attributes the frequency of the plague in Egypt, of late days, to the decay, or ſtopping up of theſe *canals*, which happened upon the Turks becoming maſters of the country.

In China, there is ſcarce a town or village but has the advantage either of an arm of the ſea, a navigable river, or a *canal*, by which inland navigation is rendered ſo common, that there are almoſt as many people on the water as the land.

The *great canal of China*, is one of the wonders of art, made about 800 years ago. It runs from north to ſouth quite croſs the empire; beginning at the city Canton. By it all kinds of foreign merchandize entered at that city are carried directly to Pekin, a diſtance of 825 miles. Its breadth and depth are ſufficient to carry barks of conſiderable burden, which are managed by ſails and maſts, as well as towed by hand. On this *canal* the emperor is ſaid to employ 10,000 ſhips, abating one, for a reaſon very peculiar. It paſſes through, or by, 41 large cities; there are in it 75 vaſt locks and ſluices to keep up the water, and paſs the barks and ſhips, where the ground will not admit of ſufficient depth of channel, beſides ſeveral thouſand draw and other bridges.

F. Magaillane aſſures us, there is a paſſage from one end of China to the other, the ſpace of 600 French leagues, always either by *canals* or rivers, except a ſingle day's journey by land, neceſſary to croſs a mountain; an advantage which this Jeſuit, who made the voyage himſelf, obſerves is not to be found in any other ſtate of the univerſe. Nouv. Relat. de Chine, chap. 8.

The *canal of Languedoc*, called alſo the *canal of the two ſeas*, as ſerving to join the Mediterranean and Cantabrian ſeas, was firſt propoſed under Francis I. but begun and finiſhed under Louis XIV. By means of it, a ready communication is made between the two fertile provinces of Guyenne and Languedoc. The *canal* is 64 leagues long, extended from Narbonne to Thouloſe, and receiving ſeveral little rivers in the way, ſupported at proper intervals with 104 ſluices. In ſome places it is conveyed over aqueducts and bridges of incredible height, built on purpoſe, which give paſſage underneath to other rivers. What is moſt extraordinary is, that in ſome places, for a mile together, a paſſage is dug for it through the rock. The expence was thirteen millions of livres, of which the king contributed near ſeven millions: the province of Languedoc the reſt.

The *canal of Briere*, called alſo *canal of Burgundy*, begun under Henry IV. and finiſhed in the reign of Lewis XIII. makes a communication between the Loire and the Seine, and ſo to Paris: to the great advantage of all this part of France, and even to Burgundy itſelf. This *canal* has 42 ſluices.

The *canal of Orleans* was begun in 1675, for eſtabliſhing a communication between the Seine and the Loire. It is conſiderably ſhorter than that of Briere, having only 20 ſluices.

The *canal of Bourbon* was but lately undertaken; its deſign being to make a communication from the river Oiſe to Paris.

The *new canal of the Lake Ladoga*, cut from Volkowa to the Neva, whereby a communication is made between the Baltic, or rather ocean, and the Caſpian ſea, was begun by the czar Peter I. 1719; by means of it, the Engliſh and Dutch merchandize is eaſily conveyed into Perſia, without being obliged to double the cape of Good Hope. There was a former *canal* of communication between the Ladoga lake and the river Wolga, whereby timber and other goods had been brought from Perſia to Peterſburgh; but the navigation of it was ſo dangerous, that a new one was undertaken.

In England, that ancient *canal* from the river Nyne, a little below Peterborough, to the River Witham, three miles below Lincoln; called by the modern inhabitants *Carrdike*; may be ranked among the monuments of the Roman grandeur, though it is now moſt of it filled up. It was 40 miles long; and ſo far as appears from the ruins, muſt have been very broad and deep; ſome authors take it for a Daniſh work. Morton will have it made under the emperor Domitian. Urns and medals have been diſcovered on the banks of this *canal*, which ſeem to confirm that opinion. Hiſt. Northampton. ch. 10.

The *canal* for ſupplying London with water by means of the New River, was undertaken and begun by Mr.

(afterwards

(afterwards Sir Hugh) Middleton, in the year 1608, and finished in five years. This *canal* commences near Ware, in Hertfordshire, and takes a course of 60 miles before it reaches the cistern at Illington, which supplies the several water-pipes that convey it to the city and parts adjacent. In some places it is 30 feet deep, and in others it is conveyed over a valley between two hills, by means of a trough supported by wooden arches, and rising above 23 feet in height. See *New River* COMPANY.

The *Duke of Bridgewater's canal*, projected and executed under the direction of Mr. Brindley, was begun soon after he had obtained an act for this purpose in 1759. It was first designed for conveying coals from a mine on his grace's estate to Manchester, but has since been applied to many other useful purposes of inland navigation. This *canal* begins at a place called Worsley-mill, about seven miles from Manchester, where the duke has cut a bason capable of holding all his boats, and a great body of water which serves as a reservoir or head to his navigation. The canal runs through a hill by a subterraneous passage, big enough for the admission of long flat bottomed boats, which are towed by a rail on each hand, near three quarters of a mile, to the coal-works. There the passage divides into two channels, one of which goes off 300 yards to the right, and the other as many to the left; and both may be continued at pleasure.

The passage is, in some places, cut through the solid rock, and in others, arched over with brick. Air-funnels, some of which are near 37 yards perpendicular, are cut, at certain distances, through the rock to the top of the hill. The arch at its entrance is about six feet wide, and about five feet high from the surface of the water; it widens within, so that in some places the boats may pass one another, and at the pits it is ten feet wide. When the boats are loaded and brought out of the bason, five or six of them are linked together and drawn along the *canal* by a single horse or two mules. The *canal* reaches Manchester in a course of nine miles; it is broad enough for the barges to pass or go abreast, and on one side there is a good road for the passage of the people, and the mules employed in the work. The *canal* is raised over public roads by means of arches, and it passes over the navigable river Irwell near fifty feet above it, so that large vessels in full sail pass under the *canal*, whilst the duke's barges are at the same time passing over them. This *canal* joins that which passes from the river Mersey towards the Trent, taking in the whole a course of 34 miles.

The Lancaster *canal* begins near Kendal, and terminates near Eccleston, comprehending the distance of 72½ miles.

The *canal* from Liverpool to Leeds is 108½ miles; that from Leeds to Selby, 23½ miles; from Chester to Middlewich, 26½ miles; from the Trent to the Mersey, 88 miles; from the Trent to the Severn, 46½ miles. The Birmingham *canal* joins this near Wolverhampton, and is 24½ miles: the Droitwich *canal* is 5½ miles: the Coventry *canal*, commencing near Litchfield, and joining that of the Trent, is 36½ miles: the Oxford *canal* breaks off from this, and is 82 miles. The Chesterfield *canal* joins the Trent near Gainsborough, and is 44 miles.

A communication is now formed, by means of this inland navigation, between Kendal and London, by way of Oxford; between Liverpool and Hull, by the way of Leeds; and between the Briftol channel and the Humber, by the junction formed between the Trent and the Severn. Other fchemes have been projected, which the preſent ſpirit of improvement will probably ſoon carry into execution, of opening a communication between the German and Iriſh ſeas, ſo as to reduce a hazardous navigation of more than 800 miles by ſea, into a little more than 120 miles by land; and alſo of joining the Iſis with the Severn.

There are many obvious advantages which accrue from theſe inland navigations. By diminiſhing the price of carriage, and facilitating the communication between remote parts of the country, they greatly conduce to the improvement and extenſion of our manufactures and commerce. They likewiſe tend, in a variety of ways, to advance and perpetuate the value of eſtates near which they paſs, by the eaſe with which manure may be procured, by the eſtabliſhment of manufactures, and by the cheap conveyance of their produce to large towns and ſea-ports: not to add, that they ſerve as drains for moiſt lands, and that they furniſh a ſupply of water for thoſe that are dry. And beſides, navigable *canals* give employment to the induſtrious labourer, as well as the ingenious artiſan.

We alſo read of divers projects and undertakings of *canals*, which were never atchieved. Demetrius Poliorcetes, Julius Cæſar, the emperors Caligula and Nero, attempted in vain to cut through the iſthmus, whereby Peloponneſus is joined to the reſt of Greece, and make a *canal* of communication between the Ionian and Ægean ſeas. Plin. Nat. Hiſt. lib. iv. cap. 4.

Seleucus Nicanor had a deſign to make a *canal* between the Euxine and Caſpian ſeas. Lucius Verus, who commanded the Roman army in Gaul under Nero, attempted to make a *canal* between the Moſelle and the Rhine.

The Spaniards have ſeveral times had in view the digging of a *canal* through the iſthmus of Darien, from Panama to Nombre de Dios, to make a ready communication between the Atlantic and the South ſea, and thus afford a ſtraight paſſage to China and the Eaſt Indies.

CANAL is alſo applied to the furrows on the face of, or underneath a LARMIER; ſometimes alſo called porticos; and fitted up with reeds or flowers: ſometimes to thoſe cavities, ſtraight or winding, made on the cauliculos of a capital. See SOFFITA.

CANALS are alſo uſed for the flutings of a column or pilaſter.

CANAL *of the volute*, in the Ionic capital, is the face of the circumvolutions, incloſed by a liſtel.

CANAL, *Canalis*, in *Anatomy*, a duct, or paſſage, through which any of the juices, or fluids of the body flow.

Under *canals* are included all kinds of veſſels, as arteries, veins, nerves, &c. See ARTERY, VEIN, &c.

The hole or perforation through the *vertebræ* of the neck whereby the ſpinal marrow communicates with the brain, is by ſome called the ſacred or great *canal*, *ſupra* *vide*.

CANALES *ſemicirculares*, in *Anatomy*, are three *canals* in the labyrinth of the ear; which open by as many orifices into the *veſtibulum*.

They are of three different ſizes, *major*, *minor*, and *minimus*. In different ſubjects they are frequently different, but are always alike in the ſame: the reaſon Valſalva ingeniouſly conjectures to be, that as a part of the tender auditory nerve is lodged in theſe *canals*, ſo they are of three ſeveral ſizes, the better to ſuit all the variety of tones; ſome of the *canals* ſuiting ſome tones, and others others. And though there be ſome difference in the form and ſize of theſe *canals* in different perſons; yet, laſt there ſhould be any diſcord in the auditory organs, theſe *canals* are always in exact conformity to one another, in the ſame man.

CANALICUM *aurum*, or CANALIENSE, that gold which is dug out of mines, or veins under ground.

CANALICULATE *leaf*, among *Botaniſts*. See LEAF.

CANALICULATE *ſtalk*. See STALK.

CANALIS is uſed by *Surgeons* for an oblong, concave inſtrument, in which to put a broken limb, leg or thigh. It is made either of braſs, wood, or earthen ware, ſometimes even of ſtraw fitted with linen cloth.

CANALIS, or CANALICULUS *arteriosus*, in *Anatomy*, a veſſel, obſerved in *fœtuſes*, but which after delivery, grows uſeleſs, and diſappears. It is a little tube, which joining the pulmonary artery and aorta, ſerves to convey the blood out of one into the other, without paſſing through the lungs. See FOETUS.

Dr. Agricola deſcribes a valve at the entry of the *canalis arteriosus* into the *aorta deſcendens*, compoſed of four ſides. Two of them prevent its being thruſt till after birth, and the other two prevent its being thruſt off from the orifice of the *canalis arteriosus*.

There have been ſome diſputes between Meſſieurs Mery, Buiſſiere, Rohault, and others, about the real uſe of the *canalis arteriosus*, as well as of the FORAMEN *ovale*.

CANALIS *naſalis*, a kind of ſulcus or furrow formed in the *oſſa unguis* and *maxillaria*, whereby a mucous humour is conveyed from the *puncta lachrymalia* to the noſe.

CANALIS *cysticus*, a duct in the liver of a fœtus, whereby a communication is maintained between the porta and cava; which, becoming uſeleſs after the birth, gradually dries up. Drake and Heiſter.

CANALIS, in *Zoology*. See TUBULUS *marinus*.

CANARIA *herba*, in *Botany*, a name given by the ancient Romans ſometimes to the rough fruit of the common agarine or chives, and ſometimes to the plant itſelf. Pliny calls this plant *ſuppa* and *ſuppago*; and the fruit of it, *ſuppæ bubrix*, *ſuppæ canarinæ*, and *ſuppæ caninæ*.

CANARIES, in *Muſic*, an old Engliſh air, having a ſprightly movement of two ſtrains, with eight bars in each; and three quavers in a bar: the firſt pointed.

CANARIUM, from *canis*, *dog*, in *Antiquity*, a Roman ſacrifice, wherein dogs of a red or ruddy colour were ſacrificed, for a ſecurity of the fruits of the earth againſt the raging heats, and diſorders of Sirius in the dog-days.

CANARIUM, in *Botany*, a genus of the *decia pentandria* claſs: its characters are, that it hath male and female flowers; that, in both, the calyx has two leaves, and the corolla conſiſts of three petals: the fruit is a drupe with a three-cornered nut. There is one ſpecies.

CANARY-*bird*, *Paſſer Canarienſis*, a ſpecies of ſinging birds, greeniſh yellow in colour, formerly brought only from

from the *Canary* islands, but of late chiefly from Germany and Switzerland; which laft, called alfo German birds are preferred to the former. The chief place for breeding *Canary-birds* is Infpruck and its environs, from whence they are fent to Conftantinople, as well as every part of Europe. They are a fpecies of the *fringilla*.

Canary-birds are diftinguifhed by different names at different times and ages: fuch as are about three years old are called *runts*; thofe above two, are named *eerfts*; thofe of the firft year under the care of the old ones, are termed *brunchers*; thofe that are new-ftown, and cannot feed themfelves, *pofers*; and thofe brought up by hand, *neftlings*.

The *Canary-birds* may be bred with us, and, if treated with proper care, they will become as vigorous and healthful as in the country from whence they have their name. The cages in which thefe birds are kept are to be made of either walnut-tree or oak, with bars of wire, becaufe thefe, being woods of ftrength, do not require to be ufed in large pieces. The common fhape of cages, which are cylindric, is very improper for thefe birds; for this allows little room to walk, and without that the birds ufually become melancholy. The moft proper of all fhapes is the high and long, but narrow.

If thefe birds eat too much, they grow over fat, lofe their fhape, and their finging is fpoiled; or at leaft they become fo idle that they will fcarce ever fing. In this cafe their victuals is to be given them in a much fmaller quantity, and they will by this means be recovered by degrees, to all their beauty, and will fing as at firft.

At the time that they are about to build their nefts, there muft be put into their cages fome hay, dried thoroughly in the fun: with this muft be mixed fome mofs dried in the fame manner, and fome dog's hair; and great care is to be taken of breeding the young, in the article of food. As foon as the young birds are eight days old, or fomewhat more, and are able to eat and pick up food of themfelves, they are to be taken out of the cage in which they were hatched, and each put feparately into another cage, and hung up in a room where it may never have an opportunity of hearing the voice of any other bird. After they have been kept thus about eight days, they are to be excited to fing by a bird pipe; but this is not to be blowed too much, or in too ſhrill a manner, leſt they fing themſelves to death.

For the firſt fifteen days the cages are to be covered with a black cloth, and for the fifteen days following with a green one. Five leſſons in a day from the pipe are ſufficient for theſe young creatures; and they muſt not be diſturbed with ſeveral ſounds at the ſame time, leſt they confound and puzzle them: two leſſons ſhould be given them early in the morning, one about the middle of the day, and two more at night.

The genius and temper of the ſeveral birds of this kind are very different. The males are almoſt always melancholy, and will not ſing unleſs they are excited to it by hearing others continually ſinging about them. The male bird of this kind will often murder the female put to him for breeding; and when there are ſeveral females together with the males, they will often do the ſame to one another from jealouſy. It is therefore not eaſy to manage the article of their breeding well in this particular, unleſs in this manner; let two female birds be put into one cage, and when they have lived together ſome time, they will have contracted a ſort of love for one another, which will not eaſily be diſſolved. Put a male bird into the cage with theſe two, and every thing will go well: their friendſhip will keep them from quarrelling about his favours, and from danger of his miſchievous diſpoſition; for if he attacks one of them, in order to kill her, the other will immediately take her part; and, after a few of theſe battles, the male will find that they are together an overmatch for him at fighting, and will then diſtribute his favours to them, and there will not fail of being a young breed or two, which are to be taken away from their parents, and educated as before directed. Some males watch the time of the female's laying, and devour the eggs as faſt as ſhe depoſits them; and others take the young ones in their beak, as ſoon as hatched, and cruſh them to death againſt the ſides of the cage, or ſome other way deſtroy them. When a male has been known once to have been guilty of this, he is to be ſhut up in a ſmall cage, in the middle of the large one in which the female is breeding her young, and thus he will often comfort her with ſinging all day long, while ſhe ſits upon the eggs or takes care of the young ones: and when the time of taking away, to put them into ſeparate cages, is come, the male is to be let out, and he will always after this live in friendſhip with the female.

If the male become ſick during the time of the female's ſitting or bringing up her young, he muſt be removed immediately, and only brought to the ſide of her cage at certain times, that ſhe may ſee him, till he is perfectly cured; and then he is to be ſhut up again in his cage in the middle.

Canary-birds are various in their notes: ſome having a ſweet ſong, others a lowiſh note, others a long ſong, which is beſt, as having the greateſt variety of notes: but they ſing chiefly, either the titlark, or nightingale notes. *See Song of birds.*

CANARY *grafs*. See PHALARIS.

CANARY-*weed*. See ARCHIL.

CANAYTE CANNELLE, a name given by the Ceyloneſe to a peculiar kind of cinnamon growing in that iſland: this is eſteemed the ſecond kind in value, and the name they give to it ſignifies bitter and ſtringent cinnamon. The bark of this kind of cinnamon tree comes off very eaſily, and is of a very fragrant ſmell when freſh; but it has a bitter taſte. It is not very common in the iſland, and is not eaſily diſtinguiſhed on the tree from the beſt cinnamon. The trees which yield the eight different kinds of cinnamon, ſo very various in flavour and virtue, are all ſo like one another, that it requires a great deal of attention to diſtinguiſh them. The root of this kind of cinnamon-tree yields a very fine ſort of camphor. Phil. Tranſ. N° 469.

CANAVAY, in *Natural Hiſtory*, a name given by the inhabitants of the Philippine iſlands to a ſea-bird which is deſcribed as being of the bigneſs of a pigeon, and laying its eggs on the naked rocks, where it ſits and hatches them. Some ſuppoſe this bird no other than the common King fiſher. But this is ſcarce probable; as we have no account of its being very beautifully coloured; and this is a circumſtance which can hardly have eſcaped thoſe who mentioned it, being ſo very remarkable. It is much more probably ſome ſea-bird wholly unknown in this part of the world.

CANCAMUM, in the *Materia Medica*, a name given by the Greeks to a gum or reſin, and continued down to the preſent age, though not without ſome uncertainty in its ſignification. The Arabian writers in general have looked on the word *cancamum* as a ſynonymous term for gum lac, which the Greeks have called *lacuna* and *lacha*, and Avicenna, *lech*.

CANCELIER, in *Falconry*, is when a light flown hawk, in her ſtooping, turns two or three times upon the wing, to recover herſelf before ſhe ſeizes.

CANCELLARIUS, in *Antiquity*. See CHANCELLOR.

CANCELLI, in *Building*, lattices, or a ſort of windows made with croſs bars of wood or iron chequer-wiſe.

The term is alſo applied to the balluſters and rails which compaſs a court of juſtice, a communion table, or the like.

CANCELLI, in a *Military* ſenſe, the ſame with BARRIER.

CANCELLING, in the *Civil Law*, an act whereby ſome former deed is rendered null, and void. This is otherwiſe called *reſciſſion*.

The word comes from the Latin *cancellare*, *to encompaſs*, or *paleſade*.

To the proper ſenſe of the word, *to cancel*, is to deface an obligation, by paſſing the pen from top to bottom, or acroſs it; which makes a kind of chequer lattice, which the Latins call *cancelli*.

CANCELLUS, in *Ichthyology*, the *wrong boir*, is a very ſmall ſpecies of CRAY-*fiſh*, which the French call *bernit*, or *St. Bernard the bernit*, becauſe it ſhuns others, and retires into the firſt ſhell it meets with. Its body is ſomewhat long, but in general, much reſembling a ſpider, except that it is a little thicker. It is found in the ſhore near rocks, enclofed commonly in a ſhell as big as a nut, of a conic figure, thick, very hard, ragged, furrowed, and grey without-ſide, but ſmooth and white within. This ſhell is ſo well adapted to the animal, that it is a hard matter to force it out of its enclofure. Some wafh it, drefs it, and eat it. It contains abundance of volatile ſalt; is aperitive, and good for the ſtone. The oil prepared from it is brought from America, and is uſed for the rheumatiſm.

In the American iſlands they find a much larger ſpecies of this animal, being three or four inches long. It is called the *ſoldier*, becauſe it purſues and fortifies itſelf in a ſhell which it ſets its own. Its naturel ſhell leaving its hinder parts naked, it employs itſelf, as ſoon as it is there, enough, in ſearching out another which may be proportioned to its ſize; into which it ſhuts its hind parts and adjuſts itſelf. But as it grows larger, and finds itſelf confined, it is obliged from time to time to go in ſearch of others; and it is good direction for the curious, to obſerve how he ſtops at all the ſhells he meets with, to conſider them, and when he finds one fit for his purpoſe, how he quits his own, and with great precipitation crouds into his new tenement, as if he was aſhamed of being naked; and if two of theſe animals are engaged at the ſame time, to enter the ſame ſhell, they fight until the weakeſt gives way.

The inhabitants fish for them, string them up by the head, and expose them to the sun, which dissolves them all but the solid parts; which dissolved substance or oil is esteemed excellent for rheumatisms, to which the savages are very subject.

CANCER, in *Astronomy*, one of the twelve signs of the zodiac; ordinarily represented on the globe in form of a crab, and in astronomical books denoted by a figure much resembling that of the number sixty-nine; thus, ♋. The reason generally assigned for its name as well as figure, is a supposed resemblance which the sun's motion in this sign bears to that of the crab-fish. As the latter walks backwards, so the former in this part of his course begins to go backwards, or recede from us, though the disposition of stars in this sign is by others supposed to have given the first hint to the representation of a crab. The stars in the sign *Cancer*, Ptolemy makes 13; Tycho 15; Bayer and Hevelius, 29; Mr. Flamsteed, no less than 83. Their orders, names, places, longitude, latitude, magnitude, &c. in the Britannic Catalogue, are as follow:

CANCER, *tropic of*, in *Astronomy*, a lesser circle of the sphere parallel to the equator, and passing through the beginning of the sign *Cancer*. See TROPICS.

CANCER, in *Ichthyology*. See CRAB, and SQUILLA.

CANCER, in *Medicine*, a roundish, hard, ragged, immoveable tumor, of an ash or livid colour, encompassed round with branched turgid veins, full of black foul blood; situate chiefly in the glandulous parts: so called, as some will have it, from the resemblance which the turgid veins shooting from it bear in figure to the crab-fish; or, as others say, because like that fish, when once it has got hold, it is scarce possible to drive it away. A *cancer* differs from a *fistula*, in that the latter is without pain. See SCIRRHUS.

Cancers also differ from those called simply *cancerous ulcers*, or tumors, which, though of a like general nature, vary in many circumstances.

Cancers appear with such a diversity, that it seems impossible to give a definition which shall agree to all. Some have a round, unequal, livid, painful hardness; others are flat without lividity, and sometimes indolent. The variety arises chiefly from their size, and the different parts they are seated in: as the breast, womb, lips, nose, eyes, ears, &c. Phil. Trans. N° 260. p. 476.

Some restrain *cancer* to those on women's breasts, which alone exhibit the appearance of crabs; and give the name *carcinoma*, and *cancer ulcer*, to those on the other parts.

It begins without any pain, and appears, at first, like a chich-pea; but grows apace, and soon becomes very painful. The *cancer* arises principally on the lax glandulous parts, as the breasts and emunctories; it is most frequent in women, especially such, says Stoberiath, as are barren, or live single. The reason of its appearing in the breasts more than other parts, is, that being full of glands, with lymphatics and blood-vessels, among them, the smallest contusion, compression, or punction, extravasates those liquors; which growing, by degrees, acrimonious, form the *cancer*. Hence it is said that a *cancer* is that in the glands, which a caries is in the bones, and a gangrene in the fleshy parts. The *cancer*, however, is sometimes found in other soft, spongy parts of the body; and there have been some found in the gums, belly, neck of the matrix, ureter, lips, nose, cheeks, abdomen, thighs, and even the shoulders.

A *cancer* arising on the legs, is called a *lupus*; on the face, or nose, a NOLI *me tangere*.

Cancers are divided, according to their several stages, into *occult*, and *open* or ulcerated.

Cancers, occult, are those not arrived at their state, or not yet broke.

It is a famous aphorism, that occult *cancers* are better uncured than cured; and that the patient will live longer with them than without them. Hippoc. Aphor. 38. 56. But physicians are not to be deterred by an old aphorism; they attempt not only a palliative, but a radical cure: the former partly by externals of the narcotic kind, to allay the pain, and hinder the spreading of the *cancer*; partly by internals, the chief of which are the *diaphoreticum Poterii*, martials, several preparations of earth-worms, and tincture of antimony, but especially the juice of the *solanum lethale*, which is a topic of great fame for the palliative cure of *cancers*. It was the great secret of Percival Willoughby.

Gendron improves it by the addition of *saccharum saturni*. The true cure of *cancers*, according to this writer, is either by exsection or amputation of the part, or by the application of cauterics. The former may be used where the tumor is moveable, and its base terminates abruptly, does not adhere to the adjacent parts, and consequently has sent no filaments to the same; as is the case in all *cancers* arising from scirrhous or scrophulous tumors. But the true *cancers*, he observes, are seldom extirpated with success; and the operation would be less in repute, if scirrhi, strumæ, and other similar tumors, were not frequently mistaken for *cancers*. Phil. Trans. N° 480.

Cancers, *ulcerated*, are known by their roughness and fulness of holes, through which ooses a filthy, stinking, gluttinous matter, frequently yellowish; by their pungent pain, which resembles the pricking with a thousand pins; and by their blackness; the swelling of the lips of the ulcer; and the veins about it, which are blackish, tumid, and varicous.

Sometimes the extremities of the blood-vessels are gnawed off, and the blood issues out. In a *cancer* of the breast, the adjacent flesh is sometimes so consumed, that one may see into the cavity of the thorax. It occasions a slow fever, a loathing, oftentimes faintings, sometimes a dropsy, and lastly death.

The generality of authors ascribe the cause of *cancers* to an acid ferment which first coagulates the juices in the glands, and afterwards corrodes and ulcerates the part. Gendron, refuting this theory, substitutes another; *the cancer*, according to him, is not a disease of the fluids, but of the solids. It arises from a disorder of the lymphatic and excretory vessels of the glands, which becoming by some accident impervious, and ceasing to filtrate and convey their liquors, by degrees degenerate into a compact horny mass, capable of germination and ulceration. What seems to confirm this origin is, that in grown *cancers* there is always found a hard callous substance not unlike horn, with blood-vessels disseminated through it, which yet are smaller and narrower than before the formation of the hardness. This callosity is found in cutaneous *cancers*, though it there extends itself in a different manner, appearing at first like a small wart, from which spring cutaneous filaments. When the ulceration has made some progress, these appear like pinheads in the flesh, which are no other than the extremities of the filaments. This substance, always found in true *cancers*, according to M Gendron, is the *cancer* itself, formed by the transmutation of the glandular and lymphatic vessels. On this principle he resolves the spreading of a *cancer* into a vegetation performed by the conveyance of the nutritious juices through the ramifications of the tumor, as through horns, nails, or the like substances. The pain proceeds from the compression of the nervous parts, as that in corns, and the lividity from the obstruction of the blood; not as commonly supposed from a caustic salt, which would soon cause an eschar. Genil. Hecherch. sur la Nat. &c. des *Cancers*, cap. 3. *Act. Erud. Lipf.* an. 1701.

The *cancer* is one of those diseases for which no competent remedy has been yet found, nor even when taken early or in its occult state. The most that medicine can do is to palliate, or keep it back by diet and general remedies. La Clerc, Treat. Chir. Operat. chap. viii. p. 198, fen. where the operation of cutting off a cancerous breast is described.

However, in the Memoirs of the Royal Academy of Sciences, mention is made of the radical cure of three inveterate *cancers*, by an infusion of the leaves of plumbago in olive oil; these *cancers* had been deemed incurable, by reason of their adherence to bony parts. Mem. Acad. Sc. 1739.

Cancers are sometimes internal. We have histories of two such in the Philosophical Transactions, from which Dr. Barrien endeavours to deduce the diagnostics of a *cancer* within the abdomen. N° 464.

Cancers, *to prevent*. When there is danger of an approaching *cancer*, the acrimony of the blood is, if possible, to be corrected by the use both of internal and external remedies, and a strict regimen in regard to diet is to be observed. Broths and soups made of the flesh of young animals, and with proper herbs boiled in them, as forrel, cresses and the others of that tribe, are very beneficial in these cases; the most wholesome drink is either fair water, or a decoction of China root, or sarsaparilla, or the like; and when the pains are violent from the scirrhus, which is now threatening to become a *cancer*, white poppy seeds may be added in considerable quantities to the decoction, and it may be sweetened with a proper quantity of syrup of diacodium. Two or three times a day also should be taken a dose of Gascoigne's powder, salt of wormwood, native cinnabar, crude and diaphoretic antimony; adding to each dose, as there shall be occasion, half a grain of laudanum, to assuage the violence of the pain. Great benefit is also sometimes received in this case by taking either the powder or juice of millepedes, with spermaceti.

Purges also of the mercurial kind frequently do great service, as do also bleeding and cupping frequently in the spring and autumn. A thin plate of lead well impregnated with quicksilver may also be very conveniently worn on the part with great advantage; for this method cannot but weaken the sense of pain, and may often prevent a *cancer*.

If the application of the plate of lead shall prove insufficient, plasters and ointments composed of such ingredients as are known to assuage pains may also be applied; the following are of this kind, and are frequently found of service. Take of the *unguentum diapompholygos*, two ounces; of opium, half a scruple; mix these into an ointment, and frequently rub the part affected with it; or take of an amalgama of quicksilver and lead two ounces; mix this with a sufficient quantity of ointment of roses, or any the like unguent; then spread a part of it on a linen rag, and apply it in the manner of a plaster to the part: or take litharge vinegar, an ounce; expressed oil of henbane seeds, poppy seeds, and the infused oil of roses, of each two ounces; mix them by a long and continued stirring together into an ointment, adding toward the end of the operation purified opium from six to ten grains, as the urgency of the symptoms may require; this is to be spread in like manner on linen rags, and applied at times to the part.

If the daubing of these ointments is disliked, a refrigerant plaster may be used in their stead; such is the lead plaster of Myrtychi, and plasters of red lead, or pompholyx, or the excellent plaster made by the following prescription: take of the fresh and depurated juices of henbane, garden-poppy, and water-hemlock, of each four ounces; boil these to a thickness over a gentle fire, adding toward the end of the boiling eight ounces of white wax, and one ounce of oil of roses, and make the whole into a plaister: or take of sugar of lead, of cerusse, of the amalgamation of quicksilver and lead, and of the expressed oil of henbane seed, and infused oil of roses, of each two ounces; make these into a plaster. If the pains are very violent, a small quantity of opium may be added to either of these plasters. Hrister's Surg. 223. Soultzer, physician to the duke of Saxe-Gotha, after observing that an effectual cure for a *cancer* is still among the *desiderata* of physic, and that mercury, antimony, and all alteratives, as well as the *belladona* and *cicuta*, have generally failed, recommends the following poultice: take carrots fresh gathered, and reduce them to a coarse powder; squeeze out the juice, and warm the pulp, and apply it in the form of a thick poultice, so that it may touch the ulcers in every part; and let the whole be covered with a warm napkin. The dressing must be renewed twice in every four hours, and the ulcers cleaned with lint dipped in a warm decoction of hemlock. This application, he says, will abate the pain, take away the loathsome smell, diminish the suppuration, and produce the discharge of a laudable pus; by continuing the use of it, the callous edges of the ulcers will be softened, the tumor diminish, and at length disappear; new flesh will be gathered, a cicatrix will be formed, and the cure completed. The extract of hemlock may be safely administered at the same time. See an account of the effects of the *cicuta* and a carrot-poultice upon a *cancer* of the breast, in the Med. Obs. and Inq. vol. iv. art. 31. The *sanies* of a *cancer*, when the carrot-poultice has failed, has been sweetened by *fixed air*, applied externally, the pain mitigated, and a better digestion produced. Dr. Percival remarks, from repeated trials, that the progress of *cancers* seems to be checked by the fixed air; but, he adds, it is to be feared, that a cure cannot thus be effected. Priestley on Air, vol. i. Appendix, p. 302.

Cancer, in a more vague sense, is extended to all ulcers disposed to putridity.

Such are the most inveterate, malignant, cavernous, sinuous, varicous, and colliquative ulcers. The Arabs call the *elephantiasis* the universal *cancer*. Celsus even ranks the gangrene and sphacelus in the class of *cancers*. Others include the caries of bones in the number. Ephem. Acad. N. C. dec. 1. an. 1. p. 8.

Cancers, primitive, are those which come of themselves, appearing at first about the bigness of a pea, and only painful at intervals; but growing bigger, and more troublesome by degrees.

Cancers, *degenerate*, are those which succeed obstinate, ill-managed tumors, or impostumes. These commence ulcerated *cancers*, without ever having been occult ones.

Cancer *album*, the white *canker*, is used by French writers for a white chalky excrement, sometimes found adhering to the tongue, and internal parts of the mouths of children, and which, unless timely brushed away, is apt to ulcerate.

In which ſenſe, it ſeems to amount to the ſame with APHTHÆ.

CANCER is alſo applied to a ſpecies of BANDAGE for the head, and divided into ſeveral parts, reſembling the legs of a crab-fiſh.

CANCER, in the *Military Art*. See ARIES.

CANCRIFORM, *Cancriformis*, the ſame with *cancroides*, or *cancerous*.

Wedelius has a diſcourſe of hard rebellious *cancriform* tumors. Ephem. Acad. N. C. dec. 3. an. 1. obſ. 12.

CANCRINE *verſes*, the ſame with RETROGRADE.

CANCROMA, in *Ornithology*, a genus of birds of the order of *grallæ*; having a gibbous beak, and the upper jaw in the form of a boat turned upwards. Linnæus reckons two ſpecies, the *cochlearia*, and the *cancrophaga*; the former is found in Guiana, and the latter in the Braſils.

CANDELARES, in *Botany*, an order of plants in the Fragmenta Methodi Naturalis of Linnæus.

CANDELARIA, in *Botany*, a name by which ſome authors have called the great white MULLEIN.

CANDELARIA, in *Entomology*, is a ſpecies of inſect, belonging to the genus of *fulgora*, and order of *hemiptera* in the Linnæan ſyſtem. It is common in China.

CANDERROO, in the *Materia Medica*, a name of an Eaſt Indian gum, not much known among us, though ſometimes imported. It has much the appearance of common amber, only that it wants its yellow colour, being white and pellucid; we ſometimes ſee it turned into toys of various kinds, which are very light, and of a good poliſh. Garcias and ſome other authors tell us, that the people of Borneo, and ſome other places where camphor is produced, have the art of adulterating the crude camphor, which they ſend over to us, with large quantities of this gum.

CANDIDATE, a perſon who ſets up for ſome poſt or place, either of honour or profit.

The word is formed of *candidus*, *white*; on account of a white ſhining garment, *toga candida*, which in thoſe who aſpired to preferments in ancient Rome, were habited at the time of their appearing for the ſame, eſpecially at the public aſſemblies, in order to diſtinguiſh them from the croud.

The white gown worn by *candidates* was looſe and ungirded, nor was there any cloſe garment under it, which ſome interpret as done with deſign to avoid any ſuſpicion people might have of bribery; though Plutarch rather thinks it done to gain the affections of the people, by ſuing in ſuch an humble garb; or elſe that ſuch as had received wounds in the ſervice of the country, might more eaſily demonſtrate thoſe tokens of their courage and fidelity.

The Roman *candidates* uſually declared their pretenſions a year before the time of election, which was ſpent in making intereſt and gaining friends. Various arts of popularity were practiſed for this purpoſe, and frequent circuits made round the city, and viſits and compliments to all ſorts of perſons, the proceſs of which formed what was called AMBITUS.

CANDIDATI *principis*, were thoſe who were recommended to any offices by the emperors. Alſo an office in the court of the emperor of Conſtantinople, anſwering to a ſecretary of ſtate among us.

The *candidatus principis* was alſo denominated *Quæſtor principis*, or *Auguſti*.

CANDIDATE *of baptiſm*, in the *Ancient Church*, was called CATECHUMEN.

CANDIDATES, in the COLLEGE *of Phyſicians*, London, is the order of members, out of whom the fellows are choſen. The *candidates* muſt be natives of England, doctors of phyſic, admitted to the degree in our own univerſities, and ought to have practiſed phyſic four years before they are admitted into the order. The number of *candidates* is never to exceed twelve.

CANDIDATE, in *Academical Orders* or *Degrees*, denotes a perſon to whom, after full examination, and the performance of inaugural exerciſes, licence is granted to take up the higheſt or doctoral dignity when he pleaſes. See DEGREE, DOCTOR, LICENTIATE, &c.

CANDIDATI *milites*, were an order of ſoldiers of tall ſtature, who ſerved as the emperor's body-guards, to defend him in fight. They were thus denominated, becauſe clothed in white, either that they might be the more conſpicuous, and their actions more taken notice of, or becauſe they were conſidered as in the way to higher preferments. Cedrenus obſerves, that it was the younger Gordian who inſtituted the *candidati*, as alſo the *protectores* and *ſcholares*. The *ſcholares* were choſen out of the troops, and conſiſted of perſons who beſt underſtood the art of war; and out of theſe *ſcholares* were choſen the *candidati*, who were ſuch as were talleſt and ſtrongeſt, and had moſt of the martial air, and were proper to inſpire terror, ſays the Chronicon of Alexandria. The *protectores* were a middle order.

CANDLE, a cotton or linen wick, looſely twiſted, and covered with tallow, wax, or ſpermaceti, in a cylindrical figure; which being lighted at the end, ſerves to illuminate a place in the abſence of the ſun.

The word *candle* comes from *candeo*, and that from *candor*, of *candeo*, *I burn*; whence alſo the middle-age Greek καυδηλα.

A *tallow candle*, to be good, muſt be half ſheep's tallow and half bullock's; the fat of hogs makes them gutter, give an ill ſmell, and a thick black ſmoke.

Tallow candles are of two kinds; the one *dipped*, the other *moulded*: the firſt, which are thoſe in ordinary uſe, are of an oval ſtanding; the latter are ſaid to be the invention of the four le Brets, at Paris. The manufacture of the two kinds is very different, excepting in what relates to melting of the tallow, and making the wick, which is the ſame in both.

CANDLES, *method of making*. The tallows, being weighed and mixed in their due proportion, are cut or hacked into pieces, to facilitate their melting, and thrown into a pot or boiler, having a cavity of ſome depth running round the top, to prevent its boiling over. Being thus perfectly melted and ſkimmed, a certain quantity of water is thrown in, proportioned to the quantity of tallows; this ſerves to precipitate the impurities of the tallow, which had eſcaped the ſkimmer, to the bottom of the veſſel. The tallow, however, intended for the firſt three dips, muſt have no water; becauſe, the dry wick, imbibing the water readily, makes the *candles* ſpit and crackle in the burning. The melted tallow is now emptied through a ſieve into a tub, having a tap for letting it out, as occaſion requires. The tallow, thus prepared, may be uſed after having ſtood three hours; and will continue fit for uſe twenty-four hours in ſummer, and fifteen in winter. As to the wicks, they are made of the cotton which the chandlers buy in lreins; and wind off three or four together, according to the intended thickneſs of the wick, into bottoms, or clues, whence they are cut out with an inſtrument contrived for that purpoſe, into pieces of the length of the *candle* required; then put on the ſticks, or broches, or elſe placed in the moulds, as the *candles* are intended to be either dipped or moulded.

CANDLES, *making of dipped*. The liquid tallow is drawn off from the tub above mentioned, into a veſſel called the mould, ſink, or abyſs, of an angular form, perfectly like a priſm, except that it is not equilateral; the ſide on which it opens being only ten inches high; and the others, which make its depth, fifteen. On the angle, formed by the two great ſides, it is ſupported by two feet, and is placed on a kind of bench, in form of a trough, to catch the droppings, as the *candles* are taken out at each dip. At a convenient diſtance from this, is ſeated the workman, who takes two ſticks or broches, at a time, ſtrung with the proper number of wicks, viz. fifteen, if the *candles* are to be of eight in the pound weight, if of ſix in the pound, &c. and holding them equidiſtant by means of the ſecond and third finger of each hand, which he puts between them, he immerges the wicks two or three times for their firſt lay, and, holding them ſome time over the opening of the veſſel to let them drain, hangs them on a rack, where they continue to drain and grow hard. When cooled, they are dipped a ſecond time, then a third, as before; only for the third lay they are immerged but twice, in all the reſt thrice. The operation is repeated more or leſs times, according to the intended thickneſs of the *candles*. With the laſt dip they neck them; i. e. plunge them below that part of the wick where the other lays ended.

It muſt be obſerved, that during the operation, the tallow is ſtirred from time to time, and the ſcum ſupplied with freſh tallow. When the *candles* are finiſhed, their peaked ends, or bottoms, are taken off; not with any cutting inſtrument, but by paſſing them over a kind of flat bottom place, heated to a proper pitch by fire underneath; which melts down as much as is requiſite.

CANDLES, *method of making moulds*. Theſe *candles* are made in moulds of different matters; braſs, tin, and lead, are the moſt ordinary. Tin is the beſt, and lead is the worſt. Each *candle* has its mould, conſiſting of three pieces, the neck, ſhaft, and foot: the *ſhaft* is a hollow metal cylinder, of the diameter and length of the *candle* propoſed; at the extremity of this is the *neck*, which is a little metallic cavity, in form of a dome, having a moulding within ſide, and pierced in the middle with a hole big enough for the wick to paſs through. At the other extremity is the *foot*, in form of a little tunnel, through which the liquid tallow runs into the mould. The neck is ſoldered to the ſhaft, but the foot is moveable, being applied when the wick is to be put in, and taken off again when the *candle* is cold. A little beneath the place where the foot is applied to the ſhaft, is a kind of ſtring of metal, which ſerves to ſupport that part of the mould, and to prevent the ſhaft from entering too deep in the table to be mentioned hereafter. Laſtly, in the hook of the foot, is a leaf of the ſame metal, ſoldered within ſide, which,

advancing into the centre, serves to keep up the wick; which is here hooked on, precisely in the middle of the mould. The wick is introduced into the shaft of the mould by a piece of wire, which being thrust through the aperture of the hook, till it come out at the neck, the wick is tied to it; so that in drawing it back, the wick comes along with it, leaving only enough a-top for the neck; the other end is fastened to the hook, which thus keeps it perpendicular. The moulds, in this condition, are disposed in a table pierced full of holes, the diameter of each being about an inch: these holes receive the moulds inverted, as far as the ring in the foot. Being thus placed perpendicularly, they are filled with melted tallow (prepared as before) drawn out of the cap into a tin pot, and thence poured into the foot. After the moulds have stood long enough to cool, for the tallow to have arrived at its consistence, the *candle* is taken out, by taking off the foot, which brings the *candle* along with it. Those who aim at perfection in their work, bleach or whiten their *candles*, by fastening them on rods or broches, and hanging them out to the dew, and exposing them to the sun for eight or ten days: care being taken to screen them in the day-time from the too intense heat of the sun; and in the night from rain, by waxed cloths.

CANDLES, *wax*, are made of a cotton or flaxen wick, slightly twisted, and covered with white or yellow wax. —Of these there are several kinds; some called *tapers*, used to illuminate churches, and in processions, funeral ceremonies, &c. and others used on ordinary occasions.

For the first kind, their figure is conical, still diminishing from the bottom, which has a hole to receive the point in the candlestick; to the top, which ends in a point: the latter kind are cylindrical. The first are either made *with a ladle*, or *with the hand*.

CANDLES, *wax, manner of making with the ladle*. The wicks being twilled, and cut off at the proper length, a dozen of them are tied by the neck, at equal distances, round an iron circle, suspended directly over a large bason of copper tinned, and full of melted wax: a large ladle full of this wax is poured gently, by inclination, on the tops of the wicks, one after another; so that running down, the whole wick is thus covered; the surplus returning into the bason, where it is kept warm by a pan of coals underneath it. They thus continue to pour on the wax, till the *candle* arrive at its destined bigness: still observing, that the three first ladles be poured on at the top of the wick, the fourth at the height of $\frac{1}{3}$, the fifth at $\frac{1}{2}$, and the sixth at $\frac{2}{3}$; by which means the *candle* arrives at its pyramidal form. The *candles* are then taken down hot, and laid aside of each other, in a feather-bed folded in two, to preserve their warmth, and keep the wax soft: they are then taken and rolled, one by one, on an even table, usually of walnut-tree, with a long square instrument of box, smooth at the bottom. The *candle* being thus rolled and smoothed, its big end is cut off, and a conical hole is made in it.

CANDLES, *wax, manner of making by the hand*. The wick being disposed, as in the former, they begin to soften the wax, by working it several times in hot water, contained in a brass caldron, tinned, very narrow and deep. A piece of the wax is then taken out, and disposed, by little and little, around the wick, which is hung on a hook in the wall, by the extremity opposite to the neck; so that they begin with the big end, diminishing still, as they descend towards the neck. In other respects, the method is the same here, as in the former case; only that they are not laid in the bed, but are rolled on the table, just as they are formed. It must be observed, however, that in the former case, water is always used to moisten the several instruments to prevent the wax from sticking; and in the latter, lard, or oil of olives, for the hands, table, &c.

CANDLES, *wax, cylindrical*, are made either with the *ladle*, or *drawn*. The first kind are made of several threads of cotton, loosely spun, and twisted together, covered with the ladle, and rolled, as the conical ones, but not pierced.

CANDLES, *wax, drawn*, are so called, because actually drawn in the manner of wire, by means of two large rollers, or cylinders of wood, turned by a handle, which turning backwards and forwards several times, puts the wick through melted wax, contained in a brass bason; and at the same time through the holes of an instrument, like that used for drawing wire, fastened at one side of the bason: so that, by little and little, the *candle* acquires any bulk, at pleasure, according to the different holes of the instrument through which it passes: by this method, may four or five hundred ells at length be drawn, running. The invention of this was brought from Venice by Pierre Bleismare, of Paris, about the middle of the last century.

The ascent of the tallow up the wick in a burning *candle*, may be resolved into the same principle of filtration, or attraction, as that of water up a heap of ashes, or even a capillary tube. The wick of a *candle* is but slightly twisted, that all its hairs may be easily come at; which being very small, and abounding in sulphur, soon take the flame: and the flame by its heat rarefying the air, and dissolving the tallow underneath, makes the globules thereof ascend into the rarefied spaces of the wick, and there, with the air about it, prove food for the flame. The Roman *candles* were at first little strings dipt in pitch, or surrounded with wax; though afterwards they made them of the papyrus, covered likewise with wax; and sometimes also of rushes, by stripping off the outer rind, and only retaining the pith. For religious offices, wax *candles* were used; for vulgar uses, those of tallow. Serv. ad Æn. lib. i. v. 730. Plin. Nat. Hist. lib. xvii. cap. 37. Lord Bacon proposes *candles* of divers compositions and ingredients, as also of different sorts of wicks; with experiments of the degrees of duration, and light of each. Good housewives bury their *candles* in flour, or bran, which, it is said, increases their lasting, almost half.—Some speak of perpetual *candles* made of salamander's wool. Bac. Nat. Hist. Cent. 4. § 369. and Cent. 8. § 744.

If any chandlers mix with their wares any thing deceitfully, &c. the *candles* shall be forfeited. Stat. 23 Eliz. And a tax or duty is granted on *candles*, by 8 and 9 Anne, cap. 9. & cap. 6. made for sale, of 1*d*. a pound, besides the duty upon tallow, by 8 Anne, cap. 9. And by 24 Geo. II. cap. 11. an additional duty of a halfpenny a pound: and by the same an additional duty of a halfpenny a pound is laid upon all *candles* imported (except those of wax and spermaceti, for which see WAX-*candles*), subject also to the two additional 5 per cents. imposed by 10 and 22 Geo. III. besides the duty of 2*s*. formerly imposed by 2 W. sess. 2. cap. 4. 8 Anne, cap. 9 and 9 Ann. cap. 6. And every maker of *candles*, other than wax-*candles*, for sale, shall annually take out a licence at 1*l*. In four weeks within the bills, and elsewhere in six weeks, after entry, he shall clear off the duties, on pain of double duty; nor sell any after default in payment, on pain of double value. 8 Ann. cap. 9. The makers of *candles* are not to use melting houses, without making a true entry, on pain of 100*l*. and to give notice of making *candles* to the excise officer for the duties; and of the number, &c. or shall forfeit 50*l*. stat. 11 Geo. I. cap. 30. See also 23 Geo. II. cap. 21. and 26 Geo. II. cap. 32.

No maker of *candles* for sale shall begin to make *candles*, without notice first given to the officer, unless from Sept. 29, to Mar. 25, yearly, between seven in the morning and five in the evening; and from Mar. 25, to Sept. 29, between five in the morning and seven in the evening, on pain of 10*l*. 10 Ann. cap. 26. The penalty of obstructing the officer, or of removing *candles* before they are surveyed, is 20*l*. 8 Ann. cap. 9. The penalty of privately making *candles* is the forfeiture of the same and utensils, and 100*l*. 5 Geo. III. cap. 43. And the penalty of mingling weighed with unweighed *candles*, of removing them before they are weighed, or of concealing them, is the forfeiture of 100*l*. 11 Geo. cap. 30.

Candles, for which the duty hath been paid, may be exported, and the duty drawn back; but no drawback shall be allowed on the exportation of any foreign *candles* imported. 8 Ann. cap. 9. 23 Geo. II. cap. 21.

It is observable, in *Optics*, that the flame of two candles joined, give a much stronger light than both of them separate. The observation was suggested by Dr. Franklin. Probably the union of the two flames produces a greater degree of heat, whereby the vapour is attenuated, and the particles of which light consists more copiously emitted. Priestley's Hist. of Vision, p. 807.

CANDLES, *medicinal, candelæ fumales*, are compositions of odoriferous, aromatic, and inflammable matters, as benzoin, storax, olibanum, turpentine, and the like, mixed up with mucilage of tragacanth, and formed into wicks in shape of *candles*. The effluvia and odours whereof, when burnt, are supposed to be salutary to the breast, &c. *Candles* for caruncles of the urinary passage, are made of wax and turpentine melted, and wicks dipt into the same, till brought to the due thickness; then smeared over with an unguent of ceruss, and precipitate and butter of antimony, to the end up the yard till they reach the caruncula. See DOUCIL.

CANDLE-*tree*, in the West Indies, a tree of whose fruit, boiled to a thick fat consistence, are made good *candles*. It seems to be the same as the candle-berry-tree.

CANDLE-*berry-tree*, *Myrica*, in *Botany*, a denomination of an aromatic evergreen, from whose berries are drawn, by boiling, a green wax, of which *candles* are made. It is also called the *Virginia myrtle*. It is a genus of the *dioecia tetrandria* class. Its characters are these: the male flowers are upon different plants from the female; and are produced in a loose, oblong, oval catkin, imbricated on every side; under each scale is situated one moon-shaped flower, having no petal, but it hath four or six short slender stamina, terminated by large twin summits, whose lobes are bifid; the female flowers have neither pe-

petal nor ſtamina, but an oval germen ſupporting two ſlender ſtyles, crowned by ſingle ſtigmas. The germen afterward becomes a berry with one cell, enclosing a ſingle ſeed. There are five ſpecies.

There is one ſort that grows naturally upon bogs in many parts of England, particularly in the northern and weſtern counties; as alſo in Windſor Park, and near Tunbridge Wells. This riſes, with many ſhrubby ſtalks, near four feet high; which divide into ſeveral ſlender branches, garniſhed with ſtiff ſpear-ſhaped leaves of a light green, ſmooth, and a little ſawed at their points, emitting a fragrant odour when bruiſed.

Moſt of the other ſorts grow naturally in North America, where, as it is there obſerved, the inhabitants get a ſort of green wax from the berries, which they make into candles. The method is deſcribed by Mr. Cateſby, in his Natural Hiſtory of Carolina.

CANDLE-*wood*, ſlips of pine about the thickneſs of the finger, uſed in New England, and other colonies, to burn inſtead of *candles*, giving a very good light.

The French inhabitants of the iſland of Tortuga uſe ſlips of yellow ſantal wood for the ſame purpoſe, and under the ſame denomination of *bois de chandelle*, which yields a clear flame, though of a green colour.

CANDLE-*fiſh*, or *anſhow by inch of*. See INCH *of Candle*.

There is alſo a kind of *Excommunication by inch of* CANDLE; wherein the time a lighted *candle* continues burning, is allowed the ſinner to come to repentance; but after which he remains excommunicated to all intents and purpoſes.

CANDLEMAS, a feaſt of the church, held on the ſecond of February, in memory of the Purification of the Bleſſed Virgin.

It takes its name either from the number of lighted candles uſed by the Romiſh church, in the proceſſions of this day; or becauſe, before *maſs*, the church conſecrated *candles* for the whole year. This ceremony was prohibited in England, by an order of council in 1548.

Candlemas is alſo called, in ancient writers, *Hypapante*; and among moderns, the *Purification*.

Some will have this feaſt to have been inſtituted by pope Gelaſius, in lieu of the heathen lupercalia; and that proceſſion was thereon made with lighted *candles* round the fields and grounds, by way of exorciſm. Hence Bede ſays, "It is happy for the church to have changed "the luſtrations of the heathens, held in the month of "February, around the fields, for the proceſſions with "hallowed *candles*, in remembrance of that divine light "wherewith Chriſt illuminated the world, whence he "was ſtyled by Simeon, *a light to lighten the Gentiles*."

Others aſcribe the origin of *Candlemas* to pope Vigilius, in the year 536, and ſuppoſe it ſubſtituted for the feaſt of Proſerpine, held with burning tapers by the heathens in the beginning of February.

CANDLESTICK, a houſhold utenſil, contrived to hold one, or more lighted candles. Larger, and more ſtately *candleſticks*, contrived for holding a great number of candles, are called *branches* and *girandoles*; and when made of glaſs, *luſtres*.

The *golden candleſtick* was the richeſt utenſil in the Jewiſh tabernacle. It was made of ſolid gold, and weighed a talent; and, according to Cumberland, the value of it, excluſive of the workmanſhip, was 5076 pounds. It contained ſeven lights, ſix branching out in three parts from the upright ſtem, and one on the top of it.

This ſacred utenſil was, after the Babyloniſh captivity, placed in the Temple, and when the Temple was deſtroyed, it was depoſited in the Temple of Peace built by Veſpaſian; and the repreſentation of it ſtill remains on the triumphal arch, at the foot of mount Palatine, on which Veſpaſian's triumph is delineated.

CANDLESTICK, *water*, a kind of jet or fountain raiſed on a foot which ſupports a little baſon reſembling the diſk of a *candleſtick*, down which the water falls into another larger baſon.

CANDO, CONDI, or CONDY, in *Commerce*, a long meaſure uſed in ſeveral parts of the Eaſt Indies, particularly at Goa, the capital of the Portugueſe ſettlements there.

Silk and woollen ſtuffs are meaſured by the *covre*, and linen by the *cando*. The *cando* uſed in Pegu is equal to the Venetian ell.

CANDOU, in *Botany*: *Parkinſ. Theatr. Dombeil. Acbar Maldivenſis*, a tree much like the cork-tree, and of the height of the walnut-tree. The trunk is fungous, and lighter than cork; the bark whitiſh, and it bears no fruit.

CANDY, in ſpeaking of SUGAR, denotes a preparation of that ſubſtance, made by melting, and cryſtallizing it ſix or ſeven times over, to render it hard and tranſparent.

CANDYING makes an operation in *Pharmacy*, as well as confectionary; thoſe ſimples which are preſerved in ſubſtance by boiling in ſugar being ſaid to be *candied*: though the performance of it is now tranſferred to the confectioner from the apothecary, to whom, originally, it belonged.

CANDY *carrot*. See SEIGNEL.

CANDY *tuft-tree*. See THERIS.

CANDY *lion's foot*. See *Cardus* LION'S *foot*.

CANE, in *Commerce*, the ſame with reed, called among botaniſts ARUNDO. See BAMBOE and REED.

Canes make a conſiderable article in commerce. There are imported two ſorts, viz. *ſwalling*, and *rattan canes*.

CANES, *ſwalling*, are ſaid, by Bradley, to be joints of the roots of a ſort of reed, called *cana Indica*. This plant ſhoots in joints about three or four feet long, near the ſurface of the ground, and at every knot produces great numbers of fibres, by which it receives its nourihſment. The joints are made ſtraight by the fire, which occaſions thoſe ſhades or clouds frequently ſeen in them. Bradley thinks, the *cow-tree* might be propagated here by planting ſome of the roots with their knots in artificial bogs, &c. *Canes* may be ſtained like tortoiſe ſhell, by a mixture of aqua fortis and oil of vitriol, laid on them at ſeveral times, over live coals, to cauſe it to penetrate the deeper, and afterwards giving them a gloſs with a little ſoft wax, and a dry cloth. Boyle.

CANES, *rattan*, are a ſmaller ſort brought from China and Japan, very tough; which being ſplit, are uſed for making of *cane* chairs. They are produced of a reed called *rattang Malabaricus minor*, or leſſer rattan. Theſe, when dry, being ſtruck againſt each other, will give fire, and are uſed accordingly, in ſome places, in lieu of flint and ſteel. Being twiſted together, they make cordage of them. The Chineſe and Japaneſe veſſels are ſaid to have their cables made of them; which are leſs liable to rot in the water than hemp. Phil. Tranſ. N° 244. p. 346. and N° 267. p. 717.

CANE *ſugar*. See SUGAR-*cane*.

CANE, *ſnuth*. See WAKE-*robin*.

CANE, *ſiſhing-rod*. See REED.

CANE, *Indian*. See CANNA.

CANE-*apple*, in *Natural Hiſtory*, a name given by the common people of Ireland to the *arbutus*, or ſtrawberry-tree. See ARBUTUS.

CANE, CANNA, a long meaſure, frequent in Italy, Spain, and the ſouth parts of France: of greater or leſs length, according to the places where it is uſed.

At Naples, the *canne* is equal to ſeven feet 3⅛ inches, Engliſh meaſure; to the *canna* of Tholouſe, and the upper Languedoc, is equal to the *vara* of Arragon, and contains five feet 83 inches; at Montpellier, in Provence, Dauphiné, and the Lower Languedoc, to ſix Engliſh feet 5⅛ inches.

CANELLA *alba*, in *Botany*, the ſame with what is otherwiſe called WINTERANIA, and ſometimes ſubſtituted for the CORTEX *Winteranus*.

CANENTES, in *Natural Hiſtory*, a name uſed by ſome of the older writers for a ſpecies of foſſile thell not known to us in its recent ſtate, but deſcribed by Klein, under the name of the *tubulus marinus tenuiſtriatus*, and by other of the late authors under thoſe of *polythalamium* and *arthrocerites*.

CANEPHORÆ, Κανηφοροι, from κανη, a *reed*, and φερω, *I bear*, in *Antiquity*, were two virgins of quality at Athens, kept in Minerva's temple in the Acropolis, who at the feaſt of the Panathenæa, carried baſkets on their heads with ſomething ſecret or myſterious therein, and delivered to them by the prieſteſs.

The baſkets were uſually crowned with flowers, myrtles, &c.—The *Canephoræ*, in their ceremonies, always marched the firſt, the prieſt next, and the chuſt of maſts followed.

The learned are at variance about the contents of the baſkets borne by the *Canephoræ*. Some will have it, that neither they, nor the prieſteſs herſelf, knew what was in them. Others conjecture that they contained the things neceſſary for ſacrifice, &c.

There were alſo *Canephoræ* in the ceremonies of Ceres and Bacchus. Thoſe in the Bacchanalia carried golden baſkets, in which were divers ſorts of firſt fruits, &c. Among ancient monuments, we find mention of divers figures of *canephoræ*. In that famous Cornelian called Michael Angelo's ring, there are three *Canephoræ* with their baſkets on their heads.

The appellation *Canephoræ* was alſo given to virgins at Athens, when, becoming marriageable, they preſented certain baſkets full of little curioſities to Diana, in order to procure leave to quit her train, and change their ſtate of life.

CANEPHORIA was a ceremony, which made part of a feaſt celebrated by the Athenian virgins on the eve of their marriage-day. The *Canephoria*, as practiſed at Athens, conſiſted in this: that the maid, conducted by her father and mother, went to the temple of Minerva; carrying with her a baſket full of preſents, to engage the goddeſs to make the marriage happy; or rather, as the ſcholiaſt

scholiaſt of Theocritus has it, the baſket was intended as a kind of honourable amends made to that goddeſs, the protectreſs of virginity, for abandoning her party; or it was a ceremony to appeaſe her wrath.

CANES, in Egypt, and other Eaſtern countries, a poor ſort of buildings for the reception of ſtrangers and travellers. People are accommodated in theſe with a room at a ſmall price, but with no other neceſſaries; ſo that, excepting the room, there are no greater accommodations in theſe houſes than in the deſerts, but that there is a market near.

CANES *Venatici*, in *Aſtronomy*, the *Grey-hounds*, two new conſtellations, firſt eſtabliſhed by Hevelius, between the tail of the Great Bear, and Bootes' arm, above the Coma Berenices. The firſt is called *Aſterion*, being that next the Bear's tail; the other *Chara*. They comprehend 23 ſtars, of which Tycho only obſerved two. The longitudes and latitudes of each are given by Hevelius.

In the Britiſh Catalogue they are 25. See the following table.

Situation of the ſtars.	Stars.	Longitud.		Latitude.		Magnitude
		°	′	°	′

CANGA, in the *Chineſe Affairs*, a wooden clog borne on the neck, by way of puniſhment for divers offences.

The *canga* is compoſed of two pieces of wood notched, to receive the criminal's neck; the load lies on his ſhoulders, and is more or leſs heavy according to the quality of his offence. Some *cangas* weigh 200 pounds; the generality from 50 to 60 pounds. The mandarins condemn to the *canga*. Sentence of Death is ſometimes commuted for by the penalty of the *canga*.

CANI, *grotto del*. See GROTTO *del Cani*.

CANIA, in *Botany*, a name given by Pliny, and ſome other authors, to the common ſtinging nettle.

CANICULA, in *Zoology*, the name by which Ariſtotle, and ſince him Bondeletius, Aldrovandus, and ſome others, have called the CATULUS.

CANICULA was alſo uſed by Pliny, and the old Romans, for that fiſh which the Italians expreſs by the ſame ſort of diminutive name, at this time the *lamiola*. It is the *galeus* CANIS of authors, the fiſh we in Cornwall call the *tope*. It is a ſpecies of SQUALUS, called by Artedi the *ſqualus* with the noſtrils placed near the mouth, and with ſmall foramina near the eyes.

CANICULA is the name given to one of the ſtars of the conſtellation CANIS *Major*; called alſo ſimply the *Dog-ſtar*, by the Greeks, SEIRIOS, *Sirius*.

Pliny and Galen alſo give the appellation Procyon to the *canicula*; though, in propriety, PROCYON is the name of another ſtar in the Leſſer Dog.

Canicula is the fourth in order in the Britannic Catalogue; in Tycho's and Ptolemy's it is the ſecond. It is ſituate in the mouth of the conſtellation, and is of the firſt magnitude; being the largeſt, and brighteſt, of all the ſtars in the heavens. Its longitude, latitude, &c. ſee among thoſe of the other ſtars of CANIS *major*.

From the riſing of this ſtar, that is, its emerſion from the ſun's rays, which now happens about the twenty-ſixth day of Auguſt, the ancients reckoned their *dies caniculares*, or dog-days.

The Egyptians and Ethiopians began their year at the riſing of *Canicula*; reckoning to its riſe again the next year, which is called the *Annus Canicul.*

CANICULAR *days*, properly denote a certain number of days, preceding and enſuing the heliacal riſing of *Canicula*, or the *Dog-ſtar*, in the morning.

Some authors tell us, from Hippocrates and Pliny, that the day the *Canicula* riſes, the ſea boils, wine turns ſour, dogs begin to grow mad, the bile increaſes and irritates, and all animals grow languid; and that the diſeaſes ordinarily occaſioned in men by it, are burning fevers, dyſenteries, and phrenſies.

The Romans ſacrificed a brown dog every year to *Canicula* at its riſing, to appeaſe its rage. They ſuppoſed *Canicula* to be the occaſion of the ſultry weather, uſually felt in the dog-days; Homer's Il. lib. xxii. v. 22. but by miſtake: in five or ſix thouſand years more, *Canicula* may chance to be charged with bringing froſt and ſnow; for it will riſe in November or December; and he actually riſes with the ſun on different days, in different horizons.

However, the almanac-makers uſually mark the beginning of the *canicular* days about the 30th of July, and their end about the ſeventh of September.

CANICULAR *year*, denotes the Egyptian natural year, which was computed from one heliacal riſing of *Canicula* to the next.

This is alſo called *annus canicul.*, and *annus cynicus*; by the Egyptians themſelves the *Sothic year*, from *Sothi*, a denomination given by them to Sirius. Some alſo call it the *heliacal year*.

The *Canicular* year conſiſted ordinarily of 365 days, and every fourth year of 366 days, by which it was accommodated to the civil year. The reaſon of their choice of *Canicula* before the other ſtars, to compute their time by, was not only the ſuperior brightneſs of that ſtar, but becauſe its heliacal riſing was in Egypt a time of ſingular note, as falling on the greateſt augmentation of the Nile, the reputed father of Egypt. Epheſtion adds, that from the aſpect of *Canicula*, its habit and colour, the Egyptians drew prognoſtics concerning the riſe of the Nile; and, according to Horus, predicted the future ſtate of the year. So that the firſt riſing of this ſtar was yearly obſerved with great attention. Bainbrigge, Canicul. cap. 4. p. 20.

CANICULUM, or CANICULUS, in the *Byzantine Antiquities*, a golden handkin, or ink-veſſel, decorated with precious ſtones, wherein were kept the ſacred *encauſtum*, or red ink, wherewith the emperors ſigned their decrees, letters, &c.

The word is by ſome derived from *canis* or *canichus*; alluding to the figure of a dog, which it repreſented; or rather becauſe it was ſupported by the figures of dogs. By Salmaſius from *κανεον*, an *inkhorn*.

The *canicelum* was under the care of a particular officer of ſtate, hence called *cancellarius* or *cancellus*, who was in great requeſt. Du Cange will have the *cancellarii* to have been the ſame with the LOGOTHETA.

CANICUM, in *Botany*, a name given by Avicenna, and ſome other authors, to the ſmall celandine, or PILEWORT.

CANINA *appa*, in *Botany*, a name given by ſome of the old Roman authors to the fruit of the aparine or gooſe-graſs. They are called by others *lappa bogrios*, and *lappa canariæ*, and the plant *lappa* and *lappago*. See ULPAVERS.

CANINANA, in *Zoology*, the name of a ſpecies of ſerpent found in America, and eſteemed one of the leſs poiſonous kinds. It grows to about two feet long, and is green on the back, and yellow on the belly. It feeds on eggs and ſmall birds; the natives cut off its head and tail, and eat the body as a delicate diſh. Ray.

CANINE, in a general ſenſe, ſomething that relates to dogs. Dr. Douglas gives frequent compariſons between the *canine* muſcles and the human.

The voice of perſons hired with the *hydrophobia* is frequently uttered with a *canine* hoarſeneſs, and bears ſome reſemblance to the barking of a dog. Dr. Lifter accounts for the cynical appearances in the *hydrophobia* from a ſuppoſition, that the patient has undergone ſomewhat of a tranſformation in the *canine* nature, or that certain of the organical parts of his body, eſpecially the *guts*, tongue, &c. are diſpoſed after the manner of a dog. Phil. Tranſ. N° 207, and N° 147.

CANINE *appetite*, *appetitus*, or *fames canina*, amounts to much the ſame with *bulimus*, though the more exact writers make a diſtinction between them two. See BULIMY. We have a late ſurpriſing inſtance of the *canine* appetite, mentioned in the Philoſophical Tranſactions, N° 476. p. 366. & ſeq. and p. 382.

CANINE *laughter*, *riſus ſardonius*, that wherein the lips are drawn far back, and the mouth much extended.

CANINE *ligament*, that whereby the prepuce of the human PENIS is faſtened to the *glans*, otherwiſe called the FRENUM.

CANINE

CANINE *madness*, *rabies canina*, is usually supposed the same with HYDROPHOBIA, though some distinguish, applying the former denomination where the patient raves, or has loft all ufe of reafon; the latter where he ftill retains his reafoning faculty, only his members are fubject to certain involuntary convulfive motions, as thofe of an epileptic or aguith perfon. See MADNESS.

The *rabies canina* is never without the *hydrophobia*, but the latter frequently without the former.

CANINE *fulphur*, a fort of native SULPHUR difcovered near Rome, intermixed with earthy or ftony matters; thus called by reafon that dogs are fo fond of it, as to dig it out of the earth.

CANINE *teeth*, CANINI *dentes*. See TEETH.

CANINUS *mufculus*, the fame as ELEVATOR *labii fuperioris*.

CANINUS *ferpens*, in *Zoology*, a name given by fome writers to the *manhalla* of the Cyclopedia, a fnake that flies at every thing that comes in its way, in the manner of our dogs.

CANIS, *dog*, in the Linnæan fyftem of *Zoology*, makes a diftinct, but very large *genus* of animals, of the order of *feræ*, and claft of *mammalia*, taking in all the dog kind, which this author only accounts fo many varieties, and other diftinct *fpecies*. The characters of this genus are, that the feveral fpecies of it have fix upper fore-teeth; that the lateral ones are longer than the others: the intermediate ones of a lobated figure. There are alfo fix fore-teeth in the lower-jaw, of which the lateral ones are lobated: the canine teeth are fingle and incurvated; the grinders are fix or feven in number.

The fpecies are the common DOG, the WOLF, the HYÆNA, the FOX, the ALOPEX, the SAGOUIN, the JACKALL, or *lupus aureus*, the *Mexican* DOG, or *American mountain cat*, with a tail bent downwards, and an afh-coloured body, variegated with brown and yellow fpots; and the TIGUIS.

CANIS *Major*, *the Great Dog*, in *Aftronomy*, a conftellation of the fouthern hemifphere, below Orion's feet, though fomewhat to the weftward of him; which ftar Ptolemy makes 20; Tycho obferved only 134 Hevelius 21; in the Britannnic Catalogue they are 32. Their order, names, places, longitude, magnitude, &c. are as follow.

Names and Situations of the Stars.	Epact's Chara.	Signs.	Longitud.		Latitude			Magnitude.
			°	′	°	′	″

CANIS *Minor*, the *Little Dog*, in *Aftronomy*, a conftellation of the northern hemifphere; called alfo by the Greeks, *Procyon*, and by the Latins *Antecanis*, and *Canicula*.

The ſtars in the conſtellation *Canis minor*, are in Ptolemy's Catalogue 2; in Tycho's 5; in Hevelius's 13. Their order, names, places, longitude, latitude, magnitude, &c. in the Britiſh Catalogue, which contains 14, are as follow.

Names and ſituations of the Stars.	Epact's Chara.	Signs.	Longitud.		Latitude			Magnitude.
			°	′	°	′	″	
In the head			1	19	58	12	36	14	6-7

CANIS *carcharias*, in *Natural Hiſtory*, a name given by Rondeletius, and other authors, to that ſpecies of ſhark called the *lamia*, or white ſhark by others, or *carcharias*, *lamia*, &c. See *Tab. of Fiſhes*, N° 3.

CANIS *piſcis*, in *lchthy logy*, the name of a large fiſh of the ſhark kind. It has three rows of extremely ſharp teeth; the eyes are ſmall for the ſize of the fiſh, the pupils are proportionably ſmall, and the iris of a fine bright ſilver colour, with a caſt of blue or green. It is brought to market in Rome, and is ſometimes caught alſo on our own coaſts, as about Penzance in Cornwall. It is extremely fond of human fleſh, and will venture to leap up even upon the ſhore for it.

CANIS *volans*, in *Zoology*, the name of an animal properly of the bat or vefpertilio kind, and diſtinguiſhed by Linnæus by the name of *vefpertilio cauda anilis*, the bat without a tail.

CANKER, ſometimes denotes a ſpeck made by a ſharp humour, which gnaws the fleſh almoſt like a cauſtic; very common to children, in their mouth eſpecially.

CANKER ſeems alſo popularly uſed for a GANGRENE, or beginning mortification.

CANKER is alſo a diſeaſe in dogs, which ſeizes their ears.

CANKER, in hawks, breeds in the throat and tongue, occaſioned by foul feeding. It is cured by waſhing the mouth with honey and white wine boiled together, then ſhewing it with cheriſil-powder.

CANKER, in horſes, is a loathſome ſoreneſs, which, if it continue long uncured, ſo feſters and putrifies the part, that it will eat to the very bone; and if it happens to come upon the tongue will eat it aſunder; ſighting upon the noſe it devours the griſtle through.

CANKER, in trees, a term uſed by our farmers to expreſs a wound or blemiſh in the trunk of a tree, which does not heal up by nature, but will increaſe and damage, if not endanger, the whole tree. Theſe wounds are ſometimes occaſioned by accidents, as blows, or by the branches of one tree galling another by the motion they are put into by the winds; if this latter be the caſe, the offending branch muſt be cut off, or drawn another way, or elſe all remedies are vain.

The wound muſt be cut and enlarged every way to the quick, and all the decayed wood muſt be taken clean out; then the whole internal ſurface of the wound muſt be filled up with tar mingled with oil, and after this it muſt be filled up with clay and horſe-dung mixed together, or with horſe-dung alone, which many eſteem beſt of all. In this caſe the dung muſt be bound over with a rag; hog's dung is by many preferred to horſe-dung for this purpoſe; and it is proper to add to this application the keeping of the roots cool and moiſt, by laying fern and nettles about them. If the *canker* be only in one of the boughs of the tree, the beſt way is to cut off the bough at once. If that be a large one, it ſhould be cut off at ſome diſtance from the body of the tree; but if a ſmall one it ſhould be cut off cloſe. The adding of a coat of dung, and pond or river mud, about the roots of trees, if they are ſubject to this from their ſtanding in a dry barren land, as is often the caſe, is a very good care. See DARE, and DISEASES *of Plants*.

CANKER *worm*. See SCARABÆUS.

CANNA, in *Botany*, *Indian* CANE, or *flowering-reed*, a genus of the *monandria monogynia* claſs. Its characters are theſe: the flower hath one petal, which is divided into ſix parts, the three upper ſegments are erect, and broader than the lower: two of which are erect, and the other runs back, and is twiſted. It hath one ſpear-ſhaped ſtamen, riſing as high as the petal, having the appearance of a ſegment. Below the empalement is ſituated a roundiſh, tough germen; which becomes an oblong, roundiſh, membranaceous capſule, having three longitudinal furrows, crowned by the empalement, which hath

both these cells filled with round, smooth seeds. There are three species.

All the sorts are propagated by *seeds*, which should be sown on a hot-bed in the spring; and when the plants are fit to remove, they should be transplanted into separate small pots, and plunged in a moderate hot-bed of tanner's bark.

CANNA, in the *Ancient Pharmacy* and *Botany*, denoted the *calamus aromaticus*, or, according to others, *cassia fistula*.

CANNA also denotes a sort of long measure, otherwise called by modern authors a CANE, by the Latins *calamus*, and in Scripture a reed.

CANNABINA, in *Botany*. See *Bastard* HEMP.

CANNABIS. See HEMP.

CANNACORUS, in *Botany*. See CANNA.

CANNEL-*coal*, a black bituminous fossil, frequent in Staffordshire and Lancashire, of a fine hard texture, so as to receive a polish, and become of service for divers works instead of ivory, but chiefly used for fuel, as affording a brighter and purer flame than the common *sea*-COAL.

Dr. Woodward takes our *cannel coal* to be the same with the *lapis* ANTHRACITES of the ancients, and the *lapis* OBSIDIANUS of some later writers. This sort of coal contains most pitch and in a less dense state; so that it burns with a bright lively flame: its specific gravity is about 1,27. *Cannel-coal*, or, as some call it, *candle-coal*, is also found in Cumberland, and some other counties of the North.—It is apt to take a texture, that it will take a tolerable polish. The chairs of the cathedral of Lincheld is said to be in a great measure paved with *candle-coal* for the black, and alabaster for the white, which when clean resembles marble. It also turns like ivory into many pretty works, as ink-standishes, salts, candlesticks, &c.

In disposing it for fire regard is had to the grain. If they would have it burn slow, they lay it flat-wise on the fire: if clear, they set it edgewise, in which case it burns as light as a candle.

CANNEQUINS, in *Commerce*, white cotton cloths brought from the East Indies. They are a proper commodity for trading on the coast of Guinea, particularly about the rivers Senega and Gambia. These cloths are folded square wise, and are about eight ells long.

CANNEVAROLA, in *Ornithology*, a name by which Aldrovandus, and some other authors, have called the lesser reed-SPARROW, called by others *fringilla cannabina*, and, by Mr. Ray, *passer arundinaceus minor*.

CANNIBAL, or CANIBAL, is used by modern writers for an ANTHROPOPHAGOUS, or man-eater, more especially of the West Indies.

CANNOCK, or CANNOT-*stone*, a base sort of iron-ore, in the Staffordshire mines, of which the worst metals is made.

CANNON, in *War*, a military engine for throwing iron, lead, or stone bullets, by force of gunpowder, to a place directly opposite to the axis of the cylinder whereof it consists. See *Tab. Gunnery, fig.* 1.

The word seems derived from the Italian *cannone*, an augmentation of *canna*, *cane*; because a *cannon* is long, straight, and hollow, like a cane.

The first *cannons* were called *bombarde*, from *bombus*, by reason of their noise. They were constructed of several pieces of iron adapted to each other lengthways, and hooped with iron rings, and employed in throwing stone bullets of a prodigious weight; accordingly their bore was enormously large, and they were very inconvenient for use. The parts and proportions of a *cannon* about eleven feet long, are its barrel, or cavity, nine feet; its tolerum, or support, fourteen, and its axis seven; the bore, or diameter of the mouth, six inches, and two lines the play of the ball; the diameter of the ball therefore five inches, and its weight thirty-three pounds. In present practice, the diameter of a shot is divided into twenty equal parts, and that of the bore in twenty-one of these parts: the French use the proportion of twenty-six to twenty-seven; and Mr. Muller recommends a kind of medium between both; or that of twenty-four to twenty-five. The metal thick about the mouth, two inches, and at the breech six. It weighs about five thousand six hundred pounds: its charge is from eighteen to twenty pounds. It carries point-blank, six hundred paces; and loads ten times in an hour, sometimes fifteen; in a day one hundred and twenty times. Its ball fifteen feet bound, and twenty long, for the rebound. It requires twenty horses to draw it. See CALIBRE, GUN, and WINDAGE.

Lurray makes brass *cannon* the invention of J. Owen; and says, the first known in England, were in 1535; and iron *cannon* was first cast in England in 1547. Lennard, however, he owns, were known before; and observes, that at the battle of Crecy, in 1346, there were five pieces of *cannon* in the English army, which were the first that had been seen in France. Mezeray also says, that King Edward struck terror into the French army, by five or six pieces of *cannon*; it being the first time they had seen such thundering machines.

In the bill of aids raised for the redemption of king John of France, in 1368, mention is made of an officer in the French army called *master of the king's cannon*, and of his providing four great *cannons* for the garrison of Harfleur. Father Daniel (dans la Vie de Philip V. dit de Valois, tom. ii.) produces a proof from the records of the chamber of accompts at Paris, that *cannon* and gunpowder were used in the year 1338.

Du Cange even finds mention of the same engines in Froissart, and other French historians some time earlier. The Germans carry the invention of *cannon* farther back, and attribute it to Albertus Magnus, a Dominican monk, about the year 1250. Isaac Vossius rejects all these conjectures, and finds *cannon* in China almost seventeen hundred years ago. According to him, they were mounted by the emperor Kitcy, in the year of Christ 85. The ancients had their fiery tubes, or *cannon*, which being loaden with pitch, flames, and iron-balls, were exploded with a vehement noise, smoke, and great effect, though much inferior to our bombs.

Cannon are made cylindrical, that the motion of the ball may not be retarded in its passage; and that the powder, when on fire, may not slip between the ball and the surface of the *cannon*, which would hinder its effect. Wolfius would have the *cannon* always decrease towards the mouth or orifice; because the force of the powder always decreases, in proportion to the space though which it is expanded. The *cannon* made after the Spanish manner, had a cavity, or chamber, at the bottom of the barrel, which helped their effects. But the *cannon* are now made with a plain cylindrical bore without any CHAMBER. A *cannon* is found to recoil two or three paces after explosion; which some account for from the air's rushing violently into the cavity, as soon as it is discharged of the ball: but the real cause is, the powder's acting equally on the breech of the *cannon*, and the ball. For a battering-piece, whose ball is thirty-six pounds, there must be two cannoneers, three chargers, and thirty pioneers.

Cannons are distinguished from the diameters of the balls they carry; but this distinction is different in different nations. The proportion of their length to their diameter, depends rather on experience than any reasoning *a priori*; and has been accordingly various, in various times and places; the rule is, that the gun be of such a length, as that the whole charge of powder be on fire before the ball quit the piece. If it be made too long, the quantity of air to be driven out before the ball, will give too much resistance to the impulse; and that impulse ceasing, the friction of the ball against the surface of the piece will take of some of its motion. Formerly, *cannons* were made much longer than at present; till some made by chance 24 feet shorter than ordinary, taught them that the ball moves with a greater impetus through a less space than a larger. This Gustavus king of Sweden proved by experience in 1624, when an iron-ball, forty-six pounds weight, was found to go farther from a new short *cannon*, than another ball of ninety-six pounds out of an old, longer piece: whereas, in other respects, it is certain the larger the bore and ball, the greater the range. Professor Euler apprehends, that the alteration in the length of *cannon* has not been supported by proper experiments; so that we may be allowed to infer, that those of the present construction will throw a shot with a greater velocity than the longer *cannon* did. And he is of opinion, that the principal reason for laying aside the use of very long and heavy *cannon* was the great difficulty of transporting them from place to place with an army. Principles of Gunnery investigated, &c. p. 246. See also on this subject, Robins's Tracts. vol. i. p. 248, &c.

The names of the several *cannons*, their length, their weight, and that of their balls, as they obtain among us, are as in the following table; though their names are generally derived, especially in naval use, from the weight of the ball which they discharge: thus a piece that discharges a ball of twenty-four pounds, is called a twenty-four pounder, &c.

Names of Cannon.	Weight of an iron ball.	Weight of the Cannon.	Length of the Cannon.
Cannon Royal	66 lb.	8000 lb.	12 *Feet.*
Demi-cannon large	30	6000	12
Demi-cannon ordinary	34	5600	12
Demi-cannon lefs	30	5400	11
Culverin large	20	4800	12
Culverin ordinary	17 lb. 5 oz.	4500	12
Culverin leſs	13	4000	11
Demi-culverin ordinary	10	2700	11
Demi-culverin leſs	9	2000	10
Saker ordinary	6	1500	10
Saker leſs	4 12	1400	8
Minion large	3 12	1000	8
Minion ordinary	3 4	800	7
Falcon	2 8	750	7
Falconet	1 5	400	6
Rabinet	8	300	5.6 *Dig.*
Base	5	200	4.6

Cannon Royal is otherwise called *Cannon of Eight*.

The velocity of a ball or bullet, discharged from a *cannon*, was formerly supposed to be only about 500 or 600 feet in a second of time. See BULLET. But Mr. Robins, Muller, and others, have since found, that it is much greater; or from 1000, even to 2000 feet, according to the length of the piece, the charge and the weight of the bullet. See GUNNERY and VELOCITY.

The greatest range of a *cannon* is ordinarily fixed at an elevation of 45°. Dr. Halley shews it to be at 44°.

It should be remarked, that this range supposes the initial velocity to be very small, because every different velocity and ball require a different elevation to produce the greatest range; from 45° downwards gradually to 30°, or even less in very great velocities. See VELOCITY *initial*.

M. S. Julian adjusts the ranges of the several pieces of *cannon*, from the weight of the ball they bear, the charge of gunpowder being always supposed in a subduple ratio of the weight of the ball: thus,

Weight of a leaden ball.	Horizontal range.	Greatest range.	Weight of a leaden ball.	Horizontal range.	Greatest range.
33 *lib.*	3600 *paces.*	6000	12	450	5000
24	3360	6000	8	400	4500
18	3200	6000	2	150	1500

For the proportions of the lengths of guns, weight of ball, and ranges, deduced from later experiments and conclusions, see GUN.

For the several parts of a *Cannon*, see ASTRAGAL, BASE-*ring*, BREECH, CALIBER, CASCABEL, CHASE, MUZZLE, OGEE, REINFORCED *ring*, TRUNNIONS, &c. See also GUN and GUNNERY.

CANNON, *boring of*, has lately been used instead of the method of casting them hollow by means of a mould. The machine for this purpose, as well as for smoothing the inner surface, which is sometimes done after they have been cast hollow, is composed of a rectangular frame of timber, A B C D (*see* TAB. *Gunnery*, *fig.* 3.), fixed upon a solid plank E F, which is raised eight or ten feet above the floor of the workhop. This frame contains two upright beams *f*, *f*, F *f*, placed level and exactly parallel to each other, and strongly fixed on the pieces of wood G, G, with their ends resting on the cross-bars that connect the sides of the frame. Their length should be about three times that of the *cannon* to be bored. In the inner side of these beams are two grooves, to which are applied two bars of wood 22, 22, which are connected together by the traverse pieces 33, 33. 33, between which the *cannon* H is fastened, so that the whole inclosed frame 22, 22, with the piece of ordnance fixed to it, may slide in the grooves of the beams F *f*, F *f*, being raised or lowered by means of the ropes and pullies K *k*, K *k*, fixed above to the upper part of the frame, and below to the breech of the *cannon*. The rope belonging to each block of pullies coils round an axis Y, Y, bearing at each end the cogged wheels N, M. Each of these wheels lays hold of a trundle N, N, containing the same number of rounds: the trundles are fixed on a common axis Z, Z, the ends of which pass beyond the sides of the frame, and bear spoked wheels *o* P, *o* P, by means of which the workmen turn the whole machine; and thus elevate or depress the *cannon* with the frame to which it is annexed at pleasure. On the floor of the workhop, directly under the frame F *f*, F *f*, a block of stone is fastened in the ground; and this supports a plate of iron or copper, placed exactly level and under a line, supposed to be parallel to the beams F *f*, F *f*, dividing the spaces between them on either side into equal parts, and coinciding with the true axis of the *cannon*.

The instrument for boring is represented in *fig.* 6. The upper part of it *a* is formed with a double slope, and it is open at *d* for admitting the square part *b d* of the trunk, which is a strong bar of iron, round at the part which is to enter the *cannon*, and terminating at its lower part in a pivot, which rests on the plate E. About three or four feet above the plate, the trunk of the borer is square, and bears upon it a strong box of wood or iron S, through which levers, as T S, pass, that are turned by men or horses. The box or trough *w* serves to receive the pieces of metal that are taken off in the operation. By this motion, and the pressure of the *cannon* on the point of the borer, it is gradually bored, till the *cannon* sinks, by the contrivance already described, to a certain mark on the borer, which answers to the required depth of its bore. It is then elevated, till the borer may be taken out. When the borer is removed, an instrument formed for smoothing the inner surface of the *cannon* is substituted in its room. This is represented by D (*fig.* 7). It is made of copper, and of a cylindric figure: in the middle there is a square hole capable of admitting the square, and a small portion of the pyramidal part of the trunk of the borer. This cylindric piece has four grooves parallel to its axis, into which are fixed cutting instruments of tempered steel, represented by CC. This instrument serves to enlarge the inside of the *cannon*, and to smooth it, by turning the trunk which supports it in the same manner as when the piece was bored. When this four-edged squarer has passed into the piece, another of five, and then another of six sharp edges is made to enter it: the last of these pairs of all the inequalities which the others had left, and gives to the inside of the *cannon* that perfectly cylindrical and polished figure which it ought to have. The *cannon*, after being thus bored and smoothed, is sent to the chafery, by whom it is finished: with them the touch-hole is bored, and there it is prepared for being mounted on its carriage; and nothing remains previous to its being used, but proving it. The method of casting solid *cannon*, and boring them with this machine, was adopted, because several inconveniences attending the other method of casting them hollow on a mould were avoided by it. The first of these instruments was constructed at Strasburgh, and remained long a secret, though it is now pretty generally used. One of their machines will serve for three furnaces. Encyclopedie, art. ALESAGE.

A machine of this kind, with some little variation in the position of its bar, very lately been introduced into this country, and is now generally used for iron and brass guns. The gun to be bored lies with its axis parallel to the horizon, and in that position, is turned round its axis by means of wheel-work, moved by one or more horses. The borer is *laid*, as above described, in the direction of the axis of the gun, and is incapable of motion in any direction except that of its length; and in this direction it is constantly moved by means of a fusil rack-wheel, kept in proper motion by a man, who thus makes the point of the borer to bear against the part of the gun that is boring, as to pierce and cut it. The outside of the gun is smoothed at the same time by men with instruments fit for the purpose whilst it turns round, so that the bore may be exactly in the centre of the metal.

For the *Methods of casting Cannon*, see FOUNDERY.

As for the metal of *cannon*, it is either iron or a mixture of copper, tin, and brass: the first added to the copper, to make the metal more dense and compact; so that the better or heavier the copper is, the less tin is required. Some to a hundred pounds of copper, add ten of tin, and eight of brass; others, ten of tin, five of brass, and ten of lead.

What are commonly called *brass cannon*, are not made of pure brass; they cannot be made either of this, or of pure copper; but it is always found necessary to mix with these metals some coarser ones, in order to make the whole run the closer and founder; such are lead, and what the founders call pot-metal. As bell-metal is a mixture of copper and tin, so pot-metal is copper and lead. About twenty pounds of lead is usually put to a hundred weight of pot-metal, but about six pounds is sufficient for a hundred weight of gun-metal, and is of full service.

Guns are now usually made of iron, because they are found to be much stronger and more durable, as well as cheaper than the compositions with brass. Mr. Muller, however, contends for the use of the latter, especially for ships, as being, upon the whole, cheaper, and more serviceable than the former. Treat. of Artil. p. 18.

Brandius describes a method of making *cannon* of leather, on occasion, and it is certain the Swedes made use of such in the long war of the last century; but these burst too easily to have much effect.

It is found, by experience, that of *two cannons* of equal *bore*, but of different lengths, the longer requires a greater charge of powder than the shorter, in order to reach the same range. The ordinary charge of a *cannon*, is for the weight of its gunpowder to be half that of its ball. See CHARGE.

Cannons are sometimes cooled by sponging them with sheep-skin dipped in water mixed with vinegar. Without this precaution they are apt to burst after many discharges. It is also requisite to clean them with the sponge, that no fire may be left behind to endanger the next charge of powder.

After each thirty discharges, the *cannon* is to be cooled with two pints of vinegar mixed with four of water, poured into the barrel; the touch-hole being first stopped.

CANNONS, *ordinary*, are those of the common or middling length, each according to the proportions of its kind; e. g. 32 calibers for a culverin.

CANNONS, *extraordinary*, are those which are longer than the usual proportion allowed to their species; e. gr. from 32 to 48 or 50 calibers for a culverin.

CANNON, *bollard*, those which are shorter than ordinary, whether they be of the whole cannon, cannon, or demi-cannon, or quarter-cannon kind. Such c. gr. are culverins from 32 to 26 calibers.

Some call those *extraordinaries* which are longer than ordinary *cannon*, yet do not reach the length of culverins. But these ought rather to be called *extraordinary cannon* or bastard culverins.

Cannon longer than ordinary are also called *finger*, *double*, &c. as those further are called *case*.

CANNON, *enforced*, or *forefted*, those stronger and thicker in metal than ordinary, which have their metal at the touch-hole one diameter thicker, in the middle five or six eighths, and at the neck three eighths.

All chambered cannon are enforced.

CANNON, *fort*, are stronger in metal than those used by land, on account of the necessity they are often under of being charged with chain-shot. They lie on ship-carriages, having four small wheels, without spokes, with two ropes to stop their running back, and bring them again to their place upon the battery.

CANNON *of energy*, or *Chace*-CANNON, in a galley, is the largest, most general, and most effective of the guns placed in the prow, or chase of the vessel, and which delivers in that over the very beak, generally carrying a shot of 33 or 34 pounds weight. It is a long piece, and recoils all along the middle of the galley to the mast.

CANNON-*mouth of a ſea*, in the *Sluices*, denotes a round, long piece of iron, sometimes compoſed of two pieces coupled together and bent in the middle. See BEE.

CANNON-*mouths*, in the *Mines*, are contrived to keep a brisk in subjection, bring it ordered that they tile gradually toward the middle, and afterd toward the paſſage, that the void space left underneath may afford a liberty to the tongue.

CANNONADE, in *Military Language*, is the application of artillery to the purposes of beating or destroying a ship, battery, or fortress.

CANNONEER, or CANNONIER, an officer in the artillery, who has the care of charging, pointing, and firing a cannon.

The *cannonier* is the same with what is otherwiſe called *gunner* in the brestſhot, *vaſſan*, and all other places, *constable*.

CANNULA, or CANULA, in *Chirurgery*, a little tube, or pipe, which the ſurgeons leave in wounds and ulcers, that they cnare not to heal up; because fluid ſuppurating. The *cannula* is to be made of gold, silver, or lead; and is perforated, that the pus, entering within it, may fall upon a ſponge, dipped in ſpirit of wine, and placed at the orifice, to keep the ulcer warm, and to prevent the external air from entering: ſome of theſe *cannulæ* have rings, whereby to keep them faſt in the wound; and others have holes with tubuluſs through them, to bind them down: ſome are round, others oval, others crooked. See *Tab. Surgery*, *fig.* 10.

There is a particular kind of *cannula*, formed taper-wiſe, with a ſcrew faſtened to one end, in manner of a cock: its uſe is for the diſcharge of the water out of the abdomen, after tapping, in an aſcites, or dropſy. To this end it is inſerted into the body, through a hole made near the navel, with a pointed inſtrument, and ſometimes a gunch; and is faſtened into its place by a bandage, and guarded from any injury of the cloaths, &c. by a caſe or cover. It has this advantage over the common tapping, that by means thereof, the water is drawn out when, and in what meaſure the patient pleaſes. See TAPPING.

There is likewiſe a kind of copper, or iron *cannula* made for the more convenient application of actual cauteries: they are made very ſhallow, and are, in effect, little more than hoops; through the aperture whereof, the actual cautery is conveyed; which, by this means, is kept from damaging the adjacent parts.

CANNULA, or CANOLA, in *Ecclesiaſtical Writers*, was a tube of silver, or other metal, wherein were put the reliks, which the people kiſſed as perfons to holineſs, &c.

CANNULA, or CANOLA, was alſo a ſort of ſyphon, through which they anciently ſucked the wine in the eucharift.

CANOE, a name given to the little boat uſed by the ſavages in both Indies, as well as by the negroes in Guinea; made chiefly of the trunks of trees dug hollow; ſometimes of pieces of bark faſtened together.

The common *canoes*, among the Indians, are thoſe made of trees hollowed; being either greater or leſs according to the ſize of the tree they are made of. They are rowed with paddles, and rarely carry ſails: the keeling is laid at the bottom; but having no ballaſt, they are frequently turned upſide down. They have no rudder, the want of which is ſupplied by the *hind* oar. The Negroes of Guinea uſe the ſame ſort of *canoes*, though made in a different manner. They are long ſhaped, having only room for one perſon in width, and ſeven or eight in length; they ſhew little wood above the water: thoſe who row are extremely dexterous, not only in giving the ſtrokes with cadence and uniformity, by which their *canoes* ſeem to fly along the ſurface of the water; but alſo in ballancing the veſſel with their bodies, and preventing their overturning, which, otherwiſe, on account of their lightneſs, would continually happen. Add, that when they are overturned, they have the addreſs to turn them up again in the water itſelf, and mount them anew. They venture as far as four leagues to ſea, but dare not venture farther.

They are uſually fifteen feet long, and a foot or two wide, though there are ſome larger, as far as thirty-five feet long, five wide, and three high, uſed for the carriage of cattle, and expeditions in war. They are fitted with ſails made of ruſhes.

On return from a voyage, the *canoe* are not left in the water, but preſently drawn aſhore, where they are hung by the two ends, and left to dry; in which ſtate they are ſo light, that two men will eaſily carry them on their ſhoulders.

The *canoes* of the Canadeſe are made of the bark of the birch-tree, ſometimes large enough to hold ſous or five perſons. Thoſe of the ſavages of Terra del Fuego, and the other iſlands of the ſtraits of Magellan, are alſo of bark, and faſhioned with great ſkill, from ten to fifteen feet long, and two wide, capable of holding eight men, who row ſtanding, with a ſurpriſing ſwiftneſs.

In the repoſitory of the Royal Society is the model of a Greenland *canoe*, covered with ſeal-ſkin, and reſembling a great bladder; ſo as that, however the waves daſh over it, the perſon in it is ſafe. It is rowed with a ſingle paddle.

CANON, a perſon who poſſeſſes a prebend, or revenue allowed for the performance of divine ſervice, in a cathedral, or collegiate church.

Canons are of no great antiquity: Paſchier obſerves, that the name *canon* was not known before Charlemagne; at leaſt, the firſt we hear of, are in Gregory de Tours, who mentions a college of *canons*, inſtituted by Baldwin XVI. archbiſhop of that city, in the time of Clotharius I. The common opinion attributes the inſtitution of this order to Chrodegangus, biſhop of Metz, about the middle of the eighth century.

Originally *canons* were only prieſts, or inferior eccleſiaſtics, who lived in community; reſiding by the cathedral church to aſſiſt the biſhop; depending entirely on his will; ſupported by the revenues of the biſhopric; and living in the ſame houſe, or the dormitories, or cloiſters, &c. They even inherited his moveables, till the year 817, when this was prohibited by the council of Aix-la-Chapelle, and a new rule ſubſtituted in the place of that which had been appointed by Chrodegangus, and which was obſerved for the moſt part in the Weſt till the twelfth century. By degrees, theſe communities of prieſts, ſhaking off their dependence, formed ſeparate bodies; whereof the biſhops, however, were ſtill heads. In the tenth century, there were communities or congregations of the ſame kind, eſtabliſhed even in cities where there were no biſhops: theſe were called *collegiate*, as they uſed the term *congregation* and *college* indifferently: the name *chapter*, now given to their bodies, being much more modern. Under the ſecond race of the French kings, the *canonical*, or collegiate life, had ſpread itſelf all over the country; and each cathedral had its chapter, diſtinct from the reſt of the clergy.

They had the name *canon* from the Greek *κανων*, which ſignifies three different things; *a rule*, *a penſion* or *fixed revenue to live on*, and *a catalogue* or *matricula*; all which are applicable to them.

In time, the *canons* freed themſelves from their rules, the obſervance relaxed, and, at length, they ceaſed to live in community; yet they ſtill formed bodies; pretending no other functions beſides the celebration of the common office in the church; yet aſſuming the rights of the reſt of the clergy; making themſelves as a neceſſary councill of the biſhop; taking upon them the adminiſtration of a ſee during a vacancy, and the election of a biſhop to ſupply it. There are even ſome chapters excepting from the juriſdiction of the biſhop, and owning no head but their dean. After the example of cathedral chapters, collegiate ones alſo continued to form bodies, after they had abandoned living in community.

Canons are of various kinds; as,

CANONS, *cardinal*, which are thoſe attached, and as the Latins call it, *incardinati* to a church, as a prieſt is to a pariſh.

CANONS, *domiciliary*, were young *canons*, who, not being in orders, had no right in any particular chapters.

CANONS, *expectatives*, were ſuch as, without having any revenue or prebend, had the title and dignities of *canons*, a ſeat in the chapter, and a place in the choir; till ſuch time as a prebend ſhould fall.

CANONS, *foreign*, were such as did not officiate in the canonries to which they belonged.—To these were opposed *manifestary canons*, or *canons residentiary*.

CANONS, *lay* or *honorary*, are such among the laity, as have been admitted, out of honour and respect, into some chapter of *canons*.

CANONS *regular*, are *canons* that still live in community; and who, like religious, have in process of time, to the practice of their rules, added the solemn profession of vows.

They are called *regulars*, to distinguish them from those *secular canons* who abandon living in community, and at the same time, the observance of the *canons* made as the rule of the clergy, for the maintainance of the ancient discipline.

The *canons* subsisted in their simplicity till the eleventh, some say the twelfth century, when some of them, separating from the community, took with them the name of *canons* or *perpetuous priests*, because they declined to live in community with the bishop; and those who were left, thenceforth acquired the denomination of *canons regular*, and adopted most of the professions of the rule of St. Augustine. This order *of regular canons of St. Augustine*, was brought into England by Adelwald, confessor to Henry I. who erected a priory at Nostel in Yorkshire, and obtained for them the church of Carlisle as an episcopal see, with the privilege of chusing their own bishop. They were singularly protected and encouraged by Henry I. who gave them the priory of Dunstable in 1107, and by queen Maud, who, in the following year, gave them the priory of the Holy Trinity in London. It appears, that under the reign of Edward I. they had fifty-three priories.

CANONS, *tertiary*, those who had only the third part of the revenues of the canonicate.

CANON, in an *Ecclesiastical sense*, is a LAW or rule, either of doctrine or discipline, enacted especially by a council, and confirmed by the authority of a sovereign.

Canons are properly decisions of matters of religion; or regulations of the polity and discipline of a church, made by COUNCILS, either general, national, or provincial.

Such are the *canons* of the council of Nice, or Trent, &c. See CONSTITUTIONS.

There have been various collections of the *canons* of the Eastern councils; but four principal ones, each ampler than the preceding. The first, according to Usher, A. D. 380, containing only those of the first ecumenical council, and the first provincial ones; they were but 165 in number. To these, Dionysius Exiguus, in the year 520, added the 50 *canons* of the apostles, and those of the other general councils. The Greek *canons* in this second collection, end with those of the councils of Chalcedon; to which are subjoined those of the council of Sardica, and the African councils. The fourth and last collection comes down as low as the second council of Nice; and to it are added, that Basilensian and Romanian have commented. See Hardouin's Acta Conciliorum et Epistolæ decretales ac Constitutiones Summorum Pontificum, in 11 tomes; commencing with the year 34, and terminating in 1714. Prod. Paris 1715.

CANONS, *Apostolical*, are those which have been usually ascribed to St. Clement. Bellarmin, Baronius, &c. will have them to be genuine *canons* of the apostles: Cotelerius observes, that they cannot be ascribed to the apostles or Clement, because they are not received with other books of Scripture, are not quoted by the writers of the first ages, and contain many things not agreeable to the apostolical times: Hincmar, De Marca, Beveridge, &c. take them to be framed by the bishops who were the apostles disciples in the second or third century: S. Basnage is of opinion, that they were collected by an anonymous writer in the fifth century; but Daille, &c. maintain them to have been forged by some heretic in the fifth century; and S. Basnage conjectures, that some of them are ancient, and others not older than the seventh century. The Greek church allow only eighty-five of them, and the Latins only fifty; though there are eighty-four in the edition given of them in the Corpus Juris Canonici.

CANON is also used for the authorized catalogue of the Sacred Writings. See BIBLE.

The ancient *canon*, or catalogue of the books of the Old Testament was made by the Jews, and is ordinarily attributed to Ezra; who is said to have distributed them into the LAW, the PROPHETS, and the HAGIOGRAPHA, to which our Saviour refers, Luke, chap. xxiv. ver. 44. The same division is also mentioned by Josephus, cont. Appion.

This is the *canon* allowed to have been followed by the primitive church, till the council of Carthage; and according to St. Jerom, this consisted of no more than twenty-two books; answering to the number of the Hebrew alphabet; though at present they are classed into twenty-four divisions, containing Genesis, Exodus, Leviticus, Numbers, Deuteronomy, Joshua, Judges, Samuel, Kings, Isaiah, Jeremiah, Ezekiel, the twelve minor Prophets, the Psalms, the Proverbs, Job, Canticles, Ruth, Lamentations, Ecclesiastes, Esther, Daniel, Ezra comprehending the book of Nehemiah and the Chronicles. However, this order is not universally observed, either among Jews or Christians: nor were all the books above enumerated admitted into the *canon* in Ezra's time. It is most likely, says Dr. Prideaux, that the two books of Chronicles, Ezra, Nehemiah, Esther, and Malachi, were added in the time of Simon the Just, when the *canon* was completed. Connection, &c. vol. ii. p. 476, &c.

But that council enlarged the *canon* very considerably, taking into it the books which we call apocryphal; which the council of Trent has further enforced, enjoining all these to be received as books of Holy Scripture, upon pain of anathema, and being attainted of heresy. The Romanists, in defence of this *canon*, say, that it is the same with that of the council of Hippo, held in 393; and with that of the third council of Carthage, in 397, at which were present forty-six bishops, and, among the rest, St. Augustine; who declared that they received it from their fathers.

Their *canon* of the New Testament perfectly agrees with ours. See Hardouin's Collect. tom. i. p. 968. art. 47. This *canon* consists of books that are well known; some of which have been universally acknowledged; such are the four Gospels, the Acts of the Apostles, thirteen Epistles of St. Paul, one Epistle of St. Peter, and one Epistle of St. John: and others concerning which doubts were entertained, but which were afterwards received as genuine; such are the Epistle to the Hebrews, that of James, the second of Peter, the second and third of John, that of Jude, and the Revelation. These books were written at different times, and they are authenticated, not by the decrees of councils, or infallible authority, but by such kind of evidence as is thought sufficient in the case of any other ancient writings. They were very extensively diffused; they were read in every Christian society; they were valued and preserved with care by the first Christians; they were cited by Christian writers of the second, third, and fourth century, as by Irenæus, Clement the Alexandrian, Tertullian, Origen, Eusebius, &c. and their genuineness is proved by the testimony of those who were contemporary with the apostles themselves, and by tradition. The four Gospels, and most of the other books of the New Testament, were collected either by one of the apostles or some of their disciples and successors, before the end of the first century. The catalogue of *canonical* books, furnished by the more ancient Christian writers, as Origen about the year 210, Eusebius and Athanasius in 325, Epiphanius in 370, Jerome in 382, Austin in 394, and many others, agree with that which is now received among Christians. For the name of writings of the several books of the New Testament, see the titles of the books themselves; as the Gospel of St. Matthew, Mark, &c.

Some of the fathers distinguish the inspired writings into three classes: PROTO-*canonical*, DEUTERO-*canonical*, and APOCRYPHAL.

CANON, *paschal*, a table of the moveable feasts, shewing the day of EASTER, and the other feasts depending on it, for a cycle of nineteen years.

The *paschal canon* is supposed to be the calculation of Eusebius of Cæsarea, and to have been done by order of the council of Nice.

CANON, in *Monastic Orders*, a book wherein the religious of every convent have a fair transcript of the rules of their order, frequently read among them as their local statutes.

This is also called *Regula*, as containing the rule and institution of their order.

The *canon* differs from the MISSALE, MARTYROLOGIUM, and NECROLOGIUM.

CANON, again, is used for the catalogue of saints acknowledged and canonized in the Roman church.

CANON is also used, by way of excellence, in the Romish church, for the secret words of the mass, from the preface to the *Pater*; in the middle of which the priest consecrates the host. The common opinion is, that the *canon* of the mass commences with *Te igitur*, &c. The people are to be on their knees, hearing the *canon* and are to rehearse it to themselves, so as not to be heard.

CANON, in the *Ancient Music*, is a rule or method of determining the intervals of notes.

Ptolemy, rejecting the Aristoxenian way of measuring the intervals in music, by the magnitude of a tone (which was supposed to be formed by the difference between a diapente and a diatessaron), thought that musical intervals should be distinguished, according to the ratios or proportions which the sounds terminating those inte-

vals bear to one another, when considered according to their degrees of acuteness or gravity; which, before Aristoxenus, was the old Pythagorean way. He therefore made the diapason consist in a double ratio; the diapente, in a sesquialterate; the diatessaron, in a sesquitertian; and the tone itself, in a sesquioctave; and all the other intervals, according as the proportion of the sounds that terminate them; wherefore taking the canon (as it is called) for a determinate line of any length, he shews how this canon is to be cut accordingly, so that it may represent the respective intervals: and this method answers exactly to experiment, in the different lengths of musical chords. From this canon, Ptolemy and his followers have been called *Canonici*; as those of Aristoxenus were called *Musici*.

CANON, likewise denotes a musical compolition, in which the parts follow each other in the same melody and intervals.

CANON, in *Geometry* and *Algebra*, a general rule for the folution of all cafes of a like nature with the prefent inquiry. Thus every laft ftep of an equation is a *canon*; and, if turned into words, becomes a rule to folve all queftions of the fame nature with that propofed.

CANON, *natural, of triangles*, is a table of fines, tangents, and fecants together: fo called, becaufe, ferving principally for the folution of triangles.

CANON, *artificial, of triangles*, is a table wherein the logarithms of fines and tangents are laid down. See SINE, under which article the method of conftructing the *natural* and *artificial canon* will be explained.

CANON *Law*, a collection of eccleſiaſtical conſtitutions, decifions, and maxims, taken partly from Scripture, partly from the ancient councils, and partly from the decrees of popes, and the reports and ſayings of the primitive fathers, whereby all matters of policy in the Roman church are regulated.

The *canon law* that obtained throughout the Weſt, till the twelfth century, was the collection of *canons* made by Dionyſius Exiguus in 520, the capitularies of Charlemagne, and the decrees of the popes, from Siricius to Anaſtaſius.—No regard was had in any thing not comprifed in theſe; and the French ſtill maintain the rights of the Gallican church to conſiſt in their not being obliged to admit any thing elſe, but to be at liberty to reject all innovations made in the canonical juriſprudence ſince that compilation, as well as papal decrees before Siricius.

Indeed, between the eighth and eleventh centuries, the *canon law* was mixed and confounded with the papal decrees, from St. Clement to Siricius; which till then had been unknown: this gave occaſion to a new reform, or body of the *canon law*; which is the collection ſtill extant, under the title of Concordia Diſcordantium Canonum, firſt made by Ivo in 1114, and perfected in 1151, by Gratian, a Benedictine monk, from texts of Scripture, councils, and ſentiments of the fathers, in the ſeveral points of eccleſiaſtical policy; and containing thoſe conſtitutions which have been determined, by way of concurrence, the DECRETS, and forming the firſt part of the *canon law*. It is now generally known by the name of the Decretum of Gratian, which was formed in imitation of the Pandects of Juſtinian; and is a confuſed immethodical compilation, full of errors and forgeries.

The ſecond part of the *canon law* conſiſts of the decrees of the popes, from the time of pope Alexander III. to pope Gregory IX. and publiſhed, under the auſpices of that pope, about the year 1230, in five books, entitled Decretalia Gregorii Noni.

In 1298, pope Boniface VIII. continued the papal decrees as far as his time, under the title of Sextus Decretalium. To theſe, pope John XXII. added the Clementines, or the five books of the conſtitutions of his predeceſſor Clement V. firſt publiſhed about the year 1317. And to all theſe were afterwards added twenty conſtitutions of the ſaid pope John, called the Extravagantes; and ſome other conſtitutions of his ſucceſſors, called Extravagantes Communes. Theſe are uſually called the DECRETALS.

All theſe compoſe the body of the *canon law*; which, including the Comments, make three volumes in folio; the rule and meaſure of church government. Indeed, with us, ſince the Reformation, the *canon law* has been much abridged and reſtrained; only ſo much of it obtaining, as is conſiſtent with the common and ſtatute laws of the realm, and the doctrine of the eſtabliſhed church. Beſides the foreign *canon law*, we have our *legatine* and *provincial* CONSTITUTIONS. In the reign of Henry VIII. it was enacted, that the *canon law* ſhould be reviewed; and till that review took place, ſuch canons, conſtitutions, ordinances, and ſyndals provincial as had been made, and were not repugnant to the law of the land or king's prerogative, ſhould ſtill be uſed and executed. The review was propoſed again in the reign of Edward VI. and of queen Elizabeth; but as it was never accompliſhed, the authority of the *canon law* in England depends upon the ſtatute of the 25th Henry VIII. c. 19. which was regulated indeed by queen Mary, and again revived by 1 Eliz. c. 1.

As to the conſtitutions and *canons* made in the convocation of the province of Canterbury in 1603, ratified by the king, and ſoon after adopted in the province of York; theſe never obtained a parliamentary confirmation; and it has been therefore adjudged, upon the principles of law and the conſtitution, that they do not bind the laity, however the clergy may regard them. Strange's Rep. 1057.

CANONARCHA, or CANONARCHUS, a dignity in the Greek church, anſwering to the PRECENTOR in the Latin, or CHANTER in the Engliſh church.

The word is formed from κανων and αρχω, *beginning*, or *governing*; becauſe it belongs to this officer to ſet the canons, or church hymns, and to direct the choir in ſinging them.

A like officer we alſo find in the ancient monaſteries, under the denomination *cannarcha*, whoſe buſineſs was to beat the ſemantrum, or wooden inſtrument, whereby the monks were called to choir to ſing canons. There appear to have been ſeveral *cannarchæ* in the ſame monaſtery.

CANONE *al ſoſpiro*, in the Italian *Muſic*, a canon, the parts of which ſucceed each other by a *ſoſpiro*, that is, the time of a crotchet.

CANONESS, in the *Romiſh Church*, a woman who enjoys a prebend, eſtated, by the foundation, to maids; without their being obliged to renounce the world, or make any vows.

There are few of theſe, except in Flanders and Germany; they are rather looked upon as a ſeminary and retreat of girls for marriage, than an engagement for the ſervice of God.

CANONESSES *of St. Auguſtine*, or *Regular* CANONESSES, are a kind of religious, who follow the rules of St. Auguſtine; of which there are various congregations.

The order of *canoneſſes* was firſt inſtituted by Lewis the Meek, in the beginning of the ninth century.

CANONICA, in *Pneumatical Hiſtory*, an appellation given by Epicurus to his doctrine of logic.

It was called *Canonica*, as conſiſting of a few canons, or rules, for directing the underſtanding in the purſuit and knowledge of truth.

Epicurus's *Canonica* is repreſented as a very ſlight and inſufficient logic, by ſeveral ancients who put a great value on his ethics and phyſics.

The ſtreſs of Epicurus's *Canonica* conſiſts in his doctrine of the *criteria* of truth.

All queſtions in philoſophy are either concerning words or things: concerning things we ſeek their truth; concerning words, their ſignification: things are either natural or moral: and the ſenſes are either perceived by themſelves, or by the underſtanding. Hence, according to Epicurus, ariſe three *criteria* of truth, viz. ſenſe, anticipation or prænotion, and paſſion. The great ſource, or principle, of Epicurus's logic is, that the ſenſes are never deceived; and therefore that every ſenſation, or perception of an appearance, is true. Stanley's Hiſt. Phil. p. xiii. p. 35.

CANONICA is alſo uſed by ſome ancients to denote the art of muſic.

CANONICA is more particularly uſed to denote that ſpecies of muſic, which does not determine the intervals of ſounds by the ear, but by a canon or ſtretched chord See CANON.

CANONICAL, ſomething that belongs to, or partakes of the nature of a rule or canon.

Canonical amounts to much the ſame with what we otherwiſe call regular.

CANONICAL is an appellation more peculiarly given to thoſe writings which have been received as the rule of our faith and practice, and comprehended in the canon or catalogue of the Scriptures.

In which ſenſe, *canonical* ſtands contradiſtinguiſhed from *apocryphal*.

The conditions then requiſite to conſtitute a book *canonical* are, that it be allowed to be written by divine inſpiration, and that it be ſolemnly accepted, and conſigned by the church for a perpetual guide or rule of faith and practice.

Divines generally hold, that thoſe books only of the new Teſtament are to be accounted *canonical*, which were either written, or at leaſt approved and authorized, by the apoſtles.

Formerly they were not ſo well diſtinguiſhed as among us. In the firſt ages of the church, Dodwell obſerves, the genuine writings of the apoſtles uſed to be bound up together with thoſe now called ſpurious, and apocryphal; for that it was not manifeſt, by any public judgment,

which of them was to be preferred to the other; but latter times thought fit to make a separation.

The Jews allow of no book for *canonical*, but those written before or soon after the return from the Babylonish captivity, when the gift of prophecy ceased among them. Eusebius lays down three marks, by which the spurious writings forged by heretics, under the name of the apostles, were distinguished from the genuine and *canonical*. Hist. Eccles. lib. iii. cap. 25.

CANONICAL, *pay*, or *duties*. See CANON, and DEUTERO-*Canonical*.

CANONICAL is also an appellation given to those epistles in the New Testament, more frequently called catholic, or general epistles.

CANONICAL, *canonicus*, was also an appellation given to all the officers and ministers of a church or monastery, from the bishop or abbot to the meanest servant, including priests, monks, virgins, and all who were entered in canon, that is, in the matricula or register of the church.

CANONICAL *horses*, *caballi canonici*, was an ancient tax or tribute, imposed on certain provinces, whereby they were obliged to furnish the emperor with so many horses to mount his cavalry.

CANONICAL *hours*, are certain stated times of the day, configned, more especially by the Romish church, to the offices of prayer and devotion. Such are *matutini*, *laudes*, *prima*, *tertia*, *vespers*. In our country the canonical hours are from eight to twelve in the forenoon, before or after which marriage cannot be legally performed in any parish-church.

CANONICAL *initiation*, a regular and legitimate collation to a benefice, agreeable to the rules of the canon-law.

CANONICAL *letters*, in the *Ancient Church*, were a sort of testimonials of the orthodox faith, which the bishops and clergy sent each other, to keep up catholic communion, and distinguish orthodox Christians from Arians, and other heretics.

When they had occasion to travel into other dioceses, or countries, humility and recommendatory letters, also letters of peace, were sent to many species of *canonical letters*. See LITTERÆ.

CANONICAL *liberty*, a freedom to which certain churches are left, being granted by the ancient canons and usages established before the papal hierarchy was carried to its height: such is that which, of later days, the French call the *Gallican liberty*.

CANONICAL *life*, the method or rule of living prescribed by the ancient clergy who lived in community.

The *canonical life* was a kind of medium between the monastic and clerical lives.

CANONICAL *obedience*, is that submission which by the ecclesiastical laws the inferior clergy are to pay to their bishops, and religious, to their superiors.

CANONICAL *portion*, is much of the effects of a person deceased, as the canons allow to the parish church to which he belonged.

CANONICAL *punishments* are those which the church may inflict: such are excommunication, degradation, and PENANCE, in Roman catholic countries; also fasting, alms, whipping, &c.

CANONICAL *purgation*, were ancient methods of proving innocency, by ORDEAL PURGATION, &c.

CANONICAL *sins*, in the *Ancient Church*, those which were capital or mortal: such especially were idolatry, adultery, murder, heresy, and schism.

CANONICUM, in a general sense, denotes a tax, or tribute.

CANONICUM is more particularly used in the Greek church for a fee paid by the clergy to bishops, archbishops, and metropolitans, for degrees and promotions.

CANONICUM also denotes a due of first-fruits, paid by the Greek laity to their bishops, or, according to Du-Cange, to their parishes. The *canonicum* is assessed according to the number of houses, or chimnies, in a place.

The emperor Isaac Comnenus made a constitution for regulating the *canonicum* of bishops, which was confirmed by another made in 1086, by his nephew Alexis Comnenus. A village containing thirty fires, was to pay for its *canonicum*, one piece of gold, two of silver, one sheep, six bushels of barley, six of wheat-flour, six measures of wine, and thirty hens. Du-Cange, Gloss. Gr. tom. i. p. 578.

CANONIST, a person skilled in, or who makes profession of the study and practice of the CANON law.

Canonists and *Civilians* are usually combined in the same person. And hence the title of *doctor juris utriusque*, or *legum doctor*, usually expressed in abbreviature, LL. D. or J. U. D.

CANONIZATION, a declaration of the pope, whereby, after a great deal of solemnity, he enters into the list of saints some person who has lived an exemplary life, and wrought miracles; or, as is often the case, performed some singular service for the church, in which a principal part of the kind of merit consists.

The word *canonization* seems to be of later origin than the thing; there being no instance of the use of the word before the twelfth century, whereas St. Ulricus was *canonized* in the tenth. The term is form'd from *canon*; because the primitive *canonizations* were only orders of the popes, or bishops, whereby persons eminent for piety, &c. were inserted in the canon of the mass, that they might be commemorated in the services peculiar to those days, the use of martyrologies was unknown in the church.

Matthew Paris distinguishes two kinds of *canonization*; a *general*, and *particular*, the first made by a general council, or a pope; the second, by a bishop, a particular church, or a provincial council.

There are instances likewise of *canonization*, or at least of something very like them, by subosts.

At first, only martyrs were *canonized*; but by degrees they came to confessors, &c.

Canonization anciently consisted in inserting the saint's name in the sacred diptychs, or *canon* of saints, in appointing a proper office for invoking him, and erecting churches under his invocation, with altars for mass to be celebrated on; raising up the body from the place of its first burial, and the like ceremonies: by degrees other formalities were added; and processions were made with the saint's image in triumph; the day of his death was declared a festival and to render the thing still more solemn, Honorius III. in 1225, added several days indulgence to a *canonization*.

It is a great dispute among the learned, when the right of *canonizing*, which it is owned was anciently common to ordinaries, especially metropolitans and primates, with the pope, became first peculiar to the pope. Some say, Alexander III. made this reserve to the holy see. The Jesuits of Antwerp, in their Prophanum, assert, it was not established till two or three ages ago; and then by a mere custom, which passed tacitly into a law; which appears not to have been generally received in the tenth and eleventh centuries. Thomassin, in his ancient discipline, thinks it was generally allowed before pope Alexander III. but since has there we read of no saints *canonized* by any but the popes: and the archbishop of Vienne in France, and his suffragans, acknowledge it in an authentic manner in the year 1231, by a letter written to Gregory IX. desiring him to canonize Stephen, bishop of Die, who died in 1208. *Quia nemo*, say they, *quantalibet miracula præsumptive polleat, absque Dei per sanctæ ecclesiæ, aut canonizantis ejus, sive primi per solum appellatum ejus sanctitas fuerit approbata.*

CANONRY, or CANONICATE, the benefice filled by a canon.

Canonicate is distinguished from prebend, in that the prebend may subsist without the *canonicate*, whereas the *canonicate* is inseparable from the prebend. It is to the *canonicate*, not to the prebend, that the right of suffrages, and other privileges are annexed. See PREBEND.

CANOPUS, in *Astronomy*, a bright star of the first magnitude in the rudder of Argo, a constellation of the southern hemisphere. See ARGO.

The longitude of *Canopus*, as given by Halley, for the year 1700, is 10° 52′ of Cancer, and its southern latitude, 72° 49′. E. Noel, in 1697, found its right ascension 93° 54′, its declination *southwards*, 52° 19′. F. Feuille, in the beginning of March 1708, observed the declination of *Canopus* 52° 30′ 4″. F. Thomas, in January 1682, found the declination 52° 33′ 35″, its right ascension 93° 32′ 20″, longitude, 10° 52′, of Cancer, latitude southern, 75° 55′. Wolf. Lex. Math. p. 303, seq. Mem. Acad. Scienc. ann. 1711. p. 292, seq.

CANOPY, in *Architecture* and *Sculpture*, a magnificent kind of decoration, serving to cover, and crown an altar, throne, tribunal, pulpit, chair, or the like. See BALDACHIN.

The word is formed from the barbarous Latin *canopeum*, or *canopium*, *a veil spread over a bed to keep off the gnats*, from *canon*, a gnat.

Canopies are also borne over the head in processions of state, after the manner of umbrellas.

The *canopy* of an altar is more peculiarly called CIBORIUM.

The Roman grandees had their *canopies*, or spread veils, called *thalæ*, over their chairs: the like were also in temples over the statues of the gods. The modern cardinals still retain the use of *canopies*.

CANOPUS, in *Hydrography*, the name by which Salvian, and some other authors have called the CABLE *galeus*, and *muscle* a kind of mark.

CANQUIN, in *Commerce*, a sort of cotton cloth made in China with this cloth they make the first garment next their skin, which is properly their shirt.

CANSCHY, in *Japan*, is the name of a tree in Japan, from which the inhabitants of that country make their paper. See a particular account of the process, from the

Ephem. N. C. in the Coll. Acad. P. Etr. tom. iv. p. 144.

CANSTRISIUS, an officer in the church of Constantinople, whose business is to take care of the patriarchs pontifical vestments, assist in robing him, and during mass to hold the incense pot, and sprinkle holy water among the people, while the hymn of the Trinity is singing. The word is also written *Canstrisius*: it is usually derived from *Canistrum*, a name which some suppose given to the incense pot, others to the kind of basket in which the patriarchs vestments were kept. Du-Cange.

CANT, a quaint, affected manner of speaking, or writing, adopted chiefly by the lower sort.

Cant is originally derived from *Andrew Cant*, a Cameronian preacher in Scotland, who, by exercise, had obtained the faculty of talking in the pulpit in such a tone and dialect as was understood by none but his own congregation.

CANT, or *Canting language*, is also applied to words and phrases affected by particular persons, or professions for low ends, and not authorized by the established language. *Cant* is not restrained to the style of gypsies, thieves, and beggars, but possesses a large department in the politer provinces of the English language.

An anonymous author has given a *canting* dictionary, comprehending all the terms used in the several tribes of gypsies, beggars, shoplifters, highwaymen, footpads, and other clans of cheats and villains, with a collection of songs in the *canting* dialect. Lond. 1725. 8vo.

A writer in the Tatler, assigns divers sources of new words: as *phiz, hippo, mob, pozz, bamm*, &c. Tatl. N° 230.

The tea-language will most of it come under the denomination of *cant*: and the like fields of the terms in alchemy, heraldry, not to say in astrology, or even chemistry, pharmacy, &c. In reality, the difference between a *cant*-term, and a technical term is not easily assigned, unless we choose to restrain the former to words introduced out of folly, affectation, or imposture; and the latter to such as are introduced for the sake of clearness, precision, and significancy.

CANT is also used to denote a tile by section.

The origin of the word, in this sense, is dubious; it may come, according to *some*, from *quantum*, how much; according to others, from *canture*, to sing, or cry aloud; agreeable to which we sometimes also call it an *balcony*.

CANT is also a term used by some carpenters, principally in ship-building; when a piece of timber comes the wrong way in their work, they say *cant* it; i. e. turn it over.

Accordingly, *cant-timbers* are those which are situated at the two ends of a ship: and they are so called, because they are *canted*, or raised obliquely from the keel, and are hereby distinguished from those whose planks are perpendicular to it.

CANT is also popularly used for an angle or corner.

CANTABRIAN, the ancient language of the north-eastern part of Spain, in use before the country was subdued by the Romans.

Dr. Wallis seems to make the *Cantabrian* the ancient language of all Spain: which, according to him, like the Gaulish, gave way to a kind of broken Latin called *romance*, or *romanfe*; which by degrees was refined into the Castilian or present Spanish. But we can hardly suppose, that so large a country, inhabited by such a variety of people, spoke all the same language.

The ancient *Cantabrian*, in effect, is still found to subsist in the more barren and mountainous parts of the province of Biscay, Alsturia, and Navarre, as far as Bayonne, much as the British does in Wales; but the people only talk it: for writing, they use either the Spanish or French, as they happen to live under the one or the other nation. Some attribute this to a jealousy of foreigners learning the mysteries of their language; others to a poverty of words and expressions. The *Cantabrian* does not appear to have any affinity with any other known language, abating that some Spanish words have been adopted in it for things whose use the Biscayens were formerly unacquainted with. Its pronunciation is very disagreeable.

The Lord's prayer, in the *Cantabrian* tongue, runs thus: *Gure aita cerucian aicena, santifica bedi bere isena, etbor bedi bere resuma, egain bedi bere varendaco cerucn beceta larrosen ere, &c.*

CANTABRICA, in *Botany*, a name by which different authors call two different species of plants. The *cantabrica* of Pliny is the ranunculus. The *cantabrica* of Turner, the clove-gillyflower.

CANTABRICA is also a name used by Clusius and some others for the little narrow-leaved bind-weed. See CONVOLVULUS.

CANTABRUM, in *Antiquity*, a large kind of flag used by the Roman emperors, distinguished by its peculiar colour, and bearing on it some words or mottos of good omen, to encourage the soldiers.

CANTALIVERS, in *Architecture*, pieces of wood framed into the front, or sides of a house, to sustain the mouldings and eaves over it.

Cantalivers are the same with modillions, except that the former are plain and the latter carved. They are both a kind of cartouches set at equal distances under the corona of the cornice of a building.

CANTALIVER-CORNICE, is a cornice with *cantalivers* or modillions under it.

Those which project much are now out of fashion, and with good reason, especially in London, as they darken, by their heaviness, the upper chambers at least; and are apt to spread, and communicate fire, in case of a misfortune of that kind; besides, that in the present mode of building, use, convenience, and simplicity are more studied than ornament.

CANTAR, or CANTARO, an eastern weight, of different value in different places, equivalent at Acra in Turky to 603 pounds, at Tunis and Tripoli to 134 pounds.

CANTAR is also an Egyptian weight, which is denominated a *cantar*, and consists of a hundred, or of an hundred and fifty *rotoli*, according to the goods they are to weigh.

CANTARO is also an Egyptian weight, which at Naples is equivalent to 75 pounds, at Genoa to 150 pounds. At Leghorn there are three kinds of *cantaro*, one weighing 150 pounds, another 144, and a third 160 pounds.

CANTARO is also a Spanish liquid measure, in use especially at Alicant, containing three gallons.

CANTARO is also a measure of capacity, used at Cachin, containing four *rubics*, the rubi 32 rotolos.

CANTATA, in *Music*, a sort of song or composition, intermixed with recitatives, airs, and variety of motions; ordinarily intended for a single voice, with a thorough bass; sometimes for two, three, or more voices, with one or more violins, or other instruments.

The *cantata* passed from Italy into France, and thence to us: it has something in it extremely fantastical and capricious, and seems only to please by its variety. The word in Italian, where it signifies the same thing.

CANTATRICES, in *Middle Age Writers*, hired weepers, and waiters at funerals.

CANTENS, in *Military Language*, are tin vessels in the form of square bottles, used for carrying water to supply the soldiers in camp.

CANTEL, *cantellus*, in *Ancient French Writers*, denotes a custom of selling by the lump, without tale or measure.

Spelman derives the word from *cantus*, and defines it by over measure, or what is added over and above strict measure. Kennet derives it from the old word *cant*, a hundred, q. d. the sale of about a hundred weight; answering to what we now call the taking of a hundred pound on content; as when we take it in a bag, sealed up without telling the pieces.

CANTERBURY-BELL, in *Botany*. See CONVOLVULUS.

CANTERII, or CANTHERII, in *Ancient Architecture*, rafters or joists of a house, which reach down from the ridge to the eave.

CANTHARÆ, among the *Ancients*, a kind of candlestick. See BRANCH.

CANTHARIAS *lapis*, in *Natural History*, a name given by some writers to a fossile substance supposed to resemble a beetle. We sometimes meet with parts of the ichthyopeita or bony parts of fishes, which are ridged longitudinally, much in the manner of the outer wing of some of the beetle tribe; and from their size and shape, which is an oblong, or oval one, of the bigness of a common beetle, and sometimes of the largest, and at others of the very smallest kinds; these have been called by some petrified beetles and *cantharias lapideas*; others have extended the name to such species of amber as have in them the body or any fragment of the beetle of any species.

CANTHARIDES, in *Medicine*, a kind of poisonous insects, with wings and feet like beetles; much used as an epispastic for the raising of blisters.

The stimulating power of *cantharides* is caused by a very acrid refinous substance contained in their insects, two scruples of which Neumann extracted from four ounces of *cantharides* by spirit of wine.

The word is formed from *cantharus*, the name of a sort of beetle, and called also *scarabæus cornutus*. The *cantharides* are properly a species of the beetle or scarab kind.

Cantharides, called also *Spanish flies*, though they ought rather to be denominated *Spanish beetles*, are produced from a kind of little worms, hatched on wheat, the leaves of the poplar, &c. There are various kinds of *cantharides*, but all of a greenish and golden line; the best are those which appear with different colours, having yellow lines running across their wings, thick, and fresh. They are killed by exposing them over a very strong vinegar, which is made to boil for that purpose; after which they are dried, and may be preserved a year or two.

Cantharides are very sharp and corrosive, abounding with a sub-

a fubtile, caustic, volatile falt; whereby they become exceedingly inſerious to the bladder, ſo as to ulcerate it, even when applied externally, if ſuffered to lie on too long. They are much commended in fevers, as they raiſe and ſtrengthen a low trembling pulſe, give relief in delirious ravings, ſoporiferous ſtupors, loſs of reaſon, &c. (the common ſymptoms of high and dangerous fevers); they often alſo reduce continual fevers to regular and diſtinct remiſſions; and to make way for the bark; cleanſe and open the obſtructed glands and lymphatics; bring on critical ſweats, &c.

Dr. Morgan accounts for theſe effects of *cantharides* thus: "the ſubtile and volatile pungent parts, of which the "*cantharides* conſiſt, being carried into the blood, and "paſſing with the lymph or ſerum into the glandules "pipes, and there by diſſolving, attenuating, and rare"fying the viſcid emotions of the lymph; and by its "oozing the nervous coats of the veſſels, they throw "off their ſtagnant fluidities, and thus reſtore the cir"culation and free drain of lymph from the arteries to "the veins; cleanſe the expiratory glands, and bring "on critical ſweats and urines. Thus, the extremely "ſubtile, active, and pungent volatile ſalts, derived from "the *cantharides*, purge the glands and lymphatics uni"verſally much after the ſame manner as common ca"thartics do the guts." Philoſoph. Principl. of Medicine, p. 304.

The ancients held them a poiſon when taken internally, undoubtedly on account of their tendency to ulcerate the bladder. Yet ſome moderns, as Langius, Bartholin, and others, have ventured to give them internally, ſupported by the authority of Hippocrates, who appears to have given them in dropſies and jaundices: and in the Philoſophical Tranſactions, we have inſtances of their internal uſe, and that with ſucceſs, by Mr. Young, in dropſical and other caſes; ſometimes mixed with camphor, and ſometimes without; only well waſhed down with large draughts of poſſet, piſſan, emulſions, or the like. The form wherein he tells us he uſes to adminiſter this fiery inſect, is that of a ſoft pill, or bolus, compoſed of three *cantharides pulver. Vrech. & Myrrhæ* 5 ß. *Sen. Anal. pr.* vi. *Reb. Lycopf. q. ſ.* This, in ſtubborn ſuppreſſions of the menſes and lochia, in difficult childbirth, and retention of the ſecundines, he finds does wonders: he adds, that the heat or pain it occaſions in the neck of the bladder, is much ſhort of what he has an hundred times ſeen, and ſometimes felt, from the application of an epiſpaſtic to the back.

Grosnault has a treatiſe expreſs on the uſe internal of *cantharides*, wherein he recommends them, eſpecially againſt ulcers in the bladder, for which he ſuffered a perſecution from the college of phyſicians, though farther experience has ſhewn he had juſtice on his ſide.

Dr. Morgan propoſes a tincture of *cantharides*, made with the *ſtone cantharis*, as good in the DIABETES.

Their principal uſe, however, is in veſicatories, to raiſe bliſters on the ſkin; and by that means to turn off and diſcharge ſome ſhare of ill humours.

Cantharides are ſometimes applied to the temples for the tooth-ach: the Germans uſe them in ſeveral diſeaſes of horſes. They muſt be choſen new, dry, and whole: they will not keep above two years, without ſpoiling or moulde ring into a duſt, which is of no uſe.

CANTHARIS. *See* GLOW-*worm*.

CANTHARUS *of a* FOUNTAIN, among Roman *Writers*, denotes the part, or apparatus, out of which the water iſſued.

It was made in divers forms, ſometimes that of a ſhell, at other times in that of an animal, which yielded water at its mouth, eyes, and the like.

CANTHARUS, in *Eccleſiaſtical Writers*, denotes a fountain, or ciſtern in the middle of the *atrium*, before the ancient churches, wherein perſons waſhed their hands and faces before they entered.

CANTHARUS, in *Ichthyology*, the name of a ſea-fiſh much reſembling the ſparus and targus in ſhape, but of a duſkier and blacker colour, covered with ſmall ſcales, and not marked with the annular black ſpots which both theſe fiſhes have near the tail. It is common in the Mediterranean, and is frequently brought to market in Rome, &c. being eſteemed a very well-taſted fiſh.

The *cantharus* of the ancients is called by Artedi the *ſtar-eyed* SPARUS, with longitudinal and parallel yellow lines on each ſide. Gesa calls this fiſh *ſcarabæus*.

CANTHARUS *auriculæ*. *See* OIL BEETLE.

CANTHUS, in *Anatomy*, the corner or angle of the EYE; formed by the commiſſure or joining of the upper and lower eyelids.

That corner next the noſe, is called the *great*, *inner*, and *domeſtic canthus*; and by ſome phyſicians the *foveolum*.—The other, towards the temples, is called the *little*, or *external canthus*.

CANTHUS, in *Chemiſtry*, the lip of a veſſel; or that part of the mouth of a veſſel which is a little hollowed, or depreſſed, for the eaſy pouring off a liquor.

Hence, to pour by decantation, *is to pour through that* place.

CANTICLES, a canonical book of the Old Teſtament, otherwiſe called the Song of Solomon; by the Jews, the Song of Songs, *Canticum Canticorum*.

The book of *Canticles* is uſually ſuppoſed to be an epithalamium compoſed by Solomon, on occaſion of his marriage with the king of Egypt's daughter. But thoſe who penetrate farther into the myſtery, ſecond to that in it the marriage of Jeſus Chriſt with human nature, the church, and good men.

On this principle the *Canticles* is held to be a continued allegory, wherein, under the terms of a common wedding, a divine and ſpiritual marriage is repreſented.

The Jews themſelves, apprehending the book liable to be underſtood in a groſs and carnal manner, prudently prohibited the reading of it before the age of thirty, and the ſame uſage anciently obtained in the Chriſtian church. Orig. Præf. in Cant. Teod. Op. tom. 1. p. 985. Hieron. in Ezek. Wolf. Bib. Heb. tom. 1. p. 126.

Among the ancients, Theodore Mopſueſtenus rejected the book of *Canticles*, as not divine. Divers rabbins have alſo queſtioned its being written by inſpiration. It is acknowledged that the name of God is not once found in it. Mr. Whiſton has a diſcourſe expreſs to prove, that the *Canticles* is not a ſacred book of the Old Teſtament. He alledges it indeed to have been written by king Solomon, the ſon of David, but aſſerts, that it was compoſed at the time when that prince, blinded by his concubines, was ſunk in filthy love, and even idolatry. This he chiefly infers from the general character of vanity and diſſoluteneſs which reigns through the *Canticles*, in which there is not, according to Whiſton, one thought that leads the mind toward religion, but all is wordly and carnal, to ſay no worſe. For the myſtic ſenſe, he aſſerts it to be without any foundation, and that the book is not cited as canonical by any writer before the deſtruction of Jeruſalem. Mr. Whiſton will have it to have been taken into the canon between the years 77 and 128, when allegories came in vogue, and the rabbins began to corrupt the text of Scripture.

CANTIMAROONS, or CANTIMAROONS, a kind of floats or rafts, uſed by the inhabitants of the coaſt of Coromandel to go a fiſhing in, and to trade along the coaſt. They are made of three or four ſmall canoes, or trunks of trees dug hollow, and tied together with cocoa ropes, with a triangular ſail in the middle, made of mats. The perſons who manage them are almoſt half in the water, there being only a place in the middle a little raiſed to lay their merchandiſe; which laſt particular is only to be underſtood of the *trading cantimaroons*, and not of thoſe who go fiſhing.

CANTING-*arms*, among *Heralds*, are thoſe ARMS which expreſs their owner's ſurname.

Thoſe anſwer to what the French call *armes parlantes*; they are a ſort of rebuſes, and are never preſumed to be noble.

CANTING-*pieces*, in *Ship Building*, the ſame as *cant-timbers*. *See* QUOIN.

In Harris's Lex. Techn. they are called *canting-rules*, but this ſeems an error of the preſs. Manwayring calls them *canted-quoynes*.

CANTO denotes a part or diviſion of a poem, anſwering to what is otherwiſe called a book.

The word is Italian, where it properly ſignifies *ſong*.

Taſſo, Ariotto, and ſeveral other Italians, have divided their longer or heroic Poems into *cantos*. In imitation of them Scarron has alſo divided his Gigantomachia, and Boileau his Lutrin, into *chants*, or *ſongs*. The like uſage has been adopted by ſome Engliſh writers, as Boiſter, who divides his Bubalbrun, and Dr. Garth his Diſpenſary, into *cantos*. A late tranſlator of part of Virgil's *Æneid* has even ſubdivided a book of Virgil into ſeveral *cantos*.

CANTO, in the *Italian Muſic*, ſignifies a ſong: hence *canto ſimplice* is where all the notes or ſtrokes are equal, called alſo *canto ſemplice*; *canto figurato*, that where the figures are unequal, and expreſs different motions.

CANTO alſo ſignifies the treble part of a ſong: hence *canto tenorizante*, the treble of the little chorus; *canto ripieno*, the treble of the grand chorus, or that which ſings only now and then, in particular places.

Canto ſignifies the firſt treble, unleſs ſome other word be added to it, as *ſecondo*; in which caſe it denotes the ſecond treble.

CANTON, a quarter of a city, conſidered as ſeparated and detached from the reſt.

The word ſeems formed from the Italian *cantone*, a *ſquare ſtone*, or *corner ſtone*.

CANTON is alſo more frequently uſed for a ſmall country, or diſtrict under its ſeparate government.

Such are the thirteen Swiſs *cantons*; each of which forms

a republic apart; but all are leagued together, and constitute what is called the Helvetic body.

CANTON, in *Heraldry*, is one of the nine honourable ordinaries; being a square portion of the escutcheon parted from the rest.

It has not any fixed proportion; though regularly it should be less than a quarter; it is often only a ninth part, and most as an addition, or difference, frequently to express bastardy. The *canton* is sometimes placed at the right corner, and sometimes at the left; in which latter case, it is called a *canton sinister*. Its form is expressed in *Tab. Heraldr. fig.* 12.—He bears ermin a *canton* argent, charged with a chevron gules.

CANTON is also used for the spaces left between the branches of a cross, or lattice.

CANTONED, a word used in *Architecture*, when the corner of a building is adorned with a pilaster, an angular column, rustic quoins, or any thing that projects beyond the naked of the wall.

CANTONED, CANTONNE, or CANTONNEE, in *Heraldry*, is when the four *cantons*, or spaces round a cross, or lattice, are filled up with any pieces.—He bears gules, a cross argent, *cantoned* with four scallop shells.

The word is also used, when there are little pieces in the *cantons*, or places of any principal figure of an escutcheon. Thus the father of Lenos is *cantoned* with four *tales*.

CANTONING, in *Middle Age Writers*, denotes the dividing a thing into hundreds, or selling it by hundred weights, or hundreds in tale.

CANTONING, in the *Military Art*, is a method of quartering troops in a town, where the garrison is so numerous, that several regiments must be quartered on the inhabitants for want of casrtas, or barracks, to contain them.

In this case they divide the town into as many parts as there are regiments to be so quartered, that the officers and soldiers of each may have a distinct part to themselves. This, in the military phrase, is called *cantoning of a town*.

CANTRED, or CANTRY, denotes a district or division of an HUNDRED towns or villages.

The word is British, compounded of *cant*, *hundred*, and *tref*, or *trev*, *town* or *village*.

In Wales the counties are divided into *cantreds*, as those in England are into hundreds. Anglesey, in particular, is divided into three *cantreves* or *cantreds*, which are each subdivided into six *cantons* or *commots*, each *canton* containing about forty *trevs* or townships. The general partition of Wales into *cantreds* and *cants* is very ancient. Rowl. Monath. Ant. Edit. 1. c. p. 176, &c.

CANVAS, or CANVASS, a coarse sort of linen or hempen cloth, usually woven open, and regularly, in little squares; serving for divers domestic purposes, and especially for the ground of tapestry-work, and painting. We have divers sorts and denominations of *canvass*, most of them imported from abroad; as Dutch, Barras, and Hessian *canvass*; packing *canvass*; guttings and ravens *canvass*; peledavies, ebbing, or Queenborough *canvass*, working *canvass*, for boots or cushions, narrow, broad, and broadest.

CANVAS also is the cloth on which painters usually draw their pictures; the *canvass* being smoothed over with a slick-stone, then lined, and afterwards whited over, makes what the painters call their *primed cloth*, on which they draw their first sketches with a coal or chalk, and afterwards finish with colours.

CANVAS is also a name sometimes given to sail-cloth.

CANVAS-*bags*, in the *Military Art*, contain about a cubic foot of earth or sand, with which they are filled. Their use is to raise a parapet in haste, or to repair one, when beaten down. See SACKS *of earth*.

CANVAS is also used among the French, for the model, or first words, whereon to air, or piece of music, is composed, and given to a poet to regulate and finish. The *canvass* of a song, contains certain notes of the composer, which shew the poet the measure of the verses he is to make. Thus De Lorbye, he has *canvass* for ten sonnets against the Muses.

CANULA. See CANNULA.

CANUTI *son*. See TRITON.

CANZONE, in the *Italian Music*, in the general, signifies a song, particularly a sort of Italian ode, or lyric poem, consisting of several stanzas, though all which the same order and disposition of verses, measures, and rhimes, are observed as in the first.

The *canzone* is usually very long, and may be set to music in much the same style with the CANTATA.

The *canzone* is a composition somewhat resembling, but less elaborate, than the MADRIGAL. It admits of little figures and points, and seldom exceeds three parts; though the name is sometimes given to a song for one voice.

There are also pieces of symphony without words, called *canzone*, much the same with sonatas.

The word *canzone* in sonatas serves to indicate that the airs it is put under are airs of brisk movement; such as are the usual figures otherwise marked with ALLEGRO.

CANZONETTA *denotes a little canzone*. See CANZONET.

The word is a diminutive of the Italian *canzone*, or *canzon*.

CANZURI a name given by some authors to a peculiar kind of camphor more esteemed than any other sort. Some have supposed it thus called from *Kanzur* or *Cansur*, the name of a place where they suppose it to be produced, which seems the more probable opinion, though Scaliger rejects it, and will have it that this fine camphor had its name from a certain gum called *canzur*, which, according to Garcias, and some others, is frequently mixed with the camphor by the people who collect it for sale.

This gum, he says, is called also *canduras*; and that it is somewhat like the crude amber, only that it is whiter. There is this great objection to this being the true sense of the word, that it expresses an adulterated kind, which it is scarce probable should be true of that which all the authors who have mentioned this kind of camphor, have agreed in calling the best and most excellent of all the sorts.

CAOUANNE, in *Zoology*, the name of a species of tortoise very much resembling the JOUANNAS of the Brasilians, but having a thicker shell, and a harder, rough, and stringy flesh of a very bad taste.

CAOUKE, in the *Turkish Dress*, a high flat turban, worn by the janissaries, or heads of the chambers of janizaries, when they go in procession.

CAOUTCHOUC, in *Natural History*, is one name, among many more, given to a very elastic resin, the produce of a tree which grows along the banks of the river of the Amazons. This tree grows to a very great height, perfectly straight, having no branches, except at top, which is but small, exceeding no more than a circumference of ten feet. It leaves bear some resemblance to those of the *manioc* (*jatropha manihot*); they are green on the upper part, and white beneath. The seeds are three in number, and contained in a pod, consisting of three cells, not unlike those of the *ricinus*, or *palma Christi*, and in each of them there is a kernel, which being thrashed and boiled in water produces a thick oil or fat, answering the purposes of butter in the cookery of the country. The juice, which is applied to a great variety of uses, is gathered chiefly in time of rain, because then it may be collected in greater quantities, it flows then most abundantly. It is extracted from the tree by simple incision, and flows in the form of a milky liquor. The means employed to inspissate and indurate it, M. de la Condamine says, are not a profound secret. M. Bomare, and others, affirm, that it thickens and hardens gradually, by being exposed to the air; and as soon as it acquires a firm consistence, it manifests a very extraordinary degree of flexibility and elasticity. Accordingly the Indians made boots of it, which water cannot penetrate, and which, when smoaked, have the appearance of real leather. Bottles are also made of this substance, to the necks of which are fastened hollow reeds, so that the liquor contained in them may be squirted through the reeds or pipes by pressure. One of these filled with water is always presented to each of the guests at their entertainments, who never fail to make use of it before eating. This whimsical custom led the Portuguese in that country to call the tree that produces this resin *pao de seringa*, and hence the name of *seringas* is given both to the tree, and to its resinous production.

Flambeaux, an inch and a half in diameter, and two feet long, are likewise made of this resin, which give a beautiful light, have no bad smell, and burn twelve hours. A kind of cloth is also prepared from it, which the inhabitants of Quito apply to the same purposes as our oil-cloth and tail-cloth. It is formed, by means of earthen moulds, into a variety of figures for use and ornament. Ever since this resin has been known in Europe, its chemical qualities, and other unfolding properties, have been very diligently investigated. It was soon found that it may be softened by warm water; but it could neither be dissolved in water, nor in spirit of wine; and though it may be dissolved in certain oils, yet the solution remains soft, of a viscous consistence, and totally incapable of being reduced to a solid and elastic state. Many attempts were made for dissolving this substance, without destroying its peculiar properties. M. Macquer, in particular, employed various oils, camphor, and different kinds of salts, for this purpose, without effect. He made use of Papin's digestor, and of the milky juices of some of our European plants, and particularly of the *milk-thistle*, without success. In some of these operations, the resin was not at all affected; and,

in others, it was altered or destroyed. At last he had recourse to the *vitriolic æther*, which quickly and easily dissolved this anomalous substance; forming with it a transparent tincture, and after evaporation leaving the resin behind, possessed of its former consistence, elasticity, and other properties, and of such a form as he chose to give it, while in its liquid state. He observes, however, that two pints of the best æther, obtained by rectifying eight or ten pints of the common æther by a gentle heat, must be used, in order to the success of the operation. The distinguishing properties of this substance, viz. its solidity, flexibility, and elasticity, and its quality of resisting the action of aqueous, spirituous, saline, oily, and other common solvents render it extremely fit for the construction of tubes, cushions, and other instruments, in which these properties are wanted. In order to form this resin into small tubes, M. Macquer prepared a solid, cylindrical mould of wax of the desired size and shape; and then dipping a pencil into the æthereal solution of the resin, daubed the mould over with it, till he had covered it with a coat of resin of a sufficient thickness. The whole piece is then thrown into boiling water; by the heat of which the wax is soon melted, and rises to the surface, leaving the resinous tube completely formed behind. This substance is very useful in drawing, &c. for erasing the strokes of black lead pencils, and is popularly called *rubber*, and *Indian-eater*.

A resin similar to this was not long since discovered by M. Poivre, in the Isle of France; and there are various milky juices extracted from trees in America and elsewhere, which by previous mixtures and preparations are formed into an elastic resin, but of an inferior quality to that of Cayenne. Hist. de l'Acad. Roy. des Scient. 1763. Ib. 1768. Ib. 1769.

CAP, a garment serving to cover the head, and made nearly of the figure thereof.

The æra of *caps* and hats is referred to the year 1440, the first seen in these parts of the world being at the entry of Charles VII. into Rouen: from that time they began, by little and little, to take place of the hoods, or chaperoons, that had been used till then. M. le Gendre, indeed, goes farther back; they began, says he, under Charles V. to let fall the angles of the hood upon the shoulders, and to cover the head with a cap, or bonnet: when this cap was of velvet, they called it *mortier*; when of wool, simply *bonnet*: the first was laced, the latter had no ornament, besides two horns, raised a moderate height one of which served in covering and uncovering. None but kings, princes, and knights, were allowed the use of the *mortier*.

The *cap* was the head-dress of the clergy and graduates. Paſquier says, that it was anciently a part of the hood worn by the people of the robe; the skirts whereof being cut off, as an incumbrance, left the round *cap* an easy commodious cover for the head; which round *cap* being afterwards assumed by the people, those of the gown changed it for a square one, first invented by a Frenchmen, called Patrouillet: he adds, that the giving of the *cap* to the students in the universities, was to denote, that they had acquired full liberty, and were no longer subject to the rod of their superiors; in imitation of the ancient Romans, who gave a *pileus*, or cap, to their slaves, in the ceremony of making them free; whence the proverb, *Recepit servum ad pileum*. Hence, also, on medals, the *cap* is the symbol of liberty, whom they represent holding a *cap* in her right hand, by the point.

The Romans were many ages without any regular covering for the head: when either the rain or sun was troublesome, the lappet of the gown was thrown over the head; and hence it is that all the antient statues appear bareheaded, excepting sometimes a wreath, or the like. And the same usage obtained among the Greeks, where, at least during the heroic age, no *caps* were known.

The sorts of *caps* or covers of the head in use among the Romans on divers occasions, were the *pileus*, *pileus*, *cucullus*, *galerus*, and *pallium*; the differences between which are often confounded by ancient as well as modern writers.

The French clergy wear a shallow kind of *cap*, called *calotte*, which only covers the top of the head, made of leather, satin, worsted, or other stuff.

The *red cap* is a mark of dignity allowed only to those who are raised to the cardinalate.

The secular clergy are distinguished by black leathern *caps*, the regulars by knit and worsted ones.

The Chinese have not the use of the hat, like us; but wear a *cap* of a peculiar structure, which the laws of civility will not allow them to put off; it is different for the different seasons of the year: that used in summer, is in form of a cone, ending at top in a point. It is made of a very beautiful kind of mat, much valued in that country, and lined with fattin: to this is added, at top, a large lock of red silk, which falls all round as low as the bottom; so that, in walking, the silk fluctuating regularly on all sides, makes a graceful appearance: sometimes, instead of silk, they use a kind of bright red hair, the lustre whereof no weather effaces. In winter they wear a plush *cap*, bordered with martin's or fox's skin; as to the rest, like those for the summer. Nothing can be neater than these *caps*; they are frequently sold for eight or ten crowns; but they are so short, that the ears are exposed.

CAP, *square*.—The *cap*, or bonnet, is a mark, or ornament of certain characters; thus churchmen, and the members of universities, students in law, physic, &c. as well as graduates, wear *square caps*. In most universities, doctors are distinguished by peculiar *caps*, given them in assuming the doctorate. Wicklif calls the canons of his time *hornedi*, from their *cap*. Paſquier observes, that, in his time, the *caps* worn by the churchmen, &c. were called *square caps*; though, in effect, they were round, yellow *caps*.

The *cap* is sometimes also used as a mark of infamy: in Italy the Jews are distinguished by a *yellow cap*; at Lucca by an *orange one*. In France, those who had been bankrupts were obliged even after to wear a *green cap*, to prevent people from being imposed on in any future commerce. By several arrets in 1584, 1622, 1628, 1688, it was decreed, that if they were at any time found without their *green cap*, their protection should be null, and their creditors impowered to call them into prison: but the sentence is not now executed.

CAP *of maintenance*, one of the regalia or ornaments of state belonging to the kings of England, before whom it was carried at the coronation and other great solemnities; and also of the mayors of several cities in England.

CAP *of a gun*, is a piece of lead which is put over the touch-hole of a gun, to keep the priming from being wetted or spilt.

To cap, is laid of a ship in the trials of the running or setting of currents.

CAP, in a ship, is a square piece of timber, put over the head, or upper end of a mast, having a round hole to receive the mast. By these *caps*, the top-masts, and top-gallant-masts, are kept steady and firm in the respective trees, where their feet stand: as those of the lower-masts do in the steps. See *Nav. Sheep. fig.* 1. n. 31. 58. 76. Vol. 113. 143. and *fig.* 1. n. 15.

CAP, in *Chemistry*, signifies the piece which terminates the top of a *mixing* FURNACE.

CAP, or *great* CAP, in *Heraldry*, a denomination of a kind of compendious baudage, serving for almost all occasions of the *head*, being in figure not unlike a helmet.

Among chirurgical instruments we meet with a *silver cap*, *pileolus argenteus* (though of late also made of wood, or even white wax), perforated at both ends, applied to the paps of nursing women, when ulcerated, for the more commodious giving of suck.

CAP, in *Physiology*, a name given to the husk or green succulent coat which covers the upper part of a nut, and connects it to the parent tree.

The *cap* consists of a pilling and parenchyma derived from the bark, and ramulets from the ligneous body of the branch.

CAP *of a* MUSHROOM, is the head or superior part expanded over the foodstalk, somewhat in manner of a canopy, or umbrella.

CAP, *black*, in *Zoology*. See PEWIT.

CAP, *Neptune's*. See NEPTUNE.

CAP, *priest's*, in *Fortification*. See BONNET *à prêtre*.

CAP-*merchant*, in a trading ship, is the same officer who is called purser on board a man of war. The French call him writer (*écrivain*.) He is appointed by the merchant to whom the ship belongs, to take care that nothing be embezzled or squandered away.

CAPACITY, in a general sense, an aptitude, or disposition to retain or hold any thing.

Our law allows the king two *capacities*, a *natural*, and a *political*: in the first he may purchase land to him, and his heirs; in the latter, to him, and his successors.—The clergy have the like.

CAPARASON, or CAPARISON, the covering or clothing laid over an horse; especially a sumpter, or horse of state.

The word is Spanish, being an augmentative of *capa*, *cape*, *hood*.

Anciently the *caparasons* were a kind of iron armour, wherewith horses were covered in battle.

CAPASH, a kind of head-dress worn by the women of Candia. It is of a stiffened fine muslin, and is made so

as to stand up very high, and extends out a great way on the right side. Pococke's Egypt. vol. ii. part. ii. p. 10.

CAPE, in *Geography*, a head-land; or a piece of land running out beyond the rest, into the sea.

Sicily was called by the ancients *Trinacria*, by reason of its three *capes*, or promontories, represented on medals, by three naked legs joined together at the top of the thigh, and bent at the knee; which pretty nearly resembles the triangular figure of that island.

CAPE, in *Law*, a writ touching pleas of lands and tenements; so termed, from the word which carries the chief intention or end of it.

Cape is of two kinds, the *magnum* and *parvum*; which in their effect are alike, as to the taking hold of things immoveable; though in certain circumstances they differ: 1. In that the *cape magnum*, or *grand cape*, lies before; and the *cape parvum*, or *petit cape*, after appearance. 2. *Cape magnum* summons the defendant to answer the default; and besides to the demand out: *cape parvum* only to the default. It is called *petit cape*, not because of its small force; but because it is contained in few words.

CAPE *magnum* is thus defined in the old Nat. Brev. "Where a man hath brought a *præcipe quod reddat* of a "thing that touches pleas of land, and the tenant makes "default at the day to him given in the original writ; "then this writ shall be for the king to take the land "into his hands; and if the tenant come not at the day "given him by the writ, he loses his land."

CAPE *parvum*, or *petit cape*, is thus defined, ibid. "Where "the tenant is summoned in plea of land, and comes "at the summons, and his appearance is recorded; and "at the day given him, prays the view; and having it "granted, makes default; then shall this writ issue for "the king, &c."

CAPE *ad valentiam*, a species of *cape magnum*, so called from the end to which it tends: it is thus described. "Where "I am impleaded of lands, and I vouch to warrant an- "other, against whom the summons *ad warrantandum* "hath been awarded, and the sheriff comes not at the "day given; then, if the defendant recover against me, "I shall have a writ against the vouchee; and shall re- "cover so much in value of the lands of the vouchee, if "he has so much: otherwise, I shall have execution of "such lands and tenements as descend to him in fee; "or, if he purchase afterwards, I shall have a re-sum- "mons against him: and if he can say nothing, I shall "recover the value."

CAPEDUNCULA, in *Roman Antiquity*, the vessels wherein the sacred fire of Vesta, was preserved. See VESTALS.

CAPELAN, in *Ichthyology*, a name given by some authors to the small species of whiting called by the Venetians *molly*, and by authors the *asellus minimus minutus*, and *merlangus*.

CAPELINE, a kind of bandage used by the French surgeons in cases of amputations; consisting of a roller with two equal heads.

CAPELLA, in *Astronomy*, a bright star of the first magnitude, in the left or preceding shoulder of the constellation AURIGA.

CAPELLA, in *Ornithology*. See LAPWING.

CAPER-*bush*, *Capparis*, in *Botany*, a genus of the *polyandria monogynia* class. Its characters are these: the flower hath four large roundish petals, and a great number of slender stamina. In the midst of these arises a single style, longer than the stamina, with an oval germen, which afterward becomes a fleshy turbinated capsule with one cell, filled with kidney-shaped seeds. Linnæus reckons thirteen and Miller ten species. The first is the common *caper*, whose full grown flower-bud is pickled, and brought to England annually from Italy and the Mediterranean. This is a low shrub, which generally grows out of the joints of old walls, the fissures of rocks, and among rubbish, in most of the warm parts of Europe. Some say the plant grows in Oxfordshire, and might doubtless be propagated in other places. In England, broom-buds pickled are frequently substituted for *capers*. When the *capers* are budded for flowering, the shoots are cut away, and the leaves and flower-buds stript off; and being passed through a sieve, the *capers* are thereby separated from the leaves.

This is a speedy way, without which they would come too dear for common use.

They are dried in a shady place; then infused in vinegar; to which, at last, salt is added: after which they are put up in barrels to be used as a pickle, chiefly in sauces; and sometimes also in medicine, as being very aperitive, and entering certain compositions for diseases of the spleen.

All the *capers* sold throughout Europe, are brought from about Toulon, in France; except some small salt *capers* from Majorca, and a few flat ones from about Lyons.

The bark of the *caper*-tree, when dried, is much prescribed by the French physicians in oppilations of the spleen.

CAPER, *bean*. See BEAN-*caper*.

CAPERS, *long*, are the style or pistil of the flower which grows into a fruit, long and round like an olive or acorn when ripe, containing divers hard brown seeds, like the grains of grapes.

CAPERS, *trifoliate*, are produced by a plant formerly brought from India; thus called, because the bottom of the calyx of the flower resembles the *capuche* of the religious of St. Francis.

CAPER is also a vessel used by the Dutch, for trolling and taking prizes from the enemy.

In which sense, *caper* amounts to the same with PRIVATEER.

Capers are commonly double-officered, and crowded with hands even beyond the rates of ships of war, because the thing chiefly in view is boarding the enemies.

CAPH, a Jewish measure of capacity for things estimated by Kimahi at the 30th part of the log, by Arbuthnot at the 36th part of the hin, or 3rd of the scah, amounting to five eighths of an English pint.

The *caph* does not occur in Scripture as the name of any measure.

CAPHAR, a toll, or duty, imposed by the Turks on the Christian merchants, who carry or send merchandizes from Aleppo to Jerusalem.

The *caphar* was first levied by the Christians themselves, when masters of the Holy Land, for the support of troops and forces posted in the most difficult parts, to watch the Arabs, and prevent their pillages. But the Turks, who have continued, and even raised the toll, abuse it; exacting arbitrary sums of the Christian merchants and travellers, on pretence of guarding them from the Arabs; with whom they yet frequently keep an understanding, and even favour their robberies.

CAPHRA, the name with *camphor*. The Arabians call it caphur and color. The authors who have written full of the navigation and trade of the East Indies, have distinguished three kinds of camphor, which they say are put to different uses, and bear a different price in the Indies. See CAMPHOR.

CAPI-AGA, or CAPI-AGASSI, a Turkish officer, who is governor of the gates of the Seraglio; or grand-master of the Seraglio.

The *capi-aga* is the first dignity among the white eunuchs: he is always near the person of the grand signior: he introduces ambassadors to their audience: nobody enters, or goes out of the grand signior's apartment, but by his means. His office gives him the privilege of wanting the timbrel in the Seraglio, and of going every where on horseback. He accompanies the grand signior to the apartment of the sultanas, but stops at the door without entering. His appointment is very moderate; the grand signior bears the expence of his table, and allows him at the rate of about forty French livres per day; but his office brings him in abundance of presents; no affair of consequence coming to the emperor's knowledge without passing through his hands. The *capi-aga* cannot be bastinadoed when he quits his post.

CAPIAS, a writ, or process, which is of two sorts; one before judgment, called *Capias ad respondendum*; granted in an action personal, when the sheriff, upon the first writ of distress, returns, *Nihil habet in balliva nostra*.

The other is a writ of execution after judgment, which is also of various kinds; as, *Capias ad satisfaciendum*, *Capias pro fine*, *Capias utlagatum*, &c.

CAPIAS *ad satisfaciendum*, is a writ of execution after judgment; lying where a man recovers in an action personal, as for debt, damages, &c. in which case, this writ issues to the sheriff, commanding him to take the body of him against whom the debt is recovered; who is to be kept in prison till he make satisfaction.

It is usual to take out this writ, where the defendant hath no lands nor goods, whereof the debt recovered may be levied: and when the body is taken upon a *Ca. Sa.* and the writ is returned and filed, it is an absolute and perfect execution against the defendant, and no other execution can be against his lands and goods. But this is unless the defendant escape, or die in execution, &c. for where a person dies in execution, his lands and goods are liable to satisfy judgment, by stat. 21 Jac. I. c. 24.

CAPIAS *pro fine*, is where one being by judgment fined to the king, upon some offence against a statute, does not discharge it according to the judgment: by this writ, therefore, his body is to be taken, and committed to prison till he pay the fine.

It is used in other cases, for not making out some pleas in civil actions. 3 Rep. 12.

CAPIAS *ultlagatum*, a writ which lies against one outlawed upon any action, perfonal or criminal; by which the fheriff is ordered to apprehend the party outlawed, for not appearing on the exigent, and keep him in fafe cuftody till the day of return; when he is to present him to the court, to be there further ordered for his contempt.

CAPIAS *in Withernam*. See WITHERNAM.

CAPIAS *ad refpondendum ad prafcriptionem*, an original writ, which lies, by the common law, againft any foldier who has covenanted to ferve the king in war, and appears not at the time and place appointed. It is directed to two of the king's ferjeants at arms, to arreft and take him wherever he may be found; and to bring him *coram concilio noftro*, within a limit of fuftenance.

CAPIATUR, *judgment quod*. When the plaintiff had obtained judgment, it was formerly conftered that the defendant fhould be either amerced, for his *willful* delay of juftice in not immediately obeying the king's writ, by rendering the plaintiff his due; or be taken up, *capiatur*, to pay a fine to the king, in cafe of any forcible injury. But now, by ftat. 5 and 6 W. and M. c. 12. no writ of *capias* fhall iffue for this fine, but the plaintiff fhall pay 6*s.* 8*d.* and be allowed it againft the defendant in his other coffs. In the court of common pleas, they enter that the fine is remitted; but in the court of king's bench, they take no notice of any fine or *capiatur* at all.

CAPICATINGA, in the *Mantua Medica*, a name by which fome authors have called the *arvum agreftius*, or Auftic fweet-flag.

CAPIDODIUS, in *Ichthyology*, a name given by Paulus Jovius, and fome others, to the fifh we call the GRAMPUS, and the generality of authors the ORCA. According to the Artedian fyftem, it is a fpecies of the *delphinus* or dolphin; and it is diftinguifhed by that author by the name of the dolphin with the fnout bending upwards, and with broad ferrated teeth.

CAPIGI, a porter, or door-keeper of the Turkifh Seraglio. There are about five hundred *capigis*, as porters in the Seraglio, divided into two companies; one conffiting of three hundred, under a chief called *Capigi-Baffa*, who has a ftipend of three ducats per day; the other conffts of two hundred, diftinguifhed by the name of *Cuavicapigi*, and their chief *Cuavicapigi-Baffa*, who has two ducats. The *capigis* have from feven to fifteen afpers per day; fome more, others lefs. Their bufinefs is to affift the janizaries in the guard of the firft and fecond gates of the Seraglio; fometimes all together; as when the Turk holds a general council, receives an ambaffador, or goes to the mofque; and fometimes only in part; being ranged on either fide, to prevent people entering with arms, any tumults being made, &c. The word, in its original, fignifies *porter*.

CAPILLAMENT, literally fignifies *hair*, being formed of the Latin *capillus*, of *caput*, q. d. *hair of the head*. Hence the word is figuratively applied to feveral things, which, on account of their length, or their finenefs, refemble hairs: as,

CAPILLAMENTS *of the nerves*, the fine fibres, or filaments, whereof the nerves are compofed.

CAPILLAMENTS, in *Botany*, more ufually called ITAMINA, are thofe fmall threads, or hairs, which grow up in the middle of flowers; and are headed with little knobs, called APICES.

Bradley feems to reftrain *capillaments* to the fmaller flowers; and *ftamina* (which he corruptly calls *apices*) to the larger.

CAPILLAMENT is alfo applied to the ftrings or threads about the roots of plants.

CAPILLARY, of the Latin *capillus*, *a hair*, is applied to feveral things, to intimate their exceeding fmallnefs, or finenefs, refembling that of a hair.

CAPILLARY *veffels*, in *Anatomy*, are the leaft, minuteft, infenfible ramifications of the veins and arteries; which, when cut, or broken, yield but very little blood.

The *capillary* veffels fhould be conceived as vaftly finer than hairs: they are beft compared to the threads of cobwebs, and are fometimes called *evanefcent* veffels.

CAPILLARY, or CAPILLACEOUS *plants*, a fpecies of plants, thus denominated from their form, and manner of growth, as having no principal ftalk, or ftem, with branches, &c. fhooting out of the fame; but growing from the ground, like hairs from the head: and bearing their feed in little tufts, or prominences, on the backfide of their leaves.

The principal of thefe is, the *capillus veneris*, or ADIANTUM; from which the reft take their name.

This genus is placed in Linnæus's twenty-fourth clafs, entitled *cryptogamia*; where he has ranged the ferns, maidenhairs, polypodium, &c. with the mofs, mufhroom, and all thofe plants which do not produce flowers confpicuous to the naked eye; being either concealed in their fructification, or fo fmall as not to be perceived without the help of glaffes. The firft order of this clafs is *filices*, &c. moft of which have their flowers and feeds on the backs of their leaves.

Capillary plants, account to touch the fame with what are otherwife denominated ACAULOUS plants. See Phil. Tranf. N° 180. p. 784.

All the *capillaries* are reputed of ufe in medicine, efpecially in the making of pectoral fyrups; to which, medicinal virtues are attributed. But, in effect, only the *capillary* of Montpellier, *adiantum album Monfpelienfe*, and that of Canada, *adiantum album Canadenfe*, are regularly ufed for that purpofe; the reft only ferve to counterfeit them.

CAPILLATUS or CAPILLATA, *Arbor*, an ancient tree at Rome, on which the Veftal virgins when fhaven for their office, hung up their hair, and confecrated it to the gods.

CAPILLARY is alfo ufed by *Mineralifts* in fpeaking of ores which ramify or fhoot out fine branches like threads.

In which fenfe it anfwers to the fame with what is otherwife called *arborefcent* and *ftriated*. Woodward fpeaks of *capillary* or arborefcent *filver*; and Boyle defcribes a piece of pure *capillary copper* from the mine at Herrengrund, the feveral tufts, or capilli of which are fhort, of a reddifh golden colour, growing together almoft like thofe of the little mofs.

CAPILLARY *roots*. See FIBROUS *roots*.

CAPILLARY *tubes*, in *Phyfics*, are little pipes, whofe canals are the narrowed poffible; not fuch, whofe diameters do not exceed that of a common hair, for fuch can be made. The uſual diameter of *capillary* tubes, is a half, third, or fourth of a line: though Dr. Hook affures us he drew tubes in the flame of a lamp much fmaller, as fine almoft as a thread of a cobweb.

CAPILLARY *tube, the afcent of water, &c. in*, is a famous phenomenon which has long entertained the philofophers. Let one end of a fmall tube, open at both ends, be immerged in water, and the liquor within the tube will rife to fome fenfible height above the external furface: or immerge two or more tubes in the fame fluid, one of them a *capillary* one, and the other confiderably larger; the water will afcend confiderably higher in the *capillary* tube than the other, in the reciprocal ratio of the diameters of the tubes, both in open air and in vacuo. See ASCENT.

Mr. Hauckbee, and others, have recourfe to the attraction of the annuli of the concave furface of the tube; to which opinion Dr. Morgan fubfcribes.

But fince in every *capillary* tube, the height to which the water will fpontaneoufly afcend, is reciprocally as the diameter of the tube; it follows, that the furface, containing the fufpended water, is always a given quantity. But the columns of water fufpended in every tube, is as the diameter of the tube: therefore, if the attraction of the containing furface be the caufe of the water's fuſpenſion; it will follow, that equal caufes produce unequal effects; which is abfurd. And, again, not only his folution, but his phenomenon alſo, is extended too far: for it is not in all fluids that the phenomenon obtains; but in mercury the very contrary is found; that fluid in a tube not rifing fo high as the level of that in the veffel; and the defect being found the greater, as the tube is fmaller.

We muſt, therefore, recur to Dr. Jurin's folution of this phenomenon, which is well fupported by experiments. "The fuſpenſion of the water (in that gentleman's "fyſtem) is owing to the attraction of the periphery of "the concave furface of the tube, to which the upper "furface of the water is contiguous, and adheres:" this being the only part of the tube, from which the water muſt recede upon its fubſiding; and conſequently the only one which, by the force of its cohefion and attraction, oppoſes the deſcent of the water. This he ſhews to be a cauſe proportional to the effect; becauſe the periphery, and the ſuſpended column, are both in the ſame proportion as the diameter of the tube. The ſuſpenſion thus accounted for, the ſeemingly ſpontaneous aſcent will eaſily be ſolved: for ſince the water that enters a *capillary* tube, as ſoon as its orifice is dipped therein, has its gravity taken off by the attraction of the periphery, with which its upper ſurface is in contact, it muſt neceſſarily riſe higher; partly by the preſſure of the ſtagnant water, and partly by the attraction of the periphery, immediately above that which is already contiguous to it. Phil. Tranſ. abr. vol. iv. p. 423, &c. N° 345. or Cotes's Hyd. and Pneum. Lect. p. 205.

Some doubt whether the law holds throughout, of the aſcent of the fluid being always higher as the TUBE is ſmaller; Dr. Hook's experiments, with tubes almoſt as fine as cobwebs, ſeem to ſhew the contrary. The water in theſe, he obſerves, did not riſe ſo high as one would have

have expected. The highest he ever found was at 21 inches above the level of the water in the basin, which is much short of what it ought to have been by the law above mentioned.

Capillary tubes which naturally discharge water only in separate drops, yield, when electrified, a continued and accelerated stream; and the acceleration is proportional to the smallness of the tube: and the effect of electricity is so considerable, that it produces a continued stream from a very small tube, out of which the water had not before been able to drop. Priestley's Hist. Electr. 8vo. vol. i. p. 171. ed. 3d.

CAPILLARY *muscles*. Many small vessels of animal bodies have been discovered by the modern invention of injecting the vessels of animals with a coloured fluid, which upon cooling grows hard. But though most anatomists know the manner of filling the large trunks, few are acquainted with the art of filling the *capillaries*. Mr. Monro has given us what he, after many trials, has found most successful, in the Medic. Ess. Edinb. vol. i. art. 9. where he enters into a very nice detail of the operation, to which we must refer the curious. Some particulars we shall give under the head INJECTION.

CAPILLARY *worm*, in children, are the same with what are otherwise called CRISONES, *tenebrae*, and *dracunculi*.

CAPILLARY *fracture*. See CAPILLATION.

CAPILLATION, or CAPILLARY *fracture*, according to some writers, is a fracture in the skull, so small that it can scarce be perceived; but yet it often proves mortal. See FRACTURE.

CAPILLITIUM *Veneris*, in *Physiology*, denotes a meteor appearing in the air, in form of fine threads resembling a spider's web.

Some think that the *capillitium Veneris* derives its origin from a cloud, the watery parts of which having been exhaled by the sun's heat, only the earthy and sulphureous parts are left behind, which shoot into this figure.

It is sometimes also found hanging about woods and coppices, or even extended on the ground like a fine net, frequently enough mistaken for spiders webs.

CAPILLUS. See HAIR.

Capillus Veneris. See ADIANTUM.

CAPIPLENIUM, from *caput*, *head*, and *plenus*, *full*; used by some authors for a catarrh; but more properly, by the Italian physicians, for a continual heaviness of the head, frequent at Rome, and almost endemic.

CAPISCOLUS, or CAPISCHOLUS, in *Ecclesiastical Writers*, denotes a dignitary in certain cathedrals, who had the superintendency of the choir, or band of music, answering to what in other churches is called CHANTER or *precentor*.

The word is also written *cabiscolus*, and *vapischolus*, q. d. *the head of the school*, or *dean of music*.

The *capiscolus* is also called *scholasticus*, as having the instruction of the young clerks and choristers, how to perform their duty.

CAPISTRUM, among the *Ancient Musicians*, was a kind of headstall, or bridle made of leather, fastened round the head, which passing over the mouth, compressed the lips and cheeks so close, that the person, whatever effort he made, could not give his pipe, or flute, above the due quantity of wind requisite to make it speak.

The figure of a musician equipt with a *capistrum*, is given by Salmasius, who maintains it to be that of Marsyas the satyr, who, according to Plutarch, was the inventor of this instrument; in virtue of which he had even dared to contend with Apollo. It was copied from an ancient teal, formerly belonging to Velleron. Plut. Sympot. lib. vii. cap. 8. Salmas. Exerc. ad Solin. p. 585.

Some pretend that the use of the *capistrum* was to hide the deformity of bloated cheeks, and a gaping mouth; especially where the teeth were bad; others, that it was intended to save the lips and cheeks from being exumbled so as to endanger hurting; others, to fortify the part, that it might yield the stronger noise. But the chief use appears to have been, to temper and moderate the breath, and prevent its animating the pipe beyond the due pitch. See PHORBEA.

The chemists give the denomination *capistrum auri* to BORAX.

CAPISTRUM, in *Surgery*, a headstall, or bandage used in case of injuries of the head, especially fractures of the jaw.

CAPITA, or CAPITUM, in *Antiquity*, denotes a tax among the Romans for the maintenance of the horses in the army, levied according to the number of heads thereof.

CAPITA, *distributive by*, is such a distribution, that every man has an equal share of *personal* estate, when all the claimants claim in their own rights, as an equal degree of kindred, and not *jure representationis*. Blackit. Com. vol. ii. p. 517.

CAPITA, *succession by*, is that where the claimants are next in degree to the ancestor, in their own right, and not by right of representation. Blackit. Com. vol. ii. p. 218.

CAPITAL, of the Latin *caput*, is used on various occasions, to express the relation of a head, chief, or principal: thus,

CAPITAL *city*, intimates the principal city of a kingdom, province, or state; as, London is the *capital*, or *capital city* of England; Moscow, of Russia; Constantinople, of the Ottoman Empire; Rouen, of Normandy, &c. See METROPOLIS.

Mr. Basle has a discourse on the advantages of being born and living in the *capital* of the country.

CAPITAL *court*, or *chief court*, the chief manor-house, or place-house where the lord of the manor holds his court; called also in Kent the court-lodge.

Capital court is sometimes used for the same with *capital* MESSUAGE.

CAPITAL *honor*, *capitale honor*, denotes the chief honour, or prime barony of the whole county, as that in ancient times usually enjoyed by the count or earl of such county.

CAPITAL *lord*, *capitalis dominus*, the lord of the fee, from whom the state is held by inferior tenants.

CAPITAL *picture*, in *Painting*, denotes one of the most excellent pieces of any celebrated master.

F. Chamillard gives a list of the pieces of each famous painter, and the places where they are found.

CAPITAL, or CAPITAL *stock*, in *Commerce*, is the fund, or stock, of a trading company, or corporation; or the sum of money which they jointly furnish, or contribute, to be employed in trade.

It is also used to denote the stock which a merchant or tradesman employs in business on his own account.

The power given by parliament to the South sea company, to increase their *capital*, was the source of all the mischief which ensued in the year 1720.

CAPITAL, in *Money Matters*, denotes the sum of money put out to interest.

In which sense it amounts to the same with *principal*, and stands opposite to *interest*.

CAPITAL *crime*, is that which subjects the criminal to a *capital* punishment; i. e. to the loss of life, either natural or civil.

CAPITAL *lees*, are the strong lees made by the soap-boilers from pot-ashes.

They are also used, in Surgery, as a caustic; and to make the *lapis infernalis*.

CAPITAL *letters*. See CAPITALS.

CAPITAL *medicines*, in *Pharmacy*, are the great, or principal preparations of the shops: these are remarkable for the number of their ingredients, and their extraordinary virtues; such as Venice treacle, mithridate, &c.

CAPITAL, in *Architecture*, the uppermost part of a column, or pilaster, serving as the head, or crowning thereof; placed immediately over the shaft, and under the entablature.

CAPITAL *of necklace*, properly, is that whose plain is round. Whereas the CAPITAL *of a pilaster* is that whose plan is square, or at least rectilinear.

The *capital* is a principal and essential part of an order of columns, or pilasters: it is made differently in the different orders; and is that which chiefly distinguishes and characterizes the orders themselves.

CAPITAL, *Tuscan*, is the most simple and unadorned: its members, or parts, are but three; viz. an abacus; under this, an ovolo, or quarter-round; and under that, a gorge, or collarino. The gorge, or neck, terminates in an astragal, or fillet belonging to the *shaft*.—See *Tab. Architec. fig.* 22.

The character of this *capital*, whereby it is distinguished from the Doric, &c. is, that the abacus is square, and quite plain, and has no ogee, or other moulding; and that there are no annulets under the ovolo.

Indeed, authors vary a little as to the character of the Tuscan *capital*. Vignola gives the abacus a fillet, in lieu of an ovolo; Vitruvius and Scamozzi add an astragal and fillet, between the ovolo and neck; Serlio only a fillet; Philander rounds the corner of the abacus. In the Tuscan column there is no neck; but the astragal of the shaft is confounded with that of the *capital*.

The height of this *capital* is the same with that of the base, viz. one module, or semidiameter. Its projecture is equal to that of the cincture at the bottom of the column; viz. eight fifths of the module. See COLUMN.

CAPITAL, *Doric*, beside an abacus, an ovolo, and a gorge, in common with the Tuscan, has three annulets, or little square members, underneath the ovolo, in lieu of the astragal in the Tuscan; and a talon, cima, or ogee, with a fillet over the abacus. See *fig.* 25.

Authors vary too, as to the characters of this *capital*: Palladio, Vignola, &c. put roses under the corners of the abacus, and in the neck of the *capital*.

The height of this *capital*, Vitruvius, &c. make one module;

dule; and its projecture thirty-seven minutes and a half.—*See Tab. Archit. fig.* 25.

CAPITAL, *Ionic*, is compoſed of three parts: an abacus, conſiſting of an ogee, and a fillet; under this a rind, which produces the volutes, or ſcrolls, the moſt eſſential part of this *capital*; and, at the bottom, an ovolo, or quarter-round: the aſtragal, under the ovolo, belongs to the ſhaft. The middle part is called the *rind*, or bark, from its ſuppoſed reſemblance to the bark of a tree laid on a vaſe, whoſe brim is repreſented by the ovolo, and ſeeming to have been ſhrunk up in drying, and to have twiſted into the volutes.

The ovolo is adorned with eggs, as they are ſometimes called, from their oval form: the Greeks call it the *echinus*.

The height of this *capital* M. Perrault makes eighteen minutes; its projecture, one module, ſeven tenths.—*See Tab. Archit. fig.* 26.

The differences in the character of this *capital* flow moſtly from the different management of the volutes; and conſiſt in this: that in the antique, and ſome of the modern, the eye of the volute anſwers not the aſtragal of the top of the ſhaft, as Vitruvius, and moſt of the moderns, make it: that the face of the volute, which uſually make a flat, a ſometimes curved and convexed, ſo that the circumvolutions go advancing outwards; as is frequent in the antique: that the border, or rim of the ſcroll in the volute, is ſometimes not only a plain ſweep, as ordinarily; but the ſweep is accompanied with a fillet: that the leaves which inveſt the baluſter, are ſometimes long and narrow; ſometimes larger and broader: that the two faces of the volutes are ſometimes joined at the outer corner; the baluſters meeting in the inner, to make a regularity between the faces on front and back of the building, with thoſe of the ſides: that among the moderns, ſince Scamozzi, the Ionic *capital* has been altered, and the four faces made a like, by taking away the baluſter, and hollowing all the faces of the volutes inwards, as in the Compoſite: that Scamozzi, and ſome others, make the volutes to ſpring out from the ovolo, as from a vaſe, after the manner of the modern Compoſite; whereas in the antique the bark paſſes between the ovolo and abacus quite ſtraight, only twiſting at its extremities, to form the volute. And, laſtly, that of late years the ſculptors have added a kind of little feſtoons, ſpringing from the flower whoſe ſtalk lies on the firſt circumvolution of the volute; and ſuppoſed to repreſent the locks of hair hanging down on both ſides of the face. See IONIC.

CAPITAL, *Corinthian*, is much the richeſt it has no ovolo; and its abacus is very different from thoſe of the Tuſcan, Doric, or Ionic; as having its faces circular, and hollowed inward, with a roſe in the middle of each ſweep: inſtead of an ovolo, and annulets, here is only a brim of a vaſe; and the neck is much lengthened and enriched with a double row of eight leaves in each, bending their heads downwards; and between them, ſmall ſtalks ariſing: whence ſpring the volutes; which do not reſemble thoſe of the Ionic *capital*; and which, inſtead of the four in the Ionic, are here fifteen; four on each ſide, under the four horns of the abacus, where the volutes meet in a ſmall leaf, which turns back towards the corner of the abacus. The leaves are divided, each making three ranges of leſſer leaves, whereof they are compoſed: each leſſer leaf is, again, generally parted into five, called *olive-leaves*; ſometimes into three and called *laurel-leaves*: the middle leaf, which bends down, is parted into eleven. In the middle, over the leaves, is a flower, ſhooting out between the ſtems and volutes, like the roſe in the abacus. The height of this *capital* is two modules and one third; and its projecture, one and ſeven thirds.

The differences in the character of this *capital* are, that in Vitruvius, &c. the leaves are in form of the acanthus; whereas, in the antique, they are more ordinarily olive-leaves: that their leaves are uſually unequal, the undermoſt being made commonly talleſt, ſometimes the ſhorteſt, though ſometimes they are all equal. Sometimes the leaves are raffled; ſometimes quite plain: the firſt row generally belly out towards the bottom, but are ſometimes ſtraight; ſometimes the horns of the abacus are ſharp at the corners, which ſeems agreeable to the rules of Vitruvius; but they are more commonly cut off. There is ſome difference too, in the form and ſize of the roſe; again, the volutes are ſometimes joined to each other; ſometimes wholly ſeparate: ſometimes the ſpires of the volutes continue twiſting even to the end of the ſame courſe; and ſometimes they turn back again near the centre, in the form of an S.—*See Tab. Archit. fig.* 21. and 27.

CAPITAL, *Compoſite*, is ſo called, becauſe compoſed of members borrowed from the *capitals* of the other columns. It takes a quarter-round, or ovolo, from the Doric; an aſtragal under this, together with volutes, or ſcrolls, from the Ionic; and a double row of leaves from the Corinthian, which it reſembles in moſt other things; conſiſting, generally, of the ſame members, and the ſame proportions. In the middle of the abacus is a flower; and under the thorns, leaves which return upward, as in the Corinthian; indeed, inſtead of ſtalks in the Corinthian, the Compoſite has ſmall flowers, lying cloſe to the vaſe, or bell; twiſting round towards the middle of the face of the *capital*, and terminating in the roſe.

The height of the Compoſite *capital* is two modules and one third; and its projecture, one module and two thirds, as in the Corinthian.—*See Tab. Archit. fig.* 28.

The differences of the character of this *capital* conſiſt in this: that the volutes, which ordinarily deſcend, and touch the leaves, are, in ſome works of the antique, ſeparate from them: that the leaves, which are generally unequal in height, the lower rank being talleſt, are ſometimes equal: that the volutes of the moderns generally ſpring out of the vaſe: whereas, in the antique, they ordinarily run ſtraight the length of the abacus, over the ovolo, without ſtirking into the vaſe: that the volutes, whoſe thickneſs is contracted in the middle, and enlarged above and below in the antique, have their ſides parallel in the works of the moderns: and, laſtly, that the volutes, which have been hitherto, both by the ancients and moderns, made as if ſolid, are now much lighter, and more airy; the folds ſtanding hollow, and at a diſtance from each other.

For the proportions of the ſeveral members of the *capitals* of columns, ſee COLUMN. See alſo each member under its proper head, as ABACUS, ACANTHUS, VOLUTE, &c.

Some architects diſtinguiſh the Tuſcan and Doric *capitals*, which have no ornaments, by the title of *capitals of mouldings*; and the three others, which have leaves and ornaments, they call *capitals of furniture*.

CAPITAL, *Impoſt*, is that which bears the return of an entablature, at the corner of the projecture of a pilaſter.

CAPITAL, *Filled*, in *Architecture*, that of a pilaſter in a re-entering angle, whether right or obtuſe.

CAPITAL, *Mutilated*, that whoſe projecture is leſs on one ſide than on another, as being too near ſome adjacent body or angle.

CAPITAL, *Attic*, that which has water-leaves in the gorgerin.

CAPITALS, *Symbolical*, thoſe adorned with the attributes of heathen deities. Such are moſt of the antique *capitals*, in which we find thunderbolts and eagles for Jupiter, trophies for Mars, lyres for Apollo, &c. Such alſo among the moderns are thoſe which bear the arms and devices of a nation, the marks of a victory, a dignity, or the like.

CAPITAL, *of a baluſter*, is that part which crowns the baluſter; which ſometimes bears a reſemblance to the *capitals* of ſome columns, particularly the Ionic.

CAPITAL *of a Niche*, is a kind of little canopy over a ſhallow niche, covering or crowning a ſtatue.

CAPITAL *of a Triglyph*, is the plat-band over the triglyph; called, by Vitruvius, *tænia*. It is ſometimes alſo a triglyph which does the office of a *capital* to a Doric pilaſter.

The *capitals* of triglyphs, according to Vitruvius, are to be a ſixth part of the module. Over them is to be placed a corona.

CAPITAL, in *Chemiſtry*, ſignifies the head of an ALEMBIC.

CAPITAL *of a Baſtion*, in *Fortification*, is a line drawn from the angle of the polygon to the point of the BASTION. The *capitals* of baſtions are from thirty-five to forty fathoms long, from the point of the baſtion to the point where the two demigorges meet.

CAPITAL *of a Lantern*, the covering which terminates the lantern of a dome, either in the figure of a bell, as that of the Sorbonne; or of a cupola, or a ſpiral, as that of the church of Sapienza at Rome.

CAPITAL *of a Mill*, the covering thereof in form of a cone, which turns vertically on the round tower, in order to expoſe the ſails to the wind.

CAPITALS, in *Printing*, large or initial letters, wherein titles, &c. are compoſed; and with which all periods, verſes, &c. commence.

All proper names of men, countries, kingdoms, terms of art, ſciences, and dignities, uſually begin with *capitals*.

The ancient MSS. both Greek and Latin, are written wholly in *capitals*.

In the early days of printing, there were alſo ſeveral editions of books in *capitals*, as of Homer, the Greek Anthology, Apollonius, &c. Johannes Laſcaris ſeems to have

have brought the ancient printers to give editions in *capitali*.

CAPITALIS *reflexus*, in *Surgery*. See CAPELINE.

CAPITANA, or CAPTAIN *galley*, the chief or principal galley of a fleet, not dignified with the title of a kingdom.

The *capitana* was anciently the denomination of the chief galley of France, which the commander went on board of. But fince the fuppreffion of the office of captain-general of the galleys in 1669, they have no *capitana*, but the firft galley is called *reale*, and the fecond *patrone*.

CAPITANEATE, in a general fenfe, the fame with CAPITANIA.

Capitaneate, in Pruffia, are a kind of noble feuds, or eftates, which, befides their revenue, raife their owners to the rank of nobility. They are otherwife called *feoda militia*. Eibl. Germ. tom. vi. p. 11.

CAPITANEI, or CATANEI, in Italy, was a denomination given to all dukes, marquiffes, and counts, who were called *capitanei regis*. The fame appellation was alfo given to perfons of inferior rank who were inveſted with fees, formerly diſtinguiſhed by the appellation *valvaſores majores*. Du-Cange.

CAPITANEUS, *in Ancient Law Writers*, denotes a tenant in CAPITE, or chief.

CAPITANEUS *caſtoræ*, the fame with advocate. Du-Cange, Gloſſ. Lat. tom. i. p. 802.

CAPITANIA, the office or dignity of a captain, and more eſpecially a perpetual feud. See CAPITANEATE.

CAPITANIA is alſo a denomination given to the twelve governments eſtabliſhed by the Portugueſe in Braſil.

CAPITATÆ *Plantæ*, in *Botany*, are thoſe plants whoſe flowers are ſtiftular, compoſed of many edged and hollow little flowers. They were thus called by *Mr.* Ray, becauſe their ſcaly calyx (or cup of the flower) moſt uſually ſwells out into a large round head, containing within it the pappous ſeed: as in the cardaus, centaury, guapweed, cinara, cirſium, lappa major, cyanus, &c.

CAPITATION, a tax or impoſition, raiſed on each perſon, in conſideration of his labour, induſtry, office, rank, &c. This kind of tributs is very ancient, and anſwers to what the Greeks called ἐπικεφάλαιον; the Latins, *cenſio, capitatio*, and *tributum*, or *tributum capitis*, or *capitulare*. By this term, taxes on the perſon are diſtinguiſhed from taxes on merchandiſe, which were called *veſtigalia, quia vehebantur*.

CAPITATION alſo denotes a certain ſum of money impoſed per head, in exigencies of ſtate.

CAPITATUS, in *Ichthyology*, a name given by Johannes Cuba, and ſome others, to that fiſh which we commonly call the bull-head, and miller's thumb, the *cottus* and *gobio capitatus* of authors. It is of the genus of the *cotti*, according to the Artedian Syſtem, and it is diſtinguiſhed by that author by the name of the fifteenth ſcalcelia *cottus*.

CAPITE, in *Law*, an ancient tenure, whereby a perſon held of the king immediately, as of his crown, either by knight's ſervice, or ſoccage.

By a ſtatute, 12 Car. II. c. 24. all ſuch tenures by knight's ſervice of the king, or of any other perſon, knights ſervice *in capite*, or SOCCAGE, with all rights, &c. are annulled.

CAPITE *cenſi*, in *Antiquity*, the loweſt rank of Roman citizens, who in public taxes were rated the leaſt of all, being ſuch as were never worth above 365 aſſes.

They were ſuppoſed to have been thus called, becauſe they were rather counted and marſhalled by their heads than their eſtates. Aul. Gell. lib. vii. cap. 13.

The *capite cenſi* made part of the fixth claſs of citizens, being below the *proletarii*, who formed the other moiety of that claſs.

The *capite cenſi* were not inrolled in the army, as being judged not able to ſupport the expences of war; for in thoſe days the ſoldiers maintained themſelves. It does not appear that before Caius Marius any of the Roman generals liſted the *capite cenſi* in their armies. Salluſt. Jug. p. 135.

CAPITIS *nævus*, in *Anatomy*, the name given by Fallopius, to one of the muſcles of the head, deſcribed by Albinus under the name of the *rectus capitis internus major*, and by Winſlow and others under that of the *rectus capitis anterior longus*. See HEAD.

CAPITIS *per tertium*, in *Anatomy*, a name given by Fallopius, and others of his time, to a muſcle ſince called, by Winſlow, COMPLEXUS *minor*, and *maſtoideus lateralis*; and by Cowper and Albinus, *trachelomaſtoideus*.

CAPITO, in *Ichthyology*, the *chub*; it is alſo called by ſome authors the *cephalus* and *ſqualus*, and *cyprinus*, and in ſome parts of England the *chevin*. It is a longer-bodied fiſh than the carp; and its head is black, large, and ſomewhat flat. It has no teeth either in the jaws, palate, tongue, or throat; its tail is forked, and all its fins are of a bluiſh black colour. Its belly is ſomewhat prominent; it is a river-fiſh, and loves the covert of old ſtumps of trees and hollow banks, and gives the angler much diverſion: it will not live in ponds; it ſpawns in May, and is in beſt ſeaſon in April, when full of ſpawn, but is never a very delicate fiſh. Ray. See CHUB.

CAPITO is alſo a name given by ſeveral authors to the *mugil* or *mullet*. GESA ſeems to have given riſe to this error: he found the word CEPHALUS in Ariſtotle as the name of the mullet, and tranſlated it by the word *capito*; not conſidering that he by that name confounded this fiſh with another, namely, the chub.

CAPITO *anadromus*, in *Ichthyology*. See ZERTA.

CAPITO *cæruleus*, the blue *chub*, a fiſh common in the Danube, and other of the large rivers in Germany, and frequently called the JERTING.

CAPITO *ripex*, in *Ichthyology*, a name given by ſome authors to the CORVUS *piſcis*, a fiſh of the ſhape of our river-chub.

CAPITOL, CAPITOLIUM, in *Antiquity*, a famous fort, or caſtle, on the Mons Capitolinus at Rome, wherein was a temple dedicated to Jupiter, thence alſo denominated *Capitolinus*, in which the ſenate anciently aſſembled, and which ſtill ſerves as the city-hall, or town-houſe, for the meeting of the conſervators of the Roman people.

It had its name *Capitol from caput, a man's head*; ſaid to have been found freſh, and yet bleeding, upon digging the foundation of the temple, built in honour of Jupiter. Arnobius adds that the man's name was Tolus; whence *capitolium*.

The firſt foundations of the *Capitol* were laid by Tarquin the Elder, in the year of Rome 139. His ſucceſſor, Servius, raiſed the walls; and Tarquin the Proud finiſhed it in the year 221: but it was not conſecrated till the third year after the expulſion of the kings, and eſtabliſhment of the conſulate. The ceremony of the dedication of the temple was performed by the conſul Horatius, in 246.

The *Capitol* conſiſted of three parts: a nave, ſacred to Jupiter; and two wings, or iſles, to Juno and Minerva. It was aſcended by ſtairs; Liſius reckons one hundred in number, becauſe there were ſo many in the aſcent of the Tarpeian rock. The frontiſpiece and *ſides* were encompaſſed with galleries, wherein thoſe, who had the honour of a triumph, entertained the ſenate at a magnificent banquet, after the performance of ſacrifice to the gods. Both inſide and outſide were enriched with numerous ornaments; the ſtatue of Jupiter, with his golden thunderbolt, his ſceptre, and crown, were the moſt diſtinguiſhed.

In the ſame *Capitol* there were, likewiſe, a temple to Jupiter the Guardian, and another to Juno; with the mint: and on the deſcent of the hill was the temple of Concord.

The *Capitol* was burnt under Vitellius, and rebuilt under Veſpaſian: it was burnt a ſecond time by lightning, under Titus; and was again reſtored by Domitian.

Anciently, the name *Capitol* was likewiſe applied to all the principal temples, in moſt of the colonies throughout the Roman empire: as, at Conſtantinople, Jeruſalem, Carthage, Ravenna, Cyprus, &c.

CAPITOLINE *Games*, *Ludi* CAPITOLINI, were annual games, or combats, inſtituted by Camillus, in honour of Jupiter Capitolinus; and in commemoration of the Capitol's not being ſurpriſed by the Gauls.

Plutarch tells us, that a part of the ceremony conſiſted in the public cryer's putting up the Hetrurians to ſale by auction: they alſo took an old man, tying a golden bulla to his neck, ſuch as were worn by their children, and expoſed him to the public deriſion. Feſtus ſays, they dreſſed him in a prætexta, hung a bulla at his neck; not as accounting him a child, but becauſe this was an ornament of the kings of Hetruria.

There was alſo another kind of *Capitoline games*, called *Agones Capitolini*, inſtituted by Domitian, and celebrated each five years; wherein there were rewards and crowns beſtowed on the victorious poets, and put on their heads by the emperor himſelf. Theſe games became ſo celebrated that the manner of accounting time by luſtres, which had obtained till then, was changed, and they began to count by *Capitolina* games, as the Greeks by Olympiads. The feaſt was not for poets alone, but alſo for athletæ, orators, hiſtorians, comedians, muſicians, &c.

CAPITOLINI, in *Roman Antiquity*, a college of men reſiding in the Capitol and art, to whom was committed the care of celebrating the Capitoline games.

CAPITOUL, or CAPITOL, an appellation given to the chief magiſtrates of Thoulouſe who have the adminiſtration of juſtice and policy, both civil and mercantile, in the city.

The *Capitouls* at Thoulouſe are much the ſame with the echevins

LIBRARY

echevins at Paris, and the conſuls, bailiffs, burgermaſters, mayors, and aldermen, &c. in other cities. In ancient acts they are called *conſules capitularii*, or *capitulini*, and their body *capitulum*. From this laſt come the words *capitularis* and *capitulo*. The appellative *capitulini* ariſe hence, that they have the charge and cuſtody of the town-houſe, which was anciently called *capitole*.

The office only laſts one year, and ennobles the bearers. In ſome ancient acts they are called *capitulum nobilium Tolioſæ*. Thoſe who have borne it, ſtyle themſelves afterwards burgeſſes. They are called to all general councils, and have the *jus imaginum*; that is, when the year of their adminiſtration is expired, their pictures are drawn in the town houſe; a cuſtom which they have retained from the ancient Romans, as may be ſeen in Signonius.

CAPITOULATE, an appellation given to the ſeveral quarters or diſtricts of the city of Tholouſe, each under the direction of a CAPITOUL; much like the wards of London under their aldermen.

Tholouſe is now divided into eight *capitoulates* or quarters, which is ſubdivided into *meuliers*, each of which has its tithing-man, whoſe buſineſs is to inform the *capitoul* of what paſſes in his tithing, and to inform the inhabitants of the tithing, of the orders of the *capitoul*.

CAPITULA *ruralia*, denote chapters held by the rural dean and clergy within the precincts of each deanry, anciently held every three weeks, then once a month, and more ſolemnly once a quarter.

CAPITULAR, or CAPITULARY, denotes an act paſſed in a chapter, either of knights, canons, or religious.

The *capitularia*, or *capitulare* of Charlemagne, Charles the Bald, &c. are the laws, both eccleſiaſtical and civil, made by thoſe emperors in the general councils, or aſſemblies of the people: which was the way in which the conſtitutions of moſt of the ancient princes were made: each perſon preſent, though a plebeian, ſetting his hand to them.

Some diſtinguiſh theſe from laws; and ſay, they were only ſupplements to laws.—They had their name, *capitulares*, becauſe divided into *capitula*, chapters or ſections. In theſe *capitulares* did the whole French juriſprudence anciently conſiſt.—In proceſs of time, the name was changed for that of *ordonnances*.

Some diſtinguiſh three kinds of *capitulars*, according to the difference of their ſubject-matter: thoſe on eccleſiaſtical affairs, are really canons, extracted from councils; thoſe on ſecular affairs, real laws; thoſe relating to particular perſons, or occaſions, private regulations.

CAPITULATION, a treaty made with the garriſon or inhabitants of a place beſieged; whereby they ſurrender themſelves up, on certain articles and conditions ſtipulated with the beſiegers.

Before a ſurrender the governor of the garriſon gives orders for beating the CHAMADE, and for fixing one or more white colours on the rampart; one of which remains either on the breach or rampart, during the time of negociation. When the chamade is beat, the fire ceaſes on both ſides, and the governor ſends ſome officers of diſtinction to the commander in chief of the beſiegers, who deliver to him the conditions on which the governor propoſes to ſurrender the town; and as a ſecurity for theſe officers, the beſiegers ſend a like number into the town. If the governor's conditions are not ſatisfactory to the general of the beſiegers, he preſcribes the conditions of ſurrender; threatening to allow no conditions, if thoſe propoſed are not complied with within a certain time. If the conditions are too hard, the officers return, and the drums are beat upon the rampart, for the recommencement of hoſtilities. During the ſuſpenſion of arms, no work ſhould be done for the ſecurity either of the beſieged or beſiegers; however, ſtratagems are counted lawful, and ſhould be guarded againſt.

If the terms of *capitulation* are agreed upon, the governor ſends two or three of his principal officers into the camp, and the general ſends the ſame number and of the ſame rank into the town, as a ſecurity for accompliſhing the *capitulation*. When every thing is finiſhed, the hoſtages on both ſides return. The conditions of the beſieged are of various kinds, according to their circumſtances. A garriſon ſhould have proviſion and ammunition at leaſt for three days, to be entitled to a compoſition, without which they are to be made priſoners of war; but this ſhould be known before the *capitulation* is ſigned. When the *capitulation* is ſettled, an officer of artillery from the beſiegers comes into the place with an officer of artillery from the garriſon, who takes an inventory of all the artillery and ammunition remaining; and a commiſſary of proviſions takes an account of the proviſions. When the beſieged have delivered a gate of the place to the beſiegers, the firſt regiment of the army enters and mounts guard. When the garriſon leaves the place, the army of the beſiegers is put under arms, and ranged in two lines, at the head of which are the general and principal officers, between which the garriſon paſſes. See further on this ſubject, Muller's Math. &c. vol. vi. p. 1557, &c.

CAPITULATION denotes alſo a kind of treaty, *pactæ conventæ*, or original contract, drawn up by the electors, before the election of an emperor; which the emperor is to ratify before his coronation, and to obſerve inviolably in the courſe of his reign.

Theſe imperial *capitulations* have only been obtained ſince the time of Charles V. They were occaſioned by the jealouſy the German princes had entertained of the too great power of the emperor. Frederic, duke of Saxony ſurnamed the Wiſe, paſſes for the author of the imperial *capitulation*; who declining the empire, which was offered him after the death of Maximilian, adviſed the electors to chooſe Charles V. under ſuch conditions as might ſecure the liberty of the empire.

The deſign of the *capitulations* is, on the one hand, to prevent the emperor from abuſing his power: to the oppreſſion of the people; and on the other, to prevent the people from breaking in on the juſt rights of the emperor. The imperial *capitulations* are conſidered as fundamental laws of the empire; and though the drawing up, preſenting, procuring the ſignature, and taking care of the execution of them, be commited to the electors, they are reputed the act of the ſtates of the empire.

The king of the Romans alſo, when elected, ſigns the emperor's *capitulations*, as being in right of ſuch election to ſucceed to the empire after the death of the emperor.

CAPITULUM, in *Anatomy*, a little head, eſpecially of a bone, anſwering to the Greek *condylus*.

CAPITULUM, in *Botany*, the head, or compound flower, of any plant; being compoſed of many leaves and threads, or ſtamina, cloſely connected in a globous, circular, or diſcous figure; as the flowers of bluebottles, ſcabious, cardunc, &c.

CAPITULUM, in the *Ancient Military Art*, was a tranſverſe beam, wherein were holes through which paſſed the ſtringa whereby the arms of huge engines, as balliſtæ, catapultæ, and ſcorpiones, were played or worked. Vitruv. de Arch. lib. i. cap. 1.

CAPITULUM, in *Eccleſiaſtical Writers*, denoted part of a chapter of the Bible read and explained.

In which ſenſe they ſaid, *ire ad capitulum, to go to ſuch a lecture*. Afterwards the place or apartment where ſuch theological exerciſes were performed, was denominated *domus capituli*.

CAPWARD, in *Zoology*, in Portugueſe, a *water-dog*, which is deſcribed to be an amphibious animal, with a body like a hog, a head like a hare, and without a tail. It keeps itſelf almoſt continually on its poſteriors, like an ape. It is found in Braſil; it lives all day in the ſea, and at night comes aſhore to ravage the gardens, and to root up the trees: the fleſh is wholeſome food.

CAPIVI. See BALSAM.

CAPNELÆON, from καπνος, *ſmoke*, and ελαιον, *oil*, among *Ancient Naturaliſts*, denotes a ſpecies of reſin, which flows ſpontaneouſly, being warmer, thinner, and more fluid than all other ſorts of reſine, ſo as nearly to approach the nature of oil, and evaporating plentifully on being expoſed to the fire; whence the denomination, which imports as much as ſmoaking oil. It is ſometimes alſo called *piſſinthos*, or flower of pitch.

CAPNICON, in *Antiquity*, chimney-money, or a tax which the Roman emperors levied for ſmoke, and which of conſequence was due from all, even the pooreſt, who kept a fire. This was firſt invented by Nicephorus.

CAPNISTON, among *Ancient Phyſicians*, denotes oil whoſe fumes rendered aromatic by burning ſpices, are conveyed to a part affected.

CAPNITIS, or CAPNITAS *jaſpis*, in the *Natural Hiſtory of the Ancients*, the name of a ſpecies of chalcedony, of a browniſh ground, clouded with a large miſt of blackiſh, looking like a column of ſmoke. The ancients alſo called our common chalcedony a jaſper, not allotting any peculiar generical name to theſe miſty ſtones; and the name they gave this ſpecies very happily expreſſed its character, becauſe it looks exactly as if obſcured by a cloud of thick ſmoke.

It is very common in the Eaſt-Indies, and is ſometimes found in Germany and France, but is ſeldom worked into any thing better than knife-hafts.

CAPNOIDES, in *Botany*. See FUMITORY.

CAPNOMANCY, a kind of divination by means of ſmoke uſed by the ancients in their ſacrifices.

The word comes from καπνος, *ſmoke*, and μαντια, *divination*. The general rule was, when the ſmoke was thin, and light, and roſe ſtraight up, it was a good omen; if the contrary, it was an ill one.

There was alſo another ſpecies of *capnomancy*, conſiſting in the obſervation of the ſmoke riſing from poppy and jeſſamin-ſeeds caſt upon lighted coals.

CAPO, in *Ichthyology*, a name given by Paulus Jovius and some others to the fish called *cucio* by the ancient Greeks, *cuculus* by the Latin writers, and by some *lyra*. It is a species of the *trigla*, distinguished by Artedi by the name of the *red trigla*, with a bifid snout, and with the coverings of the gills ftriated.

CAPO *nigra*. See DUCK.

CAPO *rufa*. See DUCK.

CAPOC, in *Commerce*, a fort of cotton fo fine and fo fhort, that it cannot be fpun. It is ufed in the Eaft Indies to ftuff palanquins, to make beds, matraffes, cufhions, pillows, &c.

CAPOLLIN, in *Botany*, *Mexicanorum Hernandez*, *feu Cerafus dulcis Indica*. It is a tree of moderate bignefs, with leaves like thofe of an almond, or our country cherry-tree. The flowers hang down in bunches, which are fucceeded by fruit refembling our cherries. It bloffoms in the fpring, and bears fruit all the fummer; it requires a temperate climate and grows in gardens and fields in Mexico, as well fpontaneoufly as by cultivation.

The juice of the young buds mollifies the tongue when parched by heat. A decoction of the bark being expofed to the fun for fifteen days, and the weight of a dram of it taken, cures the dyfentery. The powder helps inflammations. In times of dearth they make bread and drink of the fruit; but it affords an aliment inclining to melancholy, giving a rankneſs to the breath, and making the teeth black. There are three fpecies of this tree, which differ only in fruit; but all of them hang in cluſters.

CAPON, a cock chicken caſtrated young, generally as ſoon as left by the dam.

The word is formed from the Latin *capo*, of the Greek κοπτω, which ſignifies the ſame.

Capons, beſide their ufe for the table, ſerve to lead chickens, ducklings, turkey-poults, pea-hens, pheaſants, or partridges, in lieu of their natural dams, over which they have ſeveral advantages, by the largeneſs of their body, which will brood, or cover, thirty or forty young.

CAPON'S-*tail grafs*. See PERIPOCA.

CAPONE, in *Ichthyology*, a name given by the Italians to the fifh called the *hirundo* and *cernus* by authors, and by Artedi made a ſpecies of the *trigla*. It is diſtinguiſhed from the reſt of this genus by that author under the name of the *trigla* with an aculeated head, and with three appendages on each ſide to the pectoral fins.

CAPONIERE, or CAPONNIERE, in *Fortification*, is a paſſage from one work to another, ten or twelve feet wide, covered on each ſide by a parapet, terminating in a ſlope or glacis.

In dry moats, the paſſage from the curtain to the ravelin, or that from the covert-way to the arrows or detached redoubts, are called *caponieres*.

Single parapets raiſed at the entrance of the ditch, before the ravelin, behind which are placed ſmall cannons and men, to diſpute the paſſage over the ditch, are likewiſe called *caponieres*.

The *Caponiere* differs from the coffer, in that the latter poſſeſſes the whole breadth of the ditch, whereas the former only takes up part of it. See COFFER.

Caponieres are partly under ground, and partly above it. They are ſo well ſecured at the top, that no bomb or carcaſs can penetrate them.

CAPOT, in *Piquet*, is when one of the gameſters wins all the cards, in which caſe he gains forty points.

CAPPADINE, in *Commerce*, a ſort of ſilk thread, taken from the upper part of the ſilk-worm cod, after the true ſilk has been wound off. It is alſo called *laſſis* and *embaſſis*, becauſe ſlight ſtuffs under thoſe names are made of it.

CAPPANUS, in *Natural Hiſtory*, the name given by ſome authors to the ſea-worm which bores into the bottoms of ſhips.

In order to prevent the pernicious effects of this worm, ſeveral ſhips have lately been ſheathed with copper.

CAPPARIS, in *Botany*. See CAPER-*bufh*.

CAPPEROI, *Cornide*, a name given by the Ceyloneſe to a peculiar kind of cinnamon, eſteemed the third in value: this has a very ſtrong taſte and ſmell of camphor, and is by the natives ſignifies camphorated cinnamon. The tree which produces it, grows very plentifully in many parts of the iſland of Borneo, but is not met with in the eaſtern parts of it. This is often ſold to the Danes and Engliſh who come to trade on the coaſts of Coromandel; it is prohibited exportation from the iſland, but ſo long as only one port is open, there are people enough who will carry out great quantities of it.

There is a ſpecies of canella very much reſembling this kind of cinnamon-tree, which grows very frequently on the continent of India toward Goa; and another canella or wild cinnamon on the coaſt of Malabar, in many reſpects reſembles this. The barks of all theſe trees are greatly inferior to the true cinnamon in ſmell, taſte, and virtue; yet they are too often ſold to the leſs judicious traders in theſe things, either alone or mixed with the ſeveral better kinds of cinnamon, to the great damage of all that afterwards buy them. Phil. Tranſ. N° 400.

CAPRA, in *Aſtronomy*, a denomination given to the ſtar CAPELLA; and ſometimes alſo to the conſtellation CAPRICORN.

Some repreſent *Capra*, or the *She-goat*, as a conſtellation in the northern hemiſphere, conſiſting of three ſtars, comprized between the 45th and 55th degree of latitude. The poets ſay, it is Amalthea's goat, which ſuckled Jupiter in his infancy. Horace, making mention of it, calls it, *Jovis ſidera capræ*.

CAPRA *Saltans*, or CAPRA *Saltantes*, in *Meteorology*, a fiery meteor, or exhalation, which ſometimes appears in the atmoſphere, and is not fired in a ſtraight line, but with inflexions, and windings in and out, reſembling the capers of a goat.

The *capræ ſaltantes* are not ſo called from their figure, which is various, ſometimes round, ſometimes long, but from their moving by jerks ſomewhat like the leaps of that animal; and from the little tongues of fire which hang at, and ſometimes fall from them, which antiquity has been pleaſed to fancy like the beard or locks of a goat's hide.

Ariſtotle diſtinguiſhes the *capra* from the *trabs*, in that the latter proceeds with an uniform motion, the former with an irregular one, and as it were by jumps. Ariſt. Met. lib. i. cap. 5. Mem. Ac. Inſcr. tom. vi. p. 95.

The *capræ* ſeem to be very low, yet ſometimes fly ſo high, that meteorologiſts have placed them in the upper region, though not ſo conſtantly, but they are ſometimes alſo found in the middle region.

Of tubular *capræ* we have divers inſtances, in ancient as well as modern naturaliſts. Such was the flame ſaid by Seneca to have been ſeen in form of a huge ball about the bigneſs of the moon, when Paulus Æmilius waged war againſt Perſeus. Such another, he tells us, was ſeen at the death of Auguſtus; another on the tragedy of Sejanus, another at the death of Germanicus. Such was that ſeen about Michaelmas 1676, by no leſs than twelve counties at once; it is deſcribed by Mr. Nath, as it appeared near Leighland in Staffordſhire, as of a globular figure moving by jerks, and making ſhort reſts at every one of them, letting fall drops of fire, which were parts of its body; for it decreaſed in magnitude the farther it went, and the oftener it ſtopped, till at length it wholly diſappeared. Seneca Nat. Quæſt. lib. i. cap. 1. Phil. Tranſ. N° 135. p. 863. ſeq. Plott. Nat. Hiſt. Stafford. cap. i. § 40.

CAPRA *triturantis*, in *Ancient Huſbandry*, was a kind of iron leg, made in the figure of a goat, which was laid on the *tribula*, to make it more effectual in ſeparating the corn from the ears, the ancient way of threſhing.

CAPRA, in *Zoology*. See GOAT.

CAPRARIA, *ſweet-wood*, in *Botany*, a genus of the *didynamia angioſpermia* claſs. Its characters are theſe: the flower is bell-ſhaped, of one leaf, divided at the top into five equal parts; it hath four ſtamina which are inſerted in the baſe of the petal, and but little more than half ſo long as two of the lower being ſhorter than the other. It hath a conical germen, which afterwards becomes an oblong conical capſule, compreſſed at the point, having two cells divided by a partition, filled with roundiſh ſeeds. We have but one ſpecies, which grows naturally in the warm parts of America, where it is often a troubleſome weed.

CAPREA, in *Zoology*. See *Roe* DEER.

CAPREOLATÆ *plantæ*, are ſuch plants as turn, wind, and climb along the ſurface of the earth, and ſticks or trees, by means of their *capreoli*, or tendrils; as gourds, melons, cucumbers, &c.

CAPREOLI, in the *Ancient Architecture*, a ſort of rafters or timbers ſerving to ſuſtain the *cantreli*, either in buildings or machines.

CAPREOLUS, in *Botany*, the ſame with *cirrus*, or tendril.

They were thus called, not, as Philander imagines, from their reſemblance to the *capreoli*, or tendrils of vines, but from the affinity of their form and office to wild goats: as theſe butt and repel things with their horns, ſo do the former oppoſe their heads or horns to the weight of the *cantreli*.

CAPREOLUS, in *Anatomy*, denotes the *helix*, or outer ambit of the ear.

CAPREOLUS, in *Botany*, the claſper, or tendril, by which vines, peas, and ſuch like creeping plants, faſten themſelves to thoſe things which ſtand near, or are deſigned to ſupport them. This is alſo ſometimes called *clavicula*.

CAPREOLUS, in the *Ancient Huſbandry*, a kind of iron hoe or inſtrument with two forks or fangs, wherewith to ſtir and move the ground.

CAPREOLUS, in *Zoology*. See *Roe* DEER.

CAPRICE, in *Muſic*, is ſometimes uſed for an irregular compoſition, which ſucceeds rather by the force of genius than obſervation of the rules of art.

The word is French, where it signifies humorousness, fancifulness. Some deduce it from the Italian *capriccio*, and that from the Latin *caput*, *goat*, to whose wantonness it is supposed to bear allusion. Morvol. Polyhist. tom. 1. lib. ii. cap. 1.

CAPRICE is applied in *Architecture* to an edifice of a singular taste, and deviating much from the common rules of building.

CAPRICORN, in *Astronomy*, according to some, the tenth sign of the zodiac; from which also the tenth part of the ecliptic takes the same denomination.

The character whereby *capricorn* is represented in astronomical writing, is ♑.

The ancients accounted *Capricorn* the tenth sign, and when the sun arrived thereat, it made the winter solstice, with regard to our hemisphere; but the stars having advanced a whole sign towards the east, *Capricorn* is now rather the eleventh sign; and it is at the sun's entry into Sagittary, that the solstice happens: though the ancient manner of speaking is still retained.

The sign is represented on ancient monuments, medals, &c. as having the fore-part of a goat, and the hind-part of a fish; which is the form of an aegipan; and sometimes, simply, under the form of a goat.

The stars in the constellation of *Capricorn*, in Ptolemy's and Tycho's Catalogue, are 28; in that of Hevelius's 29; though it is to be observed, none of those in the tail, of the fifth magnitude, marked in Tycho's book the twenty-seventh, was lost in Hevelius's time. Mr. Flamsteed, in the Britannic Catalogue, gives 51 stars in *Capricorn*. The order, names, longitudes, latitudes, magnitudes, &c. whereof, are as follow:

Names and situations of the stars.	Bayer's Cha.	Longitud.		Latitude.			Magnitudes.

CAPRICORN, *tropic of*, a leſſer circle of the ſphere, parallel to the equator; paſſing through the beginning of *Capricorn*. See TROPIC.

CAPRICORN-*beetle*, the Engliſh name of a ſpecies of *cerambyx*. See BEETLE.

CAPRICORNUS, in *Zoology*. See MOSCHELLA.

CAPRIFICATION, a name given in the iſlands of the Archipelago to a peculiar method of propagating and ripening the fruits of the domeſtic figs-tree, by means of inſects. Plin. Hiſt. Nat. lib. xv. cap. 19.

M. Tournefort aſſures us, that this method is ſtill practiſed every year in moſt of the Grecian iſlands; and he admired the patience of thoſe who ſpent above three months in carrying the flies from one fig-tree to another. *Caprification* is formed from *caprificus*, the wild-fig-tree, from whoſe fruits the inſects are produced, which are the chief inſtruments of *caprification*. This tree bears three different ſpecies of fruit, called *formiæ*, *cratitiæ*, *and orni*, which anſwer no other purpoſe but that of facilitating the above operation. The *formiæ* appear in Auguſt, and contain little worms, hatched from eggs depoſited by flies; in October and *November*, thoſe worms become flies, which pierce the ſecond figs called *cratitiæ*, which do not appear till the end of September: theſe figs continue to the month of May following, and furniſh a lodgment for the eggs of the ſecond claſs of flies. In May, the third ſpecies of figs, called *orni*, appear; and when they are grown to a certain ſize and begin to open at the eye, they are pierced by the flies produced by the *cratitiæ*, or winter figs. When the worms bred in theſe ſpring figs are tranſformed into flies, which happens in the months of May or July, the peaſants gather them, and tranſport them to the garden fig-trees. The ſucceſs of the *caprification* depends on this circumſtance, and therefore they viſit their wild fig-trees, and their garden fig-trees every morning, to examine the eye of the fig; by which they judge when the flies are about to iſſue from the wild figs, and when they may be applied ſo as to pierce the garden figs. They are then depoſited on ſuch trees as are fit to receive them, and enter the fruit by the eye, where they lay eggs, the worms of which cauſe the garden figs to attain their proper degree of luſcioſneſs and maturity. The conſequence of this operation is, that garden fig-trees, which would ſcarcely yield twenty-five pounds of ripe figs, and theſe for drying, yield two hundred and eighty pounds.

As to the manner whereby the puncture of the flies contributes to the maturation of the fruit, poſſibly it may be by lacerating the veſſels, and extravaſating the nutritious juice when they depoſit their eggs; or when with the egg they alſo convey ſome liquor which gently fermente with the juice of the fig, and ſoftens its pulp. Even the Provence and Paris figs ripen much ſooner by wounding their buds with a ſtraw or feather dipped in ſome ripe or rotten pears alſo wounded by inſects are found to ripen the ſooneſt, and in theſe the pulp about the wound is more exquiſite than the reſt. Mem. Acad. Scienc. ann. 1705. p. 347. ſeq.

CAPRIFICATION is alſo applied in a leſs proper ſenſe to the art of propagating the palm-tree. Act. Erudit. Lipſ. 1721. p. 84.

CAPRIFICUS, in *Botany*, a term by which ſome authors, particularly Pliny, call the leſſer SPURGE *or ſpalax*. Gen. Plmac. ind. 7.

CAPRIFOLIUM, the *honey-ſuckle*. See the article HONEYSUCKLE.

CAPRIMULGUS, in *Ornithology*. See *Goat-Sucker* and *Churn-Owl*.

CAPRIOLES, in *Horſemanſhip*, are leaps which a horſe makes in one and the ſame place, without advancing forwards; and that in ſuch manner that when he is in the air, at the height of his leap, he yerks or ſtrikes out with his hind-legs as near and even together, and as far out as he can ſtretch them; in which action, he claches, or makes a noiſe with them.

The word comes from *capreolus*, a diminutive of *capra*, *goat*.

The *capriole* is the moſt difficult of all the high raiſed airs: there are ſeveral kinds of *caprioles*; as a *right capriole*, *back capriole*, *ſide capriole*, *broken capriole*, the *equa capriole*, &c.

CAPRISCUS, the *goat-fiſh*. See GOAT-FISH.

CAPSARIUS, from *capſa*, *ſatchel*, in *Antiquity*, a ſervant who attended the Roman youth to ſchool, carrying a ſatchel with their books in it, ſometimes alſo called *librarius*.

CAPSARIUS was alſo an attendant at the baths, to whom perſons committed the keeping of their cloaths.

CAPSARIUS, from *capſa*, *cheſt*, among the Roman *Bankers*, was he who had the care of the money-chell, or coffer.

CAPSICUM, *Guinea*, or *Bonnet pepper*, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: the flower hath but one petal, which is wheel-ſhaped, and hath five ſmall ſtamina; it hath an oval germen,

germen, which afterward becomes a soft fruit or capsule, of an indeterminate figure, having two or more cells divided by intermediate partitions to which adhere many compressed kidney-shaped seeds.

Guinea-pepper is more used as a sauce, and in pickle, than in physic, being frequently put into fish-sauces, or into any thing that is flatulent and windy; for which purpose it is ordered divers ways, either green or ripe, pickled, or rubbed to powder with salt. A decoction of it with pennyroyal is commended by some to expel a dead child.

The skins boiled, and used as a gargle, are good against the tooth-ach; a cataplasm of the seeds, powdered and mixed with honey, applied to the throat, is good for the quinsy.

CAPSQUARES, in *Gunnery*, strong plates of iron, which come over the trunnions of a gun, and keep it in the carriage.

These are fastened by hinges to the prize-plate, that they may lift up and down. They form a part of an arch in the middle, to receive a third part of the thickness of the trunnions; for two-thirds of them are let into the carriage, and the other end is fastened by two iron wedges, which are called the *forelocks* and *key*.

CAPSTAN, a large massy column, shaped like a truncated cone, and placed perpendicularly on the deck of a ship, and turned by levers, or bars, which pass through holes pierced in its upper extremity, serving by means of a cable which winds round the barrel, to draw up burdens fastened to the end of the cable. See *Tab.* III. *Mechanics*, *fig.* 70.

The word is also written *capstand*, *capstern*, and even *capstow*. It is formed from the French *cabestan*, which signifies the same.

The power of the *capstan* is reducible to that of the AXIS *in peritrochio*.

De Camus considers the *capstan* as a perpetual LEVER.

By the *capstan* vessels are drawn ashore, and hoisted up to be refitted; anchors weighed, and sails hoisted, &c.

There are commonly two *capstans* in a ship of war; the *main-capstan* placed behind the main-mast, standing on the first deck, and reaching four or five feet above the second: this is also called *double capstan*, because it has two drum-heads, and serves two decks for drawing of anchors; and because its force may be doubled by applying hands on each deck. It has bars, whelps, &c. for turning and stopping it. See *Tab. Ship. fig.* 2. *n. n.* 32. or *Tab.* III. *Mechanics*, *fig.* 71. And the *fore-capstan*, or *little-capstan*: this stands on the second deck, between the main-mast and the mizen: its use is, chiefly, to heave upon the fore-rope, or to heave upon the viol, to hold on by when the anchor is weighed; and on other occasions where a less force is required, than to weigh the anchors, &c. See *n.* 33, or *fig.* 70. *Tab.* III. *Mech.*

The French call that an *English capstan* where there are only half-bars used; and which, for that reason, is only half perforated: this is thicker than the others.

There is also a *flying capstan*, which may be moved from place to place.

The parts of a *capstan* are, the foot *a*, which is the lowest part; the spindle *f*, the smallest part of which turns round in an iron socket, called the saucer; the whelps, *b*, a sort of brackets let into the body of the *capstan* close under the bars, and reaching downwards from the lower part of the drum-head to the deck; the barrel A, the main body of the whole; the *drum-head c*, which is a broad cylindric piece of wood fixed above the barrel and whelps, in which are the holes for the bars to be put into; the bars, which are small pieces of timber by which the men heave; the pins, as *e*, which are little bolts of iron, thrust perpendicularly through the holes of the drum-head, and through a correspondent hole in the end of the bar, made to receive them when the bars are fixed; the pawls, which are pieces of iron bolted to one end of the beams of the deck, close to the body of the *capstan*, but so as that it have liberty to turn about every way; and against them do the whelps of the *capstan* bear; so as that by them the *capstan* may be stopped from turning back. There are also hanging pawls, as *g*, *g*. *fig.* 71. which reach from the deck above the drum-head immediately beneath it; and lastly, the swifter, which is a rope passed horizontally through holes in the outer ends of the bars and drawn tight, designed to keep the men steady whilst they work, and to afford room for a greater number to work at once.

The terms belonging to the use of the *capstan* are, *rig the capstan*, i. e. fix the bars in their respective holes; *heave the capstan*, i. e. go round with it heaving on the bars; *surge the capstan*; and *come up capstan*, that is, slacken the cable which you heave by; in a like sense they also say *launch the capstan*; *pawl out the capstan*, signifies, stop it from going back.

CAPSULA, or CAPSELLA, denotes a bag, pouch, or receptacle of divers kinds of things.

The word is a diminutive of the Latin *capsa*, literally signifying, a little box, or case; particularly a bag, or satchel, wherein boys carry their books, &c. to school.

CAPSULA, or CAPSULE, among *Botanists*, a species of *pericarpium* composed of dry elastic valves, which usually burst open at the point: this kind of PERICARPIUM sometimes contains only one cell or cavity, sometimes more; in the first case it is called *unilocular*; in the second, *bilocular*, *trilocular*, &c. according to the number of cells in it for the reception of seeds.

Those plants whose seeds are inclosed in *capsulæ*, are denominated *angiospermous*; and those whose seeds have no *capsulæ*, *gymnospermous*.

CAPSULA *communis*, or *of the Porta*, in *Anatomy*, is a membrane arising from the *peritonæum*; and including the trunk of the vena *porta* after its entrance into the liver, as a case, or cover; dividing itself into the same number of branches, and accompanying all, even in its smallest ramifications.

The same *capsula*, or membrane, likewise includes the *vasa biliaria*, and other vessels of the liver; whence it takes the name of *capsula communis*.

CAPSULA *cordis*, a membrane investing the heart; more usually called the *pericardium*.

CAPSULÆ *atrabiliariæ*, in *Anatomy*, called also *renes succenturiati*, and *glandulæ renales*, are two glands situate near the kidneys: called *atrabiliares*, from a black liquor found in their cavity; and *succenturiati* and *renales*, from their position. They are about the bigness of a nut *vomica*; their figures are somewhat various; in some bodies round, in others triangular, square, &c. The membrane wherewith they are covered is very thin; their cavity is pretty large for their bulk. Their use is very obscure; probably it is to secrete the black humour found in their cavity, which, being afterwards discharged by their duct into the emulgent, mixes with the blood; and serves, according to some, as a ferment; according to others, only to dilute its thickness: in a fœtus they are almost as big as the kidneys.

CAPSULA *of the crystalline*. See CRYSTALLINE.

CAPSULÆ *seminales*, are the same with VESICULÆ *seminales*.

CAPSULA, in *Chemistry*, is an earthen vessel, in form of a pan; wherein things are frequently placed, that are to undergo very violent operations of the fire.

CAPSULATE *plants*, CAPSULATÆ *plantæ*, are such as have a tetrapetalous regular flower, consisting of four difform petals in each flower, and which bear their seeds in short *capsulæ*: by which they are distinguished from the *siliquosæ*, which have their seed in long cases, or pods.

CAPTAIN, a military office, whereof there are various kinds and degrees, distinguished by their commands: as,

CAPTAIN *of a company*, or *troop*, is an inferior officer, who commands a company of foot, or troop of horse, under the colonel.

In the like sense, we say, a *captain* of dragoons, of grenadiers, of marines, of invalids, &c.

In the horse and foot *guards*, the *captains* are styled *colonels*; being usually persons of rank, and general officers of the army. In the colonel's company of a regiment, i. e. the first company, or that whereof he himself is *captain*, the commanding officer is called *captain-lieutenant*.

The duty of this officer is to be careful to keep his company full of able-bodied soldiers, to visit their tents and lodgings, to see what is wanting, pay them well, cause them to keep themselves neat and clean in their cloaths, and to keep their arms bright. He has power in his own company of making sergeants and corporals.

CAPTAIN, *second*, one whose command having been taken away, that is joined to another *captain*, to serve under him, and receive pay as a *captain* reformed.

Among the French, those are also *second captains*, who never had companies of their own.

CAPTAIN *en pied*, a *captain* kept in pay, that is not yet reformed.

The expression, though altogether French, occurs sometimes.

CAPTAIN-*lieutenant*, is he who commands a troop, or company in the name or place of some other person, who has the commission, with the title, honour, and pay thereof; but is dispossessed withal, on account of his quality, from performing the functions of his post.

Thus, the colonel, being usually likewise *captain* of the first company of his regiment, the company is commanded by his deputy, under the title of *captain-lieutenant*. So in England, France, &c. the king, prince, dauphin, &c. have usually the titles, dignities, &c. *of captains of the guards*, *gens d'armes*, &c. the real duty of which offices is performed by *captain-lieutenant*.

CAPTAIN, *reformed*, is one, who, upon a reduction of the forces, has his commission and company suppressed; yet is continued *captain*, either as second to another, or without any post or command at all.

CAPTAIN *of the guides*, an officer appointed for providing

guides

guides for the army. Of these he ought always to have a sufficient number with him, who know the country very well; that they may guide the army on a march, or go with convoys, parties, baggage, artillery, and detachments. To provide such the *captain* ought to have a party of horse to go to the adjacent villages, castles, or forts, to bring boors to his quarters, and keep them under a guard, till the army comes to another ground, where he may be provided with others. He ought to understand several languages, especially that of the country in which the army is.

CAPTAIN-*general* of an army, is the general or commander in chief.

CAPTAIN-*general of Great Britain* is the highest military post in our army.

In Holland the office of *captain-general* is usually joined with that of STADTHOLDER, and though, by the perpetual edict passed in 1667, the two offices were for ever disjoined, so that whoever was possessed of one, was rendered incapable of the other; this regulation lasted but five years.

CAPTAIN of *militia*, is he who commands a company of militia or trained-bands.

CAPTAIN-*bashaw*, signifies the Turkish high-admiral. See BASHAW.

He possesses the third office in the empire, and is invested with the same power at sea, that the vizir has on shore. Solyman II. instituted this office in favour of the famous Barbarossa; with absolute authority over the officers of marine and arsenal, whom he may punish, cashier, or put to death, as soon as he is without the Dardanelles. He commands in chief in all the maritime countries, cities, castles, &c. and at Constantinople is the first magistrate of police in the villages on the side of the Porte, and the canal of the Black Sea. The mark of his authority is a large Indian cane, which he carries in his hand, both in the arsenal and in the army.

The *captain-bashaw* enjoys two sorts of revenues; the one fixed, and the other casual. The first arises from a capitation of the islands of the Archipelago, and certain governments in Natolia and Gallipoli. The latter consists in the pay of the men who die during the campaigns; in a fifth of all prizes made by the beys in the provinces accruing from the labour of the slaves, whom he hires as rowers to the grand signior; and in the contributions he exacts in all places where he passes.

CAPTAIN *reis*, or CAPUDAN *reis*, an appellation given by the Turks to the grand pilot, answering to pilot royal among the French.

CAPTAIN *of a ship*, is a sea-officer, where we make two kinds; the one of a ship of war, the other of a trading vessel; though, in propriety, the title *captain* belongs only to the commanders of ships of war.

CAPTAIN *of a ship of war*, is the commanding officer of a ship, galley, fire ship, or the like.

The *captain of a man of war* is held equivalent to that of a colonel at land. The *captain* is accountable for the ship, if lost or taken by his misconduct; and his province extends to the military government, navigation, and equipment of the ship which he commands, and to the conduct of the inferior officers and men, which he is required to superintend and regulate.

In admiral ships, and all ships of the first rate, the French have two *captains*, two lieutenants, and two ensigns.

The pay of sea *captains*, in the English service, was formerly small, which defect was made up to them, by indulging them in many privileges not now allowed, as plundering of prizes, taking convoy money, and even carrying merchant goods, plate, &c. King James II. taking this last privilege away, in lieu thereof granted them an annual allowance of table monies, almost equal to their whole former pay. But this not taking place by reason of the abdication, king William III. in 1693, ordered the pay of the *captains* to be doubled, but the fund for this failing, at the peace of Ryswick, a new establishment was made in 1700, whereby nearly one third was retrenched from the sea-pay, and that of a first-rate fixed at 1*l.* of a second rate at 16*s.* and a third rate at 13*s.* 6*d.* of a fourth rate at 10*s.* of a fifth rate at 8*s.* of a sixth rate at 6*s.* per day.

CAPTAIN *of a merchant-ship*, is the master thereof; or he who has the command or direction of the ship, her crew, lading, &c. This officer is more usually called the *master*; especially in ordinary voyages.

On the Mediterranean he is called the *patron*, or *patroon*; and in long voyages, as the East Indies, South Sea, &c. the *captain*.

The proprietor of the vessel appoints the *captain*, or master; and the *captain* is to form the crew, and choose and hire the pilots, mates, seamen, &c. though when the proprietor and master reside on the same spot, this is usually done in concert with the proprietor.

CAPTAINS *of port*, in the French *Marine Affairs*, officers established in some considerable sea-ports where there are arsenals. To them belong the command of the guard of the place, the watching of the sea, and the care and custody of the vessels brought into port.

There are such *captains* at Toulon, Rochefort, Brest, Havre, Dunkirk, and Port Louis. They are to take care of mooring the king's ships, and oblige all to give the due salutes.

CAPTAINRY, *capitainerie*, in the French *Law*, denotes the government or command of a royal palace, and the lands dependent thereon.

The name is also applied to the office of *captains* of chases or woods. Such are the *capitainries* of Fontainbleau, the wood of Boulogne, &c.

CAPTION, in *Law*, is when a commission is executed, and the commissioners names subscribed to a certificate, declaring when and where such commission was executed. The *caption* usually commences with these words, *Virtute istius commissionis nos, &c. vi, Executio istius commissionis patet in quodam schedula annexata, &c. or, Capt. & exam. &c. &c. Capt. fuit hac recipr.*

The *caption*, and the executions of the commissions, must now be in English, by 4 Geo. II. cap. 26.

CAPTIVE, a SLAVE, or person taken by the enemy in war, or by a PIRATE or corsair.

CAPTIVUS, *captive*, among the Romans, differed from *debitor*, as the former were taken by force, whereas the latter surrendered themselves.

By the *Lex Cornelia*, a Roman citizen taken *captivus*, in case he returned, was reputed as having never been taken; if he died in captivity, he was reputed for dead the moment he was taken; in the former case he recovered all his right, and even the dominion over his children; in the latter his son became free from the time of his father's detention. Julius Inst. lib. 1. tit. 16. § 5. Formerly *captivus* in war became the slave of those who took them; and though slavery, such as obtained among the ancients, be now abolished, some shadow of it still subsists in respect of prisoners of war, who are reputed the property of their captors, and have no right to liberty, but by concession from them, or till their ransom is paid. Negro servants likewise, who are purchased when *captives*, continue in some degree the property of the masters who buy them; though the property consists rather in the perpetual service, than in the body or person of the captive. Black. Com. vol. ii. p. 402.

The Romans used their *captives* with great severity; their necks were exposed to the soldiers to be trampled on, and their persons afterwards sold by public auction.

Captives were frequently burnt in the funeral piles of the ancient warriors, as a sacrifice to the infernal Gods. See BURIAL.

Those of royal or noble blood had their heads shaven, and their hair sent to Rome, to serve as decorations in female toys, &c. They were led in triumph loaden with chains through Rome, in the emperor's train, at least as far as the foot of the Capitoline mount, for they were not permitted to ascend the sacred hill, but carried thence to prison. Those of the prime quality were honoured with golden chains on their hands as well as feet, and golden collars on their necks. If they made their escape, or killed themselves, to avoid the ignominy of being led in triumph, their images or effigies were frequently carried in their place.

CAPTIVITY is used, in *Scripture*, to denote the punishment inflicted by Providence on the Jews for their idolatry and wickedness. The principal *captivities*, if we except the Egyptian bondage, from which they were rescued by Moses, are the Assyrian and Babylonish. The Assyrian *captivity* was that of the ten tribes, begun in the reign of Pekah king of Israel, and completed by Shalmaneser 2 Kings, xv. 29. 2 Kings, xvii. 5, 6.

The greater part of the ten tribes were lost in this *captivity*, which put a period to the kingdom of Israel; though some of them returned with those of Judah and Benjamin, upon the decree of Cyrus, to their own land. The Babylonish *captivity* was that of the kingdom of Judah, or of the two tribes who adhered to the house of David. This was begun by Nebuchadnezzar, and completed by Nebuzaradan. 2 Chron. xxxvi. 6, 7. 2 Kings, xxv. 8. Jer. lii. 30. This lasted seventy years, and terminated in the famous decree of Cyrus, in the year before Christ 536, for restoring the Jews to their own land, and for rebuilding Jerusalem and the Temple. Ezra, i. 1. 3.

Some have computed these years from the fourth of Jehoiakim to the first issuing of Cyrus's decree. 2 Kings xxiv. 10, &c. 6th ch from the destruction of Jerusalem to the publication of Darius's decree for building the Temple, in the fourth year of his reign, Zechar. vii. 1; either of which computations will give seventy years for again, they may be computed from the twenty-third year of Nebuchadnezzar to the first Passover celebrated in the new

Temple, in the seventh year of Darius's reign. Prid. Conn. vol. i.

CAPTIVITY, *princes of the*, are heads or chiefs of the Jewish nation, appointed for the administration of justice among them, during their captivity both in the East and West, since the destruction of their temple by the Romans.

The prince of the *captivity* in the East, is said to have had the government of the Jews who dwelt at Babylon, in Chaldea, Assyria, and Persia. The prince of the *captivity* in the West, had the direction of those who lived in Judea, Egypt, Italy, and other parts of the Roman empire.

The former were called *rabbans*, and were supposed to have descended from David, in a direct line by the males; the latter called *rabbani*, only descended from David by the females.

The Jews, we are told by Philoteus, after the loss of their authority, still kept up the title, and for many ages had a person of the house of David residing about Babylon, who, under the name of the head of the *captivity*, was acknowledged and honoured as a prince among that people, and had some sort of jurisdiction, as far as was consistent with the subordination they were under, always vested in him, and sometimes even a ratification of it was obtained from the sovereigns of the country. Something of this pageantry is said to be still kept up; perhaps that they may be furnished with an answer to the Christians, when they urge the prophecy of Jacob against them; the Scripture they pretend being still preserved among them in the head of the *captivity*. See ÆCHMALOTARCHA.

CAPTURE, a prize, or prey; particularly that of a ship taken at sea.

Captures made at sea were formerly held to be the property of the captor after a possession of twenty-four hours; but the modern authorities require, that before the property can be changed, the goods must have been brought into port, and have continued a night *intra præsidium*, in a place of safe custody, so that all hope of recovering them was lost. Black. Com. vol. ii. p. 401. See PRIZE and PARAVERSA.

CAPTURE also denotes an arrest, or seizure of a criminal, *debtor*, &c. at land.

CAPUCHE. See COWL, and the next article.

CAPUCHINS, religious of the order of St. Francis, in its strictest observance.

The *Capuchins* are thus called, from *capuce* or *capuchon*, a *cowl*, or *cape*, wherewith they cover their heads; and which they added to the ordinary Franciscan habit.

They are clothed with brown or grey; are always barefooted; and never go in a coach, nor ever shave the head.

The *Capuchins* are a reform made from the order of Minors, commonly called *Cordeliers*, set on foot in the fifteenth century by Matthew de Baſi, a religious observant of the monastery of Montefalcone, who, being at Rome, said he was advertised several times from Heaven, to practise the rule of St. Francis to the letter. Upon this he made application to pope Clement in 1525, who gave him permission to retire into a solitude; and not only him, but as many others as would embrace the strict observance which same did accordingly. In 1528, they obtained the pope's bull. In 1529, the order was brought into complete form; Matthew was elected general, and the chapter made constitutions. In 1543, the right of preaching was taken from the *Capuchins* by the pope; but in 1545, it was restored to them again with honour. In 1556, there were seventeen general chapters in the order of *Capuchins*.

The *Capuchins* were at first restrained from spreading out of Italy; but Charles the IX. of France, writing to pope Gregory XIII. to demand some *Capuchins*, that pope, by a bull, dated in 1575, took off the prohibition, and granted them leave to settle any where. The cardinal of Lorraine built them a convent at Meudon, and Henry III. another at Paris, in the rue St. Honore. F. Zacharias de Boverio has written the annals of the *Capuchins* in Latin, in three volumes folio, from the year 1524 to 1643.

CAPUCHIN is also the name of a particular species of pigeon, in shape and make much like the Jacobine or Jack, but something larger than that; its beak also is longer, and it has a tolerable head of feathers on the back part of its head, but it has no cravat or chain down the throat as that species has. Its marks are the same with the Jacobine, and it seems to be no other than a bastard breed between that and a common pigeon.

CAPUCIATI, an appellation given to the followers of Wickliff in the fourteenth century, by reason they did not uncover themselves before the host, but kept on their *caput*, or cap used in those times. Spondanus speaks of the *capuciati*, under the year 1387.

CAPUCIATI is also the denomination of a faction which appeared in Auvergne in 1783, having at their head a carpenter named Durand; thus called because they wore the image of the Virgin in their white linen capuces, as the badge of their engagement.

CAPUCINE, in *Botany*, the name by which the French call the CARDAMINDUM, or *nasturtium Indicum*, a plant commonly kept in our gardens for the beauty of its flower, and its use in salads and pickles.

CAPUENA, in *Ichthyology*, the name of a fish caught in the American seas among the rocks, and about the shore, and esteemed a very delicate one for the table. It is of a long and round shape: its usual length is about five inches.

CAPUT. See HEAD.

CAPUT *baronia* the head of the BARONY, in *Scotch Customs*, denotes the ancient or chief seat, or castle of a nobleman, where he made his usual residence, and held his courts: sometimes also called *caput honoris*, or the head of the honour.

The *caput baronia* could not be settled in dowry; nor could it be divided among the daughters, in case there were no son to inherit; but was to descend entire to the eldest daughter, *exteris filiabus aliunde satisfactis*.

CAPUT *cerebelli*, in *Anatomy*, the name given by Douglas, and some others, to a muscle, described by Albinus under the name of the *intertransversi serviæ colli*, among some others of the same nature, which he distinguishes according to their situation into *priores* and *posteriores*; this being of the former number. Winslow calls it the TRANSVERSALIS *secundus anterior*.

CAPUT *cordis*, a name sometimes given to the upper and largest side of the HEART, otherwise called its BASIS.

CAPUT *draconis*, a denomination given by some to a fixed star of the first magnitude, in the head of the constellation DRACO, called the by the Arabs *Rastaben* and *Rastaban*. See NODE.

CAPUT *galinaginis*, or *gall-stalinum*, *cock's head*, is a kind of ferrum, or fringious border, at the extremities or aperitures of each of the *vasculæ seminales*, serving to prevent the seed coming from one side, from ruining upon, and so stopping the discharge of the other.

Some will have its use to be, to prevent the impulse of the seed from diluting the others of the *testes*, and so ouling out, except when assisted by the contractions of the surrounding parts; as in copulation; but this according to Dr. Drake, is rather the office of a distinct muscle placed at each orifice, and acting as a valve.—See *Tab. Anat. Spec. & Fig.* 8. *fig.* 1.

CAPUT *jejunii*, a name given to Ash-Wednesday, as being the first day of the Lent-fast.

CAPUT *lupinum*. An outlawed felon is anciently said to have *caput lupinum*, and might be knocked on the head like a wolf, because having renounced all law, he was to be dealt with as in a state of nature; but now the wilful killing of such a one is murder, unless in the endeavour to apprehend him.

CAPUT MEDUSÆ, a northern constellation included in that of PERSEUS.

CAPUT *mortuum*, in *Chemistry*, the *faces* remaining of any body, after all the volatile and humid parts, as the phlegm, spirit, salt, &c. have been extracted therefrom, by force of fire. As these *faces*, or *residua*, are very different, modern chemists specify them more particularly, by adding a term expressive of their qualities; as *earthy residuum*, *watery* or *saline residuum*, &c.

What remains after distillation is properly called *faces*. This, before it be *caput mortuum*, must likewise have pulled the *worst*, or open fire.

The *caput mortuum*, called also *terra damnata*, is found in form of a friable, porous matter, without taste or smell: it is ranked among the chemical elements, and supposed to constitute the dry, fixed, earthy, and solid part of all mixed bodies. As an element, it is more commonly expressed by the name *earth*.

It is what the chemists call a *passive element*, or *principle*; serving as the basis or support of the active ones.

The term is sometimes more immediately restrained to the remains of vitriol, after distillation; otherwise called *colcothar vitrioli*.

The *caput mortuum* is never pure, but there is still some active principle remaining in it, and particularly a fixed SALT.

Thus the *colcothar vitrioli*, exposed to the air, is reconverted into vitriol.

CAPUT *mortuum secundæ*, in *Anatomy*, a name given by Palfopius, and others, to a muscle called by Albinus *triventer cervicis*, and by some the *complexus*.

CAPUT *porcinum*, *swine's head*, a denomination given by the Romans to an order of BATTLE more frequently called *cuneus*.

CAPUT *purgii*, a barbarous term used by some physicians to denote medicines which cleanse the head, either in the way of sneezing, more frequently called *errhines*, or

by shewing in the way of salivation, called APOPHLEGMATIZANTS. See ERRHINA and STERNUTATIVE.

CAPUTIATI. See CAPUCIATI.

CAPYBARA, in *Zoology*, the name of an animal found in many parts of America, and somewhat approaching to the nature of the river-horse, but with so much of the general figure of the hog-kind, that Margrave, and some others, have called it the *porcus marinus*, or sea hog. It is of the size of a half-grown hog, measuring in length, from the head to the rump, about two feet; its belly is as prominent at that of a fat hog. It has no tail; its feet are wholly like those of the hog, but that the fore ones have four claws each, and the hinder ones only three. Its head is very thick, and proportionably too large for the body; its eyes are large and black, its ears small and round; the lower jaw is shorter than the upper, and each has two long crooked teeth that stand out a finger and a half from the jaw, and are buried two fingers in it; but these do not shew themselves outwardly when the mouth is shut. It feeds on vegetables, and its flesh is eaten by the Indians, but is not well tasted. Ray.

CAR. See CARR.

CARA, in *Botany*, a name given by the old Roman authors to a plant with large and efculent roots. We are told that the soldiers of Cæsar, in some of their marches, when distressed for provisions, made a sort of bread of the root of the *cara*. And we learn from Paulus Ægineta, and Dioscorides, that this plant was of the *pastinacha*, or parsnip kind. It was probably the *elaphoboscum*, or wild parsnip, which has roots long and thick, and of as good a taste as the garden parsnips, only that they are not so tender. It is supposed by some that our word carrot is derived from this *cara*.

CARABE, or KARABE, denotes yellow AMBER.

CARABINE, a small sort of fire-arm, shorter than a fusil, and carrying a BULLET of twenty in the pound; borne by the light horse, hanging at a belt over the left shoulder. The *carabine* is a kind of medium between the pistol and the musquet, and bears a near affinity to the harquebuss, only that its bore is smaller.

It was formerly made with a match-lock, but of late only with a flint lock.

The barrel is two feet and a half long, and is sometimes furrowed spirally within, which is said to add to the range of the piece.

CARABINEERS, a sort of light horse, carrying longer *carabines* than the rest; and used sometimes as foot, like the dragoons. The French have formed entire corps of these *carabineers*, chosen out of the whole cavalry, and better paid than the rest. There are but few of them in the English army.

CARABUS, in *Zoology*, the name of a genus of four-winged flies, belonging to the Linnæan order of *coleoptera*, whose *antennæ* are oblong, slender, and setaceous; the thorax is somewhat convex, marginated, of a cordated figure, and truncated in the hinder part.

CARACALLA, in *Antiquity*, a long garment, having a sort of capuchin, or hood a-top, and reaching to the heels; worn equally among the Romans by the men and the women, in the city and the camp.

Spartian and Xiphilin represent the emperor Caracalla as the inventor of this garment, and hence suppose the appellation *Caracalla* was first given him. Others, with more probability, make the *Caracalla* originally a Gallic habit, and only brought to Rome by the emperor above mentioned, who first enjoined the soldiery to wear it. The people called it *Antoninian*, from the same prince, who had borrowed the name of Antoninus.

The *Caracalla* was a sort of casock, or surtout. Salmasius, Scaliger, and after them Du-Cange, even take the name *Casiqua* to have been formed from that of *Caracalla* for *Caracalla*. This is certain from St. Jerom, that the *Caracalla*, with a retrenchment of the capuchin, became an ecclesiastical garment. It is described as made of several pieces cut and sewed together, and hanging down to the feet; but it is more than probable there were some made shorter, especially out of Rome, otherwise, we do not see how it could have fitted the soldiers purposes.

CARACALLA, in *Botany*. See *Kidney*-BEAN.

CARACARA, in *Ornithology*, the name of a Brasilian bird of the genus of the hawk, called by the Portuguese *gavicaon*. It is property of the sparrow-hawk kind, but of the size of a kite. They are great destroyers of the poultry. See *Tab. of Birds*, N° 4.

CARACOL, in the *Manage*, a motion which a cavalier makes half round; or a half-turn from left to right; changing hands; that his enemy may be uncertain on which side he intends to attack; whether in front or flank. The word comes from the Arabic *garagal*, and that from the Hebrew *ourac*, *involuere*: but we have it immediately from the Spanish, where *caracol* signifies properly a *snail*, and figuratively the evolution described above.

CARACOL is also the half-turn each horseman in an army makes after his discharge, to pass from the front of the squadron to the rear.

CARACOL is sometimes also used in *Architecture*, for a staircase in a helical, or spiral form.

CARACOLI, in *Commerce*, a factitious metal whereof the natives of the Caribbee islands make a kind of ornament, in form of a half-moon, which is called by the same name. The metal is brought from the *Terra Firma*; and the common opinion is, that it is composed of gold, silver, and copper; but the mixture is so perfect, that a metal results from the whole, which never rusts nor tarnishes, how long soever kept either in the sea, or the ground. The English and French goldsmiths have made frequent attempts to imitate it. Those who have succeeded best, use six parts of silver, three of purified copper, and one of gold. But the curious find all the imitations much inferior in beauty to the original metal of the savages.

M. Hauterive, procurator-general of Martinico, makes the *caracoli* to be compounded of gold only with a sort of copper found in the *Terra Firma* of America. F. Labat takes it for a native, or simple metal. The Americans also make rings, buckles, cane-heads, and the like, of *caracoli*. A. D. S. an. 1724. p. 26. It is there recommended as a remedy for the head-ach. Hist. 28.

CARACT, or CARAT, a denomination given to the weight which expresses the degree of goodness, fineness, and perfection, or imperfection of GOLD.

The word is also written *carrat*, *carrot*, *karrat*, and *karrot*. Its original is contested: but we choose to follow Kennet, who derives it from *carata*, a term which the author observes anciently denoted any weight, and came not till of later days to be appropriated to that which expresses the fineness of gold, and the gravity of diamonds. The mint-men fix the highest purity and perfection of gold at twenty-four *carats*; and the several degrees are estimated from the divisions hereof, which are called *grains*: but it is to be observed, that what care soever is taken in purifying gold, to clear it from drofs, it can never be brought to twenty-four *carats*; but still comes short, at least $\frac{1}{8}$ of a *carat*, or a grain: this grain they call a *sixteenth*; and this sixteenth they subdivide into two eighths; and each of those eighths into two fixteenths; on which calculation, they say, gold may be purified as far as the first fixteenth of the second eighth, but no further.

Gold of twenty-two *carats*, is that which has twenty-two parts of fine gold, and two of silver, or other metal; or that which, in refining, loses two parts in twenty-four of its weight. The goldsmiths generally work in gold of twenty-two *carats*; that being the standard gold of this kingdom. By the laws of France they are prohibited from working in gold below twenty-three *carats*. In England, the *carat* is divided into four grains; in Germany, into twelve parts; and in France, into thirty-two. The Chinese reckon by TOUCHES, a hundred of which correspond to our twenty-four *carats*.

Carat fine, as above, is the twenty-fourth part of the goodness of a piece of pure gold.

Carat price is the twenty fourth part of the value of an ounce or mark of gold.—They also sometimes say, the *carat weight*, which is the twenty-fourth part of the weight of the ounce or mark. Two troy grains make a *carat* grain.

CARAT is also the weight used in weighing diamonds, pearls, and precious stones; where it consists of four grains. In this sense, the word is by some supposed to be derived from *ceration*, a fruit which the Latins call *siliqua*, and we *carob bean*; each of which may weigh about four grains of wheat: whence the Latin *siqua* has also been used for a weight of four grains.

The *carat* by which jewellers estimate the weight of diamonds and pearls, is about $\frac{1}{103}$ of a troy ounce. Jeffreys on Diamonds.

Hence the *carat* is about $3\frac{1}{6}$ grains troy.

Carats are divided into halves, quarters, or grains; and further, into eighths, fixteenths, and thirty-two parts. Id. Ibid.

CARAGACH, in *Commerce*, a cotton that comes from Smyrna, by the way of Marseilles.

CARAGANA, in *Botany*. See *Bitter*-VETCH.

CARAGROUCH, a silver coin of the empire, weighing nine drams, which does not quite amount to a French crown, of three livres Tournois.

CARAGUATA, a Brasilian name by which some authors have called the common great aloe.

From an incision made in the shoots of this plant, there flows a great quantity of liquor, whereof the Brasilians make wine, vinegar, honey, and sugar.

CARAGUATA is also a sort of thistle which grows in Brasil, and in some other parts of America. The leaves of this plant being steeped in water, and afterward well washed and rubbed, afford a kind of flax very fine and strong, proper for several manufactures. The Americans make fishing nets of it.

CARAITES, a sect among the ancient Jews: whereof

there are still some subsisting in Poland, Russia, Constantinople, China, and other places of the Levant; whose distinguishing tenet and practice it is, to adhere closely to the words and letter of the Scripture, exclusive of allegories, traditions, and the like.

Leo of Modena, a rabbin of Venice, observes, that of all the heresies among that people, before the destruction of the temple, there is none now left but that of the *Caraim*, a name derived from *Mikra*, which signifies the pure text of the Bible; because of their keeping to the Pentateuch, observing it to the letter, and rejecting all its interpretations, paraphrases, and constitutions of the rabbins. Aben Ezra, and some other rabbins, treat the *Caraites*, as Sadducees; but Leo de Juda calls them, more accurately, Sadducees reformed; because they believe the immortality of the soul, paradise, hell, *resurrection*, &c. which the ancient Sadducees denied. He adds, however, that they were doubtless originally real Sadducees, and sprung from among them.

M. Simon, with more probability, supposes them to have risen hence: that the more knowing among the Jews opposing the dreams and reveries of the rabbins, and urging the pure texts of Scripture to refute their groundless traditions, for the name of *Caraim* given them, which signifies as much as the partizans of *Scripture*, it ex. pressed attached to the texts of Scripture. The other Jews give them the odious name *Sadducees*, from their agreement with those sectaries on the head of traditions.

Isaac Vossius, and Stanislaus, rank the *Caraites* among the Sabeans, Magi, Manichees, and Mussulmen, but by mistake: Wolfgang, Fabricius, &c. say, the Sadducees and Essens were called *Caraites*, in opposition to the Pharisees: others take them for the Doctors of the law so often mentioned in the Gospel: but these are still conjectures. Josephus and Philo make no mention of them; which shews them to be more modern than either of those authors. In all probability, this sect was not formed till after the collection of the second part of the Talmud, or the Gemara; perhaps not till after the compiling of the Mischna in the third century.—The *Caraites themselves* pretend to be the remains of the ten tribes led captive by Shalmaneser. Wolfius, from the Memoirs of Mardacheus, a *Caraite*, refers their origin to a massacre among the Jewish doctors, under Alexander Janneus, their king, about one hundred years before Christ: because Simeon, son of Schetach, and the queen's brother, making his escape into Egypt, there forged his pretended traditions; and, at his return to Jerusalem, published his visions; interpolating the law after his own fancy, and supporting his novelties on the notices which God, he said, had communicated by the mouth of Moses, whose depositary he was: he gained many followers; and was opposed by others, who maintained, that all which God had revealed to Moses was written. Hence the Jews became divided into two sects, the *Caraites* and *Traditionaries*: among the first, Juda, son of Tabbai, distinguished himself; among the latter, Hillel. Wolfius reckons not only the Sadducees, but also the Scribes, in the number of *Caraites*. But the address of the Pharisees prevailed against them all; and the number of *Caraites* decreased: Anan, indeed, in the eighth century, retrieved their credit a little; and rabbi Schalomon in the ninth. They succeeded pretty well till the fourteenth; but since that time they have been declining. The *Caraites* are but little known; their works coming only into very few hands, even among the greatest Hebraists. Buxtorf never saw more than one; Selden two; but Mr. Pelg had five, before he grew rich enough to speak of them with assurance. He asserts, that soon after the prophets had ceased, the Jews became divided on the subject of works, and supererogation; some maintained their necessity from tradition; whilst others, keeping close to the written law, set them aside; and it was from those last that *Caraitism* commenced. He adds, that after the return from the Babylonish captivity, the observation of the law being to be re-established, there were several practices found proper for that end; and these, once introduced, were looked upon as essential, and appointed by Moses; which was the original of Pharisaism; as a contrary party, contriving to keep close to the letter, founded *Caraitism*.

The modern *Caraites*, Leo of Modena observes, have their synagogues, and ceremonies; they pretend to be the sole proper Jews, or observers of the laws of Moses; calling the rest by the term *Rabbanim*, or *followers of the Rabbins*: these hate the *Caraites* mortally; refusing to ally, or even to converse with them, and treating them as *mamzerim*, or bastards; because of their rejecting the constitutions of the rabbins relating to marriage, reputations, purifications of women, &c. This aversion is so great, that if a *Caraite* would become a rabbinist, he would never be received by the other Jews.

The *Caraites*, however, do not absolutely reject all kind of traditions; but only such as do not appear well grounded. Selden, who is very express on this point, in his Uxor Hebraica, observes, that besides the mere text, they have certain interpretations, which they call *hereditary*, and which are proper traditions. Their theology only seems to differ from that of the other Jews, in that it is purer, and clearer of superstition: they give no credit to the explication of the Cabbalah, chimerical allegories, nor to any constitutions of the Talmud, but what are conformable to the Scripture, and may be drawn from it by just and necessary consequences.

Peringer observes of the *Caraites* in Lithuania, that they are very different both in aspect, language, and manners, from the rabbinists, wherewith that country abounds. Their manners tongue is the Turkish; and that they use in their schools and synagogues. In stature of many of the learned, who hold that they reject all but the Pentateuch.

Caleb, a *Caraite*, reduces the difference between them and the rabbinists to three points: 1. In that they deny the oral law to come from Moses, and reject the Cabbala. 2. In that they abhor the Talmud. 3. In that they observe the festis, as the rabbinists, &c. much more rigorously than the rabbins do. To this may be added, that they extend the degrees of affinity, wherein marriage is prohibited, almost to infinity.—See on this subject, Belandi Antiq. Hebraicæ, part. ii. cap. 9. & 12. Basnage de Sect. Karaeorum. Basnage's Hist. of the Jews, book ii. chaps. 8, 9.

CARAMANGCE, a dog which comes from China. The Tunquinese value it very much.

CARANDA, in the *Materia Medica*, a name used by some authors for the tamarind-tree.

CARANNA, a hard, brittle, resinous gum, brought from some parts of the West Indies, as Carthagena and New Spain; of an aromatic flavour; and sometimes used in medicine as a cephalic.

The trees from which it runs, are like the palm-tree. When it is fresh, it is white; but as it grows stale, it becomes greyish inclining to green, in which condition it is sent to Europe, where the white is seldom to be met with. It is brought in lumps wrapped up in leaves. To be of the best quality, it must be soft, of a pleasant aromatic smell, and as white as snow. As this gum is very dear, it is seldom sold unadulterated; and other sorts are often substituted in its stead, which have not the same properties. When applied to the head, it has an extraordinary virtue to relieve it from pain; which renders it highly valuable. It produces the same effects in the joints; and is so much esteemed in medicine, that it is become a proverb in pharmacy to say, Whatever the *tacamahaca* has not cured, the *caranna* will.

The Americans make a balm of it, which they pretend to be a sovereign remedy for the cure of wounds, and the hæmorrhoids or piles.

CARANTIA, in the *Materia Medica*, a name given by some authors to the CANNA, or *Indian Reed*, the sweet-pipe.

CARAPACE, the thick, solid, firm flesh, which covers the turtle or tortoise; and to which adhere those fine transparent shells, which are known under the name of tortoise-shell, of which snuff-boxes, and several sorts of inlaid work are made.

CARAPO, in *Ichthyology*, the name of a fish, of which there are two kinds caught in many parts of the lakes of America. The first has a long and thin body, of the shape of a knife-blade, the back being thick, the belly very thin and narrow; the tail is pointed; and the chief fin of the fish is a foot in length, and two fingers broad in the broadest part. The head is flat and pointed, and the lower jaw runs out a little farther than the upper; the mouth is very narrow, and the bottom jaw is furnished with very small and sharp teeth; the upper is toothless; its eyes are very small; and it is covered with little scales. It is of a brown colour, with a faint admixture of red, and the back and head are somewhat blackish; there runs a dusky line all along their sides in their middle, and under this the fish is speckled with black spots of the size of a seed of mustard.

The second kind no way differs from the first, but that it is much narrower in proportion to its length, and has no spots. They are both eatable. Margrave.

CARAPOPEBA, in *Zoology*, the name of a small species of lizard, common in the Brasils, and esteemed a poisonous animal. Its body is of a liver colour, and has several white spots. There are marks of white on the tail,

tail, variegated with some small quantity of yellow; the eyes are remarkably bright and vivid. Ray.

CARARA, a weight at Leghorn, and in other parts of Italy, used in the sale of wool and cod fish, equivalent to sixty pounds of that country.

CARASSIUS, in *Ichthyology*, the name of a genus of barbel-mouthed fishes of the carp or bream kind, of which there are three species. It is a small fresh-water fish, of about three, four, or five inches long, with a flatted body and a rising back; it resembles the bream indeed in shape very nearly, but is somewhat thicker: its colour is a pale yellow, and its belly of a deeper yellow, without any redness. The mouth is small and round; and the eyes small, and sunk in their orbit. See CRUCIAN, and CYPRINUS.

CARATH, in the *Materia Medica*, a name given by the Arabian writers to the SCAMMONY.

CARAT, CARRAT, or CARACT. See CERACT.

CARAVAN, or CARAVANE, in the East, a troop or company of travellers, merchants, and pilgrims, who for their greater security march in a body through the deserts, and other dangerous places, infested with Arabs and robbers.

The word comes from the Arabic *carauan*, or *carran*; and that from the Persian *kerden*, or *karden*, *conducere*, *a leader or duke*. Vide Perizil. Itin. Mund. ed. Hyde. p. 61.

There is a chief, or agi, who commands each *caravan*, and has under him a number of janizaries, or other forces, sufficient for their defence. The *caravans* encamp every night near wells, or rivulets known to the guides; and observe a discipline as regular as in war. They checke use camels for their vehicles, because of their enduring much fatigue, eating little, and passing three or four days without drinking.

The grand signior gives one fourth part of the revenue to Egypt on defray the expence of the *caravan* that goes yearly to Mecca, to visit Mahomet's tomb: the deputies, in this *caravan*, are from forty thousand to seventy thousand; accompanied with soldiers to protect them from the pillage of the Arabs, and followed with eight or nine thousand camels, laden with all necessary provisions for so long a passage across deserts.

Days journeys are distinguished in the East, into journeys of *horse-caravans*, and journeys of *camels*: those of horses are equal to two of camels.

There are four regular *caravans* which go yearly to Mecca; the first from Damascus, composed of the pilgrims from Europe and Asia; the second from Cairo, for the Mahometans of Barbary; the third from Zabith, a place near the mouth of the Red sea, where those of Arabia and India meet; the fourth from Babylon, where the Persians assemble. Most of the inland commerce in the East is carried on by *caravans*. The late czar, Peter the Great, established a trade between Russia and China by means of a *caravan*. M. Bougnon, geographer of the duke of Lorrain, has given a treatise of the *caravans* of merchants in India, wherein he shews of what they are composed; how many sorts there are; the several uses of the different sorts of animals in them; the price given for them; the officers and men appointed to conduct them, and the pay of each; with their manner of marching, halting, fighting, treating, &c.

In the horse *caravans*, to the number of eighty elephants, there are a thousand dromedaries, and at least two thousand horses, exclusive of four thousand travellers. Two men are required to lead each elephant; five to three dromedaries; and seven to twelve camels. Such a number of servants joined with the officers and passengers, the number whereof is not limited, renders the body very formidable; the passengers indeed are not obliged to fight, but in case they refuse, provision will scarce be allowed them afterwards even for their money.

As few of the Arab princes have any other subsistance than what they can get by pillage, they keep continually spies on foot, to give them intelligence of the departure and motion of a *caravan*, which they frequently attack with superior force: in case of refusal, they come to an accommodation; but if the *caravan* be beaten, it is absolutely plundered, and the whole guard made slaves; though more indulgence is shewed to strangers. The taking of a single *caravan* sometimes enriches a prince for ever.

The profits to be made in a *caravan*, during its march, are often incredible: Mr. Bougnon gives instances where, by repeated bargains and exchange, a person has made twenty thousand crowns out of a single gold watch, and thirty *lacs* of *ecus*.

Any decayer is at liberty to form a company, in order to make a *caravan*. He in whose name it is raised, is considered as the *caravan-bachi*, or chief of the *caravan*, unless he appoint some other in his place. If there be several merchants equally concerned, they elect a *caravan-bachi*; unto which they appoint officers to conduct the *caravan*, and decide all controversies which may arise during the journey.

There are five sorts of *caravans*, viz.

CARAVAN, *horse*, composed of elephants, dromedaries, camels, and horses.

CARAVAN, *mule*, in which there are but few elephants.

CARAVAN, *asinary*, that in which there are no elephants.

CARAVAN *of horses*, that in which there are neither camels but dromedaries but only horses.

CARAVANA, *fee*, are companies of merchant vessels, loaden with goods, and convoyed by ships of war.

CARAVAN is also an appellation given to the voyages, or campaign, which the knights of Malta are obliged to make at sea, against the Turks and Corsairs, in order to arrive at the commanderies and dignities of the order. They are thus called, because the knights have frequently joined the *caravan* going from Alexandria to Constantinople.

CARAVANIER, a person who leads the camels and other beasts of burden used in the countries of the East.

CARAVANSERA, a large public building, or inn, defigned to receive and lodge the *caravans*.

The word comes from the Arabic *carauan*, or Persian *karuan* or *caruan*, a *caravan*, and *serai*, *a large house*.

Of these *caravanseras*, or, as Chardin calls them, *caravanseras*, there are a great number throughout the East, erected out of the charity and magnificence of the princes, &c. of the several countries.

Those of Schiras and Cashan, in Persia, are said to have cost sixty thousand crowns each. They are open to people of all religions and countries, without any questions asked or any money required.

The *caravanseras* are usually large square buildings, with a spacious court in the middle thereof. They are encompassed with galleries and niches, under which are a kind of lumber-rooms, or elevation, some feet high, where travellers rest themselves, and make their lodgings as well as they can: their baggage, and the goods that carry them, being fastened to the foot of the banqueze. Over the gate, there is frequently a set of little chambers; which the *caravanseraglier* lets out at a very dear rate to such as have a mind to be alone.

Though the *caravanseras* serve in lieu of inns, yet there is this essential difference between them and our inns, that the traveller finds nothing at all in the *caravanseras*, neither for himself nor his cattle, but must carry all his provisions and necessaries with him. They are chiefly built in dry, barren, defert places; and are generally furnished with water from a great distance, and for a vast expence; there being no *caravanseras* without its well of water. There are several of them in cities; where they serve not only as inns, but as shops, warehouses, and even exchanges.

There are some *caravanseras* where most things may be had for money; and as the profits of these are considerable, the magistrates of cities, to whose jurisdiction they belong, take care to place them well: they have an inspector, who fixes the price of lodging without appeal. These are few cities in the East without their *caravanseras*; especially within the dominions of Turky, Persia, and the Great Mogul. Those of Constantinople, Ispahan, and Agra, the capitals of three empires, are distinguished for their magnificence and commodiousness.

In Turky, none but the grand signior's mother and sister, with the viziers and bashaws, who have been in three battles against Christians, are allowed to build a *caravanseras*.

CARAVANSERASKIER, the director, steward, or intendant of a *caravanseras*.

At Ispahan there are *caravanseras* in manner of halls or exchanges, where goods are laid up, and exposed to view; for which the *caravanseraskier* is accountable, in consideration of a certain fee.

CARAVELL, thus they call a small veffel on the coast of France, which goes to fish for herring on the banks. They are commonly from twenty-five to thirty tons burden. Those which are designed for the same fishery in the British channel, are called by the French *semaques*: their are from twelve to fifteen tons burden.

CARAUNA, in *Ichthyology*, the name of a small Brasilian fish, in many respects approaching to the garden kind. Its colour is a fine bright red, all over spotted with very small black spots.

CARAWAY, *Carum*, in *Botany*, a genus of the *pentandria digynia* class. Its characters are these: it hath an umbellated flower, compofed of seven small umbels, which are formed on rays to the general umbel; neither of which have any involucrum: the flower hath five heart-shaped petals, and five hairy ftamina; the germen is situated under the flower, which becomes an oblong channelled fruit dividing into two parts, each having an oblong furrowed seed. There are two species.

The common *caraway*, whose seed is used both medicinally and in the kitchen, grows naturally in some of the rich meadows in Lincolnshire and Yorkshire, and is sometimes found in pastures near London. It is also cultivated in some places.

The seed of the *carui*, or *carawai*, is narrow, longish, furrowed on the back, and of a brisk aromatic taste.

It is one of the greater hot seeds, and is esteemed stomachic, and diuretic: it dispels wind and strengthens digestion, &c. The English and Germans make great use of it, particularly in biscuits, comfits, seed-cakes, and other foods and confections.

CARBASA *Carbasa*, a term used by many of the ancient writers to express pieces of cloth made of the *linum recens fusilium*, or asbestos stone, which being found plentifully about Carystium, was thence called by the name of the place. Pausanias calls it *linum Carpasium*, for the same sort of reason; Carpasia, a town in the island of Cyprus, being a place famous for affording large quantities of the stone in its neighbourhood.

CARBENSIS *aqua*, in the *Materia Medica*, the name of a mineral water of Germany, of which Hoffman from Peraderus has given the following account. All about the place of its origin, and along the canals through which it passes, it deposits an earthy and ferruginous matter, which concretes into a stony hardness. When any alcaline liquor, whether fixed or volatile, is added to these waters, they become turbid, and precipitate a whitish earthy matter to the bottom of the vessel; after the evaporation of the water they leave a *sal enixum*, and an alcaline earth: two quarts of them leave two scruples and ten grains of the earth, and twelve grains of the salt. If it be kept for any time in a glass, or earthen vessel, it deposits a sediment of a yellow ochreous earthy matter, and when immediately taken from the spring, it changes to a bluish brown colour, on being mixed with galls. It contains a very large portion of a subtile mineral spirit; for if a long necked vessel be filled half full with it, and the orifice stopped with the thumb, the whole, on a little shaking, sends up a froth to the top; and when the thumb is taken off, the water squirts out to several feet distance. It makes an effervescence on mixing oil of vitriol with it; but this falls but a very little time. From the whole, it seems to contain a large quantity of calcareous earth, and some small portion of ferruginous matter, whence it purges both by stool and urine, though mostly the latter way; the former operation which is pretty constant, is owing to this alcaline earth meeting with an acid in the *prima viæ*, and being by it changed into a bitter purging salt, of the nature of Glauber's.

CARBEQUI, or *ore of copper*, a coin which is current in the province of Georgia in Asia; particularly at Teffis, the capital.

CARBO *equaticus*. See CORMORANT.

CARBONADE, or CARBONADO, in *Cookery*, flesh, fowl, or the like, seasoned, and broiled on the coals.

CARBUNCLE, among the *Ancient Naturalists*, is a sort of stone, whereof Pliny and Theophrastus relate many fabulous wonders.

The name is formed of the Latin *carbunculus*, q. d. *a burning coal*. Pliny, treating of the *carbuncle*, distinguishes twelve sorts of it.

Many of the ancients, and some of the moderns after them, have supposed the *carbuncle* to be taken from the dragon's head: and we read of many cavaliers, who went to combat with dragons, on purpose to gain this invaluable jewel.—Vartoman affures us, that the king of Pegu uſed no other light in the night-time, but that of his *carbuncle*, which caſt a blaze like that of the ſun.

CARBUNCLE, among *Modern Lapidaries*, is a ſtone of the ruby kind, very rare, and of a rich, glowing, bloodred colour.

The diſtinguiſhing character of the *carbuncle* is, that it is a gem of great hardneſs, and of a deep red with an admixture of ſcarlet. It was known among the ancients by the name *anthrax*, which was uſed metaphorically to ſignify that this gem was in ſome lights of a fire colour, the proper ſignification of the word being a piece of lighted charcoal.

The *carbuncle* is uſually found pure and faultleſs, and is of the ſame degree of hardneſs with the ſapphire, being ſecond only to the diamond. It is ever found naturally of an angular figure, ſmaller at one end than at the other, and at that ſmall end tapering to a pointed pyramid, compoſed with the ſame number of planes with the column, which is ſix, and thoſe uſually very unequal. It is found adhering by its baſe to a heavy and hard ferruginous ſtone of the emery kind, and is always more finely coloured towards the point than in the baſe of the column.

Its uſual ſize is near a quarter of an inch in length, and two-thirds of that in diameter to its thickeſt part. It bears the force of fire unaltered, not parting with its colour by it, as does moſt of the gems; nay, it even will not be at all affected by fire, nor become in the leaſt degree paler. It is found only in the Eaſt Indies, ſo far as is yet known, and that but very rarely.

The diſtinctions between the ſeveral red gems are very nice, and their names in ſome degree arbitrary. Many authors have confounded the *carbuncle* with the ruby, and determined with Garcias, that every ruby which exceeded twenty-four carats in weight, was properly a *carbuncle*. This gem, however, is by all trials proved to be evidently the *carbuncle* of the ancients, and eſſentially different from the ruby in wanting the purpliſh tinge into which the colour of that gem goes off, as it is extremely evident in all the deep ones; this going off into a true ſcarlet, and for that reaſon giving the colour of a lighted charcoal in the *fun*, which renders the ruby, garnet, nor any other gem can do which has the blue or purple caſt.

The fineſt *carbuncles* are ſaid to be produced in the iſland of Ceylon, the king of which country is poſſeſſed of a *carbuncle* a palm broad, and three inches thick, of the brightneſs of fire.

Some include GRANATES and HYACINTHS under the claſs of *carbuncles*.

CARBUNCLE, in *Medicine*, is a malignant tumor, ariſing ſometimes on one part, and ſometimes on another; accompanied with a painful heat, mortification, livideſs, and at laſt a blackneſs of the part.

The Greeks call it ANTHRAX; the Latins *carbunculus*, ſometimes alſo *carbo*; and the French *charbon*; all importing *coal*; from the reſemblance of its ſcab to a coal of fire. It is ſometimes peſtilential, and ſometimes not. When it ariſes without puſtules, it is properly called *pruna*; when with, *ignis Perſicus*.

It uſually begins with one or more puſtules, under which is formed a putrid ulcer; ſometimes with a ſcab, without any puſtules: the ulcer being formed under the ſcab. Within the tumor is a kernel, very painful, ſometimes red, and ſometimes livid, or blackiſh.

The *carbuncle* is owing to a ſharp, cauſtic, malignant, ſaline humour, which gnaws and corrupts the part wherein it is diſcharged.

CARBUNCLE is alſo, in *Medicine*, ſometimes uſed for the *furunculus*, or BOIL.

This is more particularly called the *benign carbuncle*, by way of diſtinction from that which is of the *malignant* kind.

CARBUNCLE is alſo frequently uſed to denote a ſmall eruption, which coming on any part of the body, ſoon diſcharges its contents, and afterwards appears in form of a craſſy tubercle, of the ſize of a millet-ſeed, ſurrounded with a red fiery circle.

CARBUNCLE, *peſtilential*. This is an inflammation that ariſes in time of peſtilential contagion, with a veſicle or bliſter, almoſt like thoſe that are cauſed by burning; but this inflammation generally terminates in a mortification, and putrefies the adjacent parts down to the bone, all about becoming as black as a coal.

This kind of inflammation always breaks out very ſpeedily, ſometimes even in an hour or two, attended with the moſt intolerable heat and pain. On opening it, there is always diſcharged a darkiſh limpid or watery ſanies, and the fleſh underneath is of a black colour, the mortification having then already ſeized it, and ſpreading more and more by degrees; but in thoſe who recover, the mortification then ſtops, and the putrefied fleſh ſuppurates, and parts from the ſound.

The ſize and number of theſe inflammations in the ſame patient, are both very various and uncertain; there is no part of the body but what they may infect; and they are generally, if not always, accompanied by buboes.

The immediate cauſe of theſe is a violent inflammation, excited in the blood by a peſtilential venom; and the inflammation, from the nature of the caſe, is ever ſpeedy, and always followed by ſphacelation and corruption of the parts. What is remarkable, is, that the parts and juices do not ſuppurate into matter, as is uſual in other tumors, but whatever is internally corrupted, ſeparates and entirely falls off: for the inflamed parts ſuppurate at the margin of the inflammation, ſo that if the patient does not die ſuddenly, the ſphacelated parts are ſeparated, and naturally thrown off.

Carbuncles are always a worſe ſymptom than buboes in theſe caſes, eſpecially if the eruptions turn directly either livid or black; but if they are red firſt, and then gradually turn to a citron colour, the danger is leſs.

Thoſe *carbuncles* alſo which ariſe in the face, neck, breaſt, or arm-pits, are always accounted the worſt, and uſually kill the patient.

The chief buſineſs of internal medicines, in this caſe, is to keep the patient in a conſtant breathing ſweat; and the buſineſs to be aimed chiefly at in external applications, is to procure, as ſoon as poſſible, the ſeparation

of the sphacelated parts from the sound. Some, therefore, use scarification alone in the cure, and that with very good success; for, by making a great number of incisions in the corrupted parts, they let out the pestilential venom which corrupted the whole. Others on the same occasion use aloes, as a cataplasm, a mixture of two ounces of flour and half an ounce of vinegar, made with water or fermented malt into a proper form, and with an ounce of honey, and an ounce of powder of saffron; these ingredients are to be thoroughly mixed in, and the cataplasm to be applied warm, and renewed frequently, till the whole *carbuncle* separates and falls off from the sound parts; and this is a much better and safer method of exercising the *carbuncle*, than by cutting it out at once, by which operation some have been known to have been killed upon the spot. When the greatest part of the *carbuncle*, however, of its own accord separated from the sound parts, the part where it adheres may always be safely divided with the scalpel; and this, indeed, is absolutely necessary.

If an inflammation and luxuriant flesh grows internally in this case, either of itself, or from the exuberation of the *carbuncle* being made too soon, this must ever be necessarily entirely consumed by the application either of the *Egyptian* ointment, or of the following: take two spoonfuls of honey, the yolks of two eggs, and of burnt alum, gentian, and birthwort-root in powder, each an ounce; make the whole into an ointment.

If the inflammation in digesting the adjacent parts to a gangrene, it will be most proper to use the following application: take salt of wormwood, half an ounce; of the herb fendition, and of cider and chamomile flowers each a handful; and of river-water two pints and a half: when these have been well boiled and strained, mix with the liquor five ounces of camphorated spirit of wine, and two ounces of Venice treacle; and let this be applied hot to the parts, in sheets of double linen rags being well wetted in it, and repeated frequently till the violence of the inflammation abates.

When the mortified flesh of the *carbuncle* has separated itself from the sound part, it is necessary to cleanse the ulcer perfectly with digestive ointments, lest any of the matter remain there, and mix itself again by degrees with the blood; and this detersion of the ulcer is always to be continued till there remain no more symptoms of the pestilential infection in the patient; and after this the wound may be healed like other ulcers. Heister.

CARBUNCLE, *Carbunculus*, also denotes a sort of fossil matter found in Hesseria, formed of a hard earth of the same name, concealed in the rivers of the mountains, by the heat of the subterranean vapours.

Pliny and Varro speak of the *carbunculus*, as a peculiar kind of hot, dry, lean soil.

CARBUNCLY, in *Heraldry*, a charge, or bearing, consisting of eight rails, or spokes, four whereof make a common cross, and the other four a saltier. See *Fess*, *Pile*, *Saltier*, &c.

Some call these rails *lunets*, or *flowrs* because round, and studded with buttons, or pearls, like pilgrims staves; and frequently tipped, or terminated with flours-de-lis. Others blazon them, royal sceptres, placed in saltier, pale and fesse.

CARBUNCULATION, the blasting, or scorching of the new-sprouted buds of trees, or plants, either by excessive heat, or excessive cold.

It happens chiefly in the spring and autumnal seasons, when vegetables being covered with dewy vapours, a sudden cold comes on them, which, congealing those vapours, the nutritious juice of the plant is coagulated, and the texture of its fibres destroyed.

CARCAJOU, in *Zoology*, a species of quadruped in North America; small, but very strong and ravenous: see the description of it by M. Sarasin, in Hist. Acad. Sc. 1713. See GLUTTON.

CARCAPULI, in *Botany*, the Indian yellow orange of Malabar. This is a tall spreading tree; the trunk in most is compass, as two men can encircle with their arms. The leaves stand by pairs on the sprays, at the extremities of which appear yellowish and tetrapetalous flowers, which are void of smell, but of a pontik taste. The calyx consists of four pale concave leaves; and the fruit, which hangs by a pedicle an inch long, is big, round, and distinguished by eight or ten exuberances like ribs: with a small head at the top, fluted in like manner with small ribs. It is first green, then yellow, and when ripe, wrinkle; and has an acid sweetish sort of taste. The seeds are contained in the middle of the pulp; are oblong, flattish, and of a dark azure colour. This fruit, according to Acosta, as to figure and shape, is like a quince with the rind taken off, and equalling in the manner of grossous pats, but not separable, as in the quince; it is covered with a thin, light, and thinny rind. It is dried, and exported from Malabar to other countries.

It is commonly eaten, and the inhabitants commend it much for medicinal uses: but its most eminent for stopping a flux of the belly, of what kind soever, especially that occasioned by excessive vomiting.

CARCAPULI *Lentiginosus*, C. Bauhine confounds this with the preceding, but they differ in flower and fruit, though agreeing in other respects. The fruit bears a round, fulvescently gold-coloured fruit, as big as an apple; the latter produces a round sweet fruit, of the bignets of a cherry: the first is called by the natives simply *carapa*, the other *rana charada*. They both afford gum gutta, but the latter the best. But this gum gutta, says Dr. Syme, ought not be confounded with the common gum gutta, which, as Bontius states us, is collected from a plant which is near akin to the *Ficus Indica*, and is called by the Indians *Lenan Cambodia*, because it grows plentifully in the country of Cambodia.

CARCARIAS *canis*. See SHARK.

CARCASE, the corpse, or body of a dead animal. Thus, we say, the *carcases* of the soldiers lurked, &c. were seen long after wards on the field of battle.

The *carcase* of a fowl, capon, partridge, leveret, rabbit, &c. is what remains thereof, after the four members, or limbs, viz. the legs and wings, have been cut off.

CARCASE, in *Architecture*, is the shell, or ribs of a house; containing the partitions, doors, rafters, &c. made by the carpenter, &c. The *carcase* is otherwise called the FRAMING.

CARCASE, or CARCUSS, in *War*, a kind of bomb, either oblong, and oval, or circular; consisting of a shell, or case, furnished with irons, with holes: but more commonly of a coarse strong canvas, pitched over, and girt with iron hoops; filled with combustible matters, as hand-granadoes, casks of musquets, loaded pistols, and preparations of gunpowder, &c. Its use is to be thrown out of a mortar, to set houses on fire, and do other execution.

It has the name *carcase*, because the circles which join from one ring, or plate, to the other, seem to represent the ribs of a human *carcase*.

The oblong *carcases* are now disused, on account of the uncertainty of their flight: the round ones are composed of pitch, saltpetre, sulphur, and corned powder.

In lieu of the ancient *carcasses*, a new sort has been introduced made of iron bands, or hoops, which include a canvas bag, filled with combustible matter, hardly to be extinguished.

We have also a third sort of *carcasses*, of a late invention, for the sea-service, differing in nothing from a bomb, except in their being filled with a composition like the above mentioned, and having five holes all primed with powder and quick-match, which take fire from the flash of the mortar, and continuating it to the composition, cause it to burn vehemently from these holes.

CARCELES, in *Antiquity*, were the jails, or barriers of the circus, within which the horses were confined, till the signal was given by the magistrate for starting.

The word is Latin, supposed to be formed a *coercendo*, as they served as a restraint to the horses ready to run.

The number of *carceres* was twelve. In the early days of Rome they were made of wood, which Claudius afterwards changed for marble. They were kept shut with bars, fastened by ropes, which, the moment the signal was given, flew open all at once. Some think that only four were used at a time. Dict. in Claud cap. xxi. n. 6.

CARCINIUM *Oniscum*, a new genus of marine animal, discovered by M. Banks and Dr. Solander, in their passage to Madeira, which thrive in the water with colours that exceeded in variety and brightness any thing they had ever seen. The beautiful colouring and splendour of these animals were equal to those of an *iris*; and from their resemblance to that gem, they gave this denomination to the genus. One of them lived several hours in a glass of salt water, swimming about with great agility, and displaying at every motion a change of colours almost infinitely various. See DACTYL.

CARCINOMA, in *Medicine*, a tumour more usually called a CANCER.

The word comes from *καρκινος*, *cancer*, and *νομη*, *depasio*, *to feed upon*.

CARCINOMA is sometimes used to denote a disorder of the *tunica cornea* of the eye, wherein the little veins of the part appear turgid and livid.

CARCINOMATOUS, the same with CANCEROUS.

Scirrhi and strumæ, which are formed of the humours stopped by their viscidity, or coagulated by an acid, as also polypuses, wherein the vellicæ retain their order and distribution, are originally different from *carcinomatous* tumors, which, according to Gendron, arise from an indisposition of the glandulose vesicle. Yet, when the

structure of the vessels is once destroyed, the former degenerate into a hard insensible lump, capable of germination, so that they lose their former nature, and become cancerous. Phil. Trans. N° 260. p. 479.

CARD, in the *Woollen Manufactory*. See CARDING.

The word seems formed from the Latin *cardus (fullonum)* which denotes the fuller's teazle; a kind of thistle whose head is used to smooth and raise the nap of cloth, &c. Skin. Etym. Angl. in voc.

There are divers sorts of these *cards*, as *stock-cards*, *hand-cards*, *wool-cards*, *iron-cards*, &c.

Cards for wool in England, may not be imported, nor the wire taken out of old ones, to be put into new leather and boards, in order for sale, upon forfeiture thereof, or of the value, if not found: but may be amended for the proprietors own use, or for transportation only.

CARDAMOMY. See CARDING.

CARDAMUNDUM, in *Botany*. See CRESSES.

CARDAMINE, *lady's smock*, in *Botany*, a genus of the *tetradynamia siliquosa* class. The characters are these: the flower hath four oblong petals placed in form of a cross; it hath six stamina, four of which are the length of the empalement, the other two, which are opposite, being much longer; it hath a cylindrical germen, which afterwards turns to a long, compressed cylindrical pod, with two cells, opening in two valves which twist spirally, and cast out the seeds when ripe by their elasticity. Linnæus enumerates fifteen, and Miller ten species. Miller's Gard. Dict.

This plant is also known by the names of *cuckow-flower*, and *meadow-cresses*. It is a kind of NASTURTIUM, and is pungent and diuretic; but is not used either in composition, or common prescription. Dr. Baker recommends it to the trial of physicians as an antiscorbutic remedy, in the Medical Transact. vol. ii. p. 449.

CARDAMOMUM, or CARDAMON, medicinal seeds of the aromatic kind, contained in capsulæ or pods, brought from the East Indies; and used in the compositions of Venice treacle and many other medicines. Their pungency and aromatic smell are exalted by an essential oil. Neumann.

This seed is distinguished into three kinds, according to the several sizes of the pods, viz. *major*, *minus*, and *maximum*; or great, lesser, and greatest: but the taste, smell, colour, and form of the *grain*, is the same in all, being of a purple colour, angular, of a sharp biting taste, and a strong penetrating smell.—The last kind is also called *grana of paradise*; but the first excels the rest, both in smell, taste, and virtue: it is this that enters the composition of the theriaca.

The *cardamoms* warm and deterge: they strengthen the nobler parts, assist the mind, and help digestion, and are used in diseases of the breast, stomach, and womb.

CARDANES, in *Natural History*, the name of a small insect resembling a beetle, of a very sweet smell, and very soft to the touch. It is very swift in its motions, and is of a plaichild colour, having two short wings, which do not nearly reach to the tail; it is likewise remarkable for having the tail of the same shape with the head, so that, when it stands still, it looks as if it had two heads, one at each end.

CARDASS, a sort of card, proper for carding flocks of silk, to make coppadine of it. It is also the name which the French give to those flocks of silk.

CARMASSES, is also the name which in the cloth manufactories of Languedoc, they give to a sort of large card, which is used for carding the dyed wool, designed for making cloth of mixed colours.

CARDERS, in the *Woollen Manufactory*, are persons who prepare wool, &c. for spinning, &c. See CARDING and CLOTH.

Carders, spinners, weavers, fullers, shearmen, and dyers, not performing their duty in their occupations, shall yield to the party grieved, double damages, to be committed until payment. One justice to hear and determine complaints. Cowpers, combers, forters, spinners, or weavers, conveying away, embezzling, or detaining any wool or yarn, delivered by the clothier or any other person, shall give the party grieved such satisfaction as two justices, mayor, &c. shall think fit; if not able or willing to make satisfaction, for the first offence to be whipped, or set in the stocks in some market-town, or in any other town where the offence is committed: the second offence to incur the like, or such further punishment by whipping, &c. as justices shall think proper. Conviction by one witness on oath, or confession.

CARDIA, in *Natural History*, a genus of *shell-fish*, the shell of which is formed of two ovals, and resembles the figure of a heart: it casts; the valves are equal and globular. Of this genus are several species; under it are comprehended the cockles, ark-shells, &c. together with the *pectines inæquilii*, or scallops without ears. See HEART-*shell*.

CARDIACA. See MOTHER-*wort*.

CARDIACS, CARDIACA, in a general sense, comprehend all medicines beneficial to the heart; whether internally, or externally applied.

The word comes from καρδια, *cor*, the heart being reputed the immediate seat of their operation.

CARDIACS, in a more particular sense, denote medicines which raise the spirits, and give present strength and chearfulness. Their amount to the same with what are popularly called *cordials*.

Cardiacs are supposed to produce their effect, by putting the blood into a gentle fermentation, whereby the springs, before decayed, are repaired and invigorated; and the tone and elasticity of the fibres of the vessels restored: the consequence of which is a more easy and brisk circulation. See CORDIALS.

CARDIACUS *plexus*, in *Anatomy*, a plexus, or piece of network, formed of a ramification of the *par vagum*, or eighth pair of nerves.

CARDIALGIA, CARDIALGY, in *Medicine*, a violent sensation of heat, or acrimony, attended with a constrictory pain, felt towards the upper or left orifice of the stomach, though seemingly at the heart; sometimes accompanied with palpitations of the heart, fainting, and a propension to vomit: better known by the name of *cardiac passion* or HEART-*burn*.

The word is compounded of καρδια, which denotes either the *heart*, or the left orifice of the stomach, and αλγος *pain*.

It is otherwise called *cardi-gmus*; though some distinguish, reserving the latter to the severer degrees of this disorder, which rise to palpitations and fevers, and *cardialgia* to the slighter accesses of it.

Physicians divide this distemper into the idiopathic and sympathetic; the first, which is also called by some the *convulsiva nervosa*, takes its rise from crudities in the *primæ viæ*, and is often owing to worms; the other usually is owing to a suppression of the menstrual, or hæmorrhoidal discharges. These differ greatly in degree, the symptomatic being much the most violent, as the *ventriculus* and *vasa brevia* are brought into consent with it; but the most violent degree of the *cardialgia* is that which is attended with fainting: in this the whole mechanism is drawn into consent, and is affected with spasmodic contractions. Sometimes also in the idiopathic *cardialgia* there is a great apprehension of suffocation; this arises from the consent of the *diaphragm* and *pericardium*.

CARDIALGIA, *signs of it*. These are a sensation of pressure and tension about the pit of the stomach, a straitness and anxiety of the *præcordia*, and often there comes on a nausea, and sometimes actual vomiting. When there are worms in the case, water comes into the mouth in great quantities, and the mucous matter is left in the bottom of the jaws, as if a piece of something cold lay there. Heat and cold often return successively and suddenly on the person, and the complaint is always worse upon an empty stomach, and mitigates on taking a full meal; whenever the patient can belch also, it gives him considerable relief for the time; and finally, where the commotions of blood in the *vasa brevia* are in fault, there is usually a slight touch of a fever attending it.

CARDIALGIA, *persons subject to the*. These are principally valetudinary people, who have somewhat of the *primæ viæ*; sometimes hypochondriac persons have it to a very great degree, these people being usually troubled with flatulencies; women subject to hysteric complaints also, and such as have suppressions of the menses, often fall into it; and not uncommonly infants, in cases of worms. The cause of the complaint is either flatulency or a foulness of the stomach and intestines, which occasion a reciprocal laxation and stricture of the tone of the stomach and intestines, and other parts which are drawn into consent.

The occasional causes of it coming on, are costiveness and the retention of flatulencies; sudden cooling of the abdomen when the body is hot; coarse foods, and such as are hard of digestion; and the swallowing of the victuals in large quantities without chewing it: the change of a common coarse diet, into a finer, will sometimes occasion it: and sometimes the suppressing of a violent passion of anger, while eating. Tender constitutions are in general most subject to it.

CARDIALGIA, *prognostics in it*. This, in its simple state and first stages, is no very terrible complaint; but its long continuance often brings on habitual faintings, and sometimes there is danger of congestions of the blood, and inflammations. The symptomatic kind is more difficult of cure, as well as more violent than the idiopathic; for this often is but of short duration, whereas the other frequently becomes habitual, and brings on convulsions, especially in cases where hot medicines have been given in it, with intent to strengthen the tone of the stomach. There have

have also been instances where vomits given to hypochondriac persons have brought on delirium, and even absolute madness.

CARDIALGIA, *method of curing the.* In the idiopathic *cardialgia*, the peccant matter is to be prepared and corrected by resolvents, abstergents, and incrusting medicines, such as the *tartarus tartarisatus*, and vitriolated tartar; after this the acrid aromatics are to be given, among which common pepper is one of the very best: with this may be given the acrid roots, as those of pimpernel, arum, and the like; and with all these it will be very proper to drink at certain intervals wine under hot, and aromatised with the spices. Mustard seed is particularly recommended by some on this occasion; and, in many cases, the common absorbents serve in the place of correctors, by rendering the matter soft and pulpy.

After a few days taking these things, if there be no contra-indication to the case, it will be very proper to give a vomit; to which purgative two or three grains of tartar emetic, with some of the tartarised tartar, is a very proper medicine. Where there are worms in the case, after the bitter digestives have been given, such things are to follow as will destroy those animals, as *nitrum vitriolatum*, and the like; after these things, it will be very proper to give the *theriaca* every night in small doses, by way of anodyne; and after all this, the tone of the parts is to be strengthened by chalybeates, with the common bitters.

In cases of the symptomatic *cardialgia*, attended with fainting, the hot medicines prescribed in the last case are wholly to be abstained from; and in their place the temperating nitrous ones are to be taken, with a little cinnabar, and the digestive salts impregnated with a few drops of the essential oils of the spices. Medicines of this kind are always of singular service in cases of flatulence and constriction of the *precordia*, and disorders of a like kind, from whatever cause, and in either sex. In the intermediate days during a course of these, the patient is to take some purgatives of the gentler kind, and afterwards the common chalybeates and bitters for restoring the tone of the parts; and, finally, the best of all preservatives against a return of this complaint, are bleedings at the spring and autumnal seasons. Junker Consp. Med. p. 580. &c.

CARDINAL, a term serving to express the relation, or quality, of prime, principal, or most considerable.

The word is formed of the Latin *cardo, a hinge*; it being on these fundamental points, that all the rest of the same kind are supposed to turn.

Thus, justice, prudence, temperance, and fortitude, are called the four *cardinal virtues*, as being the basis of all the rest.

CARDINAL *flower*, in *Botany*, *Lobelia*, a genus of the *syngenesia monogamia* class. Its characters are these: the empalement of the flower is cut into five linear segments, the two upper being larger than the other. The flower is of one petal, with a long cylindrical tube, a little curved; and is divided at the brim into five segments, two of which compose the upper lip, and are smaller than the three lower which compose the under. It hath five awl-shaped stamina, terminated by oblong summits, which coalesce at the top in form of a cylinder, but open in five parts at their base; it has an acute germen, situated below the flower, supporting a cylindrical style, crowned by a hairy obtuse stigma. The germen afterward becomes an oval capsule, opening at the top, filled with small seeds.

This genus is the *rapuntium* of Tournefort.

CARDINAL *Points*, in *Cosmography*, are the four intersections of the horizon with the meridian, and the prime vertical circle. See POINT.

Of these, two, viz. the intersections of the horizon and meridian, are called *North* and *South*, with regard to the poles they are directed to.

To determine the places of these points, see MERIDIAN *line*.

The other two, viz. the intersections of the horizon, and first vertical, are called *East* and *West*.

The *cardinal points*, therefore, coincide with the four *cardinal* regions of the heavens; and are 90° distant from each other. The intermediate points are called COLLATERAL POINTS.

CARDINAL *Points of the Heavens*, or, *of a Nativity*, are the rising, and setting of the sun, the zenith, and nadir.

CARDINAL *Signs*, in *Astronomy*, are Aries, Libra, Cancer, and Capricorn. See SIGN.

CARDINAL *Winds*, are those that blow from the *cardinal* points.

CARDINAL *Numbers*, in *Grammar*, are the numbers one, two, three, &c. which are indeclinable; in opposition to the ordinal numbers, first, second, third, fourth, &c. See NUMBER.

CARDINAL, in *Ornithology*, a name given in Louisiana to a bird, from the shining red of its plumage and crapehit, &c. It keeps its nest all winter, in which it hores up provision during the summer, to the quantity sometimes of a Paris bushel, which is artfully deposited, and covered first with leaves, and then with small branches, &c. See Melanges D'Hist. Natur. tom. iv. p. 287.

CARDINAL is more particularly used for an ecclesiastic prince, one who has a voice, both active and passive, in the Roman conclave, at the election of a pope.

Some say, the *cardinals* were so called from the Latin *incardinare*, which signifies the adoption in any church made of a priest of a foreign church, driven thence by misfortune; and add, that the use of the word commenced at Rome and Ravenna; the revenues of the churches of which cities being very great, they became the common refuge of the unhappy priests of all other churches.

The *cardinals* compose the pope's council, or senate; in the Vatican is a constitution of pope John, which regulates the rights and titles of the *cardinals*; and which declares, that as the pope represents Moses, so the *cardinals* represent the seventy elders, who, under the pontifical authority, decide private and particular differences.

Cardinals, in their first institution, were only the principal priests, or incumbents of the parishes of Rome. In the primitive church, the chief priest of a parish, who immediately followed the bishop, was called *presbyter cardinalis*; to distinguish him from the other petty priests, who had no church, nor predecessor: the term was first applied to them in the year 1505, when Sylvester, bishop of Rome, in the year 500, ordained priests were alone allowed to baptize, and administer the eucharist. When the *cardinal* priests became bishops, their *cardinals* are became vacant; they being then supposed to be raised to a higher dignity.—Under pope Gregory, *cardinal* priests, and *cardinal* deacons, were only such priests or deacons, as had a church or chapel under their particular care: and this was the original use of the word. Leo IV. in the council of Rome, held in 853, calls them *presbyteros sui cardinis*; and their churches *parochias cardinales*.

The *cardinal* continued on this footing till the eleventh century: but as the grandeur and state of the bishops became then exceedingly augmented, he would have his council of *cardinals* make a better figure than the ancient priests had done. It is true, they still preserved their ancient title; but the thing expressed by it was no more. It was a good while, however, before they had the precedence over bishops, or got the election of the pope into their hands: but when they were once possessed of those privileges, they soon had the red hat and purple; and growing still in authority, they became at length superior to the bishops, by the sole quality of being *cardinals*.

Du-Cange observes, that originally there were three kinds of churches: the first or genuine churches were properly called *parishes*; the second, *oratories*, which were chapels joined to hospitals, and served by *monks*; the third were simple *oratories*, where private masses were said, and were discharged by local and resident chaplains. He adds, that to distinguish the principal, or parish churches from the chapels, and oratories, the name *cardinales* was given them. Accordingly, parish churches gave title to *cardinal* priests, and some chapels also, at length, gave the title of *cardinal deacons*.

Others observe, that the term *cardinal* was given not only to priests, but also to bishops and deacons who were attached to certain churches; to distinguish them from those who only served them *ex postmo*, and by commission. Titular churches, or benefices, were a kind of parishes, i. e. churches assigned each to a *cardinal* priest; with some fixed district depending on it, and a font for administering of baptism, in cases where the bishop himself could not administer it.—These *cardinals* were subordinate to the bishops; and accordingly in councils, particularly that held at Rome in 868, subscribed after them.

It was not, however, only at Rome, that priests bore this name; for we find there were *cardinal* priests in France: thus, the curate of the parish of St. John de Vignes is called in old charters, the *cardinal* priest of that parish.

The title of *cardinal* is also given to some bishops, *quatuor* bishops; e. g. to those of Mentz and Milan; the archbishop of Bourges is also, in ancient writings, called *cardinal*; and the church of Bourges a *cardinal* church. The abbot of Vendome calls himself *cardinalis natus*.

The *cardinals* are divided into three classes, or orders; containing six bishops, fifty priests, and fourteen deacons; making in all, seventy; which constitute what they call the *sacred college*. The *six* first bishops, who are, as it were, the pope's vicars, bear the titles of the bishopricks

bishoprics assigned to them, the rest take such titles as are given them: the number of *curiosi* bishops has been fixed; but that of *suburbani* priests and deacons, and consequently the sacred college itself, is always fluctuating. Till the year 1125, the college only consisted of fifty-two, or fifty-three: the council of Constance reduced them to twenty-four; but Sixtus IV. without any regard to that reduction, raised them again to fifty-three, and after that were again diminished.

According to Onuphrius, it was pope Pius IV. who first enacted, in 1562, that the pope should be chosen only by the senate of *cardinals*; whereas, till that time, the election was by all the clergy of Rome. Some say, the election of the pope rested in the *cardinals*, exclusive of the clergy, in the time of Alexander III. in 1160. Others go higher still, and say, that Nicholas II. having been elected at Sienna, in 1058, by the *cardinals* alone, occasioned the right of election to be taken from the clergy, and people of Rome; only leaving them that of confirming him by their consent; which was at length, however, taken from them. See his decree for this purpose, issued in the Roman council of 1059, in Harduin's Acts Conciliorum, tom. vi. pt. 1. p. 1165. Whence it appears, that the *cardinals* who had the right of suffrage in the election of his successors, were divided by this pontiff into *cardinal bishops* and *cardinal clerics*; meaning by the former the seven bishops who belonged to the city and territory of Rome; and by the latter, the *cardinal presbyters* or title-men of the twenty-eight Roman parishes, or principal churches. To these were added, in process of time, under Alexander III. and other pontiffs, new members, in order to appease the tumults occasioned by the edict of Nicholas II.

The *cardinals* began to wear the red hat at the council of Lyons in 1245. See CORDELIERS. The decree of pope Urban VIII. whereby it is appointed, that the *cardinals* be addressed under the title of *eminence*, is of the year 1630: till then, they were called *illustrissimi*.

See further concerning the origin and rights of *cardinals*, in Onuphrius, Duarenus, Ciaconius, and Aubery has given the General History of *Cardinals*, in five volumes, 4to.

CARDINAL has also been applied to secular officers.

Thus, the prime ministers in the court of the emperor Theodosius, are called *cardinales*. Cassiodorus, lib. vii. Variorum, 3. makes mention of the *cardinal* prince of the city of Rome; and in the list of officers of the duke of Bretagne, in 1274, we meet with one Raoul de Thorel, *cardinal* of Quillart, chancellor and keeper of the vicomte de Rohan; which shews it to have been an inferior quality.

CARDINALITIUS, in *Ornithology*, a name given by some to the *accentor cauda cuneata*, commonly called the Virginian NIGHTINGALE.

CARDING, in the *Manufactories*, a preparation of wool, cotton, hair, or flax, by passing it between the iron points, or teeth, of two instruments, called *cards*, to comb, disentangle, and range the hairs or fibres thereof; and to dispose it for spinning, &c.

Before the wool be *carded*, it is oiled, or greased with oil: whereof, one fourth of the weight of the wool is required, for wool destined for the woof of stuffs; and one eighth for that of the warp. See CLOTH.

CARDIOGMUS, is sometimes used for CARDIALGIA.

CARDIOGMUS, in a more restrained sense, denotes a peculiar species of CARDIALGIA, attended with an anxiety of the *præcordia*, and a painful heaviness, caused by a flatulent distension of the abdomen and stomach, which compresses the *diaphragm*.

CARDIOIDE, in *Geometry*, is thus formed; let the diameter AB (*Tab. Analysis, fig. 38.*) of the circle AMBA, revolve about the point A, and on AB produced let B *a*, MN, AN, &c. be always equal to AB; then will the point *a* describe a curve, which from its figure resembling a heart, is called *cardioide*.

From the construction it appears, that AN=BA+AM, and that NMAN is always double of the diameter AB, and is bisected by the circle in M.

This curve is algebraical, if AB=*a*, *a*E=*x*, EN=*y*, its equation will be,

$$y^4 - 6ay^3 + 12x^2y^2 - 6a^2y + a^2 + 12x^2y - 8a^3 + 3a^2x^2 = 0$$

For the method of drawing tangents, and other properties of this curve, see Phil. Trans. N° 461. sect. 8. See also Mem. Acad. Scienc. 1705, where M. Carré first proposed this curve.

CARDIOSPERMUM, in *Botany*, the name by which Linnæus calls that genus of plants named COLINGUA by Tournefort and other authors. See *Heart-Pea*.

CARDIOTE, in *Natural History*, the name of a stone mentioned by the old authors, and called also *cardiolus*. Pliny tells us, there were three kinds of it; the one black, in which there was the plain figure of a heart delineated in white; another green in that part where the heart was figured; and the third white all over, except that the heart is marked in black. We know of no such stones as these at present, unless they are to be sought for among the agates, the various and accidental counterfeits of the veins to which, representing sometimes a thousand singular figures, among which imagination may easily trace hearts, eyes, and the like. Our modern writers understand by this name a very different stone, more usually called BUCARDITES, from its resembling the heart of an ox.

Pliny describes a stone of this kind, found near Stoken Church, so exactly like the heart of a man, that the very trunks of the descending and ascending parts of the vena cava, with a part of the aorta, were represented in it in their due position. Nat. Hist. Oxf. chap. 5. § 154.

CARDIUM, in *Zoology*, a genus of worms in the Linnæan system, belonging to the order of *testacea*.

CARDO, in *Anatomy*, the second *vertebra* of the neck; so called, because the head turns upon it.

CARDONIUM, among *Ancient Physicians*, denotes wine medicated with herbs.

It is made by pouring must, or new wine on the herbs.

CARDOON, a species of wild ARTICHOKE.

CARLOPATIUM, in *Botany*, a name applied by some authors to the *carlina officinalis*.

CARDS, *Playing* CARDS, are little pieces of fine thin paste-board, whereon are printed divers points and figures; a certain number, or assemblage of which, serve for the performance of divers games: as basset, ombre, picquet, whist, &c. A full pack consists of fifty-two *cards*.

A pack is always wrapped up in a piece of paper, on which are printed the name, fign, dwelling place, &c. of the maker; with the lord of the stamp-office of England, signifying that the stamp-duty has been paid, and that there is a penalty of 10*l.* for every pack sold unlabelled.

Among sharpers, divers sorts of false or fraudulent *cards* have been contrived: as marked *cards*, bread *cards*, counter-band, middle-band, &c.

CARDS, *marked*, are those where the aces, kings, queens, and knaves, are marked on the corners of the backs with spots of different number and order, either with clear water, or water tinged with pale Indian ink, that those in the secret may distinguish them. Aces are marked with single spots on two corners opposite diagonally; kings with two spots at the same corners; knaves with the same number transformed, &c.

CARDS, *bread*, are those which are either longer or broader than the rest; chiefly used at whist and picquet.

The broad *cards* are usually for kings, queens, knaves, and aces; the long for the rest. Their design is to direct the cutting, to enable him in the secret to cut the *cards* disadvantageously to his adversary, and draw the person unacquainted with the fraud, to cut them favourably for the sharper. As the pack is placed either endways or sideways to him that is to cut, the long or broad *cards* naturally lead him to cut to them. Bread *cards* are sometimes made thus by the manufacturer; but in defect of these, sharpers pare all but the breast with a razor or pen-knife.

Corner-bend, denotes four *cards* turned down finely at one corner, to serve as a signal to cut by.

Middle-bend, or *Keep-handridge*, is where the *cards* are bent two different ways, which enables an opening or arch in the middle, to direct likewise the cutting.

The inventor of *cards* is not known, nor even the age when they first appeared; but by the manner they were always made of, viz. leaves of paper, they should seem to be much posterior to the time of Charlemagne. They were probably invented about the year 1390, to divert Charles VI. then king of France, who was fallen into a melancholy disposition. By the four suits or colours, the inventor ought design to represent the four states or classes of men in the kingdom. The *coeurs* or hearts denote the *gens de chœur*, choir-men or ecclesiastics. The nobility or prime military part of the kingdom are represented by the ends or points of leaves of pikes, which, through ignorance of the meaning of the figure, we have called spades. By diamonds are designed the order of citizens, merchants, and tradesmen. The trefoil leaf, or clover grass, corruptly called club, alludes to the husbandmen and peasants. The four kings are David, Alexander, Cæsar, and Charles; representing the four celebrated monarchies of the Jews, Greeks, Romans, and

and Franks under Charlemagne. The queens repreſent Argine (for Regina, queen by deſcent), Ether, Judith, and Pallas; which are tropical of birth, piety, fortitude, and wiſdom. The knaves denoted the ſervants to the knights: others apprehend that the knights themſelves were denoted by theſe *cards*, becauſe Hogier and Lahire, two names of the French *cards*, were famous knights at the time when they were ſuppoſed to be inacted.

The method of making playing *cards* ſeem to have given the firſt hint to the invention of printing, as appears from the firſt ſpecimens of printing at Haerlem, and thoſe in the Bodleian library.

CARDS, *making of*. The cutting of the moulds, or blocks, for theſe *cards*, is preciſely the ſame as that uſed for the firſt books; and a ſheet of wet or moiſt paper is laid on the form or block, which is firſt lightly brathed over with an ink, made of lamp-black mixed with ſtarch and water; and then rubbed off with a round lift, in the hand. The *court-cards* are colour by help of ſeveral patterns, called *ſtencils*, conſiſting of papers cut through with a pen-knife; where the apertures, or inciſions of which, the ſeveral colours as red, &c. are ſeverally applied (for at the firſt printing, the *card* has only a mere outline.) Theſe patterns are pointed with oil coloure, to keep them from wearing out by the bruſhes: being laid on the caſte-board, they ſtrike a bruſh full of colour looſe over the pattern; which leaving the colour within the apertures, forms the face or figure of the *card*.

This, very probably, was the way of the firſt printing at Haerlem; as might have been diſcovered long ago, if it had been conſidered, that the great letters in our old manuſcripts of nine hundred years ago, are apparently done by the illuminers, after this method of *card-making*.

Cards and dice may, upon ſufficient ſecurity, be exported without paying the ſtamp-duty. 10 Ann. c. 19. § 170. 5 Geo. I. c. 10. § 11.

Playing *cards* may not be imported. 10 Ann. c. 19. § 165. See STAMPS.

CARDS, in *Manufacture*. See CARD.

CARDUELIS, in *Ornithology*, the name of a very well known bird, called in Engliſh the GOLD-*finch*, and by the old naturaliſts the *chrysomitris* and *acanthis*: the laſt from its yellow head, and the laſt from its feeding among thiſtles.

CARDUS, in *Botany*, a name given by the Romans to the plants called *cactus* by the Greeks. Theſe words were ſometimes uſed by both as the general names of the thiſtle kind, and in that ſenſe the word *cardus* and *cardinus* are the ſame; but ſome of the Roman authors have uſed this as the Greeks did *cactus*, in a more limited ſenſe, expreſſing by it only the artichoke. This they knew both in its wild ſtate, and in its garden ſtate; the wild plant was very prickly, and the garden one much larger in all its parts, and ſmooth.

Columella is almoſt the only author among the ancients who ſeems to make the *cactus* and *cinara* different plants; but his diſtinction turning only upon the one being prickly, the other not, it comes to no more than that *cactus* was the name of the plant in its wild ſtate, and *cinara* in its garden ſtate.

CARDUUS, in *Natural Hiſtory* and *Botany*, a name common to divers ſpecies of plants, in Engliſh, called THISTLES.

CARDUUS *Benedictus*. *See Bleſſed* THISTLE.

CARDUUS *Pollinarius*, or *Fuller's weed*. See TEASEL.

CAREENING, a term, in the *Sea Language*, uſed for the laying a veſſel on one ſide, to caulk, ſtop up leaks, and refit or trim the other ſide.

The word comes from *carina*, which ſignifies the ſame, formed of the Latin *carina, the keel of a ſhip*.

A ſhip is ſaid to be brought to a *careen*, when the greateſt part of her lading, &c. being taken out, and a pontoon, or another veſſel lower than herſelf, laid by her ſide, ſhe is haled down to it as low as occaſion requires, and there kept, by the weight of ballaſt, ordnance, &c. as well as by ropes, leſt it ſhould ſtrain her maſts too much. This is done with deſign to trim her ſides, or bottom, to caulk her ſeams, or to mend any fault ſhe has under water. Hence, when a ſhip lies on one ſide in ſailing, ſhe is ſaid to *ſail on the careen*.

Ships of war are generally *careened* every three years.

The *half careen* is when they can only *careen* half the ſhip; not being able to reach ſo low as the bottom of the keel.

CAREER, or CARIER, in the *Manege*, a place incloſed with a barrier, wherein they run the rings.

The word is alſo uſed for the race, or courſe of the horſe itſelf, provided it does not exceed two hundred paces.

In the ancient circus, the *career* was the ſpace which the horſe, or quadriga, were to run at full ſpeed, to gain the prize. See CIRCUS.

CAREEN, in *Falconry*, is a flight or tour of the bird, about one hundred and twenty yards.

If it mounts more, it is called a *double-career*; if leſs, a *ſemi-career*.

CARELIA, in *Botany*, a name given by ſome to the *baſtard hemp* AGRIMONY, or AGRIMONY.

CARELOPULI, in *Botany*, a name given by ſome authors to the tree which affords us the gamboge, the *gutta gamba*, and *gambogia* of the ſhops.

CARET, in *Grammar*, a character in this form (^) denoting that there is ſomething inſerted or interlined, which ſhould regularly have come in where the character is placed.

CARETTA, in *Zoology*. See TORTOISE.

CARETTI, in *Botany*, a name by which many authors have called the *acacia germina*, or the tree which produces the maſtich, or bezoar nuts.

CAREX, in *Botany*, a word uſed by Linnæus as the name of a genus of plants, of the *monœcia triandria* claſs; comprehending thoſe called *cyperoides* by Tournefort and others, and the *gramoides* of other authors. The characters of the genus are theſe: it produces male and female flowers, in moſt ſpecies, on the ſame plant; the male flowers are diſpoſed into a long ſpike: the cup is an oblong and imbricated ornament, conſiſting of acute, hollow, and lanceolated ſcales, each containing one flower; there is no corolla: the ſtamina are three erect, ſetaceous filaments, of the length of the cup; the antheræ are oblong, and not peniculous, but erect.

In the female flowers the cup is the ſame as in the male; there are no petals, but there is an inflated oblong nectarium: the germen is three-square, and is placed within the nectarium: the ſtyle is very ſhort; the ſtigmata are ſometimes three, ſometimes but two; they are long, crooked, pointed, and hairy. The nectarium grows larger when the flower is fallen, and contains the ſeed: it is the ſeed in ſingle, of an acute, and ſomewhat oval form, three-cornered, and has one of its angles uſually much ſmaller than the others. The *ſcapoides* of authors uſually have the male and female flowers on the ſame plant. There are thirty-eight ſpecies.

CARGADORS, a name given by the Dutch to a kind of brokers who make it their buſineſs to find freight for ſhips which want loading, and veſſels for merchants or paſſengers who want conveyance to ſuch or ſuch a place.

CARGO, the lading or FREIGHT of a ſhip.

CARGO, *ſimples*, is that which contains ſomething of every ſort neceſſary to furniſh the tradeſmen of the place it is ſent to, with parcels fit to fill their ſhops, and invite their cuſtomers.

Officers and ſailors on board a veſſel are allowed to carry a ſmall *cargo or parcel*, not exceeding a certain bulk or weight, for their own account, without paying any freight.

CARGO is ſometimes alſo uſed for an INVOICE of the goods where with a ſhip is laden.

CARGO alſo denotes a weight uſed in Spain, and Turky, amounting to about three hundred Engliſh pounds.

CARIA, in *Natural Hiſtory*, a name given by authors to a very miſchievous ſpecies of ant, common in ſome parts of the Eaſt Indies. This creature is larger than our ant, and is the common food of a great many other animals, as the ſquirrels, ſerpents, lizards, and a great many birds. In order to defend itſelf from ſo many enemies it enters into large communities, which together erect great hills of earth, of five or ſix feet high. The fields in ſome places are full of theſe, and it is in vain to attempt beating them down, ſince they would be immediately made up again; the creature builds them with firm and tough clay, which it wets as it lies: and the wall or outer caſe is built ſo thick and firm, that ſcarce any rain can hurt it.

There is another ſpecies of the *caria* much ſmaller than this, which builds in the peoples houſes, not in the fields. In the centre of the habitation of this creature there is uſually found a fort of comb, or collection of cells, reſembling a bees-comb. Obſervations for l'Aſie, p. 380.

CARIAMA, in *Ornithology*, the name of a Braſilian bird of the size of the heron, and, like that bird, frequenting watery places. It makes a loud noiſe like the turky, and is a very valuable and well-taſted fowl. Marcgrave's Hiſt. of Brazil. This is a ſpecies of the palamedea. See SCREAMER.

CARIATIDES, or CARIATES, in *Architecture*. See CARYATIDES.

CARIBOU, in *Zoology*, an American animal of the stag kind.

CARICA, in *Botany*. See PAPAW.

CARICA, among *Ancient Naturaliſts*, denotes a kind of fig peculiar to Syria; ſometimes alſo the dried fig. It is alſo uſed in ancient writers to denote the fruit of the palm tree, otherwiſe called *carnata*, which was ſent annually by clients, on New Year's day, as a preſent or acknowledgment to their patrons.

CARICATURA, in *Painting*, a loading, or exaggerating

of the defects of an object represented, with a concealment of the beauties or advantages of it; yet so as ſtill to preſerve a reſemblance. Vide Spectat. N° 537.

The word is Italian, formed of *carico*, *charge*, *burden*, or the like.

CARICOUS, *or* CARYOUS *tumor*, a ſwelling reſembling the figure of a fig; ſuch as are frequently found in the piles.

The word comes from *carica*, a kind of fig; which is from *Caria*, a country where they are frequent, and from whence they are ſometimes brought.

Quincy repreſents the *carinous* tumor as the ſame with what Hippocrates called *carycoides*, which ſeems to be a miſtake; *sycoides*, in Hippocrates, denoting an excrement of a bloody colour, reſembling a kind of condiment or confection, anciently called *caryon*, made of blood, and invented by the Lydians.

CARICUM, in *Pharmacy*, a cathartic medicine, which deterges ſordid ulcers, and eats away proud fleſh. Hippocr. de Ulceribus. It is prepared of black hellebore, ſandarach, *ſquama æris*, waſhed lead, ſulphur, orpiment, and cantharides: theſe being mixed, are made up with oil of cedar into a liquid medicine. Sometimes there is added arum, in decoction or juice, or the powder of it mixed with honey. The dry medicine, or powder, for the ſame purpoſe, is prepared of the ſame ingredients, omitting the oil of cedar, and the honey: it is alſo made of black hellebore, and ſandarach only.

CARIES, in *Medicine*, a ſolution of continuity in a bone, attended with a waſte of its ſubſtance, occaſioned by ſome acrimonious matter corroding it.

The *caries* is a kind of rottenneſs, or putrefaction, peculiar to the hard, or bony parts of the body; anſwering to a gangrene or mortification in the ſoft, or fleſhy part; or, according to others, to an abſceſs, or ulcer.

Caries ariſe either from a conſtant afflux of vicious humours, or from their extreme acrimony; or from a bruiſe, compound fracture, luxation, ulcer, venereal diſorders, corroſive medicines, or from their being ſtripped or laid bare of their fleſh, and long expoſed to the air, &c. This diſorder, if not quickly remedied, ſpreads and communicates itſelf to the neighbouring parts of the bone, and makes the ſame progreſs that ulcers do in the ſofter parts.

There are ſeveral ſpecies of *caries* in the bones. The learned Mr. Monro mentions ſeven which he has ſeen. Theſe he diſtinguiſhes by the appellations of, 1. The dry or gangrenous *caries*. 2. The worm-eaten *caries*, or ulcer of the bones. 3. The carnous *caries*, or ulcer of the bones with hyperſarcoſis. 4. The phagedenic *caries*, with hyperſarcoſis. 5. The ſcrophulous *caries*. 6. The ſcirrho-cancrous *caries*. 7. The ſpreading cancrous *caries*.

He enters into a curious detail of the ſeveral natures of theſe kinds of *caries*, and of the proper management. A ſpeedy and ſafe ſeparation of all the corrupted part is the principal indication to be purſued. See Medic. Eſſ. Edinb. vol. v. art. 24. Abridg. vol. ii. p. 150, ſeq. where he ſhews the analogy between theſe diſeaſes of the bones to thoſe of other parts of the body. This is no ſurpriſing, ſince bones have the ſame general texture, and are only diſtinguiſhed from other parts by a greater ſolidity or firmneſs.

A *caries* differs from a SPINA *ventoſa*, in that the latter begins within the ſubſtance of the bone, and proceeds outward; whereas the former begins on the ſurface, and proceeds inward.

Caries are divided into *idiopathic* and *ſymptomatic*.

CARIES, *idiopathic*, or *ſimple*, is an erоſion of a bone, happening without any other diſeaſe, commonly owing to ſome external cauſe, rarely to an internal one, as the afflux of humours.

CARIES, *ſymptomatic*, that which oftenеſt happens to perſons deeply affected with ſome other diſorder, eſpecially the ſcurvy, or venereal diſeaſe.

Caries may alſo be divided in reſpect of their degree.

Thoſe in the firſt degree diſcover a yellow faintneſs on the ſurface of the bone; in the ſecond a blackneſs; in the third a roughneſs, and inequality of the bone, cauſed by a multitude of foramina or little holes; in the fourth the corruption penetrates deeper through the whole ſubſtance, which it ſeems as it were to diſſolve.

A *caries* is properly a diſorder, in which the bone, from whatever cauſe, is deprived of its periоſteum, and having loſt its natural heat and colour, becomes fatty, yellow, brown, and at length black; this is the firſt and ſlighteſt degree of the diſorder, and is what, according to Celſus, the ancients called *ſcutulum*, and the *nigrities oſſium*. But the greater degree of this diſorder is where the bone is eroded and eaten, and becomes uneven by reaſon of the number of ſmall holes, of which it is full, when it diſcharges a ſtinking ſanies, whoſe acrimony ſoftens, relaxes, and deſtroys the fleſhy parts that grow round it. This is a true *caries*, or ulcer of the bone, and every bone in the body is ſubject to this diſorder; and though this ulcer may appear to be ever ſo ſafely or happily healed, yet it too often happens that after the cicatrix is formed, and has been ſo for ſome time, a new abſceſs will be made, the whole diſorder will return afreſh, and the acrimonious and corrupted matter, which continually oozes out from the carious bone, being inſected within, will produce many very grievous ſymptoms, and deſtroy the neighbouring fleſh again: but the worſt of all *caries*, and this to which the ſcull may indeed be eſteemed peculiarly ſubject, is that which falls upon the ſutures, or thoſe parts of the bones that lie very deep, becauſe in this caſe there is no acceſs for the hands to clean the bone, and there is no remedy but amputation of the limb.

Many methods have been attempted for the cure of a *caries*; the firſt and moſteſt is applied to the ſlighteſt degree of the diſeaſe, and is performed by the application of ſpirituous remedies, ſuch as ſpirit of wine, Hungary-water, or in ſlight inſtances, ſuch as the powder of birth-wort, florentine, iris, myrrh, or aloes. Either of theſe powders is to be ſprinkled on the part, after the ſanies has been carefully wiped away with dry lint, and this continued till the cure is perfected. In a *caries* that penetrates ſomewhat deeper, ſtronger remedies take place, ſuch as powder of cryſtalline, or its eſſence, made in well rectified ſpirit of wine; or oil of cloves, cinnamon, or guaiacum; either of theſe may be touched on with a pencil, or laid upon dry lint, and applied: ſome alſo uſe the corroſive medicines, the phagedenic water, and ſpirit of nitre, or of ſulphur; and, in the place of theſe, a ſolution of quick-ſilver in *aqua fortis* may be uſed with great ſucceſs. When, by theſe means, an exfoliation of the bone has been produced, the buſineſs is then to treat it with balſamics.

A ſecond method of cure for a greater degree of *caries*, is perforating the bone with the trepan, and dreſſing the part afterwards either with balſamics, or with dry lint. By theſe means the exfoliation of the bone is forwarded, and new veſſels puſh themſelves through the *foramenula*, which, joining with the neighbouring fleſh, make a new covering for the bone.

The third method of cure is performed by the rafpatory, or chiſel, taking off the corrupted or vitiated part of the bone, till all beneath appears white or ruddy, and ſolid; and the fourth, which is the moſt ancient, and the moſt ſpeedy, and certain method, is by the actual cautery, burning down the vitiated part of the bone. This method, however, is not neceſſary, except in great degrees of this diſorder; and in performing it great care muſt be taken not to injure the neighbouring ſole parts; for this reaſon, an aſſiſtant ſhould always draw back the lips of the wound both ways, while this is performed; and if the opening be not wide enough, it ſhould be opened and enlarged by ſponge tents before, or widened by the knife, till the bone has fair, and the part muſt be carefully wiped firſt with dry lint, from the ſanies; and if there be any ſungous fleſh, that muſt alſo firſt be removed. One application of the cautery, when the diſorder is conſiderable, will ſeldom prove ſufficient; it uſually requires to be repeated ſeveral times, at proper intervals; and if the *caries* be of ſuch extent that one cautery will not cover it all over, the firſt muſt be applied to the middle, and the ſucceeding towards the edges. This operation is not attended with any great pain, if care be taken not to injure the adjacent ſoft parts; for the bones are, in themſelves, free from any ſenſe of pain. Where the cranium is the ſeat of this diſorder, the cautery is attended with great hazard, as it is alſo in a *caries* of the ribs, or ſternum, from the neighbourhood of parts of the utmoſt conſequence to life. The carpus and tarſus alſo will very badly admit of cauterifing, becauſe of the neighbourhood of the tendons and ligaments, which it is ſcarce poſſible to avoid injuring in the operation. After cauterizing, the part is to be dreſſed with dry lint only, or if the patient complains of great heat in the part, the lint may be dipped in ſpirit of wine before it is applied; afterwards balſamics are to be applied, till the part exfoliates; and then, if the cure be perfect, the vacuity will ſoon be filled with new ſound fleſh. But if the bone remains bare, or the fleſh it is covered with be ſoft and ſpungy, and does not adhere ſufficiently to the ſubjacent bone, or where the bone remains diſcoloured, in either of theſe caſes the cure will not be complete, but the diſorder will break out again, unleſs prevented. In theſe caſes, therefore, the work muſt be all done over again, the ſpungy fleſh removed, and the actual cautery again applied, before the cure is finiſhed. Heiſter.

Anatomiſts, in diſſecting of bodies, frequently find *carious* bones; particularly thoſe of the *jaws*, legs &c. where nothing of that kind was ſuſpected during the

person's life-time; nor any disorder felt therefrom. Mr. Chesselden conjectures, that the cure of a *carious* bone might be directly attempted, without waiting, as our surgeons usually do, for an exfoliation.

CARIGOI, or CARIGUEYA, in *Zoology*, the name by which *some authors* have described a very remarkable American animal, more usually known by the name of the OPOSSUM.

CARILLONS, a species of CHIMES frequent in the Low Countries, particularly at Ghent and Antwerp, and played on a number of bells in a belfrey, forming a complete series or scales of tunes and semitones, like those on the harpsichord and organ. There are pedals communicating with the great bells, upon which the *carillonneur* with his feet plays the base to sprightly airs, performed with the two hands upon the upper species of keys. These keys are projecting sticks, wide enough asunder to be struck with violence and velocity by either of the hands edgeways, without the danger of hitting the neighbouring key. The player is provided with a thick leather covering for the little finger of each hand, to guard against the violence of the stroke. These *carillons* are heard through a large town. Barney.

CARIMPANA, in *Botany*, the name of an Indian palm-tree, described in the *Hortus Malabaricus*, the leaves of which, when full grown, are thirty feet long, and nine feet broad, or more, if carefully extended.

CARINA, a Latin term, properly signifying the KEEL of a ship, or that long piece of timber running along the bottom of the ship, from head to stern; upon which the whole structure is built, or framed.

CARINA is also frequently used for the whole capacity or bulk of a ship; containing the hull, or all the space below the deck.

Hence the word is also sometimes used, by a figure, for the whole ship.

CARINA is also used in the ancient architecture.—The Romans gave the name *carina* to all buildings in form of a ship, as we still give the name *nave* to the middle or principal vault of our Gothic churches; because it has this figure.

CARINA, among *Anatomists*, is used to denote the *fœtus de fa*. As likewise for the fibrous rudiments, or embryo of a chick, appearing in an incubated egg.

The *carina* consists of the entire *vertebræ*, as they appear after ten or twelve days incubation.

It is thus called, because crooked, in form of the keel of a ship. Boranists also, for the like reason use the word *carina*, to express the lower petalum of a PAPILIONACEOUS flower.

CARINA is also used, by some *Chemists*, for the twentieth part of a drop.

CARINÆ were also weepers, or women hired, among the ancient Romans, to weep at FUNERALS: they were thus called from *Caria*, the country whence most of them came.

CARINATED *leaf*, in *Botany*, expresses a leaf whose back resembles the keel of a ship.

CARIOUS, the state of a bone putrefied or rotten. See CARIES.

Horstius gives the history of a *stapes*, taken out of a carious bone. Ephem. Acad. N. C. Dec. 2. ann. 10. Obs. 165. p. 107.

CARIPI, a kind of cavalry in the Turkish army. The *caripi*, to the number of about 1000, are not slaves, nor bred up in seraglios or seminaries, like the rest; but are generally Moors, or renegado Christians, who having followed adventures, and being poor, and having their fortune to seek, by their dexterity and courage have arrived at the rank of horse-guards to the grand signior. They march with the Ulufagi on the left hand, behind him: their pay is twelve aspers per day.

The word *caripi* signifies *poor*, and *stranger*; an appellation said by Chalcondylas to have been given them, because chiefly brought out of Egypt, Africa, &c.

CARISSIMI, in *Antiquity*, a quality, or appellation given by the emperors to presidents, governors of provinces and others.

CARISTIA. See CHARISTIA.

CARITAS.—The *poculum caritatis*, or grace-cup, was an extraordinary allowance of wine, or other liquors, wherein the religious at festival-, drank in commemoration of their founder and benefactors.

CARK, or CARET, a certain quantity, or measure, of wool, equal to a thirtieth part of a SARPLAR.

CARL. See CHURLE.

CARLIN, CARLINE, or CAROLINE, a small *silver* coin, current in Naples and Sicily, equivalent to about four pence English.

CARLINA, or CAROLINA, a plant of the THISTLE kind, said to have been discovered by an angel to Charlemagne, to cure his army of the plague; whence its denomination.

CARLINÆ *radix*, in the *Materia Medica*, the name of a root kept in the shops in some places, and distinguished into two kinds, the white and the black; the white is the root of the common *carline-thistle*, which produces no stalk, the other of the *carlina acaulescens*, called the black chamelion thistle.

The white *carline* root is of the thickness of one's thumb, and is often two feet long; it is known on the outside, and white within, and should be chosen plump, firm, and well dried. It is accounted a very efficacious medicine in pestilential diseases.

The black is a smaller and shorter root than the white, and is much less esteemed in medicine. The plant which produces the white grows very frequent with us on hilly places, and is a very singular plant, producing a number of fine long prickly and jagged leaves, and, in the centre of them, a large purple flower, of the thistle kind, but growing close to the ground; the other is very frequent in France, but is not met with in England.

Carline is esteemed a very powerful sudorific and alexipharmic. Schroder tells us *also*, that it is good against worms, and in dropsies; and that it is a powerful emmenagogue and diuretic.

CARLINES, or CARLINGS, in a ship, two pieces of timber lying fore and aft, along from one beam to another, directly over the keel; serving as a foundation for the whole body of the ship. On these the ledges rest, whereon the planks of the deck and other matters of carpentry, are made fast. The *swoms* have their ends let into the beams called *salter-bolt-ways*. *See Tab. Ship. fig.* 2. *n.* 29. 37. 60. and 92.

CARLINE-*knee* are timbers going athwart the ship, from the sides to the hatchway, serving to sustain the deck on both sides.

CARLOCK, or CHARLOCK, in *Botany*, a species of the RADISH.

CARLOCK, a sort of isinglass, or isinglass imported from Archangel. It is made with the sturgeon's bladder; and is used for clarifying wine, as also in dying. The best comes from Astracan, a city in Muscovy, at the mouth of the river Wolga, where they catch great quantities of sturgeon.

CARLOSTADIANS. See CAROLOSTADIANS.

CARLSBAD *Water*, so called from a small town of that name on the confines of Bohemia, remarkable for its warm mineral springs, of which there is an account in Phil. Trans. vol. 1. part 1. N° 4. anno 1757. See WATER *mineral*.

CARMEL, *Knights of Mount*, are a military order of knights Hospitallers, instituted in 1607, by Henry IV. of France, under the title, habit, and rule of *our Lady of Mount Carmel*, and in consequence of a bull of pope Paul V. in 1608, united to the order of St. Lazarus of Jerusalem, with all its commanderies, priories, and other goods for its endowment.

The founder proposed it to consist of one hundred French gentlemen, who should be obliged, in times of war, to march close to the kings of France, as their guard.

Authors are much divided, whether to call this a new institution, or a reformation of that of St. Lazarus; though it is generally accounted a new institution. See LAZARUS.

CARMELITES, or *White-Friars*, an order of religious, making one of the four tribes of mendicants, or begging friars; and taking both the name and origin from Carmel, a mountain of Syria, formerly inhabited by the prophets Elias and Elisha, and by the children of the prophets; from whom this order pretend to descend in an uninterrupted succession.

The manner in which they make out their antiquity has something in it too ridiculous to be rehearsed. Some among them pretend they are descendants of J. C. Others go farther, and make Pythagoras a *Carmelite*, and the ancient Druids regular branches of their order.

Phocas, a Greek monk, speaks the most reasonably; he says, that in his time, viz. in 1185, Elisha's cave was still extant on the mountain; near which were the remains of a building, which intimated there had been anciently a monastery; that some years before, an old monk, a priest of Calabria, whose name was Bertnold, by revelation, as he pretended, from the prophet Elias, fixed there, and assembled ten brothers. In 1209, Albert, patriarch of Jerusalem, gave the solitaries a rigid rule; which Papebroch has since printed. In 1217 or according to others, 1226, pope Honorius III. approved and confirmed it; though it was afterwards mitigated by Innocent IV. St. Louis brought some of these *Carmelites* with him from the Holy Land into France. Many of the popes gave them the title of *Brothers of the Blessed Virgin*.

The *Carmelites* came into England in the year 1240, and erected a great number of monasteries. Their first houses were at Alnwick in Northumberland, and Aylesford in

Kent,

Kent. In England and Wales they had about forty houſes. This order is eminent for the devotion of the ſcapulary, for its miſſions, and for the great number of ſaints with which it has ſtocked the Romiſh church. In the laſt century, there were four canoniſations in this order, viz. of S. Thereſa, S. Andrew Corſin, S. Mag. de Pazzi, and S. J. de la Croix.

The order of the *Carmelites* is divided into two branches, viz. *Carmelites of the ancient obſervance*, called the *mitigated*, or *mitigate*; and thoſe of the *firſt obſervance*, called *bare-footed Carmelites*.

The *ancient obſervance* has only one general, under whom are forty provinces; and the congregation of Mantua, which has a vicar-general.

Bare-footed CARMELITES are a reform of the ancient *Carmelites*, ſet on foot in 1540, by St. Thereſa; ſo called from their going bare-footed.

She began with the convents of nuns, whom ſhe reſtored to the primitive auſterity of the order, which had been mitigated by Innocent IV. in 1245; and at length carried the ſame reform among the friars. Pius V. approved the deſign and Gregory XIII. confirmed the reform in 1580.

There are two congregations of bare-footed *Carmelites*, which have each their general, and their ſeveral conſtitutions; the one *the congregation of Spain*, divided into ſix provinces; the other called *the congregation of Italy*, comprehending all the reſt, not depending on Spain.

CARMEN, an ancient term among the Latins, uſed, in a general ſenſe, to ſignify a verſe; but in a more peculiar ſenſe, to ſignify a ſpell, charm, form of expiation, execration, &c. couched in a few words, placed in a myſtic order, on which its efficacy depended.

Pezron derives *carmen* from the Celtic *carm*, the ſhout of joy, or the verſes which the ancient bards ſung, to encourage the ſoldiers before the combat; adding, that the Greek χαρμη, ſignifies combat and joy: which is true: but then it does not come from the Celtic *carm*, but from χαιρω, *I rejoice*.

Some fetch the origin of the poetical *carmina*, or verſes, better; and ſay, they took that name from their reſemblance to thoſe ſpells: others, on the contrary, ſay, that the ſpells had their original from the poetical verſes, and took their name from their reſemblance to thoſe: it is at leaſt certain, that many of the ancient charms, wherewith diſeaſes were ſuppoſed to be cured, were metrical verſes, to which in thoſe ages, greater efficacy was aſcribed than to mere words or proſe.

Vigenere, again, derives *carmen* from *Carmenta*, becauſe that prophetreſs couched her predictions in verſes, or ſhort periods: but others ſay, the prophetreſs took the name *Carmenta* from *carmen*, on the ſame account.

CARMEN, was anciently a denomination given to precepts, laws, prayers, imprecations, and all ſolemn formulæ, couched in a few words, placed in a certain order, though written in proſe.

In which ſenſe it was, that the elder Cato wrote a *Carmen de Moribus*, which was not in verſe, but proſe.

CARMEN *ſaliare*, a ſet of ancient verſes compoſed by Numa, ſung by the SALII, accompanied by the clalhing of *Ancilia*, or ſacred buckliers. See ANCYLE.

CARMEN alſo denotes a form of prayer, or words whereby divers among the ancients devoted themſelves. Such was that of the Decii, ſpoken of by Pliny, Hiſt. Nat. lib. xxviii. cap. 2.

CARMENIAN *wool*, a denomination given to a kind of goat's hair, brought from Carmenia, or Caramania, a country of Aſia Minor.

CARMENTALIA, a feaſt among the old Romans, celebrated annually on the 15th of January, in honour of *Carmenta*, or *Carmentis*, a prophetreſs of Arcadia, mother of Evander, with whom ſhe came into Italy, ſixty years before the Trojan war.

The ſolemnity was alſo repeated on the 15th of January, which is marked in the old calendar by *Carmentalia repetita*.

This feaſt was eſtabliſhed on occaſion of a great fecundity among the Roman dames, after a general reconciliation with their huſbands, with whom they had been at variance, in regard of the *uſe of* coaches being prohibited them by an edict of the ſenate.

It was the women who celebrated this feaſt: he who offered the ſacrifices, was called *Suverdes Carmentalis*.

Authors are divided about the origin of the word *Carmenta*: Vigenere ſays, the prophetreſs was ſo called *quaſi carens mente*, out of her ſenſes; by reaſon of the enthuſiaſm ſhe frequently fell into. Others ſay, ſhe took her name from *carmen*, verſe, becauſe her prophecies were couched in verſes: but Vigenere, as before noted, maintains *ce nom* to be derived from *Carmente*.

CARMES, *Eau de*, the Carmelite water, famous in France, and moſt parts of Europe, for its extraordinary cordial virtues. It is ſaid to be extremely reviving, to be good in all ſorts of fits, apoplexies not excepted; and to relieve the gout when it attacks the ſtomach. The Carmelites at Paris, who make conſiderable advantage by vending this water, keep the preparation of it a great ſecret.

CARMINATIVES, in *Medicine*, are remedies, whether ſimple or compounded, uſed in colics, and other flatulent diſtempers, to diſpel the wind.

Numbers appear to be ſtrangers to this term, as it does not appear to carry in it any thing expreſſive of the medicinal efficacy of thoſe ſimples which paſs under the denomination. This term had certainly its riſe when medicine was too much in the hands of thoſe jugglers, who, for want of true knowledge in their profeſſion, brought religion into the party; and what through their ignorance they were not able to do by rational preſcription, they pretended to effect by invocation, and their intereſt with heaven. Which cant being generally, for ſurprize ſake, couched in ſome ſhort verſes, the word *carmen*, which ſignifies a verſe, was uſed alſo to mean an inchantment; which was frequently made uſe of to ſatisfy the people of the operation of a medicine they could not account for. And as thoſe medicines now under this name, are of quick efficacy, and the conſequences thereof in many inſtances ſurpriſing; the moſt violent pains, ſometimes ariſing from pent-up wind, immediately ceaſing upon its diſperſion; ſuch medicines as give relief to this cauſe, are more properly termed *carminatives*, as if they were cured by inchantment.

How they expel wind may be conceived, when we conſider that all the parts of the body are perſpirable. Sanctorius, in his Medicina Statica, determines all we call wind in the bowels to be ſuch perſpirable matter as makes its eſcape through the coats of the ſtomach and inteſtines. Between the ſeveral membranes likewiſe of the muſcular parts, ſuch matter may break out and lodge for ſome time. Now, whatever will gently and tender ſuch collections of vapours thinner, muſt conduce to their utter diſcharge out of the body, and conſequently relieve thoſe uneaſineſſes ariſing from their retention. And as all thoſe things that paſs under the denomination are warm, and conſiſt of very light ſubtil parts, it is eaſy to conceive how a mixture of ſuch particles may agitate and rarefy thoſe flatuſencies, ſo as to facilitate their expulſion, eſpecially conſidering thoſe grateful ſenſations which ſuch medicines give to the fibres, and which cannot but invigorate their tonic undulations ſo much, that by degrees the obſtructed wind is diſlodged, and at laſt quite diſpelled. But if the obſtruction be not great, the rarefaction of the wind upon taking ſuch a medicine, is often ſo ſudden, and likewiſe its diſcharge, that it goes off like the explolion of gunpowder.

All the things under this claſs, being warm and diſcuſſive, are much uſed in the compoſition of cathartics, of the rougher ſort eſpecially; for the irritation occaſioned by theſe, would be ſcarcely tolerable, without the mitigation of ſuch grateful ingredients. Many likewiſe of this ſort, are in the compoſition of diſcuſſive topics.

The four *carminative* flowers are thoſe of chamomile, melilot, motherwort, and dill: beſide angelica, fennel, lovage, anile, caraway, coriander, cummin, &c. which all agree in their *carminative* qualities; and are therefore uſed in compoſitions of that intention.

CARMINE, a bright red or crimſon colour, bordering ſomewhat on purple, uſed by painters in miniature; and ſometimes by painters in oil, though rarely by reaſon of its exceſſive price, and becauſe it will not mix with oil, ſo as to have the due effect in this kind of painting. *Carmine* is the moſt valuable product of the *cochineal inſect*: it is a *feces* or ſediment, ſubſiding to the bottom of the water, wherein are ſteeped COCHINEAL, CREMOR, and ARGOUR: ſome add BORAX, but this gives the *carmine* too much of the orange caſt. For this purpoſe thirty-ſix grains of *cremor* are boiled up three times in two pints and a half of rain or river *water*; then five drams of *cochineal* are put into the water, ſtrained through a linen cloth from the preceding liquor, and boiled up three times; to this eighteen grains of the huſk of *cremor*, and the ſame quantity of *rock* alum, are added, and it is boiled up once: the liquor is ſtrained through a linen cloth, and ſuffered to ſtand for ſeven or eight days; the *feces* dried in the ſun, or a ſtove, will be the *carmine*. However, the *cremor* and *argour*, as well as the *rennet*, are now generally omitted. Kunckel directs firſt to communicate a ſcarlet dye to fine wool, by boiling it in equal proportions of bran water and common water, with a mixture of alum and tartar, for two hours: half a pound of wool will require one pound of alum, and half a pound of pulverized tartar: the wool muſt then be drained, and having boiled four ounces of cochineal with two ounces of tartar, in a mixture of bran water and common water, the wool muſt be put in and boiled for an hour and a half, and it will take the colour. The *car-*

nine may be extracted from the wool by boiling it in a ſtrong ley of pot-aſh, till it has loſt its colour: then paſs the ley through a filtrating bag, and pour a ſolution of two pounds of alum in water into the coloured ley; and the dye will thicken; and, when it is again filtrated, the *carmine* will remain in the filtre; and the operation may be repeated as often as it is found neceſſary. Encyclopedie.

To be good, it muſt be almoſt an impalpable powder. As this colour is prepared by diſſolving cochineal in an alkaline lixivium, and precipitating the ſolution by alum, it conſiſts of the colouring matter of cochineal, adhering to the earth of alum; the beſt comes from France, where the method of preparing it is kept a profound ſecret.

Some make *carmine* with Braſil or Fernambouc wood, and gold leaf, beat in a mortar, and ſteeped in white wine vinegar; the ſcum ariſing from this mixture, upon boiling, when dried, makes a ſort of *carmine*: but this kind is much inferior to the former. See DYING.

CARNABADIUM, in *the Materia Medica* of the ancients, a name given to a drug frequently mentioned by the Greek and Arabian writers. It is properly an Arabian word which the Greeks have adopted, and given a Greek termination to, writing it καρναβάδιον. Guillandini ſuppoſes this to be the ſame with the *durmegi*, or *durvion*, of the ſame authors; but nothing can be more abſurd than ſuch an opinion, as examination of theſe writers themſelves ſhewing that they commonly uſed it for caraway or carui ſeed, and ſometimes for the Æthiopian cummin.

CARNARIUM, a charnel-houſe, or repoſitory for the bones of the dead.

CARNATIONS, in *Gardening*. See DIANTHUS.—Theſe flowers are propagated two ways, the one by ſeed, the other by layers; the firſt of theſe methods is the way to raiſe new flowers, the other is the way to preſerve and multiply thoſe of former years.

For the raiſing of them from ſeed, great care muſt be taken to procure good ſeed.

When they are in the flower the fineſt kinds ſhould be marked, and all the layers that can be, ſhould, during the time of their flowering, be laid down from them: toward the latter end of Auguſt theſe will have taken root, and they are then to be taken off, and planted out into pots, two in each pot. The method of laying them is this. Slip off the leaves from the lower part of the ſhoot intended to be laid, and cut a ſlit in one of the middle joints, and cut off the tops of the leaves, and cut out the ſwelling part of the joint, where the ſlit is made; then raiſe the earth about the place a little, and bend down the flit part of the ſhoot into it, keeping the top upright, and faſten it in its place by a hooked ſtick, ſtuck into the ground over it, and cover it with the earth; then give it a gentle watering, afterwards is neceſſary, and in ſix weeks the layers will have taken ſo much root as to be ready to tranſplant.

They require ſhelter in the winter ſeaſon, and as it is difficult to ſhelter a large number in their pots, which are uſually nine inches over, it may be a better way to plant them out in Auguſt in very ſmall pots, ſheltering a number of theſe during the winter in a frame; and in the middle of February they may be tranſplanted into the pots they are to flower in: theſe in April ſhould be ſet out upon a ſtage of boards, open to the ſouth-eaſt, but defended from the weſt winds, and not too near trees, walls, or buildings, where they are to flower.

CARNATION-*tree*. See *Anona* COLTSFOOT.

Spaniſh CARNATION, in *Botany*. See BARADOES *Flower-fence*.

CARNATION, among *Dyers*, to dye a *carnation*, or red roſe colour, take liquor of wheat-bran a ſufficient quantity, alum three pounds, tartar two ounces; boil them and enter twenty yards of broad cloth; after it has boiled three hours, cool and waſh it: take freſh clear bran-liquor a ſufficient quantity, madder five pounds; boil and finiſh according to art.

The Dow dyers know that the ſolution of jupiter, or delved tin, being put in a kettle to the alum and tartar, in another proceſs, makes the cloth, &c. attract the colour into it, ſo that none of the cochineal is left, but the whole is abſorbed by the cloth.

CARNATION, *Fleſh-colour*, in *Painting*, is underſtood of all the parts of a picture in general, which repreſent fleſh: or thoſe parts of human nature which are naked, and without drapery.

Titian and Correggio, in Italy, and Rubens and Van-Dyke in Flanders, excelled in *carnations*.

It may be here obſerved, that the word *carnation* is not properly uſed for any particular part of the perſon painted, but for the whole nudity of the piece. See COLOURING.

CARNEDDE, in *Britiſh Antiquity*, denote heaps of ſtone ſuppoſed to be druidical remains, and thrown together on occaſion of confirming and commemorating a covenant. Gen. xxxi. 46. They are very common in the iſle of Angleſey: and were alſo uſed as ſepulchral monuments, in the manner of *tumuli*: for Mr. Rowland found a curious urn in one of theſe *carneddi*. Whence it may be inferred that the Britons had the cuſtom of throwing ſtones on the deceaſed. From this cuſtom is derived the Welſh proverb, *Karn arnſhon*, ill betide thee. Rowland's Mona Antiqua Reſtaurata.

CARNEIA, in *Antiquity*, a feſtival in honour of Apollo, ſurnamed Carneus, held in moſt cities of Greece, but eſpecially at Sparta, where it was firſt inſtituted.

The reaſon of the name, as well as the occaſion of the inſtitution, is controverted. It laſted nine days, beginning on the 13th of the month Carneus. The extraordinaries were in imitation of the method of living, and diſcipline uſed in camps.

CARNEL.—The building of ſhips firſt with their timber and beams, and after bringing on their planks, is called *carnel-work*, to diſtinguiſh it from cloſh-work. Veſſels alſo which go with mizzen-ſails inſtead of main-ſails, are by ſome called *carnels*.

CARNELIAN. See CORNELIAN.

CARNEUM *ſpeculum*, in *Anatomy*, a name given by ſome writers to a muſcle of the *abdomen*, called by Veſalius the *pyramidalis cutis abdominis*; and by Falloppius, the *muſculus carnoſus*. It is now generally known by the name of PYRAMIDALIS.

CARNEY, a diſeaſe in horſes, wherein their mouths become ſo furred that they cannot eat.

CARNICULA is uſed by ſome for a caruncle, more particularly for that fleſhy ſubſtance which inveſts the teeth.

CARNID, in *Natural Hiſtory*, a name given by Aretheus to what is called CARNICH by more ancient writers.

CARNIFEX, among the *Romans*, the common executioner. By reaſon of the odiouſneſs of his office, the *carnifex* was expreſly prohibited by the laws from having his dwelling houſe within the city.

In middle age writers *carnifex* alſo denotes a butcher.

Under our Britiſh kings, the *carnifex* was an officer of great dignity; being ranked with the archbiſhop of York, earl Goodwin, and the lord Steward. Flor. Wigorn. ann. 1052: *Rex Hardicanutus Africum Ebor. Archiep. Goodwinum comitem, Ediricum diſpenſatorem, Thrond ſuum carnificem, & alios magnæ dignitatis viros Londinum miſit.* Spelm. Gloſſ. p. 125

CARNIFICATION, the making of, or turning to fleſh. Phyſicians give inſtances of the *carnifications* of BONES, that is, where the bones loſe their natural conſiſtence, and become ſoft and fleſhy. This is a tranſmutation which is the reverſe of OSSIFICATION.

CARNIFORMIS *abſceſſus*, an abceſs with a hardened orifice which generally riſes where the muſcles apply themſelves to the joints.

CARNIVAL, or CARNAVAL, a ſeaſon of mirth and rejoicing, obſerved with great ſolemnity by the Italians, and particularly at Venice.

The word is formed of the Italian *carnavale*; which Du-Cange derives from *carn-a-val*, becauſe the *fleſh* is then put into the *pot*, in order to make amends for the ſeaſon of abſtinence enſuing. Accordingly, in the corrupt Latin, he obſerves, it was called *carnelevamen*, and *carniprivium*; as the Spaniards ſtill denominate it, *carnes tolendas*.

The *carnival* time commences from Twelfth-day, and holds till Lent. Feaſts, balls, operas, concerts of muſic, intrigues, marriages, &c. are chiefly in *carnival* time.

CARNIVOROUS, CARNIVORUS, an epithet applied to thoſe animals which naturally ſeek, and feed on fleſh.

It is a diſpute among naturaliſts, whether or no man be naturally *carnivorous*? Some contend that the fruits of the earth were intended as his ſole food; and that it was neceſſity in ſome places, and luxury in others, that firſt prompted him to feed upon his fellow-animals. Pythagoras and his followers looked on it as a great impiety; and ſtrictly abſtained from all fleſh, from the notion of a metempſychoſis; and their ſucceſſors, the Bramins, continue the ſame to this day.

The conſideration Gaſſendus chiefly inſiſts on, why man ſhould not be *carnivorous*, is the ſtructure and conformation of our teeth; the moſt of them being either inciſores or molitores; not ſuch as *carnivorous* animals are furniſhed with, proper to tear fleſh; except the four *canini*: as if nature had rather prepared us for cutting herbs, roots &c. than for eating meat.

To which may be added, that when we do feed on fleſh, it is not without a preparatory coction, by boiling, roaſting, &c.

And even then, as Dr. Drake obſerves, it is the hardeſt of digeſtion of all other foods, and is prohibited in fevers, and many other diſtempers: and laſtly, that children are rather averſe to all animal foods, till their palates become vitiated by cuſtom; and the breeding of worms in them is generally aſcribed to the too early tasting of fleſh.

To theſe arguments, Dr. Wallis ſubjoins another; which is, that all quadrupeds which feed on herbs or plants, have a long colon, with a cæcum at the upper end of it, or ſomewhat equivalent, which conveys the food, by a long and large progreſs, from the ſtomach downwards, in order to its ſlower paſſage and longer ſtay in the inteſtines; but that in *carnivorous* animals ſuch cæcum is wanting, and inſtead thereof there is a more ſhort and ſlender gut, and quicker paſſage through the inteſtines. Now, in man, the cæcum is very viſible: a ſtrong preſumption, that nature, which is ſtill conſiſtent with herſelf, did not intend him for a *carnivorous* animal. It is true, the cæcum is but ſmall in adults, and ſeems of little or no uſe; but in a foetus, it is much larger in proportion: and it is probable, our cuſtomary change of diet, as we grow up, may occaſion this ſhrinking.

To the arguments uſed by Dr. Wallis and others, to prove that man is not naturally *carnivorous*, Dr. Tyſon anſwers, that if man had been deſigned by nature not to be *carnivorous*, there would doubtleſs have been found ſomewhere in the globe, people who do not feed on fleſh; and as hiſtory ſeems not to furniſh any inſtance hereof, may not we ſay, that what is done univerſally by the whole ſpecies, is natural? For what the Pythagoreans did to abſtaining from fleſh, was on the principle of a tranſmigration: a miſtake in their philoſophy, not a law of nature: and though in ſome countries, men feed more ſparingly on fleſh than in others, this is owing to their own choice, from the diſadvantage they perceive by it. *Beſides*, that *carnivorous* animals are not always without a colon and *cæcum*, nor are all animals *carnivorous* which have thoſe parts: but that the caringeya, or opoſſum, for inſtance, has both a colon and a cæcum, yet feeds on poultry, and other fleſh; whereas the hedge-hog has neither colon nor cæcum, and therefore ought to be *carnivorous*, yet it feeds only on vegetables; and that hogs, which have both, will feed on fleſh greedily enough when they can get it; and that rats and mice, which have large cæca, feed on bacon, as well as bread and cheeſe.

And, from the multitude of *carnivorous* animals which want thoſe parts, and of *non-carnivorous* which have one or both, no ſafe concluſion can be drawn; ſince we might as well argue, that becauſe the ape-kind, dog-kind, goat-kind, and ſheep-kind, which live on herbage, have four ſtomachs, therefore all thoſe which have not four ſtomachs were not deſigned by nature to be graminivorous; whereas the horſe-kind, and hare-kind have but one ſtomach, yet feed on graſs like the former: add, that in many animals which live on the ſame ſort of food, the ſtructure of the ſtomach is found very different; and that in others which live on different foods, ex. gr. on fleſh, on graſs, &c. the ſtomachs are found ſo like, that it is difficult to aſſign any difference between them; and if we cannot make a judgment what food is moſt natural to an animal from the ſtructure of its ſtomach, which is the part moſt concerned in digeſting it, much leſs can we judge from the colon or cæcum, which are parts remote from the ſtomach, and ſeem, rather as a cloaca for the reception of the feces, than of uſe for digeſting or aſſimilating the food.

In fine, ſince man has all manner of teeth, fit for the preparation of all ſorts of food, ſhould it not rather ſeem that nature intended we ſhould live on all? And as the alimentary duct in the human kind, is fitted for digeſting all ſorts of food, may we not rather conclude that nature did not intend to deny us any? Phil. Tranſ. N° 469. 10, 11. Abridg. vol. v. p. 10.

CARNUS, in *Chronology*, the Syracuſian name for the Athenian month METAGITNION; which was the ſecond of their year, and anſwered to the latter part of our July and beginning of Auguſt.

CARNOSUS, *muſculus*, in *Anatomy*, a name given by Fallopius and others to a muſcle, called by Veſalius the beginning of the ſtraight muſcle of the abdomen, and now generally known by the name of PYRAMIDALIS.

CARNOSA *Membrana*, } in *Anatomy*; ſee PANNICULUS
CARNOSUS *Panniculus*. } CARNOSUS, and MEMBRANE.

CARNOSITY is uſed by ſome authors, for a little fleſhy excreſcence, tubercle, or wen, formed in the urethra, the neck of the bladder, or yard, which ſtops the paſſage of the urine.

Carneſities are very difficult of cure: they are not eaſily known, but by introducing a probe into the paſſage, which there meets with reſiſtance. They uſually ariſe from ſome venereal malady ill managed.

CARNOSUM *ſolium*, in *Botany*. See LEA.

CARNUBIA, in the *Materia Medica*, a name by which ſome authors have called the *carob*, or ſweet pipe.

CARO, in *Anatomy*, &c. See FLESH.

CARO *muſculoſa quadrata*, in *Anatomy*, a muſcle ſo calle by Fallopius and Spigelius, but more popularly PALMARIS *brevis*.

CAROB, or ST. JOHN'S *Bread*, *ceratonia*, in *Botany*, a genus of the *polygamia trioecia* claſs. Its characters are theſe: it is male and female on diſtinct trees; the male flowers have no petals, but a fleſhy germen ſituated within the receptacle, which becomes a long, fleſhy, compreſſed pod, divided by tranſverſe partitions, each having one large, roundiſh compreſſed ſeed. We have but one ſpecies, which is a native of the ſouthern parts of Europe, where it grows in the hedges, and produces a great quantity of long, flat, brown-coloured pods, which are thick, mealy, and of a ſweetiſh taſte.

Theſe pods are eaten by the poorer ſorts of inhabitants in a ſcarcity of other food; but they are apt to looſen the belly, and cauſe griping in the bowels. They are directed by the college phyſicians as ingredients in ſome medicinal preparations.

CAROB is alſo a goldſmith's ſmall weight, amounting to the 24th part of a grain. It is alſo called *prime*.

CAROCHA, a name which the Spaniards and Portugueſe give to a kind of mitre made of paper or paſteboard, on which are painted flames of fire, and figures of demons, worn by thoſe who are condemned to death by the tribunal of the INQUISITION. See ACT *of faith*.

CAROENON, *vapetos*, ſometimes alſo called *caranum*, denotes wine boiled down, till a third be evaporated.

CAROLI, among ſome phyſicians, denote venereal puſtules on the penis; called alſo *corſer pudendum*.

CAROLINE, is a ſilver coin of Sweden, with the legend, *A deuspra nobis quis contra*. See COINS.

CAROLINE, is alſo a name given to the four books compoſed by order of Charlemagne, to refute the ſecond council of Nice, with regard to the worſhip of IMAGES. They contain one hundred and twenty heads of acculation againſt that council, drawn up by the biſhops of France, and firſt publiſhed in 1549, by M. du Tillet, biſhop of Meaux, under the title of Elia Phyllus.

CAROLOSTADIANS, or CARLOSTADIANS, an ancient ſect, or branch of Lutheraniſm, who denied the real preſence of Chriſt in the euchariſt.

They were thus denominated from their leader Andrew Carolloſtadius, who having originally been archdeacon of Wittemberg, was converted by Luther, and was the firſt of all the reformed clergy who took a wife; but diſagreeing afterwards with Luther, chiefly in the point of the ſacrament, founded a ſect apart. The *Carloſtadians* are the ſame with what are otherwiſe denominated SACRAMENTARIANS, and agree in moſt things with the ZUINGLIANS.

CAROLUS, an ancient Engliſh broad piece of gold, ſtruck under king Charles I. whoſe image and name it bears. Its value has been eſtimated at twenty-three ſhillings ſterling: though at the time when it was coined it is ſaid to have been only rated at twenty ſhillings.

CAROLUS is uſed for a ſmall copper French coin, mixt with a little proportion of ſilver, firſt ſtruck by Charles VIII. of France, whence it took its name; being, at the time when it ceaſed to be current, valued at ſix *deniers*.

CAROPI, in *Botany*, a name given by the inhabitants of the Philippine iſlands to a plant more uſually known among authors by the name of TUGUS; a plant greatly eſteemed by the natives, and ſuppoſed by Camelli to be the true *amomum* of the Greeks, ſo much valued in thoſe ancient times.

CAROTERI, in *Matters of Commerce*, denotes a certain weight or quantity of divers kinds of goods, ex. gr. of cloves, from four to five hundred weight; of carratts, from five to nine hundred weights; of mace, about three hundred weight; and of nutmegs, from ſix to ſeven and an half hundred weight.

CAROTIC is uſed by ſome writers to denote thoſe who are ſeized with a CARUS.

CAROTIDS, in *Anatomy*, two arteries of the neck, on each ſide, ſerving to convey the blood from the aorta to the brain.—See *Tab. Anat.* [*Angeiol.*] *fig.* 1. n. 5. 5. 13. 13. (*Oſteol.*) *fig.* 5. 1. 1. 2. 3. 3. *lit.* zz. yy. (*Splanch.*) *fig.* 12. *lit.* p.

The *right carotid* ariſes from the ſubclavian, juſt where that ſprings out of the aorta; but the left immediately out of the aorta. They both lie pretty deep, and being defended by the aſpera arteria, paſs free from any compreſſure, and without ſending out almoſt any branches, ſtraight to the cranium. Juſt before their arrival there, they ſend forth the external *carotid*; and paſſing the os petroſum, proceed on with ſome circumvolutions, till laying aſide their muſcular membrane, and giving branches to the dura mater, they paſs along the cranium, defended by the ſides of the ſella-turcica, and dura mater: and ſending

feeding branches to the outer parts of the pia mater, and the nerves, they at last reach the cerebrum; where dividing into infinite ramifications, they are loft in the cortical part; or perhaps proceed even into the medullary part thereof.

Hippocrates and the ancients placed the feat of drowsiness in these arteries, whence they had the name *carotidi*, i. e. *soporiferæ*, from *κάρος*, *Drowsiness*. For the same reason they were also called *lethargicæ* and *apoplecticæ*.

CAROUGE, in *Botany*, a filiquous fruit, sweet and good to eat, when arrived at a proper degree of maturity. The tree which bears it grows in Spain, and in several places of the Mediterranean. The fruit is of great use in fattening beasts of burden, and is often given them instead of barley or oats: it is of some use in medicine, on account of its pectoral virtue, being taken in decoction.

The Spaniards call it *garroba*, or *algarroba*.

CARP, in *Ichthyology*. See CYPRINUS.

The *carp* which was first brought into England by Leonard Mascal, about the year 1514, is the most valuable of all kinds of fish for the stocking of ponds, because of its quick growth and great increase. If the breeding and feeding of this fish were more understood and practised, the advantages would be very great, and fish-ponds become as valuable an article as gardens. The gentleman who has land in his own hands, may, beside furnishing his own table and supplying his friends, raise a great deal of money, and very considerably improve his land at the same time, so as to make it yield more this way than by any other employment whatever. The sale of *carp* makes a part of the revenue of the nobility and gentry in Prussia, Pomerania, Brandenburg, Saxony, Bohemia, Mecklenburg, and Holstein.

For this purpose particular attention should be paid to the soil, water, and situation of the *carp* pond: the best kinds of ponds are those which are surrounded by the finest pastures and cornfields of a rich black mould, having soft springs on the spot, or running water, that is neither too cold, nor impregnated with acid, calcareous, selenitic, or other mineral particles. The water indeed may be softened by exposing it to the air and sun in a reservoir, or by forming an open channel for it at some distance from the pond. They should likewise be sheltered against the easterly and northerly winds, and be fully exposed to the influence of the sun.

It is found by experience most convenient to have three kinds of ponds for *carp*; viz. the spawning pond, the nursery, and the main pond. The first sort of pond must be well cleared of all other kinds of fish, especially those of the rapacious kind, such as the pike, perch, eel, and trout, and also of all the newts or lizards and the water-beetles. It should be supplied with soft water, and be exposed to the sun and air. A pond of one acre requires three or four male *carp*, and six or eight female ones, and in the same proportion for each additional acre. The best *carp* for breeding are those of five, six or seven years old, in good health, with full scales, fine full eyes, and a long body, and without any blemish or wound. The pond should be stocked on a fine calm day, towards the latter end of March or in April. *Carp* spawn in May, June, or July, according to the warmth of the season, and for this purpose they swim to a shady, warm, sheltered place, where they gently rub their bodies against the sandy ground, grass, or osiers, and by this pressure the spawn is forced out. At the spawning season all kinds of fowl should be kept from the ponds. The young fry, hatched from the spawn by the genial influence of the sun, are left in the pond through the whole summer, and even the next winter, if the pond is deep enough to prevent their suffocation under the ice in a severe winter; otherwise the breeders and the fry are put into separate ponds, more convenient for their wintering.

The second kind of ponds are the nurseries: the young fish should be removed into the nursery in March or April, on a fine calm day: a pond of an acre will admit a thousand or twelve hundred of this fry. When they are first put in, they should be well watched and driven from the sides of the pond, lest they become the prey of rapacious birds. In two summers they will grow so much as to weigh four, five, sometimes six pounds, and to be fleshy and well-tasted.

The main ponds are the last sort: *chep* are put into these, that measure a foot, head and tail inclusive. Every square of fifteen feet is sufficient for one *carp*; their growth depends on the room, and the quantity of food allowed them. The best seasons for stocking the main ponds are spring and autumn: *carp* continue to grow for a long time, and to a very considerable size and weight. Mr. Forster mentions one which he had seen in Prussia above a yard long, and of twenty-five pounds weight; and two or three hundred between two and three feet long, and which, he was told, were of between fifty and sixty years standing. Gesner mentions an instance of one that was an hundred years old: these were tame, and came to the shore in order to be fed, and swallowed with ease a piece of white bread of the size of half a halfpenny roll. Ponds should be well supplied with water during the winter, and when they are covered with ice, holes should be opened every day for the admission of fresh air, through want of which *carp* frequently perish. See *Carp*-Fishing.

Carp are sometimes fed, during the colder season, in a cellar: the fish is wrapped up in a quantity of wet moss, spread on a piece of net, and then gathered into a parcel, in such a manner, however, as to allow him room to breathe. The net is then plunged into water, and hung up to the ceiling of a cellar: the dipping moss at first he repeated every three or four hours, but afterward it need only be plunged into the water once in about six or seven hours. Bread soaked in milk is first given him in small quantities; in a short time the fish will bear more and grow fat by this treatment. Many have been kept in this way, breathing nothing but air, for several days successively. Phil. Trans. vol. lxi. pt. i. art. xxxvii. p. 310, &c.

CARP, *golden*. See GOLD-fish.

CARP-*Stone*, *Lapis carpionis*, a kind of gem said to be found in the fauces, by others in the back-bone, of the *carp* fish, about the size of a pea, of a triangular figure, and white colour without, but yellow within. It is supposed to be of use against the stone, and ebullitions of the bile, being taken in powder, or held in the mouth.

CARP-*cloth*, a coarse kind of cloth, made in the northern parts of England.

CARPACK, in the *Egyptian Dress*, a sort of red cap turned up with fur, which some make a custom of wearing in common, though it is properly a part of the dress of the interpreters only, the same cap with muslin tied round it being more properly the common dress.

CARPÆA, from *καρπαία*, a kind of dance or military exercise, in use among the Athenians and Magnesians, performed by two persons; the one acting a labourer, the other a robber.

The labourer, laying by his arms, goes to sowing and ploughing, still looking warily about him, as if afraid of being surprised: the robber at length appears, and the labourer quitting his plough, betakes himself to his arms, and fights in defence of his own. The whole was performed to the sound of flutes and in cadence.

Sometimes the robber was overcome and sometimes the labourer; the victor's reward being the oxen and plough. The design of this exercise was, to teach and accustom the peasants to defend themselves against the attack of ruffians.

CARPASIUM *linum*. See LINUM *Carpasium*.

CARPASUM, or CARBASUM, in the *Materia Medica* of the ancients, the name of a poisonous gum, exudating from a tree, so like myrrh in appearance, that many perished by the error of using it instead of myrrh, or mixed among it. We are, at this time, wholly ignorant of its nature; but that it was a gum exudating from a tree is plain from the account of Dioscorides, who calls it *opocarpasum*, as we do the flowing balm of Gilead, *opobalsamum*. The wood of the tree which produced it, he calls *xylocarpasum*, in the same manner as the other wood is called *xylobalsamum*. This wood was little less poisonous than the *carpasum*, or gum itself.

Galen tells us that the *carpasum* was like myrrh of the very purest and finest kind; and that those people who were most curious of all to have fine myrrh, often met with the *carpasum* among it, and gave death, instead of relief, to the persons they administered it to. We find, by the words of Galen, that this gum was not only like myrrh, but was also brought from the same places, and was often mixed with it. The finest myrrh usually had most of this poison among it, and we may collect from the same account that it was a sweet scented gum, for otherwise no body could have mistaken it for myrrh. Galen de Med. Simpl. lib. xii.

CARPENTER, an artificer whose business is to *cut*, fashion, and join timber and other wood for the purposes of building.

The word is formed from the French *charpentier*, which signifies the same, formed of *charpente*, which denotes timber; or rather from the Latin *carpentarius*, a maker of *carpenta*, or carriages.

CARPENTERS *Work*, in *Architecture*, includes the framing, flooring, roofing; the foundation, carcase, doors, windows, &c.

Company of CARPENTERS. See COMPANY.

CARPENTER's *Joint rule*. See RULE.

CARPENTER, *ship*, a person employed in the decks, in the construction and repairing of vessels.

CARPENTER *of a ship*, is an officer at sea, whose business is to have things in readiness for keeping the vessels in repair; and to attend the stopping of leaks, fitting masts or yards, also caulking, careening, breaming, and the like. He is to watch the timber of the vessel that it does not rot, consult

consult frequently with other officers on the state of the masts, yards, &c. and in time of battle he is to have plugs, tompions, and planks ready, for repairing breaches made by the enemy's cannon.

The *carpenter* has a mate under him, and a crew of gang to command on necessary occasions.

CARPENTRY, the art of cutting, framing, and joining large pieces of wood for the uses of BUILDING.

Carpentry is one of the arts subservient to architecture, and is divided into two branches, *house-carpentry*, and *ship-carpentry*; the first employed in raifing, framing, roofing, flooring, &c. of houfes, &c.

The fecond in the conftruction of veffels for fea; as fhips, barks, barges, boats, &c.

The rules and practices in *carpentry*, as to plaining, fawing, mortefeling, tenanting, fcribing, paring, moulding, &c. are much the fame as thofe in joinery: fo likewife are the tools, or inftruments, and the ftuff is the fame in both; all the difference between the two arts conſiſting in this, that joinery is ufed in the fmaller and more curious works; and *carpentry* in the larger, ſtronger, and coarſer.

Fr. Pyrard aſſures us, that the art of *carpentry* is in its greateſt perfection in the Maldive iſlands: their works there, he obſerves, are ſo artfully managed, that they will hold tight and firm without either nails or pins. He adds, they are ſo curiouſly put together, that no body can take them aſunder but thoſe acquainted with the myſtery.

CARPENTUM, in *Antiquity*, a denomination common to divers ſorts of vehicles, anſwering to coaches as well as waggons, or even carts, among us.

The *carpentum* was originally a kind of car or vehicle wherein the Roman ladies were carried; though in after-times it was alſo uſed in war.

Some derive the word *a carvis*: others from *Carmenta*, mother of Evander, by a converſion of the *n* into *r*: *carpentum* for *carmentum*. Thus Ovid, Faſt. lib. i.

Nam prius Auſonios matres Carpenta vehebant
Hoc quoque ab Evandri dicta parente rear.

CARPERA, in *Ichthyology*, a name given by Cuba, and ſome other writers on fiſhes, to the CARP. See CYPRINUS.

CARPERTARIA, in *Botany*, a name uſed by ſome authors, for the bacharis or wilmercreſs, a wild plant common in hedges in ſpring.

CARPOBALSAMUM, in the *Materia Medica of the Ancients*, a name given to a kind of ſpice, or aromatic drug, often mentioned by Ægineta and others, and made an ingredient in cordial and theriacal medicines. This was a vegetable ſubſtance, being the top-ſhoots of young twigs of an oddiferous thurn, growing in Pamphylia, and ſmelling very like the fineſt cinnamon.

As the ancients uſed both this drug and cubebs, it is certain that had they both been the produce of the ſame tree, they muſt have known it; and this it is plain they did not know, for they have nowhere named any ſuch thing: but on the contrary, they have expreſly ſaid, that the *carpobs* was the fhoots of a tall tree, which produced no fruit. Avicenna gives alſo this account, and adds, that it grew, in his time, on mount Libanus, and that the part gathered for that uſe was certain twigs, very long, cylindric, and but little thicker than a needle, which had a very fragrant ſmell.

CARPESIUM, in the *Materia Medica*, a name given by ſome authors to *cubebs*. See CARPESITA.

CARPET, a ſort of covering, worked either with the needle, or on a loom; to be ſpread on a table, trunk, an eſtrade, a paſſage, or a floor.

Perſian and Turkey *carpets* are thoſe moſt prized; eſpecially the former: *carpets* that had a hair or ſhag on one ſide only, were called by the ancients *ſtatera*; thoſe that had a ſhag on both ſides, were called *amphimalla*. Engliſh *carpets*, eſpecially thoſe of Axminſter, and thoſe manufactured by Mr. Moor, are much valued. Among *Jockeys*, *to ſtarve the carpet*, is to GALLOP very cloſe, or near the ground; a fault foreigners charge on Engliſh horſes. Figuratively, an affair, propoſal, &c. are ſaid to be brought on the *carpet*, or tapis, when they are under conſideration, &c.

CARPET-*knights*, a denomination given to gown-men, and others, of peaceable profeſſions, who, on account of their birth, office, or merits to the public, or the like, are, by the prince, raiſed to the dignity of knighthood. They take the appellation *carpet*, becauſe they uſually receive their honours from the king's hands in the court, kneeling on a *carpet*. By which they are diſtinguiſhed from knights created in the camp, or field of battle, on account of their military proweſs.

Carpet-knights poſſeſs a medium between thoſe called *tract*, or *dunghill-knights*, who only purchaſe, or merit the honour by their wealth; and *knights-bachelors*, who are created for their ſervices in the war.

CARPINUS, in *Botany*. See HORNBEAM.

CARPIONE, in *Ichthyology*, a name given by Salvian to the fiſh called by other writers *carpio lacus Benaci*. It is the ſame with that fiſh called in ſome parts of England the *red* CHARRE. Artedi diſtinguiſhes it from the other ſpecies of SALMON, by calling it the ſmall *ſalmon* with five rows of teeth in the palate.

CARPOBALSAM, or CARPOBALSAMUM, the fruit of the tree which yields the true oriental balm, or baſſam; very much reſembling, both in figure, ſize, and colour, that of turpentine.

The word comes from καρπος, *fruit*, and βαλσαμον, *balſam*. The *carpobalſamum* is an oblong fruit with a ſhort ſtout-ſtalk, a brown wrinkled rind, marked with four ribs; of a grateful taſte and ſmell.

It is ſeldom found in ſhops; ſome ſubſtituting Jamaica pepper, and others cubebs, in its place.

CARPOBOLUS, *Loufperdon*, in *Botany*. See PUFF-*ball*.

CARPOCRATIANS, a branch of the ancient Gnoſtics, ſo called from *Carpocrates*, who in the ſecond century revived, and improved upon the errors of Simon Magus, Menander, Saturnil, and other GNOSTICS.

He owned, with them, one ſole principle, and father of all things, whoſe name, as well as nature, was unknown. The world, he taught, was created by angels, vaſtly inferior to the firſt principle. He oppoſed the divinity of Jeſus Chriſt; making him a mere man, born of Joſeph and Mary, according to the ordinary courſe of nature, though poſſeſſed of uncommon gifts, which fet him above other creatures. He inculcated a community of women; and taught, that the ſoul could not be purified, till it had committed all kinds of abominations, making that a neceſſary condition of ſanctification; that all actions were indifferent in their own nature, and were rendered good or evil by the opinions of men, or the laws of the ſtate.

CARPOS, καρπος, *fruit*. The word in this ſenſe is too well known and underſtood to admit of any explanation; but it is neceſſary to obſerve that the old Greek writers did not keep ſtrictly to the ſenſe of the word, limiting it, as we do, to that part of a plant or a tree which ſucceeds the flower, and in which the ſeeds are contained; but they often uſed it in a larger ſenſe, and expreſſed by it the efculent part of a plant, though it did not ſerve to this purpoſe.

CARPUM *ſuſtentum interior*, in *Anatomy*, a name given by Spigelius to the muſcle called by Albinus, *ulnaris internus*, and by Winſlow, *internus cubitalis*.

CARPUS, in *Anatomy*, the WRIST; or that part between the palm of the hand, and the arm.—See *Tab. Anat. ſ. Oſteol.* fig. 3. n. 9. and 7. n. 15. See WRIST.

The Arabians call it *rafeta*; the Latins ſometimes *carpimus*.

CARR, *carrum*, in the *Middle Age*, denoted any ſort of vehicle, or carriage, either by land or ſea.

CARR, CARRUS, a kind of rolling throne, uſed in TRIUMPHS, and at the ſplendid entries of princes.

The word is from the ancient Gauliſh, or Celtic, *carr*; mentioned by Cæſar, in his Commentaries, under the name *carrus*.

Plutarch relates, that Camillus having entered Rome in triumph mounted on a *carr*, drawn by four white horſes, it was looked on as too haughty an innovation.

CARR is alſo uſed for a kind of light, or open chariot. Pontanus obſerves, that Erichthonius was the firſt that harneſſed horſes, and joined them in a *carr*, or chariot.

The *carr*, on medals, drawn either by horſes, lions, or elephants, uſually ſignifies either a triumph or an apotheoſis: ſometimes a proceſſion of the images of the gods, at a ſolemn ſupplication; and ſometimes of thoſe of ſome illuſtrious families at a funeral.—The *carr* covered, and drawn by mules, only ſignifies a *conſecration*, and the honour done any one of having his image carried at the games of the Circus.

The *carr* uſed by the ladies was called *pilentum*, *carpentum*, and *baſterna*.

CARRAC, or CARRACK, a name given by the Portugueſe to the veſſels they ſend to Braſil and the Eaſt Indies; being very large, round built, and fitted for fight, as well as for burden. Their capacity lies in the depth, which is very extraordinary. They are narrower above than underneath, and have ſometimes ſeven or eight floors; they carry about 2000 tons, and are capable of lodging 2000 men; but of late they are little uſed. Formerly they were alſo in uſe among the knights of Rhodes, as well as among the Geneoeſe, and other Italians.

It is a cuſtom among the Portugueſe, when the *carracs* return from India, not to bring any boat or ſloop for the ſervice of the ſhip, beyond the iſland of St. Helena; at which place they ſink them on purpoſe, in order to take from the crew all hopes or poſſibility of ſaving themſelves in caſe of ſhipwreck.

CARRAGO, in *Antiquity*, a kind of fortification, or defence about a camp, compoſed of carts, waggons, and the

the like vehicles, chained or fastened together; chiefly used by the barbarous nations.

CARRARA *marble*, among our *Artificers*, the name of a species of white marble, which is called *marmor LUNENSE*, and *lignifrum* by the ancients: it is distinguished from the Parian, now called the ſtatuary marble, by being harder and leſs bright.

CARRAT, CARAT, or CARACT. See CARACT.

CARRIAGE, a vehicle for the conveyance of perſons, goods &c from place to place.

CARRIAGE *of a cannon*, is the frame, or timber-work, whereon it is mounted; ſerving to point and direct it for ſhooting; and to convey it from place to place; of which there are three ſorts; viz. thoſe uſed in garriſons, at ſea aboard ſhips, and in the field. The two firſt differ only in ſome iron rings, and alſo that the trucks or wheels of garriſon carriages are made of caſt iron, whereas thoſe of ſhip carriages are of wood. Both have the ſame irons, except the breech-rings, which are peculiar to the latter.

CARRIAGE, *ſlay, of a field-piece*, conſiſts of two wheels, which carry long and ſtrong wooden beams, or cheeks, between which the cannon is as it were framed, moving on its trunnions as on a centre: when it is required to move them, they add a vant-train, compoſed of two ſmaller wheels.

The *carriage* conſiſts of the cheeks, the tranſoms, the bolts and plates, the train, the bands, the keys and locks, the bridge, the bed, the hooks, the trunnion-holes, and the cap-ſquare.

The ordinary proportion is, for the *carriages* to have 1/8 of the length of the gun; the wheels to be half the length of the piece in height four times the diameter, or caliber, gives the depth of the planks at the fore-end; in the middle 3/4.

The *carriages* for mortars are low, with four wheels, each of one piece, exactly like the *ſea-carriages*.

CARRIAGE, *bed*, is a cart made on purpoſe for carrying of mortars, and their beds from one place to another; and likewiſe for carrying guns in the field, which are too heavy to be tranſported on their own carriages.

CARRIAGES, *truck*, are two ſhort planks of wood ſupported on two axle-trees, having four trucks, or wheels, of ſolid wood, about a foot and a half, or two feet diameter, for carrying mortars or guns upon a battery, when their own carriages cannot go, and for removing timber, and other burthens; and are drawn by men.

CARRIAGE, *the, of a ſhip gun*, conſiſts of four wheels, without ſpokes.

The parts of a *ſea-carriage*, are the two cheeks, the axle-trees, bolts, cap-ſquares, commonly called clamps in the *ſea*-ſervice, hooks, forelocks, trucks, and linſpins. The breadth of the wheels is always equal to that of the cheeks; but the height of the cheeks, and diameter of the trucks, depend on the height of the gun-ports above the deck. See on the ſubject of *carriages* relating to the military art, both as to their conſtruction and the dimenſions of their parts, Muller's Treat of Artillery, vol. iv. See GALLOPER, LIMBER, TUMBRIL, &c. See alſo BED, BRECHINGS, &c. and HOWITZ, MORTAR, &c.

CARRIAGE, in *Agriculture*, denotes a ſort of ſurrow, cut for the conveyance of water, to overflow or improve the ground.

Carriages are of two kinds, the main *carriage*, whoſe mouth is of breadth ſufficient to receive the whole ſtream intended; and leſſer *carriage* iſſuing from ſpace to ſpace, out of the former.

CARRIAGE alſo ſignifies the removal of goods, or other things, from one place to another, eſpecially with a cart or cart.

CARRIAGE alſo denotes the money or hire paid to a carrier, or other bearer of goods.

Juſtices of peace have power to aſſeſs the price of *carriage* of goods yearly, at their Eaſter ſeſſions; and if any carrier ſhall take above the rates and prices ſo aſſeſſed, he ſhall forfeit 5*l.* 3 and 4 W. and M. cap. 12.

A common carrier having the charge and *carriage* of goods, is to anſwer for the ſame, or the value, to the owner. Co. Lyt. 78. And where goods are delivered to a carrier, and he is robbed of them, he ſhall be charged, and anſwer for them, becauſe of the hire. 1 Roll. abr. 338.

Where goods are ſtolen from a carrier, he may bring an indictment againſt the felon, as for his own goods, though he has only the poſſeſſory, and not the abſolute property; and the owner may alſo prefer an indictment againſt the felon. Kel. 39. If a carrier is robbed of goods, alſo either he or the owner may bring an action againſt the hundred to make it good.

The *carriage* of letters is called *poſtage*. See POST.

CARRIAGE *by ſea*, is denominated FREIGHT.

CARRIAGE, *bill of, lettre de voiture*, among the French, denotes a paper given to a carrier, expreſſing the quantity and quality of the goods and parcels committed to him, partly to entitle him to receive his hire from the perſon to whom they are directed, and partly that this letter, may ſhew whether all be brought, and whether in due time, and in the condition required.

CARRIAGE is alſo uſed to denote the ſpace of ground, over which the inhabitants of *New France*, and other colonies of North America, who trade with the ſavages, uſually by means of canoes, are obliged to carry their boats and proviſions, &c. on their ſhoulders. This they are forced to when they come to places in lakes or rivers, covered with willows, or otherwiſe rendered impracticable to paſs by water, till they meet with ſome new place, convenient for reimbarking.

CARRIER, he who undertakes to convey perſons, goods, papers, money, or the like, from place to place, on condition of a certain price, either fixed by authority or cuſtom, or left to private agreement. See CARRIAGE.

In Holland *carriers* are called *reuliers*, becauſe they always keep the ſame road, or route; ſetting out, and arriving, at fixed hours.

CARRIER *pigeon*, a ſort of pigeon uſed, when properly trained up, to be ſent with letters from one place to another.

It is larger in ſize than moſt of the other kinds. Its length from the tip of the beak to the end of the tail being often fifteen inches; but its greateſt weight not twenty ounces. Its fleſh is firm and its feathers cloſe; it is long-necked, and of a better ſhape than moſt other pigeons. The upper chap of the bill is half covered from the head with a white or blackiſh tuberous ſarfuraceous fleſh, which projects or hangs over both its ſides, on the upper part neareſt the head, and ends in a point about the middle of the bill. This is called the *wattle*. The eyes are ſurrounded with the ſame ſort of corrugated fleſh for the breadth of a ſhilling, and their iris is red. Their beak is long, ſtraight and thick; their wattle generally broad across the beak, ſhort from the head toward the point, and tilting forward from the head; and the head narrow, long and flat; the neck very long and thin, and the breaſt broad; the feather is chiefly black or dun, though there are blues, whites, and pyed.

It has its name from its remarkable ſagacity in returning to the place where it was bred, though carried to great diſtances; from which property it is made uſe of to carry letters to diſtant places, as a ſpeedy and ſafe method of conveyance.

They are trained to this ſervice in Turky and Perſia, and are carried firſt, while young, ſhort flights of half a mile, and afterwards more, till at length they will return from the fartheſt part of the kingdom. Every baſhaw has a baſket of theſe pigeons, bred at the ſeraglio, which, upon any emergent occaſions, as an inſurrection, or the like, he diſpatches with letters, braced under their wings, to the ſeraglio, only ſending out more than one, for fear of accidents. Lightow aſſures us, that one of theſe birds will carry a letter from Babylon to Aleppo, which is thirty days journey, in forty-eight hours. This is alſo a very ancient practice: Hirtius and Brutus, at the ſiege of Modena, held a correſpondence with one another by means of pigeons. And Ovid tells us, that Taurothenes, by a pigeon ſtained with purple, gave notice to his father of his victory at the Olympic games, ſending it to him at Ægina. Ælian. Var. Hiſt. lib. ix. cap. 2. Pliny, lib. x. cap. 24.

Anacreon tells us, that he conveyed a billet-doux to his beauteful Bathyllis, by a dove. Ode 9. See DRAGOON, and HORSE-man.

CARRIERE. See CAREER.

CARROBALISTA, in the *Ancient Military Art*, denotes a ſpecies of *ballſta*, mounted on wheels, and drawn by horſes; by which it differed from the *manuballſta*, which being leſſer and lighter was thrown by the hand.

CARROCIUM, or CARROCERUM, in *Middle Age Writers*, denotes the BANNER, or chief flag of an army, which was mounted on a kind of chariot, and drawn by oxen.

CARROT, *Daucus*, in *Botany*, a genus of the *pentandria digynia* claſs. Its characters are theſe: it hath an umbelliferous hermaphrodite flower, which hath five heart-ſhaped petals turning inward, and five hairy ſtamina. The germen ſits under the flower, which afterward becomes a roundiſh ſtriated fruit, covered with ſtinging hairs.

Carrots were introduced into this kingdom by the Flemings, in the reign of queen Elizabeth, and firſt ſown about Sandwich in Kent. There are two or three ſorts of this plant cultivated for the uſe of the kitchen; and theſe are ſown at ſeveral different ſeaſons of the year, to afford a ſupply of young roots, in all ſeaſons, for the table.

The season for sowing them, for the earliest crop, is soon after Christmas. They should be sown in an open situation, but near a wall; though if they are sown close under it, they will be drawn up to feed too fast, and give no good roots: about eight inches distant is the properest place.

They delight in a warm sandy soil, which should be light, and well dug to a good depth, that the roots may meet with no obstruction in running down, which makes them grow forked, and shoot out lateral branches, especially when the ground has been too much dunged the same year that the seeds were sown, which will also occasion their being worm-eaten. The hairyness of these seeds makes them apt to flock together in small clusters, and renders it difficult to sow them equally: they should therefore be always sown on a rainy day, when there is no wind stirring to blow them together, and be well rubbed between the hands to separate them thoroughly: when they are sown they should be trod in with the feet, and the ground raked level over them.

When they first come up, they should be hoed out to four inches distance; and a month after this, they must be cleared again; and if they are to be drawn while young, they are now to be left at six inches distance every way: if they are to stand to grow large, they must be separated to ten inches.

The second season for sowing *carrots* is in February. This must be done under a wall or hedge, and on warm banks: but those which are to be in open large quarters, should not be sown till the beginning of March.

In July they may be sown again for an autumnal crop, and finally in the end of August for those which are to stand the winter. These last will be fit for use in March, before any of the spring ones; but they are seldom so tender or well eaten.

In order to preserve *carrots* for use all winter, they are to be dug up in the beginning of November, and laid in a dry place in sand; and those room being planted again in February will ripen seeds in August for succeeding crops: the longest and straightest roots are to be chosen for this purpose.

The cultivation of *carrots* has lately become a considerable branch of agriculture. For this purpose the ground should be ploughed early, before the winter begins, that the frost may mellow the soil, and well dunged. The seed should be sown in March or April, separating it first by putting it through a fine chaff-sieve. Four pounds of seed are sufficient for an acre. In about seven or eight weeks they are fit for hoeing, and in a fortnight after they should be harrowed, which is done without injury to the *carrot* plants. Mr. Billing, an ingenious farmer in Norfolk, obtained from twenty acres and a half of land, of different sorts, and differently prepared, five hundred and ten loads of *carrots*, which, as experience led him to conclude, were equal in use and effect to a thousand loads of turneps, or three hundred loads of hay. Some of them measured two feet long, and from twelve to fourteen inches round.

The season for drawing *carrots* is a little after Michaelmas; and the best method of drawing them is by breaking the ground about six inches deep, with a four-pronged fork; though Mr. Billing has ploughed them up with a narrow-chared wheel-plough, without injury, and the flock was turned into the ground to feed on them, without any farther preparation. Cows, sheep, horses, and hogs, become, by use, fond of *carrots*, and are greatly nourished by them. See Billing's Account of the Cultivation of *Carrots*, 1767. 8vo.

CARROT, *wild*, or *Daucus Sylvestris*. The seeds of this plant are esteemed one of the most powerful diuretics we are acquainted with, of our own growth. They are also esteemed provocatives to venery. They are also given in disorders of the breast and lungs, in pleurisies, in strangaries, and in the stone and gravel. An infusion of them in white wine is excellent in hysteric complaints. Many instances are related, in which tea made of the heads or seeds of the *wild carrot*, has given great relief in these complaints. Ale may be made of it, by adding to nine ounces of the seed, eighteen ounces of raisins of the sun. These must be put into a bag, and hung in a vessel of six gallons of good ale, after fermentation. After eight days it will be fine, and it may be drank in the quantity of three pints a-day.

See remarks on the ale of the *carrot* pool-tree, in the Lond. Med. Observ. &c. vol. iv. p. 178. 191. and Ibid. p. 358.

CARROT, *comb.* See STIGMA.

CARROT, *dead*, or *Southernwood*. See THARSIA.

CARRUCA, PLOUGH, a species of tumbrel. See FENNEL.

CARROUSAL, or CARROWSAL, properly a council, or council of chariots and horses: or a magnificent entertainment, on occasion of some public rejoicing; consisting in a cavalcade of several persons, richly dressed, and equipped after the manner of the ancient cavaliers, divided into squadrons, meeting in some public place, and practising juils, tournaments, and other noble exercises. The word is since become of more general use, and is given to any merry meetings.

The word comes from the Italian *carosello*, a diminutive of *carro*, *charist*. Tertullian ascribes the invention of *carrousels* to Circe; and will have them instituted in honour of the Sun, her father; whence some derive the word from *carrus*, or *currus solis*.

The Moors introduced cyphers, liveries, and other ornaments of their arms, with trappings, &c. for their horses. The Goths added crests, plumes, &c.

CARR-TAKERS, are officers of the king's houshold, who, when the court travels, have charge to provide waggons, carts, &c. to transport the king's furniture and baggage.

CARRUCA, in *Antiquity*, a splendid kind of car, or chariot, mounted on four wheels, richly decorated with gold, *silver*, ivory, &c. in which the emperors, senators, and people of condition were carried.

The word comes from the Latin *Carrus*, or British *carr*, which is still the Irish name for any wheel-carriage.

CARRUCA, or CARUCA, is also used in *Middle Age Writers*, for a PLOUGH.

CARRUCA was also used sometimes for *carrucata*. See CARRUCATA.

CARRUCAGE, *carrugium*, a kind of tax anciently imposed on every plough, for the public service. See CARRUCATE and HIDAGE.

CARRUCAGE, CARUCAGE, or CARRAGE, in *Husbandry*, denotes the ploughing of ground, either ordinary, as for grain, hemp, and flax; or extraordinary, as for wood, dyers weed, rape, and the like.

CARRUCATE, *carrucata*, in our *Ancient Laws* and *History*, denotes a plough-land, or as much arable ground, as can be tilled in one year, with one PLOUGH.

In Domesday inquisition, the arable land is estimated in *carrucates*, the pasture in HIDES, and meadow in ACRES. Skene makes the *carrucate* the same with *hide*, or *hida terræ*; Littleton the same with SOC.

The measure of the *carrucate* appears to have differed in respect of place as well as time. In the reign of Rich. I. it was estimated at 60 acres, and in another charter of the same reign at 100 acres: in the time of Ed. I. at 120 acres: and in the 25th of Ed. III. a *carrucate* of land in Burcester contained 112 acres, and in Middleton 150 acres. Dugd. Mon. tom. ii. p. 107. Kennet, Par. Ant. p. 471. Du-Cange.

By a statute under William III. for charging persons to the repair of the highways, a plough-land is rated at fifty pounds *per annum*, and may contain houses, mills, wood, pasture, &c. Stat. 7 and 8 Will. III.

CARRYING, in *Falconry*, signifies a hawk's flying away with the quarry.

Carrying is one of the ill qualities of a hawk, which she acquires either by a dislike of the falconer, or not being sufficiently broke to the LURE.

CARRYING, among *Huntsmen*. When a hare runs on cotten ground (or even sometimes in a frost), and it sticks to her feet, they say she *carries*.

CARRYING, among *Riding-Masters*. A horse is said to *carry low*, when having naturally an ill-shaped neck, he lowers his head too much. All horses that arm themselves carry low; but a horse may carry low without arming. A French branch, or gigot, is prescribed as a remedy against *carrying low*.

A horse is said to *carry* well, when his neck is raised, or arched, and he holds his head high and firm, without constraint.

CARRYING *wind*, a term used by our dealers in horses to express such a one as frequently tosses his nose as high as his ears, and does not carry handsomely. This is called *carrying wind*; and the difference between *carrying* to the wind, and bearing upon the hand, is this: that the horse who bears upon the hand, shakes the bridle and refists it, while he shakes his head; but the horse that carries in the wind puts up his head without shaking; and sometimes beats upon the hand. The opposite to *carrying* in the wind, is arming and *carrying low*; and even between these two there is a difference in wind.

CART, a vehicle, mounted on two wheels, drawn by horses, used for the carriage of heavy goods.

Mr. Sharp's *rolling cart* is fixed upon two rollers, running a-breast, or parallel with each other, and both placed under the body of the *cart*, working upon pivots like the wheel of a wheel-barrow. The rollers are both cylinders of cast iron, two feet diameter, and fifteen inches broad. An iron spindle passes through the centre of each roller, upon the ends of which rest the four planks that support the body of the *cart*.

The word seems formed from the French *charrette*, which signifies

fignifies the fame; or rather the Latin *carreta*, a diminutive of *carrus*. See CARR.

In London and Weſtminſter *carts* ſhall not carry more than twelve ſacks of meal, ſeven hundred and fifty bricks, one chaldron of coals, &c. on pain of forfeiting one of the horſes. Stat. 6 Geo. I. cap. 6.

By the laws of the city, cart-men are forbid to ride, either on their *carts* or horſes. They are to lead, or drive them on foot, through the ſtreets, on the forfeiture of ten ſhillings. Stat. 1 Geo. I. cap. 57.

Criminals are drawn to execution in a *cart*. Bawds, and other malefactors are whipped at the *cart's* tail.

Scripture makes mention of a ſort of *carts*, or drags, uſed by the Jews to do the office of threſhing. They were ſupported on low thick wheels, bound with iron, which were rolled up and down on the ſheaves, to break them, and force out the corn. Something of the like kind alſo obtained among the Romans, under the denomination of *plauſtra*, of which Virgil makes mention. Georg. I.

Tardaque Eleuſinæ matris volventia plauſtra,
Tribulaque, traheæque——

On which Servius obſerves, that *trahea* denotes a *cart* without wheels, and *tribula* a ſort of *cart* armed on all ſides with teeth, uſed chiefly in Africa, for threſhing corn. The Septuagint and St. Jerome repreſent theſe *carts* as furniſhed with ſaws, inſomuch that their ſurface was beſet with teeth. David having taken Rabbah, the capital of the Ammonites, ordered all the inhabitants to be cruſhed to pieces under ſuch *carts*, moving on wheels ſet with iron teeth; and the king of Damaſcus is ſaid to have treated the Iſraelites in the land of Gilead in the ſame manner. 2 Sam. xii. 31. Amos, i. 3. Calm. Dict. Bibl. tom. i. p. 366.

CART-*loaf*, in our *Saxon Conſtitns*, denotes wood to be employed in making or repairing inſtruments of huſbandry.

CARTE BLANCHE, a French term, ſeldom uſed but in this phraſe, To give, or ſend any one the *carte blanche*; i. e. to ſend him a blank paper, ſigned, for him to fill up with what conditions he pleaſes.

Much like this is the French *blanc ſeing*, a paper without writing, except a ſignature at the bottom, given by contending parties to arbitrators, or common friends, to fill up with the conditions they judge reaſonable, in order to end the quarrel.

CARTEL, originally ſignifies a placart, or manifeſto in writing, poſted in public places to notify its contents.

The word comes from the Italian *cartello*, or Latin *cartellus*, which ſignifies the ſame; formed by diminution of *charta*, *paper*.

CARTEL, a letter of defiance, or a challenge to ſingle combat; much in uſe when thoſe combats were practiſed, for the deciding of difficult, and not otherwiſe to be determined, controverſies at law. See DUEL.

The uſe of *cartels*, or challenges to fight, is very ancient, there being divers inſtances of them in Homer, Virgil, and other Greek and Latin poets. Rymer gives the *cartel* which Edward III. ſent to Philip de Valois, challenging him either to fight him, body to body, or a hundred men againſt a hundred, or army to army, within ten days before the gates of Tournay. Fœd. tom. v.

CARTEL alſo denotes a treaty or agreement between two princes or generals, relating to the exchange of priſoners taken in war.

There are alſo *cartels* ſettled between princes in time of war, for what relates to commerce, that it may be carried on without interruption, notwithſtanding other hoſtilities.

CARTEL is alſo uſed for a ſhip commiſſioned, in time of war, to exchange the priſoners of any two hoſtile powers; or to carry any requeſt or propoſal from one to another. The officer who commands her is ordered to carry only a ſingle gun, for the purpoſe of firing ſignals.

CARTEL alſo denotes a meaſure of capacity for corn, uſed in divers parts of France, being of different values from thirty to fifty pounds.

CARTESIAN *Philoſophy*, or CARTESIANISM, the ſyſtem of philoſophy advanced by Des Cartes, and maintained by his followers, the *Carteſians*.

The *Carteſian* philoſophy is founded on two great principles, the one metaphyſical, the other phyſical. The metaphyſical principle is this, *I think, therefore I am*. This principle has been attacked and defended, with great ſpirit, zeal, and partiality, on both ſides: for, though it be true, that we are as ſure by an inward perception or conſciouſneſs, that we exiſt, as that we think; yet it is true, too, that the concluſion of this reaſoning, *I am*, is drawn from the antecedent *I think*: ſince *to think*, ſuppoſes *to be*, or *exiſt*; and the mind ſees clearly the neceſſary connection between thinking and being.

From our having the idea of a Being infinitely perfect and neceſſarily exiſting, Des Cartes concludes that he actually is, upon whoſe will he makes the certainty of ſelf-evident propoſitions, and of all neceſſary truths to depend. From the knowledge thus eſtabliſhed, he proceeds to deduce a complete knowledge of his effects by neceſſary ſteps; and he rejects all final cauſes from philoſophy. He infers the reality of material objects from the veracity of the Deity.

The phyſical principle of *Carteſianiſm* is this, that *nothing exiſts but ſubſtances*: which appears a dangerous principle to the divines; and is accordingly controverted every day in the ſchools of the catholics; who undertake to prove that there are abſolute accidents.

Subſtances he makes of two kinds; the one a ſubſtance that thinks, the other a ſubſtance extended. Actual thought, therefore, and actual extenſion, are the eſſence of ſubſtance: ſo that the thinking ſubſtance cannot be without ſome actual thought; nor can any thing be retrenched from the extenſion of a thing, without taking away ſo much of its ſubſtance.

The firſt article is oppoſed by Mr. Locke, who endeavours to ſhew, that thinking is not eſſential to the ſoul, or that its eſſence does not conſiſt in thought; but that there are various occaſions wherein it does not think at all. See DREAM. The latter is ſtrongly oppoſed by the Jeſuits, &c. as inconſiſtent with the doctrine of TRANSUBSTANTIATION; but is much better confuted by the modern writers, from the principles of the Newtonian philoſophy.

The eſſence of matter being thus fixed in extenſion, Des Cartes naturally concludes there is no vacuum, nor any poſſibility thereof in nature; but that the world is abſolutely full: for mere ſpace is precluded by this principle; becauſe extenſion being implied in the idea of ſpace, matter is ſo too. If there were any ſuch thing as a vacuum, ſays he, it might be meaſured: the vacuum, therefore, is extended, and of conſequence is matter; every thing extended being matter. See VACUUM.

He defines motion to be the tranſlation of a body from the neighbourhood of bodies that are in contact with it, and conſidered as quieſcent, to the neighbourhood of other bodies; and thus deſtroys the diſtinction between abſolute or real, and relative or apparent motion. He maintains that the ſame quantity of motion is always preſerved in the univerſe; becauſe, God, he ſays, muſt be ſuppoſed to act in the moſt conſtant and immutable manner. And hence he likewiſe deduces his three laws of motion. See MOTION.

Theſe principles of phyſics once ſuppoſed, Des Cartes explains mechanically, and according to the laws of motion, how the world was formed; and whence the preſent appearances of nature do ariſe. He ſuppoſes, that God created matter of an indefinite extenſion: that he divided this matter into little ſquare portions, or maſſes, full of angles; that he impreſſed two motions on this matter; one whereby each party revolved round its centre; another, whereby an aſſemblage or ſyſtem of them, turned round a common centre: whence aroſe as many different vortices, or eddies, as there were different maſſes of matter, thus moving round common centres.

Theſe things thus put into motion, the conſequences according to Des Cartes, in each vortex, will be as follow: the parts of matter could not move and revolve among each other, without having their angles gradually broken; and this continual friction of parts and angles muſt produce three elements: the firſt, an infinitely fine duſt, formed of the angles broken off; the ſecond, the ſpheres remaining, after all the angular irregularities are thus removed; theſe two make the matter of his firſt and ſecond element. And thoſe particles not yet rendered ſmooth and ſpherical, and which ſtill retain ſome of their angles, and irregular parts, make the third element.

Now the firſt, or ſubtileſt element, according to the laws of motion, muſt take up the centre of each ſyſtem, or vortex, by reaſon of the ſmalneſs of its parts, and this is the matter which conſtitutes the ſun, and the fixed ſtars above and the fire below. The ſecond element, compoſed of *ſpheres*, makes the atmoſphere, and all the matter between the earth and the fixed ſtars; in ſuch manner, as that the largeſt ſpheres are always next the circumference of the vortex, and the ſmalleſt next its centre. The third element, or the hooked particles, is the matter that compoſes the earth, all terreſtrial bodies, comets, ſpots in the ſun, &c.

The parts of the ſolar vortex, according to his ſyſtem, increaſe in denſity, but decreaſe in celerity, to a certain diſtance; beyond which he ſuppoſes all the particles to be equal in magnitude, but to increaſe in celerity. He accounts for the gravity of terreſtrial bodies from the centrifugal force of the ether revolving round the earth; and upon the ſame general principles he pretends to explain the phenomena of the magnet, and to account for every other operation in nature.

His ſyſtem, though very artfully concerted, yet carries with it more the air of a romance, than of a juſt philoſophy. Accordingly, both divines and philoſophers exclaim againſt it: the firſt, becauſe it leads to atheiſm, by furniſhing the maintainers of an eternal matter, with means how, from the laws of motion, to account for the production of the world: though it is certain, Des Cartes ſuppoſed a Deity; and ſo muſt all who admit his philoſophy; elſe whence will they derive that motion of matter, which of itſelf is deſtitute of any ſuch principle?

But the philoſophers have much better pleas againſt it; and the elements, ſubtile matter, hooked atoms, vortices, and other machines, are now clearly on the ſame footing with the occult quality of the ancient Peripatetics. Indeed Des Cartes, by introducing geometry into phyſics, and accounting for natural phenomena from the laws of mechanics, did infinite ſervice to philoſophy; and contributed both by his practice and example, to free it from that venerable ruſt, which in a long ſucceſſion of ages it had contracted: accordingly, to him, in ſome meaſure, is owing the preſent ſyſtem of mechanical, and even the Newtonian philoſophy.

Carteſianiſm was nearly prohibited by an arret of the parliament of Paris; and had been ſo, in effect, but for a burleſque addreſs preſented to the firſt preſident.

Rene des Cartes the noble founder of this ſect, was of Bretagne, born in the year 1596. His monument informs us, "That having ſtudied all the learning of the "ſchools, which proved ſhort of his expectation, he be-"took himſelf to the army, in Germany and Hungary; "and there ſpent his vacant winter hours in comparing "the myſteries and phenomens of nature, with the "laws of mathematics; daring to hope, that theſe "might unlock the other. Quitting therefore, all other "purſuits, he retired to a little village near Egmond, "in Holland; where ſpending twenty-five years in con-"tinual reading and meditation, he effected his de-"ſign."

He was a perſon of great genius and penetration, both as to the invention, and orderly ranging and diſpoſing of things. He began a new method of philoſophy, and finiſhed it on his own foundation. His reputation in foreign nations appears on his monument; which conſiſts of four faces, inſcribed with ſo many encomiums. It was erected at Stockholm, where he died, in the year 1650, by Monſieur Chanut, the king of France's reſident in that court. But his bones were afterwards removed to Paris, at the charge of M. d'Abbes, who alſo erected a handſome monument over them, in the church of St. Geneviefve.

See an accurate account and examination of the *Carteſian* ſyſtem, in Maclaurin's view of Sir Iſaac Newton's Philoſophical Diſcoveries, chap. iv.

CARTHAMUS. See *Baſtard* SAFFRON.

CARTHUSIANS, a branch of the BENEDICTINES, an order of religious, inſtituted by St. Bruno, about the year 1084 (ſome ſay in 1080, and others in 1088), remarkable for the auſterity of their rule, which obliges them to a perpetual ſolitude; a total abſtinence from fleſh, even at the peril of their lives; and to feed on bread, water, and ſalt, one day in every week; and abſolute ſilence, except at certain ſtated times.

Their houſes were uſually built in deſarts, their fare coarſe, and their diſcipline ſevere. It is obſerved that the monaſtical piety is ſtill better preſerved in this, than in any of the other orders. M. l'Abbé de la Trappe, however, endeavours to ſhew, that the *Carthuſians* do not live up to the auſterity enjoined by the ancient ſtatutes of Guigues, their firſt general. M. Maſſon, general of the order, anſwers the Abbé; and ſhews that what he calls the ſtatutes, or conſtitutions of Guigues, are, in reality, only cuſtoms compiled by father Guigues; and that they did not become laws till long after. The word is formed from *Carthuſianus*, or *Carthuſienſis*, a denomination given them in Latin, from a village in Dauphiné called *Chartreuſe*, in Latin *Carthuſium*, *Carteſium*, as ſome ſay, where the firſt monaſtery of this kind was erected. Hence the French call the religious of this order *Chartreux*, and their convents *Chartreuſes*; an appellation which alſo appears to have anciently obtained in England; whence the name of that celebrated hoſpital, or rather college, in London, the Charter-houſe; by corruption from *Chartreuſe*.

The *Carthuſian* habit is all white within, their ſcapular being joined in the ſides by two pieces of the ſame ſtuff. They wore a hair ſhirt next their ſkin. Their prior and procurator, who may go abroad upon the neceſſary affairs of the houſe, appear in a black cloak down to the ground, and a black hood over the white one; the hood not round, but tapering to a point.

There are few nuns of this order. There have, however, been ſome female *Carthuſian* convents; but the increaſe of them was prohibited in 1368; and there remain only *five* at this day, *four* in France and one at Bruges in Flanders. They were brought into England by Henry II. about the year 1180, and had only nine houſes; their firſt houſe being at Witham, in Somerſetſhire.

CARTHUSIAN *powder*, *poudre de Chartreux*. See KERMES *mineral*.

CARTILAGE, in *Anatomy*, a ſmooth, ſolid, uniform, flexible, elaſtic part of an animal; ſofter than a bone, but harder than any other part.

Cartilages form to be nearly of the ſame nature with bones, and only to differ as more or leſs hard. There are ſome very hard, and which even become bony with time; as thoſe v.g. which form the ſternum. Others are ſofter, and ſerve to compoſe entire parts; as thoſe of the noſe, ears, &c. where an eaſy gentle motion is required; their natural elaſticity ſerving them inſtead of antagoniſt muſcles.

There are others ſofter ſtill, partaking of the nature of ligaments, and thence called *ligamentous cartilages*.

There are *cartilages* of various figures, acquiring various names from the things they reſemble: one is called *anomalous*, becauſe it reſembles a ring; another *ſcipoides*, from its reſembling the point of a dagger; a third *ſcutiformis*, becauſe made like a buckler; and ſo of the reſt. See each under its proper head.

Cartilages have no cavities for marrow; nor any membranes, or nerves, for ſenſation. Their uſes are to prevent the bones from being damaged or wounded by a continual friction; to join them together by a lynchondroſis; and to contribute, in great meaſure, to the well forming of ſeveral parts; as the noſe, ears, trachea, eyelids, &c.

Cartilages cover the extremities of bones joined together by moveable articulations, increaſe the volume of ſome of them after the manner of epiphyſes, unite others very cloſely together, and have no immediate adhetion or connexion with others. The *cartilages* which belong to the bones, differ from each other in fize, figure, ſituation, and uſe, and may all be ranked under two general heads; thoſe which are cloſely united to bones, and thoſe which are not immediately connected with them. The *cartilages* united to bones are of four kinds; ſome cover both ſides of the moveable articulations, and are very ſmooth and ſlippery; ſome unite the bones to each other, either ſo firmly as to allow no ſenſible motion, as in the ſymphyſis of the *oſſa pubis*, and ſtill more in that by which the epiphyſes are joined to the bones; or in ſuch manner as to allow of different motions, as in thoſe by which the bodies of the *vertebræ* are connected. The firſt eaſily grow hard, but the others appear in ſome degree yielding, and retain their flexibility.

Some increaſe the ſize and extent of bones, as the cartilaginous portions of almoſt all the true ribs: theſe are articulated with bones; others with *cartilages*, as the *ſpatum narium*; others ſerve only for borders, as thoſe of the baſis of the *ſcapula*, and of the *criſta* of the *oſſa ilium*, the *ſuperciſia* of cavities, and thoſe of the ſpinal and tranſverſe proceſſes of the *vertebræ*. Some, in fine, have a ſingular form, as thoſe of the ears, and moſt of thoſe of the noſe; in which laſt, their elaſticity appears moſt ſenſibly. The *cartilages* belonging to the ſecond general claſs, or thoſe not immediately joined to bones, are for the moſt part placed in the moveable joints; and theſe may likewiſe be ſubdivided into ſeveral kinds. Some lie altogether looſe, being neither joined to the articulated bones, nor to the *cartilages* which cover them, but ſlide freely between them in different directions; as thoſe which are placed in the articulation of the *tibia* with the *os femoris*; in that of the lower jaw with the *oſſa temporum*; and in that of the clavicle with the ſternum. Thoſe between the clavicle and acromium, and between the firſt and ſecond *vertebræ* of the neck, are of the ſame kind. Some are partly joined to other *cartilages*, and partly ſlide between the cartilaginous extremities of the articulated bones, as the *cartilage* at the lower extremity of the *radius*. There may alſo be reckoned among the *cartilages*, though not ſo properly, ſeveral of the ſmall ſeſamoide bones, which remain long cartilaginous; and alſo the cartilaginous portions of tendons, which do the ſame office with the ſeſamoide bones. Wiſlow.

It is commonly held, that all bones in their original were only *cartilages*, and arrived at the hardneſs of BONES by a gradual induration.

Hence it is, that in ſome caſes the *cartilages* themſelves have been found oſſified; of which a famous inſtance happened ſome years ago at Milan, where a malefactor was judged innocent, and ſaved, becauſe his *apparatoria* being turned bony, he was not ſuffocated by the hangman's rope.

CARTILAGES, *articulating*. See JOINT *Cartilages*.

CARTILAGINOUS *fiſhes*, thoſe, whoſe ſpine, or back-bone,

bone, is of the consistence of a cartilage, being hollow within, and containing medulla. See ITEM.

Cartilaginous fins, are of two kinds; flat, as the rais or skates; and long and round, as the *eels*, &c.

CARTILAGINOUS *leaf*, among *Botanists*. See LEAF.

CARTON, or, as we pronounce it, CARTOON, in *Painting*, a design, made on thick paper, to be afterwards calqued through, and transferred on the fresh plaster of a wall, to be painted in fresco.

The word, in the original French, signifies *thick paper*, or *pasteboard*.

CARTON is also used for a design coloured, for working in mosaic, tapestry, &c. The *Cartons* formerly preserved at Hampton-court, but now in the queen's palace at Buckingham-house, are designs of Raphael Urbin, intended for a tapestry. See Richardson, in his Essay on Painting; where he spends a great part of a chapter on the colouring of the *Cartons*.

CARTOUCH, a wooden case about three inches thick, got round with musin, and loaded with two, three, or four hundred musquet balls, besides six or eight balls of iron of a pound weight, to be fired out of a small sort of mortar, chiefly for the defence of a pass, or the like. The *cartouch* is also called by the French *gargouse*, *garbe*, *garbe*, or *garbage*.

In cannon of calcomacy, or other posts, which defend the passage of the dock, or the like, *cartouches* have a terrible effect: since, bursting asunder, they spread the shot they are loaden with far and wide. These are divers other forms and compositions of *cartou hes*, and is one made for grape.

CARTOUCH is also used for what is more frequently called a CARTRIDGE.

CARTOUCHE also denotes an ornament in architecture, sculpture, &c. representing a scroll of paper; being usually in form of a tablet, or flat member, with writings; wherein is some inscription, or device, ornament of armory, cypher, or the like.

It is nearly akin to a medallion, from which it only differs in this, that the latter is used under the cornice in the cave of a house, and the former in wainscotting within doors. Some workmen call the *cartouches* DENTILS.

The word is French, formed from the Italian *carteccia*, which signifies the same.

Cartouches are sometimes drawn on paper, as in the titles of maps, &c. and are sometimes made of stone, brick, plaster, wood, &c. for buildings.

CARTOUCHES, in *Heraldry*, a name given to a sort of oval shields, much used by the popes and secular princes in Italy, and others, both clergy and laity, for painting or engraving their arms on. Many suppose this form derogatory to the honour of the person; but though the square shield, with the rounded and pointed bottom, is more in use with us, as also with the French and Germans, yet this is supposed more truly the figure of the Roman shield worn by the soldiery, and therefore more ancient and honourable than either that or the indented shield of the Germans.

CARTRIDGE, in the *Military Art*, the charge or load of a fire-arm, wrapped up in a thick paper, paste-board, or parchment; to be the more readily charged, or conveyed into the piece.

Cartridges are the same with what the French call *cartouche*; from which word Skinner scruples not to derive *cartridge*.

Those of cannon and mortars are usually in cases of pasteboard, or tin, sometimes of wood, half a foot long; taking up the place of the bullet in the piece, to whose caliber the diameter is proportioned. Those of musketers, pistols, and small arms, only contain the charge of powder, with a ball wrapped up in a thick paper.

Flannel *cartridges* are now preferred, because they do not retain the fire, and sure therefore less liable to accidents in loading. A parchment cap is made to cover them, in order to prevent the dust of powder from passing through them, which is taken off before they are put into the piece. Mr. Muller recommends for this purpose to boil the flannel in fize. In quick firing, the shot is fixed to the *cartridge* by means of a wooden bottom, hollowed on one side, so as to receive nearly half the shot, which is fastened to it by two small slips of tin crossing over the shot, and nailed to the bottom; and the *cartridge* is tied to the other end of this bottom. They are fixed likewise in the same manner to the bottoms of the grape-shot, which are used in field-pieces. Syst. of Math. &c. vol. v. p. 291.

CARTRIDGE-*box*, a wooden or iron case, covered with leather, holding a dozen or more musket *cartridges*, borne by the soldier on his belt, hanging a little below the right pocket-hole.

CARVA, in *Botany*, a name given by the Indians to one of the kinds of cinnamon-tree. This is of all others the most esteemed among them, and serves for the most purposes. They extract camphor and a liquid oil from the leaves; they extract oil of cinnamon from the bark; and from the leaves they make another oil, which is called oil of cloves, and sold as such. The fruit yields them an oil resembling that of juniper, and afterwards they extract from them a thick, fat substance, like wax, serving them for the making of unguents and plasters, and also for the making of their candles.

CARVAGE, *carvagium*, the same with CARUCAGE.

Henry III. is said to have taken *carvages*, that is, two marks of silver of every knight's fee, to marry the marriage of his sister Isabella to the emperor.

Carvage could only be imposed on the tenants *in capite*.

CARVAGE also denotes a privilege whereby a man is exempted from the service of *carvage*.

CARUCATARIUS, in *Ancient Law Books*, he that held land by CARUCATE, or by plough tenure.

CARUCATE. See CARUCATA.

CARVER, a cutter of figures or other devices in wood. See CARVING.

Carvers answer to what the Romans called *sculptores*, who were different from *scalptores*, or engravers, as these last wrought in metal.

CARVER is also an officer of the table, whose business is to cut up the meat, and distribute it to the guests.

The word is formed from the Latin *carpere*, which signifies the same. The Romans also called him *carpi*, sometimes *scissor*, *sindonis mundior*, and *structor*.

In the great families at Rome, the *carver* was an officer of some figure. There were masters to teach them the art regularly, by means of figures of animals cut in wood. The Greeks also had their *carvers*, called *tarsiæ*, q. d. *dexterous*, or *dispatchers*. In the primitive times, the master of the feast carved for all his guests. Thus in Homer, when Agamemnon's ambassadors were entertained at Achilles's table, the hero himself carved the meat. Of later times, the same office on solemn occasions was executed by some of the chief men of Sparta. Some derive the custom of distributing to every guest his portion, from those early ages when the Greeks first left off feeding on acorns, and learned the use of corn. The new diet was to great a delicacy, that to prevent the guests from quarrelling about it, it was found necessary to make a fair distribution. Athen. Deipn. lib. i. cap. 10. Potter. Arch. lib. iv. cap. 10.

CARVING, in a general sense, the art or act of cutting or fashioning a hard body by means of some sharp instrument, especially a chissel.

In which sense, *carving* includes statuary and engraving, as well as cutting in wood.

CARVING, in a more particular sense, is the art of engraving or cutting figures in wood.

In this sense, *carving*, according to *Pliny*, is prior both to statuary and painting. See CUTTING *in wood*.

CARVIST, in *Falconry*. See FALCON.

CARUM, in *Botany*. See CARAWAY.

CARUNCULA, CARUNCLE, a term in *Anatomy*, properly signifying a little piece of flesh, being a diminutive of the latin *caro*, *flesh*.

The name *carunculæ* is applied to several parts of the body; as,

CARUNCULÆ *cutaneæ alæ*, a name which some anatomists give the NYMPHÆ.

CARUNCULÆ *lachrymales*, are two little eminences, one in each great canthus, or corner of the EYE; separating the two *puncta lachrymalia*.

Some retain the appellation *lachrymalis* to the *caruncula* in the greater, or inner canthus; calling that in the lesser canthus *innominata*.

Some have given the name *caruncula* to that pendant fleshy part called UVULA, or *columella*.

CARUNCULA is also applied to certain fleshy morsels preternaturally contained in divers parts and humours of the body. We sometimes meet with capillary *carunculæ* excreted with the urine. See TRICHIASIS.

To the head of *caruncinlæ* also belong those fleshy excrescences called *polypusses*. See POLYPUS.

CARUNCULÆ *myrtiformes*, in *Anatomy*, are four little *caruncles*, or fleshy knobs, about the size of myrtle-berries, whence their name; found adjoining to, or rather in the place of the HYMEN, in the parts of generation in women.

Some suppose them to be largest in maids, and to grow less and less by the use of venery; but others, with more probability, make them the consequences of venery in the first copulation; deriving them from the broken membrane of the *hymen*, whose fragments shrunk up they appear to be.

CARUNCULÆ *papillares*, or *mamillares*, are little protuberances in the infide of the *pelvis* of the KIDNEYS, made by the extremities of the tubes which bring the serum from the glands in the exterior parts, to the *pelvis*.

They were firſt diſcovered by Carpus; and thus called, from their reſembling a little teat or pap. They are in form of acorns heads, and are leſs red than the fleſh, as well as harder than the ſame. They are about the bigneſs of a pea, but larger at top than at bottom; ending, as it were, in a point, in the place where they are perforated to let the urine fall into the *penis*.

CARUNCULÆ URETHRÆ. See BOUGIE and *Medicinal* CANDLES.

CARUS, *Kapos*, in *Medicine*, a ſpecies of lethargic diſeaſe, conſiſting in a profound ſleep, with a ſudden deprivation of ſenſation and motion, and an acute fever.

The *carus* differs from *coma* in this, that the patient, in the latter, anſwers when interrogated; but not in the former: from a lethargy it is diſtinguiſhed by the fever which attends it, which the lethargy is free from; and by the return of ſenſation, which the lethargic perſon finds when agitated or pricked: from a proper apoplexy, by the freedom of reſpiration, which is always hurt in an apoplexy: from an epilepſy, in that there is no motion or froth at the mouth in the *carus*: from a ſyncope, by the pulſe, which is high, and the face ruddy; whereas the pulſe is low, and the face cadaverous, in the ſyncope: from an hyſteric ſuffocation, in that the patient hears and remembers things in the latter, not in the former.

CARYATES, in *Antiquity*, a feſtival in honour of Diana, ſurnamed Caryatis, held at Caryum, a city of Laconia. The chief ceremony was a certain dance, ſaid to have been invented by Caſtor and Pollux, and performed by the virgins of the place.

During Xerxes's invaſion, the Lacedæmonians not daring to appear and celebrate the cuſtomary ſolemnity, to prevent incurring the anger of the goddeſs by ſuch an intermiſſion, the neighbouring ſwains are ſaid to have aſſembled and ſung paſtorals, or *bucoliſts*, which is ſaid to have been the origin of bucolic poetry.

CARYATIDES, or CARIATES, in *Architecture*, a kind of order of columns, or pilaſters, under the figure of women, dreſſed in long robes, ſerving to ſupport entablatures. See *Tab. Archit. fig.* 38.

The origin of the *Caryatides* is related by Vitruvius: the Greeks, he obſerves, having taken the city *Carya*, led away their women captives; and to perpetuate their ſervitude, repreſented them in their buildings as charged with burdens, ſuch as thoſe ſupported by columns.

Though this order, as many call it, differs from the general ſimplicity and plainneſs of the ancients, it is, nevertheleſs, introduced in many of their buildings: the temple of Erichtheus, at Athens, affords a beautiful inſtance.

The *Caryatides*, M. le Clere obſerves, are not now repreſented as among the ancients, viz. as ſymbols of ſlavery, with hands tied before and behind; thoſe characters being ſuppoſed to be injurious to the fair ſex. Among us, they are repreſented as images of juſtice, prudence, temperance, &c. Their legs are always to be cloſe to each other, and even acroſs; their arms are laid flat to the body, or to the head, or at leaſt as little ſpread as poſſible; that as they do the office of columns, they muſt have, as near as poſſible, the figure thereof. Sometimes their arms are cut off, for the greater delicacy; as in the hall of the Swiſs guards in the Louvre: but M. le Clere does not approve ſuch mutilations.

When inſulated, they ſhould never have any great weight to ſupport; and their entablature and podeſtal are ordinarily to be Ionic.—When they join to a wall, &c. it is adviſeable to put a conſole over them, which may appear to ſuſtain the weight of their entablature: otherwiſe, as they repreſent women, they do not ſeem ſo proper to ſuſtain great loads.—When they are made in form of angels, the ſame author would have them ſupport the entablature, which in that caſe is to be Corinthian, with their hands.

The ancients made the *Caryatides* frequently to ſupport baſkets, or corbeils of flowers; and theſe they called CANEPHORÆ; or *ciſtiferæ*.

CARYOCATACTES, in *Ornithology*, the name of a bird of the magpye kind, of a browniſh colour, all over beautifully variegated with white triangular ſpots, and very full of white feathers about the anus and origin of the tail. It is common in the mountainous parts of Germany.

CARYOCOSTYNUM, in *Pharmacy*, a kind of purging electary, the two principal ingredients of which, that give the denomination to the whole, are cloves, and coſtus. It works briſkly, and fetches the humours from the moſt remote parts: whence, and by reaſon of its warmth, it is preſcribed againſt rheumatic, arthritic, hydropic, paralytic, &c. diſorders.

CARYOPHYLLATA, *avens*, in *Botany*. See HERB *Bennet*.

CARYOPHYLLEOUS, in *Botany*, a term uſed by Mr. Tournefort to expreſs a ſort of flowers of the pink kind, or reſembling the pink-flowers in ſhape. Theſe are compoſed of ſeveral petals diſpoſed in an orbicular form, and riſe from the bottom of the cup as from a ſort of tube. See *Tab.* IX. *of Botany, Claſs* 8.

CARYOPHYLLON *Pimis*, the fruit of the *roſſa caryophyllata*, or cloveberry-tree, whoſe bark is uſed in medicine.

CARYOPHYLLUS, the CLOVE.

CARYOPHYLLUS *aromaticus*, in *Botany*, the *clove-ſpice*. See CLOVE-*tree*.

CARYOPHYLLUS *marinus*, a name given by Dr. Woodward to a foſſile *mycetites*, or corallioide body found in ſeveral parts of Germany.

CARYOTA, in *Botany*, the name of a genus of plants deſcribed by the author of the Hortus Malabaricus, under the name of *ſchunda-pana*, and belonging to the *polygamia* of Linnæus. The characters are theſe: it produces male and female flowers in the ſame ear; the male flowers have for their cup the whole compound ſpatha: the flower is divided into three parts, and the petals are very ſmall and ſharp-pointed; the germen of the piſtil is roundiſh, the ſtyle is pointed, and the ſtigma ſimple; the fruit is a roundiſh berry, containing only one cell, in which are contained two large and oblong ſeeds, which are cylindric or rounded on one ſide, and flatted on the other.

CARYSTIUM *linum*. See LINUM *caryſtium*.

CARYSTIUM *marmor*. See MARMOR.

CARYUS, in the *Materia Medica*, a name given by Dioſcorides, and ſome other of the ancient Greeks, to the *eryngium*, or ſea-holly, called by us *eryngo*. It was thus named from its having a ſmall head or cluſter of flowers like a walnut. See ERYNGIUM.

CASA, in *Antient* and *Middle Age Writers*, is uſed to denote a cottage or houſe.

CASA *Santa*, denotes the chapel of the Holy Virgin at Loretto.

The *Santa Caſa* is properly the houſe, or rather chamber, in which the bleſſed Virgin is ſaid to have been born, where ſhe was betrothed to her ſpouſe Joſeph, where the angel ſaluted her, the Holy Ghoſt overſhadowed her, and, by conſequence, where the ſon of God was conceived or incarnated.

Of this building the catholics tell many wonderful ſtories, too childiſh to tranſcribe.

The *Santa Caſa*, or holy chamber, conſiſts of one room, forty-four ſpans long, eighteen broad, and twenty-three high. Over the chimney, in a niche, ſtands the image called the great *Madonna*, or Lady, four feet high, made of cedar, and, as they ſay, wrought by St. Luke, who was a carver as well as a phyſician. The mantle or robe ſhe has on is covered with innumerable jewels of ineſtimable value. She has a crown, given her by Lewis XIII. of France, and a little crown for her ſon.

CASCABLE, the knob or button of metal behind the breech of a CANNON, as a ſort of handle whereby to elevate and direct the piece: to which ſome add the fillet and ogee as far as the baſe-ring. See *Tab. Gunnery, fig.* 1.

The neck of the *caſcable* is the part which joins it to the breech-mouldings; its diameter is $\frac{1}{4}$ of a calibre; that of the button ſomething more than a calibre. The length of the *caſcable* is always two calibres and a quarter. They are made of various figures, ſometimes like a bunch of grapes, or like the heads of different kinds of animals. The French diſtinguiſh their calibres by the different forms of their *caſcables*; in England they are made with a button and a few breech-mouldings.

CASCADE, a ſteep fall of water from a higher into a lower place.

The word is French, formed of the Italian *caſcata*, which ſignifies the ſame; of *caſcare, to fall*; and that from the Latin *cadere*.

Caſcades are either natural, as that of Tivoli, &c. or artificial, as thoſe of Verſailles, &c. and either falling with a gentle deſcent, as thoſe of the Sceaux; in form of a buffet, as at Thiaucn; or down ſteps, in form of a cafcade, as at St. Cloud; or from baſon to baſon, &c.

A natural *caſcade*, falling with a great noiſe, is more properly called a CATARACT.

CASCANS, or CASCANES, in *Fortification*, are holes and cavities in form of wells, made in the terreplein, near a rampart; from whence a gallery dug in like manner, under ground, is conveyed, to give air to the enemies mine.

CASCARILLA, a name by which ſome authors have called the Jeſuit's bark: the *quinquina*, or *china-china*, of other writers: but more generally applied to the *thuſſac-rio*. See THUS *Judaicum*.

CASE, ſometimes denotes a veſſel, or receptacle in form of a tomb, commonly decorated with gold and ſilver, wherein the body of a ſaint, or ſome RELICS of it, are preſerved.

In which ſenſe, the word is formed from the French *chaſſe*.

Originally theſe *caſes* were made in the figure of little Gothic churches, purſuant to that ancient Chriſtian maxim, that the ſaints having been the living temple of the Holy Ghoſt, are entitled, after their death, to have their bones incloſed in the figure of the viſible houſe of God.

The *caſe* of St. Genevieve is never brought down without great ceremony, nor except in time of extreme publick dangers or calamities.

CASE, in *Grammar*, is underſtood of the different inflexions or terminations of nouns, ſerving to expreſs the different ſtates or relations they bear to each other, and to the things they repreſent. For the reaſon of the name, ſee DECLENSION.

There is a great diverſity among grammarians, with regard to the nature and number of *caſes*: they generally find ſix *caſes* even in moſt of the modern languages, which they call the *Nominative*, *Genitive*, *Dative*, *Accuſative*, *Vocative*, and *Ablative*: but this ſeems only in compliance with their own ideas, which are formed on the Greek or Latin, and which they tranſfer to other languages.

The truth is, if, by *caſe*, be only meant an occaſional change in the termination of a noun, or name, which ſeems to be the juſt idea of *caſe*; there will, in this ſenſe, be juſt as many *caſes* as there are different terminations of nouns in the ſame number, i. e. in ſome languages more, in others leſs, and in others none at all.

Indeed, the generality of authors either have not any preciſe notion of *caſes* at all, or they wander ſtrangely from that notion: for they always reckon five *caſes* of nouns in the Greek, and ſix in the Latin: though ſeveral of theſe *caſes* be frequently alike, as the genitive and dative ſingular, of the firſt declenſion of the Latin; the dative and ablative plural of the ſecond, &c. the genitive and dative dual of the Greek, &c. So that the termination is not the ſole criterion of the *caſe*.

It ſeems, however, much more agreeable to the principles of grammar, which only conſiders words materially, to make as many different *caſes*, as there are changes in the terminations of a name; which would free the Engliſh, and other modern tongues, from the embarraſſment of *caſes*; moſt of them expreſſing the various relations, not by changes in termination, as the ancients; but by the ſituation of the ſubſtantive, as in the nominative and accuſative caſes, or by the appoſition of articles and prepoſitions. On this footing it is certainly wrong to ſay, *of a father*, is the genitive *caſe* of father; and *to a father*, the dative; for *of* and *to* are no part of the noun *father*: they are no cloſes or terminations, but articles or modificatives, which ſhew the different relation of the word *father*. And the ſame may be ſaid of the *caſes* of nouns in the French, Italian, Spaniſh, Portugueſe tongues, &c. Neverthelefs, the relation of poſſeſſion, which anſwers to the genitive *caſe* is often expreſſed by a different termination of the ſubſtantive: as "God's grace," or, as it was formerly written, "Godis grace," the grace of God. So that the Engliſh ſubſtantives may be conſidered as having two terminations for *caſes*; that of the nominative, and that of the genitive or poſſeſſive *caſe*. In this reſpect it bears ſome reſemblance to the German, which is probably derived from the ſame Teutonic original.

But it is otherwiſe in the Greek name πατηρ, or the Latin *pater*; which are real *caſes* of the words πατερ, and *pater*, and different from thoſe words: and ſomewhat like this may be ſaid of the Hebrew, Arabic, Armenian, Poliſh, and German languages; which in the ſame number admit of changes, in the terminations of words: and yet in theſe languages, *caſes* are different from what they are in the Greek and Latin. The Hebrew nouns, for inſtance, are not properly declined by *caſes*; the relation expreſſed by the genitive *caſe*, it is true, occaſions an alteration in them; but then this alteration, inſtead of being in the noun governed, as in the Latin, in the Hebrew is in that which governs; as רכב שקר, *verbum ſubſtantive* where the change is not in שקר, *falſitas*, but in רכב for רכב, *verbum*.

It muſt be obſerved, however, that though many of the languages have not properly any *caſes* of nouns; yet moſt, if not all of them, have a kind of *caſes* in their pronouns, without which it would be hard to conceive the connexion, or ſyntax, of a diſcourſe; and which, therefore, make a neceſſary part of grammar; thus, in Engliſh, *I* and *we*; and in French, *Je* and *nous*. See the relations expreſſed by each *caſe*, under its proper head, NOMINATIVE, GENITIVE, DATIVE, &c.

CASE, in *Printing*, a large, flat, oblong frame, placed aſlope, divided into ſeveral compartments, or little ſquare cells; in each of which are lodged a number of types, or letters of the ſame kind: whence the compoſitor takes them out, each as he needs it, to compoſe, and make a page, or form.

A frame of *caſes*, in printing, uſually conſiſts of two pair, viz. an upper and lower, Roman and Italic. A ſhallow *caſe* ſhews the letter baſe, as being the leaſt ſhadowed by the ſides of the boxes. A deep *caſe* has the advantage of holding a great number of letters, ſo that the compoſitor need not diſtribute ſo often.

They ſay, *a caſe*, or rather *pair of caſes*, of Greek, of Hebrew, of Pica, &c.

CASE of a ſilk-worm, is a lodge framed within its web, wherein to depoſit its *ova*.

CASE is alſo uſed for a certain numerous quantity of divers things: a *caſe* of piſtols implies a brace; a *caſe* of glaſs, &c. See GLASS.

CASE is alſo uſed for a frame ſurrounding a door, window, or the like. In which ſenſe we ſay a *door-caſe*, *window-caſe*, &c.

CASE, *action upon the*, in *Law*. See ACTION.

CASE, *ſpecial*, in *Law*, relates to a kind of ſpecial verdict in which the jury generally find a verdict for the plaintiff, but ſubject nevertheleſs to the opinion of the judge or the court above, on a *ſpecial caſe* ſtated by the counſel on both ſides with regard to a matter of law.

CASE *ſtated out of Chancery*, reſpects a queſtion of law in the proceſs of any cauſe referred by this court to the opinion of the judges of the court of King's Bench; before whom it is heard, and who certify their opinion to the chancellor in order to a decree.

CASE-HARDENING, a method of preparing iron, ſo as to render its outer ſurface hard, and capable of reſiſting the file, or any edged tool. It is uſed by file-cutters for caſtle files; by gun-ſmiths, to harden the barrels of guns; and by others, on other occaſions.

The proceſs of *caſe-hardening*, which is no other than a ſuperficial converſion of iron into ſteel, depends on the cementation of it with vegetable or animal coals. See HARDENING and STEEL.

CASE-SHOT, are muſquet-balls, ſtones, old pieces of iron, or the like, put up into *caſes*, and ſo ſhot out of great guns.

Caſe-ſhot is chiefly uſed at ſea, to clear the enemies decks when they are full of men.

CASEI *di cavallo*, the name of a peculiar cheeſe, famous in Italy and many other places, and made of the milk of the female buffalo, that ſpecies being as commonly tamed and kept there as the ox and beiſer with us.

CASEMATE, or CASEMENT, in *Architecture*, the ſame with *cavetto*, denotes a hollow MOULDING, which ſome architects make one fifth of a circle, and others one fourth.

CASEMATE, or CAZEMATE, in *Fortification*. See CAZEMATE.

CASEMENT, is uſed in building for a little moveable window uſually within a larger, being made to open or turn on hinges. We ſay, a ſingle *caſement*; a folding *caſement*; a *caſement* with a lock, with a turn-about or turn-buckle; a *caſement* with a cockſpur or pull-back at the hand-hole, whereby with to ſhew it to.

CASEOUS, ſomething that partakes of the nature or qualities of CHEESE.

MILK conſiſts of a *caſeous*, a butyrous, and a ſerous part. Whey, according to ſome naturaliſts, is formed of the *caſeous* parts of the juices of plants, ſeparated by the bees from the ſerous parts, which make the HONEY. Phil. Trans. N° 234. p. 368.

Cataracts are by ſome divided into milky, and *caſeous*, differing only in the degree of hardneſs or conſiſtence.

Konig gives a caſe of a *caſeous* EMPYEMA.

CASERNS, or CAZERNS, in *Fortification*, little rooms, or huts, erected between the ramparts, and the houſes of fortified towns, or even on the ramparts themſelves: to ſerve as lodgings for the ſoldiers of the garriſon, to eaſe the garriſon.

There are uſually two beds in each *caſern*, for ſix ſoldiers to lie, who mount the guard alternately; the third part being always on duty.

CASES *reſerved*, in the *Romiſh Polity*, are conſiderable ſins the abſolution of which *is reſerved* by the ſuperiors to themſelves, or their vicars.

There are ſome *caſes reſerved* by the pope, and others by the biſhops: in convents ſome are *reſerved* by the chapters, &c. None but theſe, or their vicars, can abſolve in ſuch *caſes*, except at the article of death, when all *reſerved caſes* are abſolvable, by the ordinary.

CASH, in *Commerce*, the ſtock or ready money, which a merchant, or other perſon, has *in his preſent* diſpoſal, to negotiate; ſo called from the French term, *caiſſe*, i. e. *cheſt*, or *coffer*, for the keeping of money.

M. Savary ſhews, that the management of the *caſh* of a company, is the moſt conſiderable article; and that wherein its good or ill ſucceſs chiefly depends.

CASH-

CASH-book. See BOOK.

CASHEW-Nut. See ACAJOU and ANACARDIUM.

CASHIER, *the cash-keeper*; he who is charged with the receiving and paying the sums of a society.

In the generality of foundations, the *cashier* is called *treasurer*.

CASHIERS *of the Bank*, are officers who sign the notes that are issued out, examine and mark them when returned for payment, &c.

CASHOO, a medicinal and aromatic drug, which is frequent among perfumers. All that has yet been advanced about the origin and composition of this drug, is entirely fabulous. What follows will sufficiently acquaint physicians, apothecaries, and druggists with what they ought to know of it. *Cashoo* is extracted from a tree which is called *cotes* in the country where it grows, which is a province of Indostan called Behar, the capital of which is Patna. This province, which is crossed by the famous river Ganges, lies a hundred leagues above the kingdom of Bengal. *Cashoo* is properly an extract made by a decoction and maceration of the several parts of this tree, and rendered solid by evaporation. There are two sorts of simple *cashoo*, the rough, and the purified or refined; the latter is a composition of purified *cashoo*, mixed with aromatic drugs, and made into lozenges. This *cashoo* is made for the use of the Indians, who chew it either alone, or mixed with pinang or areca. Rough *cashoo* is a commodity which is brought down the Ganges as far as Bengal; whence it is distributed throughout the Indies, where there is a great consumption of it; and to the Europeans, who send it into Europe. What is sent into Europe, however, is mostly purified: for *cashoo* is not used rough any where.

Cashoo is much valued in medicine: among other effects ascribed to it, is the stopping of a cough, and strengthening the stomach; beside which it sweetens the breath, when being reduced to an impalpable powder, mixed with ambergrise, and mucilages of gum adragant, it is made into pastils. *Cashoo* must be chosen of a tanned red on the outside, of a bright red within, very shining, and not burnt. Kæmpfer observes, that they prepare at Odowara perfumed *cashoo*, of which they make pills, small idols, *flowers*, and other figures, which they put into little boxes for sale. The women are very fond of it, and use a great deal of it, because it fastens the teeth, &c. The thickened juice is carried to Japan, by the Dutch and Chinese; and after it has been prepared at Macao, or at Odowara, they buy it again, and carry it to other places.

CASI, in the *Persian Policy*, one of the two judges under the nadab, who decide all religious matters, grant all divorces, and are present at all public acts; having deputies in all cities of the kingdom.

CASIA, in *Botany*, the name of a genus of plants, of which there are two species: 1. The Montpelier poetic *cassia*, called the berry-bearing shrub *syrian*. See PONT. *cassia*. 2. The tall myrtle-leaved Spanish *cassia*.

CASING, among *Hunters*, denotes the stripping off the skin of a hare, fox, or badger. They say, *flay* a deer, *case* a hare, and all sorts of vermin. This is done by beginning at the snout or nose of the beast, and so turning his skin over his ears down to the body, and the very tail.

CASING *of Timber-work*, is the plastering of a wooden house all over on the outside with mortar, and striking it, yet wet, by a ruler, with the corner of a trowel, or the like instrument, to make it resemble the joints of freestone: by which means, the whole house appears as if built thereof. It is best done on heart-laths, because the mortar is apt to decay the sap-laths in a short time. It is commonly laid on at two thicknesses, the second before the first is dry.

CASINGS, a country word for cow-dung dried, and used as fewel.

CASK, a piece of defensive armour, wherewith to cover the head and neck; otherwise called *helmet*, and *head-piece*. The word is French, *casque*, formed from *casseau*, or *casseret*, a diminutive of *casse*, *a helmet*.

Le Gendre observes, that anciently, in France, the *gens d'armes* all wore *casks*. The king wore a *casque* gilt; the dukes and counts, silvered; gentlemen of extraction wore them of polished steel; and the rest of plain iron.

The *casque* is frequently seen on ancient medals; where we may observe great varieties in the form and fashion thereof; as the Greek fashion, the Roman fashion, &c. F. Joubert makes it the most ancient of all coverings of the head, as well as the most universal: kings, emperors, and even gods themselves, were figured therewith. That which covers the head of Rome, has usually two wings, like those of Mercury: and that of some kings is furnished with horns, like those of Jupiter Ammon; and sometimes barely bulls or rams horns, to express his common force.

CASK, in *Heraldry*, the same with helmet.

CASK is also used as a common name for VESSELS of divers kinds; in contradistinction from the liquor, or other matter contained therein.

Thus a hogshead of spirits, &c. is said to weigh 4 C. 1 and 22 *lb. cask* and liquor; a puncheon, 6 C. 3 and 2 *lb. cask* and liquor. See TUN, &c.

CASK *of Sugar*, is a barrel of that commodity, containing from eight to eleven hundred weight. A *cask* of almonds is about three hundred weight.

No one shall transport any wine *casks*, &c. except for victualling ships, under a certain penalty, by 35 Eliz.

CASKET, in a general sense, a little coffer, or CABINET.

CASKETS, in *Sea-language*, are small ropes made of lines, and fastened to gromets, or little rings upon the yards; their use is to make fast the sail to the yard when it is to be furled.

CASKETS, *bread*, are the longest and highest of these, or those in the midst of the yard, between the ties.

CASLEU, in the *Hebrew Chronology*. See CISLEU.

CASPARGUS, in *Ichthyology*, a name given by Salvian, from Ælian, to the fish commonly called by authors, *sparus*, and by the Italians, *spara*. It is distinguished by Artedi by the name of the plain yellowish SPARUS, with a large annular spot near the tail.

CASQUE, in *Natural History*, a name given to a kind of murex, called the helmet-shell. There are several species of this shell, and they all approach somewhat to a triangular figure, and are smoother than the other murexes; yet they have all a sort of tubercles near the lip.

CASSADA, or CASSAVA, *Jatropha*, in *Botany*, a genus of the *monœcia monadelphia* class. Its characters are these: it hath male and female flowers on the same plant; the male flowers are salver-shaped, of one petal, whose brim is cut into five roundish segments which spread open: they have ten awl-shaped stamina, five alternately shorter than the other; the female flowers which are situated in the same umbel, have five petals spreading open like a rose; in the centre is a roundish germen with three deep furrows, which afterward becomes a roundish capsule with three cells, each containing one seed. There are eight species.

All these plants are natives of the warm parts of America, so are too tender to thrive in the open air in England. The first sort is cultivated in the West Indies for food; where it is propagated by cutting the stalks into lengths of seven or eight inches, which take root when planted.

They plant this shrub in new grounds designed for cacao walks, not only because they are absolutely necessary for a planter as food for his negroes; but also to prevent the growing of weeds, and to shade the young cacao plants as they come up, which would not otherwise be able to bear the excessive heat of the sun: for which reason they delay planting the cacao nuts until the *cassada* shrub be grown high enough to shade them.

They generally take up the *cassava* roots within a year or thereabout after planting: at the foot of every shrub are found several roots, of a fleshy substance, without any sensible fibres. They wash these roots well in water, and having scraped them as we do carrots, they rasp them with large copper rasps. The raspings are afterward put into a bag made of coarse cloth or rushes, and placed under a press, to express all the moisture, which is hurtful to animals, and even poisonous: they then dry the remaining matter over the fire, and when it is sufficiently dressed, they make it into cakes, which being dried either in the *sun*, or by artificial heat, are the *cassada* bread; which is very nourishing, and will keep without moulding, as well as biscuit.

The use of it is apt to contract the throat, if eaten dry, and sometimes brings on a danger of choaking; the best method is to moisten it in broth, or otherwise, before it is eaten, or else to have a bottle of water at hand to wash down every mouthful.

The juice expressed in preparing this root for bread, will kill any animal that drinks it crude: but it may be boiled over the fire till a great part is evaporated, and the remainder, if it be far evaporated, will be sweet, and serve in the place of honey; if less evaporated, and set by to ferment, it will make a very good and wholesome vinegar. The juice of the roucou or ANNOTTO is said to be a counter-poison for it.

The thicker cakes of *cassada* bread are eaten by the poorer sort: the thinner, called *farina*, are eaten by the rich. There is a kind of it which may be eaten raw, and which is now getting into use; instead of the other, which is a speedy poison, if eaten with its juice.

CASSAMUNAIR, or CASSUMUNIAR, in *Medicine*, an aromatic vegetable drug, brought from the East Indies, highly valued as a nervine and stomachic, and reputed a specific

ſpecific in epileptic and convulſive diſeaſes. It is ſuppoſed by ſome to be a ſpecies of galangal, by others of zedoary: its true name is not known, that of *caſſumunar* being apparently feigned to hide it: of late it has been imported by the name of *temptic*.

CASSANDRA, in *Natural Hiſtory*, a name given by ſeveral authors to a very elegant fea-ſhell of the *conchæ perſicæ*, or *nucleus* kind, more uſually known under the name of the LYRA, or harp-ſhell. It is ſuppoſed to be called *caſſandra*, becauſe of its being found on the ſhores of the iſland of Caſſia. There are three ſpecies of it.

CASSAON, in *Ichthyology*, the name of a ſmall fiſh of the ſhark kind, but leſs miſchievous, called CUCUAS by the Braſilians.

CASSATION, in the *Civil Law*, the act of abrogating, or annulling any act or procedure.

The word comes from the Latin *caſſare*, *to quaſh*, or *make void*.

The occaſions of *caſſation* are, 1ſt, when a decree is directly contrary to another decree; and both againſt the ſame party: 2dly, When decrees are directly contrary to the expreſs diction of ſtatutes or cuſtoms: 3dly, When the formalities preſcribed by the laws have not been obſerved.

CASSETTES, or CASSINS, in the *Manufacture of China Ware*, are veſſels made of Stourbridge or other good potter's clay with a third of ſand, in which the China ware is baked. They are generally made of a round form, with a flat bottom. They are either turned or formed in a mould. See PORCELAIN.

CASSIA, *wild ſenna*, in *Medicine* and *Pharmacy*, a purgative fruit, brought from the Eaſt, being the produce of a tree of the ſame name, called in Engliſh the *pudding-pipe-tree*.

This is ſometimes more particularly denominated *caſſia fiſtularis*, *wild ſenna*, or *pipes*, by way of diſtinction from another thing called *caſſia lignea*.

It is a genus of the *decandria monogynia* claſs. Its characters are theſe: the flower hath five roundiſh concave petals, which ſpread open; it hath ten declining ſtamina, of which three of the lower are long, and three upper ſhorter; the ſummits of the three lower are large, arched, hooked, and ſeparated at their points. In the centre is ſituated a long taper germen, which afterward becomes a long pod, divided by tranſverſe partitions, each containing one or two roundiſh ſeeds, faſtened to the margin of the upper valve. Miller enumerates fifteen ſpecies.

There are four kinds of *caſſia*, alike in properties, and nearly in figure; being all in long black pods: but very different, if conſidered with regard to the trees that produce them. Theſe are, the *caſſia* of the Levant, that of Egypt, that of Braſil, and that of the Antilles iſlands.

CASSIA *of the Levant*, is the fruit of a very high tree, whoſe bark is aſh-coloured, its wood very fine, and its grain cloſe; towards the centre, its wood is of an ebony black, towards the circumference yelloviſh; its flowers are yellowiſh, and produce a fruit in form of a long pod, ſoldered and mailive; of a reddiſh colour, bordering on black. When ripe, it is full of a black, ſweetiſh pulp, divided by little woody cells: in this pulp are found little hard grains, in manner of ſtones, ſhaped like hearts, which are the ſeeds of the tree. This *caſſia* muſt be choſen new, in large pods, heavy, and of a fine colour; the bark, when broken, fine and white within, full of a black ſoft pulp of a ſweetiſh taſte.

CASSIA *of Egypt*, is like that of the Levant, except that the tree is higher, and the leaves narrower; the fruit ſmaller, and the bark ſofter.

CASSIA *of Braſil*, is the largeſt of all: ſome of the pods are found four or five inches in circumference. This kind is not very common in the ſhops.

CASSIA *of the Iſlands*, is that now chiefly uſed; though heretofore the popular *caſſia* was the Lenitive. It is ſent from the Antilles, where it is produced in ſuch abundance, that the veſſels, in their home voyages, uſe it as ballaſt; whence it is, that we find it ſo often foul and dirty: the tree that yields it reſembles a peach-tree. Its flowers, which are yellow, grow in cluſters; and, as they decay, leave behind them a fruit or pod an inch thick, and a foot (ſometimes two) long. The fruit, while in its growth, is green; when ripe, it becomes of a dark violet colour. It is choſen in the ſame manner as that of the Levant.

When the pod is entire, and the pulp not yet taken out, it is moſt properly called *caſſia fiſtularis*, or *caſſia in the cane*. For uſe, the pulp is taken out, and driven through a hair ſieve. The apothecaries have little of the better kind, but what is old, and boiled up with ſugar, to make it keep.

Caſſia, when green, as alſo the flowers of the *caſſia*-tree, are candied in the Levant, and the iſlands; and have almoſt the ſame effects of the common *caſſia*, which is the baſis of moſt of the purgative electuaries.

CASSIA, *the tincture of*, is a light infuſion of the pulp with the ſeed.

CASSIA, *the extract of*, is nothing but the pulp ſeparated from the ſhell and the ſeeds; with the addition of a certain quantity of ſugar, to preſerve it from turning ſour. Officinal preparations from *caſſia*, are, the *caſſia extracta cum tel. & ſine ſenna*; and the *confectio ex caſſia*.

CASSIA *Caryophyllata*. See CLOVE-tree.

CASSIA *Lignea*, or XYLOCASSIA, is the bark of a tree much like that which bears the cinnamon; growing promiſcuouſly with it in the iſland of Ceylon, but more properly the cinnamon of Sumatra, Java, and Malabar. Phil. Tranſ. vol. xlviii. p. 381.

The ancients had two kinds of this bark, the *ſuccus expreſſus*, and the other the *xylocaſſia*. But they were only the names of the ſame thing collected in a different manner: however, they are applied by the moderns to different ſubſtances.

The two barks are gathered and dried in the ſame manner; in ſmell and taſte are nearly alike; they are equally ſweet, pungent, and agreeable, and their colour, form, and thickneſs ſcarce differ at all. But the *caſſia* is the fatter, and more mucilaginous; and in chewing diſſolves in the mouth, without leaving anything woody behind; whereas the woody part of cinnamon ſtill remains, though ever ſo well chewed.—Some authors will have the tree which bears cinnamon bear the *caſſia* too; and make the only difference between them to conſiſt in this, that the firſt comes from Ceylon, and the latter from the coaſt of Coromandel. Of this opinion is Mr. White, who maintains that the difference in their produce is merely the effect of culture, and of the different manner of curing the plant. Phil. Tranſ. vol. l. part ii. N° 116. See CINNAMON. The Edinburgh college direct a ſimple water to be kept, ten pints of which are drawn from a pound and a half of *caſſia lignea*.

CASSIA *ſtalks*, in the *Gloſs Trade*, is that iron with a piece of wood placed on it, on which they lay the glaſs after they have taken it off the pipes, and on which they turn the glaſs, to faſten the pontee to it.

CASSIANI, a ſect in *Civil Law*, who adhered to the ſyſtem and interpretations of Caſſius, a celebrated lawyer, in oppoſition to thoſe of Proculus, whoſe adherents were denominated *Proculiani*.

CASSIANISM, from *Caſſian*, a teacher in Gaul to thoſe who were called ſemipelagians towards the cloſe of the fifth century, is ſometimes uſed for SEMIPELAGIANISM.

CASSIDA, in *Botany*. See SKULL-cap.

CASSIDA, in *Zoology*, the name given by Dr. Hill to a genus of BEETLES, called in Engliſh the tortoiſe-beetles, but comprehended by Linnæus under the *order of inſecta*, in the claſs of inſects. See SCARABÆUS.

Under this genus are comprehended all the cryptated beetles, or thoſe covered with a hard cruſt; of which there are a great many ſpecies.

CASSIDARUS, in the *Ancient Armories*, he who had the care and cuſtody of the *caſſides*, or helmets.

Spon gives an ancient inſcription found at Rome, on a tomb erected to a *caſſidarius* of the emperor Domitian.

CASSIDONY, a name given by the Italians and Germans to a ſort of beads made of the yellow and red chalcedony, a very beautiful ſtone, or of an agate ſomething reſembling it in colour. They alſo call the ſtones themſelves by this name; but are by no means determinate in the meaning of the word, not reſtraining it to any one peculiar ſpecies.

CASSIDONY, *Sinachar*, in *Botany*, Tourn. Inſt. R. H. 201. tab. 95. Its characters are theſe: the flower hath an oval permanent empalement, whoſe brim has ſome obſcure indentures; it is of the lip-kind, having a cylindrical tube longer than the empalement, whoſe brim ſpreads open. The upper lip is large, bifid, and open; the under cut into three roundiſh, almoſt equal ſegments. It has four ſtamina within the tube, which are turned aſide, two of them ſhorter than the other terminated by ſmall ſummits; and a quadrifid germen ſupporting a ſlender ſtyle the length of the tube, crowned by an obtuſe indented ſtigma. The germen turns to four almoſt oval ſeeds, which ripen in the empalement. To which the following notes muſt be added: the flowers are ranged in ſeveral ſeries, and the ſpikes terminated by tufts of leaves. There are three ſpecies.

Linnæus has joined this genus to *lavendula* or LAVENDER.

The flowers of the *ſpachos* are much uſed in medicine, in diſeaſes of the head and nerves, eſpecially in ſuch as are ſuppoſed to ariſe from cold cauſes. They alſo promote the evacuation by urine, and by the menſes; and in ſome places are eſteemed one of the greateſt antidotes, and given in large doſes againſt the effect of poiſons, and the bites of venomous animals. Meſue, and the Arabians

in general, speak of it as a purge, and particularly as good in cases where phlegm was to be evacuated; though they say it did this but slowly and weakly. At present, we do not acknowledge any purging quality in it. There is a very fragrant oil drawn from the flowers and tops of this plant, in the same manner as that from lavender; but it is not much in use with us. The flowers are an ingredient in the Venice treacle, mithridate, and some other of the officinal compositions.

It is to be observed that there is another plant, called *ſtœchas*, in the ſhops; and by the writers on the materia medica; this has the epithet *citrina*, for its diſtinction from the *ſtœchas* we have been treating of, which is either called *ſtœchas* without any addition, or *ſtœchas Arabica*. The *citrina ſtœchas* has none of the virtues of this kind, nor is it of the ſame genus of plants, but of the ELICHRYSUM kind.

The ſeveral ſpecies of *ſtœchas* are propagated by ſowing the ſeeds in March, in a bed of dry light earth; when the young plants are about three inches high, they muſt be removed into other beds, and placed at about ſix inches diſtance, watering and ſhading them till they have taken root. They muſt alſo then be kept clear from weeds, and ſheltered from the ſeverity of the winter by mats, or a light covering of pea haulm, or other ſuch matter: and in March, or the beginning of April, they may be removed into the places where they are to remain. The poorer the ſoil is, in which they are planted, the better they will ſtand the winter, and the more fragrant will be their flowers. They may be propagated by cuttings planted in ſpring, but the ſeeds ripening very well with us, the raiſing of them from thoſe is the much better way.

CASSIDONY, *mountain*. See CUDWEED.

CASSILI, in *Natural Hiſtory*, a name given by the inhabitants of the Philippine iſlands to a ſpecies of water-raven, called alſo *colocolo*.

CASSINE, in the *Military Language*, is a farm-houſe, where a number of ſoldiers have poſted themſelves, in order to make a ſtand againſt the approaches of an enemy.

CASSIOBURY, *buſh*, *Caſſine*, in *Botany*, a genus of the *pentandria trigynia* claſs. Its characters are theſe: the flower hath but one petal, which is cut into five obtuſe ſegments; it hath five ſtamina, which ſpread from each other; and a conical germen, which afterward becomes an umbilicated berry with three cells, each containing a ſingle ſeed. There are two ſpecies.

In South Carolina, it is called *caſſina*, or South-ſea thea. The inhabitants of that country do not make ſo great uſe of this tea, as thoſe of Virginia and North Carolina; in the laſt of which the white people have it in as great eſteem as the Indians, and make as conſtant uſe of it.

CASSIOPEA, in *Aſtronomy*, one of the conſtellations of the northern hemiſphere, ſituate next to Cepheus.

In 1572, there appeared a new ſtar in this conſtellation, which at firſt ſurpaſſed in magnitude and brightneſs Jupiter himſelf: but it diminiſhed by degrees, and at laſt diſappeared, at the end of eighteen months. It alarmed all the aſtronomers of that age, many of whom wrote diſſertations on it; among the reſt Tycho Brahe, Kepler, Maurolycus, Lycetus, Gramineus, &c. Beza, the landgrave of Heſſe, Roſa, &c. wrote to prove it a comet, and the ſame which appeared to the Magi, at the birth of Jeſus Chriſt, and that it came to declare his ſecond coming: they were anſwered on this ſubject by Tycho.

The ſtars in the conſtellation *Caſſiopea*, in Ptolemy's Catalogue, are thirteen; in Hevelius's, thirty-ſeven; in Tycho's, forty-ſix; but in the Britannic Catalogue, Mr. Flamſteed makes them fifty-five. The order, names, longitudes, latitudes, magnitudes, &c. whereof are as follow:

Names and ſituations of the ſtars.	Bayer's Char.	Signs.	Longit.		Latitude			Magnitude.
			°	′	°	′		
		♈	21	6	45	0	0N	6
			21	29	16	56	26	10	5
			23	5	5	14	38	32	6

55.									

CASSIS, in *Antiquity*, a plated, or metalline helmet, different from the *galea*, which was of leather.

CASSIS *levis*, the *ſmooth helmet-ſhell*, a name given by Rumphius, though very improperly, to the genus of ſhells called *dolia* and *tonnæ clavatæ*. Theſe have no alliance at all with the helmet-ſhells; and what makes the name ſtill worſe, is, that *caſſis* itſelf is not a generical name, though uſually ſo underſtood, all the *caſſides* or helmet-ſhells being only a peculiar kind of MUREX, as the figure of their mouth and their rudiments of ſpines or protuberances evidently ſhew.

CASSITERIA, in *Natural Hiſtory*, the name of a genus of cryſtals. The word is derived from κασσιτερος, *tin*; and expreſſes cryſtals which are influenced in their figures by an admixture of the particles of that metal. See *Tab. of Foſſils, Claſs* 3.

Theſe are all pyramidal, without columns, and compoſed only of four ſides or planes. Of this genus there are only two known ſpecies.

CASSOCK, a kind of ſurtout, or long upper garment, worn over the reſt of the habit: particularly by the clergy, and anciently likewiſe by the laity.

The word comes from the French *caſaque*, a *horſeman's coat*: ſome derive them again, by corruption, from a garment of the Coſſacks: others derive the name *caſſock*, as well as the thing, from the ancient *caracalla*, a ſort of upper garment which hung to the heels.

CASSONADE, in *Commerce*, caſk ſugar, or ſugar put into caſks or cheſts, after the firſt puriſication, but which has not been refined. It is ſold either in powder or in lumps;

lumps; the whiteſt, and that of which the lumps are largeſt, is the beſt. Many imagine it to ſweeten more than loaf-ſugar; but it is certain that it yields a great deal more ſcum.

CASSOWARY, in *Ornithology*, the name of an African bird of the oſtrich kind, but not quite ſo tall, though larger bodied; called alſo by many authors *emeu*, *ame*, or *eme*, and *caſuarius*. It has a crown on the middle of its head; and its head and neck are almoſt naked, having only a few hairs, which are ſet ſtraggling; the ſkin is of a purpliſh blue, but toward the bottom of the neck on the under part, it is a little reddiſh. At the bottom of the neck, there are alſo two fleſhy protuberances which hang over the breaſt; its mouth opens very wide; its legs are very long, and very robuſt; it has three toes on each foot, all placed before; it has the rudiments of wings, but they are very ſhort, and have only five quills each, which are almoſt naked. It has no tail; its body is large, and is thinly covered with brownish feathers, which have more the appearance of briſtles than of real feathers, to a ſlight obſerver. It is very common in Africa, and is caught alſo in many parts of the Eaſt Indies. It feeds on fleſh or vegetables, and is eaſily made tame. See *Tab. of Birds*, N° 20.

CASSUMUNAR, in the *Materia Medica*, a root approaching to the nature of zedoary, though belonging to a different ſpecies of plants.

We have it from the Eaſt Indies; its ſurface is ſomewhat wrinkled, and is marked at certain diſtances with circular rings, which ſurround it, and riſe prominent above the reſt of the ſurface. It is of a very compact nature, hard and heavy; not eaſily cut through with a knife, or powdered in a mortar. When cut, it ſhews a very ſmooth and ſhining ſurface; and when broken, is found to be much yellower within.

It has a fragrant aromatic ſmell; and is a very famous medicine in nervous caſes, being accounted an excellent cardiac and ſudorific. It is alſo given as a ſtomachic and carminative with ſucceſs, and is moſtly preſcribed in powder, boluſes, or infuſions.

CASSYTA, in *Botany*, a genus of the *enneandria monogynia* claſs. The corolla is in the form of a calyx, divided into ſix ſegments; the nectarium is compoſed of three truncated glands encompaſſing the germen; the interior filaments are glandular; and the drupe contains a ſingle ſeed.

There is but one ſpecies.

CAST is particularly uſed to denote a figure, or ſmall ſtatue of BRONZE.

CAST, among *Wax-Chandlers*, denotes a ladleful of melted wax, poured on the wicks of candles made by the ladle.

CAST, among *Founders*, is applied to tubes of wax, fitted in divers parts of a mould of the ſame matter, by means of which, when the wax of the mould is removed, the melted metal is conveyed into all the parts which the wax before poſſeſſed.

CAST, among *Bowlers*. See BOWLING.

CAST alſo denotes a cylindrical piece of braſs, or copper, ſit in two, leſigthwiſe, uſed by the founders in ſand to form a canal or conduit in their moulds, whereby the metal may be conveyed to the different pieces intended to be caſt.

CAST, among *Plumbers*, denote a little brazen funnel, at one end of a mould, for caſting pipes without ſoldering, by means of which the metal melted is poured into the mould.

CAST *of the country*, with *Miners*, the colour of the earth.

CAST, in *Falconry*, denotes a ſet or couple of hawks.

To *caſt* a hawk to the perch, ſignifies to ſet her upon it.

CAST, or CASTE, in ſpeaking of the Eaſtern affairs, denotes a tribe, or number of families, of the ſame rank and profeſſion.

The diviſion of a nation into *caſts* chiefly obtains in the empire of the Great Mogul, kingdom of Bengal, iſland of Ceylan, and the great peninſula of India oppoſite thereto. In each of theſe, there are, according to father Martin, four principal *caſts*; viz. the *caſt* of the *brahmans*, which is the firſt and moſt noble; the *caſt* of the *rajas*, or princes, who pretend to be deſcended from divers royal families; the *caſt* of the *chanirs*, which comprehend all the artificers; and that of the *parias*, the loweſt and moſt contemptible of all: though Henry Lord, it muſt be obſerved, divides the Indians about Surat into four *caſts*, ſomewhat differently from Martin; viz. into BRAHMS, or prieſts; *cattery*, or ſoldiers; *bodder*, which we call banians, or merchants; and *wyſe*, the mechanics or artificers.

Every art and trade is confined to its proper *caſt*, nor is it allowed to be exerciſed by any but thoſe whoſe fathers profeſſed the ſame. So that a taylor's ſon can never riſe to be a painter, nor a painter's ſon fall to be a taylor. Though there are ſome employments which are common to all the *caſts*: e. g. every body may be a ſoldier or a merchant. There are alſo divers *caſts* which are allowed to eat the ground, but not all.

CASTAGNOLE, in *Ichthyology*, a name given by the Italians to the fiſh called by the generality of authors CHROMIS, and reduced by Artedi to the genus of the SPARUS; he diſtinguiſhes it by the name of the ſparus with the ſecond ray of each belly-fin carried out into a great length.

CASTALDUS. } See CASTALDUS.
CASTALDY. }

CASTALOGNE, or CASTELOGNE, a coverlid made of fine wool, on the weaver's loom.

CASTANEA. See CHESTNUT.

CASTARON, a name given by the old Arabian writers to the *ſcirrhus*, or SCIRRHOUS.

CASTANETS, CASTAGNETTES, or CASTANETTAS, a kind of muſical inſtrument, wherewith the Moors, Spaniards, and Bohemians accompany their dances, ſarabands, and guitars. It conſiſts of two little round pieces of wood dried, and hollowed in manner of a ſpoon, the concavities whereof are placed on one another, faſtened to the thumb, and beat from time to time with the middle finger, to direct their motion and cadence. The *caſtanets* may be beat eight or nine times in the ſpace of one meaſure, or ſecond of a minute.

CASTELLAIN, *Caſtellanus*, the lord, owner, or captain of a caſtle; and ſometimes the conſtable of a fortified houſe. Bract. lib. v. tract. 2. c. 16. 3 Edw. I. c. 7. It has likewiſe been taken for him that hath the cuſtody of one of the king's manſion houſes, called by the Lombards *curtes*, in Engliſh *courts*; though they are not caſtles or places of defence. 2 Inſt. 31. And Manwood, in his Foreſt Laws, ſays there is an officer of the foreſt called *caſtellanus*.

CASTELLAN, the name of a dignity or office in Poland. The *caſtellans* are ſenators of the kingdom, but ſenators of the lower claſs; and in diets, ſit on low ſeats behind the palatines, or great ſenators. They are a kind of lieutenants of provinces, and command a part of a palatinate under the PALATINE.

CASTELLANY, the diſtrict or extent of land under the juriſdiction of a lord caſtellan.

The province of Flanders is divided into ſo many *caſtellanies*, each of which bears the name of the capital, as the *caſtellany* of Lille, of Ypres, of Ghent, &c. The court of *caſtellany* was anciently compoſed of the caſtellan, a fiſcal, procurator, notary, regiſter, &c.

In Poland, a *caſtellany* is a petty government under the adminiſtration of a CASTELLAN.

CASTELLARIUS, the keeper, or curator, of a caſtellum. Gruter gives an ancient ſepulchral inſcription in memory of a *caſtellarius*.

CASTELLATION, *Caſtellatio*, in *Middle Age Writers*, the act of building a caſtle, or of fortifying a houſe, and rendering it a CASTLE.

By the ancient Engliſh laws, *caſtellation* was prohibited, without the king's eſpecial licence. *Du-Cange*.

CASTELLORUM *operatio*, caſtle work, or ſervice and labour done by the inferior tenants for the building and upholding of caſtles of defence; toward which ſome gave perſonal aſſiſtance, and others paid their contributions. This was one of the three neceſſary charges, to which all lands among our Saxon anceſtors were expreſsly ſubject.

CASTIGATION, *Caſtigatio*, among the Romans, the puniſhment of an offender by blows, or beating with a wand or ſwitch.

Caſtigation was chiefly a military puniſhment, the power of inflicting which on the ſoldiery was given to the tribunes. Some make it of two kinds, one with a ſtick or cane, called *fuſtigatio*; the other with *rods*, called *flagellatio*: the latter was moſt diſhonourable.

CASTIGATIONS, in a *Literary Senſe*, denote corrections, or emendations of the text of an ancient writer.

CASTIGATORY. See CUDGEL-*ſtick*.

CASTILLAN, a gold coin, current in Spain, valued at fourteen rials and a half.

CASTILLAN *alſo* denotes a weight uſed by the Spaniards in the weighing of gold, containing the hundredth part of a Spaniſh pound. It is alſo uſed at Buenos Ayres, and the mines of Chili and Potoſi.

CASTING is ſometimes uſed for the quitting, laying, or throwing aſide any thing; thus, deer *caſt* their horns, ſnakes their ſkins, lobſters their ſhells, hawks their feathers, &c. annually.

CASTING *of feathers*, is more properly called *moulting* or *mewing*.

A horſe *caſts* his hair or coat, at leaſt once a year, viz. in the ſpring, when he *caſts* his winter coat; and ſometimes at the cloſe of autumn he *caſts* his ſummer coat, in caſe he hath been ill kept.

Horſes ſometimes alſo *caſt* their hoofs, which happens

frequently to couch-horses brought from Holland; which being bred in a moist, marshy country, have their hoofs too flabby, so that coming into a drier soil, and less juicy provender, their hoofs fall off, and others, that are firmer, succeed.

CASTING is also used for overthrowing.

In which sense we say, to *cast* a horse, an ox, or the like.

CASTING is also used for distributing or disposing the parts of a thing to the best advantage.

The *casting* of a building is more properly called COST-PARTITION.

Theatrical writers speak of *casting* a play, i. e. disposing the several parts or characters to proper actors.

CASTING *of candles*, signifies filling the moulds with tallow.

CASTING *a colt or foal*, denotes the abortion of a mare.

CASTING *of drapery*, among *Painters*, a free, easy, negligent way of clothing a figure.

CASTING, in *Falconry*, is any thing given a hawk to purge and cleanse his gorge.

Of these there are two kinds, viz. plumage, i. e. feathers; and coney: the latter whereof is generally in pellets about the bigness of hazel-nuts, made of soft fine cotton and conveyed into her gorge after supper. In the morning she will have cast them out; at which time they are to be observed, and from the colour and condition they are found in, the state of her body is conjectured. If they be *cast* out round, white, and not stinking, nor very moist, it is an indication all is well; if otherwise, particularly if black, greco, slimy, or the like, she is distempered. The *casting* of plumage is observed after the same manner as that of coney.

CASTING *a figure*, among *Astrologers*, the erecting of a celestial theme, and dividing the heavens into houses.

CASTING, in *Founding*, is the running of a melted metal into a mould prepared for that purpose.

CASTING *of guns, silver, or copper*, in plates. See COINING.

CASTING, in *Joinery, &c.* Wood is said to be *cast* or warped, when, either by its drought or moisture, or the drought or moisture of the air, or other accident, it shoots or shrinks; to prejudice to its flatness or straightness.

CASTING *of lead on cloth*, is the using of a frame or mould covered with woollen cloth, and linen over it, to cast the lead into very fine sheets.

CASTING *of lead on sand*, is done by means of a large frame or trough, nearly full of sand, which is made perfectly level, and imprinted with any device from moulds pressed down in the sand: the lead is then turned out of the kettle into a receiver or trough, and poured on the sand, whilst two persons slide a gauge or lath, of such thickness as to leave a space between it and the sand answering to the substance of the lead, along the edges of the frame; the surplus runs into reservoirs by channels made in the sand.

The goldsmiths use the bone of the CUTTLE-*fish*, to mould and cast their lesser works of gold and silver; that bone, when dried, being reducible to a kind of a fine pumice, very susceptible of all impressions.

CASTING *in plaster, or plaister*, is the filling with fine liquid plaister, a mould that had been taken in pieces from off a statue or other piece of sculpture, and run together again. There are two things to be observed with regard to the mould: the first, that it be well soaked with oil before the plaister be run, to prevent its sticking: the second, that each piece wherein it consists, have a pack thread, to draw it off the more easily when the work is dry.

CASTING *of moulds, of letters, bells, figures, &c.* See FOUNDERY.

CASTING, in *Navigation*, denotes the motion of sailing off, so as to bring the direction of the wind on either side of the ship, after it had blown for some time right a-head.

CASTING-*net*, a sort of fishing net, so called because it is to be *cast* or thrown out, which when exactly done, nothing escapes it, but weeds, and every thing within its extent, is brought away.

CASTING *a point of traverse*, among *Seamen*, signifies the pricking down on a chart the point of the compass any place bears from you; or finding what point of the compass the ship bears at any instant, or what way the ship has made.

CASTING *of timber-work*. See CASING.

CASTLE, *Castellum*, in *Ancient Writers*, denotes a town or village surrounded with a ditch and wall, furnished with towers at intervals, and guarded by a body of troops.

The word is originally Latin, *castellum*, a diminutive of *castrum*.

Castellum originally seems to have signified a smaller fort, for a little garrison. Though Suetonius uses the word where the fortification was large enough to contain a cohort.

The *castella*, according to Vegetius, were often like towns, built in the borders of the enemy and sometimes there were constant guards, and sentinels against the enemy.

Hoffley takes them for much the same what were otherwise denominated stations.

CASTLE, or CASTLE-*seed*, is also an appellation given by the country people in the North to the Roman *castella*, as distinguished from the *castra stativa*, which they usually call *chesters*. Hoffley represents this as an useful criterion, whereby to discover, or distinguish, a Roman camp or station.

CASTLE, in a modern *sense*, is a place fortified by nature, or art, either in a city or country, to keep the people in their duty, or to resist an enemy.

A *castle* is a sort of little CITADEL.

CASTLE, in *Sea Language*, denotes an elevation on the deck of a vessel; or a part of the deck, fore and aft, raised above the rest.

Fore-CASTLE, *Castella de prora*, &c. See FORE-*castle*.

Hind-CASTLE, *Castella de puppi*. See POOP.

CASTLE-WARD, or CASTLE-GUARD, *Castelgardum*, or *Wardum Castri*, an imposition laid on such as dwell within a certain compass about any *castle*, towards the maintenance of those who watch and ward the *castle*.

The word is sometimes also used for the circuit itself, inhabited by such as are subject to this service.

CASTLE, *water*, a piece of hydraulic work finished with one or more fronts of building, with seeming windows and the like, containing a reservoir which gives play to cascades, &c.

Or, a *water-castle* may be defined a receptacle of the public water furnished by an AQUEDUCT, or otherwise, in which are inclosed the cocks of several water-pipes with a little bason; contrived to distribute and send it to different parts.

The *castella* of the ancient aqueducts are still visible at Rome, though half ruined. They are lined with a durable kind of cement, which, according to Pliny, surpasses in hardness the stones themselves. It is made of lime slacked in wine, and beaten up with hog's grease, and the juice of figs or pitch.

Modern writers on hydraulics treat of the laws of the efflux of water out of *castella* into pipes, canals, &c.

Signior Poleni has a treatise express on *castles*, or reservoirs, whereby the waters of rivers are derived, the sides of which *castles* are made converging.

CASTOR, in *Zoology*. See BEAVER.

CASTOR-*stin*. See BEAVER, &c.

CASTOR, in *Astronomy*, a moiety of the constellation GEMINI; called also APOLLO.

Its latitude northwards for the year 1700, according to Hevelius, was 10° 4′ 23″; and its longitude, of Cancer, 16° 4′ 14″.

It is also called *Refulgens*, *Apollo*, *Apollinis Auctor*, and *Auctor*.

CASTOR *and Pollux*, in *Meteorology*, a fiery meteor, which at sea appears sometimes sticking to a part of the ship, in form of one, two, or even three or four fire-balls; when one is seen alone, it is more properly called *Helena*; two are denominated *Castor and Pollux*, and sometimes *Tyndaridæ*.

Castor and Pollux are called by the Spaniards, *San Elmo*; by the French, *St. Elme*, *St. Nicholas*, *St. Clare*, *St. Helene*; by the Italians, *Hermi*; by the Dutch, *Vyer Vueren*.

Castor and Pollux are commonly judged to portend a cessation of the storm, and a future calm; being rarely seen till the tempest is nigh spent. *Helena* alone portends ill, and witnesses the severest part of the storm yet behind.

When the meteor sticks to the mast, yards, &c. they conclude, from the air's not having motion enough to dissipate this flame, that a profound calm is at hand; if it flutter about, it indicates a storm.

CASTOR *oil*, in *Pharmacy*. See PALMA *Christi*.

This oil is the product of the RICINUS *Americanus fructu rotundo hispido* of Sir Hans Sloane; or of the PALMA *Christi* of Du Tertre, Frezier, and Labat. It is variously prepared in the West Indies. It is drawn from the fruit in the manner in which we make birch wine; it is prepared by expression, which is the preferable method, as oils of all kinds have their acrimony heightened by the action of fire. At other times the seeds are collected ripe, when moist replete with this unctuous juice, cleansed from the husks, bruised in a mortar, and beat into a paste. They are then boiled with a sufficient quantity of water, when the oil rises to the surface, and is skimmed off whilst any continues to appear.

It seems particularly adapted for the common complaints of infant children, and the cure of bilious disorders; and certainly is by all accounts a very valuable medicine. It was known to Dioscorides and Pliny, who gave it the

name

name of *alcam chimam*; the Arabs call it *alcam de thorve*. Dr. Fraser has given an account of its preparation and virtues, confirmed by a letter of the Rev. Mr. Monod of Guadaloupe to Dr. Mary, in the Lond. Medic. Obser. &c. vol. ii. p. 235.

Dr. Canvane has published a Dissertation on *Castor Oil*, its history and virtues, and strongly recommended it in all bilious, calculous, and nephritic disorders. The dose for adults is from two to three or four spoonfuls, in two spoonfuls of pepper-mint water, or the *tinct. stomachica* of the London Dispensatory. It may be made into a *potio alba* by mixing two or three spoonfuls with a sufficient quantity of the yolk of eggs, to incorporate it thoroughly, and then adding two ounces of simple, and two or three drams of compound pepper-mint water. It may be given to children mixed with honey; and it acts so mildly, that new born infants may take it in about a tea-spoonful for a dose.

There is a paper on the effects of *castor oil* and the Peruvian bark in the hooping-cough, in the Lond. Med. Obf. &c. vol. iii. p. 287.

CASTOREA, in *Botony*, the name given by Plumier to a genus of plants since called by Linnæus DURANTA.

CASTOREUM, or CASTORIUM, in *Pharmacy*, a medicinal matter inclosed in bags or purses, near the anus of the castor or beaver; falsely taken for the testicles of that animal. See BEAVER.

The bags in which the *castoreum* is contained, are about the bigness of a goose egg, and found indifferently in males and females; the liquor inclosed serves to give the castor an appetite, being prefled out of its receptacles, on occasion, by the foot: when taken off, the matter dries and condenses, so that it may be reduced to a powder, by hanging in the chimney it soon becomes of the consistence of wax. It is oily, of a sharp, bitter taste, and a strong disagreeable smell. It is used to fortify the head and nervous parts: it raises the languishing spirits, resists poisons, and provokes the menses in women. It is used in lethargies, apoplexies, vertigos, tremblings, suffocations of women, and on other occasions. Bartholine, and other authors ascribe to it a wonderful property of precipitating things to the bottom of the water.

For the choice of *castoreum*, the best is that of Russia; that of Canada is much inferior; the largest bags, and those that smell strongest, are the most esteemed, especially when heavy, and well fleshed. Care is to be taken, that it has not been adulterated with honey, or other drugs, to increase its weight, which is known by squeezing it: the sophisticated being softish, and yielding a liquid, stinking honey; and the natural hard and heavy, of a brisk smell, and full of filaments.

Castoreum is used in the composition of Venice treacle and mithridate, beside various other hysteric and cephalic medicines. They draw an oil from it, called *oil of castor*; and it is also used abroad while in its liquid state, to make several kinds of unguents.

The Ruffian way of curing *castoreum* is described in the Philosophical Transactions thus: "to prepare the matter of the beaver's stones (the bags it should be), boil "a pepper quantity of water, with half a shovel full of "wood ashes, tie the bags in couples, and put them in "the boiling water for half a quarter of an hour. Lay "birch-bark on the fire, and smoke the bags well over "it for an hour, till they be well dried; hang them up "for a week or more, till perfectly dry and hard; they "may then be packed up for use or exportation."

CASTRAMETATION, the art or act of encamping, i. e. of placing or disposing an army in camp. See CAMP.

The word is more used in speaking of the encampments of the ancients than those of the moderns. It comes from the Latin *castrum*, *camp*, and *metari*, *to measure*, or *lay out*.

CASTRATING *a book*, among *Booksellers*, is the taking out some leaf, sheet, or the like, which renders it imperfect, and unfit for sale. The word is also applied to the taking away particular passages, on account of their obscenity, too great freedom with respect to government, &c.

CASTRATING is also used among *Gardeners*, in speaking of melons and cucumbers; where it signifies the same with PRUNING or PINCHING of other plants.

CASTRATION, in *Chirurgery*, the operation of gelding, i. e. of cutting off the testicles, and putting a male animal out of a capacity of generation.

Castration is much in use in Asia, especially among the Turks, who practise it on their slaves, to prevent any commerce with their women. The Turks often make a general amputation.

Castration also obtains in Italy, where it is used with a view to preserve the voice for singing. See EUNUCH, and CONSERVATORIOS.

The Persians, and other Eastern nations, have divers methods of making eunuchs, different from those which obtain in Europe: we say, of making eunuchs, for it is not always done among them by cutting, or even collision. Cleora and other poisonous herbs do the same office, as is shewn by Paulus Ægineta. Those eunuchified in this manner are called *thlibiæ*. Besides which there is another sort named *thlasiæ*, in whom the genitals are left entire, and only the veins which should feed them are cut; by which means the parts do indeed remain, but so lax and weak, as to be of no use.

Castration was for some time the punishment of ADULTERY.

By the laws of the Visigoths, sodomites underwent the same punishment.

By the civil law, it is made penal in physicians and surgeons to *castrate*, even with consent of the party, who is himself included in the same penalty, and his effects confiscated. The offence of mayhem by *castration* is, according to all our old writers, felony; though committed upon the highest provocation. See a record to this purpose of Henry III. transcribed by sir Edward Coke, 3 Inst. 62, or Blackstone's Com. vol. iv. p. 206.

Castration is sometimes found necessary on medicinal considerations, as in mortifications, and some other diseases of the testicles, especially the *sarcocele* and *varicocele*. Some have also used it in maniac cases.

CASTRATION is also in some fort practised on women. Athenæus mentions, that king Andromenes was the first who *castrated* women. Hesychius and Suidas say Gyges did the same thing. Galen observes, that women cannot be *castrated* without danger of life: and Dalechampius, on the forementioned passage of Athenæus, holds, that it is only to be understood of simple padlocking.

CASTRATION, in respect of brutes, is called GELDING, and SPAYING. See also FISH.

CASTRATION is also used by some physicians for correcting the more violent medicines, especially purgatives. See CORRECTION and CORRECTORS.

CASTRATION also denotes the art of retrenching, or cutting away any part of a thing from its whole.

CASTREL, a kind of HAWK resembling the lanner in shape, but the bobby in size. The *castrel*, called *also kestrel*, is of a slow and cowardly kind; her game is the growse, though she will kill a partridge. See FALCONRY.

CASTRENSIANI, or CASTRENSES, in *Antiquity*, an order of servants in the Greek emperor's household, to whom belonged the care and service of what related to his table and cloathing. They were thus called either on account of their attending the emperor when in camp, or because they observed a sort of camp discipline in the court; or rather because they were considered as soldiers, were paid as such, and had the privileges belonging to the military body. The *castrenfians* were also called *castrenses ministri*, and *miniftriani*.

To this order belonged the bakers, butlers, waiters, fullers, taylers, &c. They had a head, or superior, who was called *comes castrensis*, which was a palatine dignity under the chamberlain.

CASTRENSIS, in *Medicine*, an appellation given to certain contagious and epidemic diseases, especially fevers. See CASTR-*desease*, &c.

CASTRUM *Doloris*, in *Middle Age Writers*, denotes a catafalco, or a lofty tomb of state, erected in honour of some perfon of eminence, usually in the church where his body is interred; and decorated with arms, emblems, lights, and the like.

Ecclesiastical writers speak of a ceremony of consecrating a *castrum doloris*; the edifice was to be made to represent the body of the deceased, and the priest and deacon were to take their posts, and say the prayers after the same manner as if the corpse were actually present.

CASTS may be taken very well from medals on cakes of lead melted with sulphur, which form a blackish mass, considerably more tough than sulphur alone. See an account of the process for making this matter, &c. in Lewis's Commerc. Phil. Techn. p. 354. See *Impressions of* MEDALS.

CASU *Confimili*, in *Law*, a writ of entry, where a tenant by courtesy, or for life, aliens in fee, or in tail, or for another's life: it takes its name hence, that authority being given by stat. Weft. 2. to the clerks in chancery, to make new forms, as often as any new case should arise, not under any of the old forms; they framed this writ to the likeness of the other called *Casu provisio*.

CASU *Provisio*, a writ of entry given by the statute of Gloucester, in case where a tenant in dower aliens in fee, or for term of life, in tail: and lies for him in reversion against the alienee.

CASUAL, something that happens fortuitously, or without any design, or measures taken to bring it to pass.

CASUAL *death*. See DEODAND.

CASUAL *ejector*, in *Law*, a nominal descendant in ejectment,

ment, and who continues such until appearance by or for the tenant in possession. Blackst. Comm. vol. iii. p. 203.

CASUAL *revenues*, are those which arise from forfeitures, confiscations, deaths, attainders, &c.

CASUAL *theology*, a denomination given by some to what is more frequently called casuistry. See CASUISTRY.

Adam Ohander, chancellor of the university of Tubingen, has published a system of *casual theology*, containing the solution of dubious questions, and cases of conscience. Theologia *Casualis*, 6 vol. 4to. Tubing. 1682.

CASUALTY, in the *Tin Mines*, a word used to denote the earth and stony matter which is, by washing in the stamping-mills, &c. separated from the tin-ore, before it is dried and goes to the crazing-mill.

CASUIST, a person who professes to resolve cases of conscience. Escobar has made a collection of the opinions of all the *casuists* before him.

To *casuistry* belong the decision of all difficulties arising about what a man may conscientiously do, or not do; what is sin, or not sin; what things a man is obliged to do in order to discharge his duty, and what he may let alone without breach of it.

M. le Feore, preceptor of Lewis XIII. called the books of the *casuists* the art of quibbling with God; which does not seem far from the truth; by reason of the multitudes of distinctions and subtilties with which they abound.

CAT, in *Zoology*. See FELIS.

The *domestic cat* is diversified with an almost infinite variety of colours and streaks; but the natural colour, in a wild state, is a brown tawny, variegated with streaks of a pale whitish colour. In France the *cats* are all of a bluish lead colour, and in the north of Europe they are all white.

CAT, in *Sea Language*, denotes a ship formed on the Norwegian model, and employed in the coal-trade. It is distinguished by a narrow stern, projecting quarters, a deep waist, and by having an ornamental figure on the prow. These vessels usually carry from four to six hundred tons.

CAT, in a ship. See CAT-*heads*.

CAT, *fish*. See SEA-*cat*.

CAT'S *eye*, among *Naturalists*, a kind of precious stone, of a lucid texture, whose colours are variable, according to the position of the stone to the light.

Cat's eye is by the Latins called *oculus catti*, and sometimes *ophiopalus*, as having white zones or rings like the ONYX; and its colour variable like OPAL, from which last it differs chiefly by its superior hardness.

The *cat's eye* is of a glittering grey, interchanged with a straw-colour, and answers the description given by Pliny of the asterias, between which and our *cat's eye* there appears no other difference than that the ancients took their denomination from the brightness and shining of the stone, whereas the modern name is taken from the figure of it. See ASTERIA.

CAT-*gut*, a denomination given to small strings for fiddles, and other instruments, made of the intestines of sheep or lambs, dried and twisted, either singly, or several together.

These are sometimes coloured red, sometimes blue, but are commonly left whitish or brownish, the natural colour of the gut. They are used also by watch-makers, cutlers, turners, and other artificers. Great quantities are imported into England, and other northern countries, from Lyons and Italy.

CAT-*harpings*, are small ropes running in little blocks from one side of the shrouds to the other, near the deck: their use is to force the shrouds, and make them tight, for the greater security of the masts, and to afford room for drawing the yards in more obliquely, to trim the sails for a side-wind, when they are said to be clofe-hauled.

CAT-*heads*, in a ship, are two strong short beams of timber, which project almost horizontally over the ship's bows, on each side of the bowsprit. One end of the *cat-head* rests on the fore-castle, and is bolted to the beams; the other part projects like a crane, and carries in its extremity two or three small sheaves, about which a rope called the *cat-fall* passes, communicating with the *cat-block*, which also contains three sheaves, and is fitted with a large strong hook, sometimes called *cat-hook*, which catches the ring of the anchor when it is to be drawn up. The machine formed by this combination of pullies is called the *cat*, and serves to pull the anchor up to the *cat head*, without tearing the ship's side with its flukes. The *cat-head* also serves to suspend the anchor clear of the bow, when it is necessary to let it go.

CAT'*s-head* is also a denomination given to a sort of waste stony lumps, not inflammable, found in coal-mines. In these there are frequently impressions of ferns. Phil. Transf. N° 360. p. 970.

CAT-*holes*, in a ship, are over the ports, at right with the capstan as they can be: their use is to heave the ship a-stern upon occasion, by a cable or hawser called stern-fast.

CAT *of mountain*, the name of a beast of prey approaching to the leopard-kind. See CATUS *Pardus*, and CATUS *Cervarius*.

CAT-*mint*. See CATMINT.

CAT'*s-paw*, denotes a slight breath of wind, perceived at a distance in a calm, by the impression made on the surface of the sea, which soon decays.

CAT-*salt*, a name given by our salt-workers to a very beautifully granulated kind of common salt. It is formed out of the bittern or leach brine, which runs from the salt when taken out of the pan. When they draw out the common salt from the boiling pans, they put it into long wooden troughs, with holes bored at the bottom for the brine to drain out; under these troughs are placed vessels to receive this brine, and herein them are placed certain small flicks, to which the *cat-salt* adhere itself in very large and beautiful crystals. This salt contains some portion of the bitter purging salt, and is very sharp and pungent, and is white when powdered, though pellucid in the mass. It is used by some for the table, but the greatest part of what is made of it is used by the makers of hard soap.

CAT-*silver*, a name given to certain fossile substances, usually called also *glimmer*, and in Latin *mica*. They are various species of the *bractteatia*, or foliaceous tales, in small spangles. See MICA.

CATABAPTIST, a person averse from baptism; particularly from that of infants.

The word is compounded of the preposition κατα, which, in composition, signifies *against*, and βαπτω, *I wash*.

CATABASION, in the Greek *Church*, a place under the altar wherein the relics are kept.

The word is formed from κατα*Caino*, *I descend*; because they went down into it.

CATABATHMOS, in *Antiquity*, a steep valley, dividing Egypt from Africa.

The word is formed from κατα*baino*, *to descend*, on account of the hastiness and precipitation of its descent.

CATABIBAZON, in *Astronomy*, the moon's descending node; called also DRAGON'S *tail*.

CATABULENSES, in the *Middle Age*, a sort of ministers or servants of the empire, appointed to conduct the public carriage from one *catabulum*, or stage, to another.

The *catabulenses* appear also to have had the charge of conveying the public corn to and from the mills: whence, in the Theodosian code, they are joined with bakers.

CATABULUM, in the *Middle Age*, a kind of stable or building, wherein beasts, especially of burden and carriage, were kept for the public service.

The ancient Christians were sometimes condemned to serve in the *catabula*, that is, to work at the cleaning of them, attending the beasts, &c.

CATAC, in *Botany*, a name by which some authors call AGRIMONY.

CATACAUSTIC *curves*, in the *Higher Geometry*, the species of CAUSTIC *curves* formed by *reflexion*.

CATACHRESIS, a figure in *Rhetoric*, whereby an improper word is used instead of a proper one.

The word is formed from κατα*chraomai*, *abuter*, *I abuse*; of κατα, *against*, or *contrary to*, and χραομαι, *I use*.

The *catachresis* is, when for want of a word proper to express a thought, we use, or rather abuse, a word that comes somewhat near it: as when we call a person who has killed his mother, master, or prince, *parricide*; which word, in propriety, is only applicable to him who has murdered his father: and the *gregis ipse color*, is also a *catachresis*.

CATACLASIS, from κατα*cnao*, *I distort*, in *Medicine*, denotes a distortion of the eye, wherein the eye-lid is inverted by a convulsion of the muscles that close it; called also *contortion*.

CATACLEIS, in *Anatomy*, a cartilaginous bone, or rather a cartilage in the juncture of the *omoplata*, or shoulder-blade.

CATACLYSMUS, from κατα*cluzo*, *I deluge*, a Greek name for a deluge, or inundation of waters.

CATACOMBS, or CATACUMBS, CATACUMBE, denote grottos, or subterraneous cavities, for the burial of the dead.

Some derive the word from the Greek κατα, and κυμβος, a *hollow cavity*, or the like.

Catacombs are also denominated *crypta*, and *cœmeteria*.

Anciently, the word *catacumbæ* was only understood of the tombs of St. Peter and St. Paul; and M. Claufelius observes, that among the more knowing of the people of Rome, the word *cœmeteria* is never applied to the subterraneous burying places hereafter to be mentioned, but only to a chapel in St. Sebastian, one of the seven ftational churches; where the ancient Roman calendars fay the body of St. Peter was depofited, under the conſulate of Tuſcus and Buſſus, in 258.

CATACOMB is more particularly uſed, in Italy, for a vaſt aſſemblage of ſubterraneous ſepulchres about Rome, chiefly at about three miles from that city in the Via Appia, ſuppoſed to be the ſepulchres of the martyrs; and which are viſited accordingly out of devotion; and reliques are taken thence, and diſperſed throughout the catholic countries, after having been firſt baptized by the pope, under the name of ſome ſaint.

Theſe *catacombs* are ſaid by many to be caves, or cells, wherein the primitive Chriſtians hid, and aſſembled themſelves together; and where they interred ſuch among them as were martyred. Each *catacomb* is three feet broad, and eight or ten high; running in form of an alley, or gallery, and communicating, with others: in many places, they extend within a league of Rome. There is no maſonry or vaulting therein, but each ſupports itſelf: the two ſides, which we may look on as the parietes, or walls, were the place where the dead were depoſited; which were laid lengthwiſe, three or four rows over one another, in the ſame *catacomb*, parallel to the alley. They were commonly cloſed with large thick tyles, and ſometimes pieces of marble, cemented in a manner inimitable by the moderns. Sometimes, though very rarely, the name of ſome of the deceaſed is found on the tyle: frequently, a palm is ſeen, painted or engraven; or the cypher Xp, which is commonly read *pro Chriſto*.

Mr. Monro, in the Philoſophical Tranſactions, ſuppoſes the *catacombs* to have been originally the common ſepulchres of the firſt Romans, and dug in conſequence of theſe two opinions; that ſhades hate the light, and they love to hover about the places where the bodies are laid. The *catacombs* of Rome have made the greateſt noiſe in the world; but there are ſuch belonging to many other cities. Biſhop Burnet deſcribes thoſe of Naples, which he ſays are without the city, and much more noble and ſpacious than thoſe of Rome. The like are alſo ſaid to be in the neighbourhood of all the great towns in that part of Italy; and others have been diſcovered at Syracuſe and Catanea in Sicily, and in the iſland of Malta.

The largeſt, and thoſe commonly the moſt frequented, are the *catacombs* of San Sebaſtiano, thoſe of St Agneſe, and the others in the fields a little off St. Agneſe: as to the *catacombs* in the church-yards of the Vatican, women are only allowed to go into them one day in the year, viz. on Whitſun-Monday, on pain of excommunication. There are men kept conſtantly at work in the *catacombs*. As ſoon as theſe labourers diſcover a grave, with any of the ſuppoſed marks of a ſaint about it, intimation is given to the cardinal Camerlingo, who immediately ſends men of reputation to the place, where finding the palm, the monogram, the coloured glaſs, &c. the remains of the body are taken up with great reſpect, and tranſlated to Rome. After the labourers have examined a gallery, they ſtop up the entry that leads into it; ſo that moſt of them remain thus cloſed: there being only a few left open, to keep up the trade of ſhewing them to ſtrangers. This, they ſay, is done to prevent people's loſing themſelves in theſe ſubterraneous labyrinths, which has often happened: but more probably to deprive the public of the means of knowing whither and how far the *catacombs* are carried. Monro in Phil. Tranſ. N° 265. p. 644.

Laying up the bodies in caves, is certainly the original way of diſpoſing of the dead; and appears to have been propagated by the Phœnicians, throughout the countries to which they ſent colonies: the interring, as we do now, in the open air, or in temples, was firſt introduced by the Chriſtians. When an ancient hero died, or was killed in a foreign expedition, as his body was liable to corruption, and for that reaſon unfit to be tranſported entire, they fell on the expedient of burning, in order to bring home the aſhes, to oblige the mourners to follow; that ſo his country might not be deſtitute of the benefit of his ſurviage. It was thus burning ſeems to have had its original; and by degrees it became common to all who could bear the expences of it, and took place of the ancient burying: thus *catacombs* became diſuſed among the Romans, after they had borrowed the manner of burning from the Greeks; and now, none but ſlaves were laid in the ground.

Places thus prepared, might afford convenient retreats to the primitive Chriſtians; but could never be built by them. When the empire became Chriſtian, they were again diſuſed; till the reading of ſome author, who mentions them, occaſioned them to be again looked into.

—As to the famed cypher Xp, it is obſerved to have been in uſe among the ancients, long before Chriſtianity aroſe. The abbot Bencini ſays, it was compoſed of the Greek letters XP, under which ſomething myſtical was comprehended: but no author gives any account what that myſtery was.

CATACOUSTICS, from κατὰ and ἀκούω, *I hear*, called alſo CATAPHONICS, the ſcience of reflected ſounds: or that part of acouſtics, which conſiders the properties of echoes.

CATADIOPTRICAL, *teleſcope*, the ſame with reflected TELESCOPE.

CATADROMUS, from κατὰ and δρόμος, *I run*, in *Antiquity*, a ſtretched ſloping rope in the theatres, down which the FUNAMBULI walked, to ſhew their ſkill.

Some have taken the word to ſignify the hippodrome, or decurſorium, wherein the Roman knights uſed to exerciſe themſelves in running and fighting on horſeback.

But the moſt natural meaning is that of a rope, faſtened at one end to the top of the theatre, and at the other to the bottom, to walk or run down, which was the higheſt glory of the ancient *ſchœnobates*, or *funambuli*. Elephants were alſo taught to run down the *catadromus*. Suetonius ſpeaks of the exploit of a Roman knight, who paſſed down the *catadromus* mounted on an elephant's back. In Ner. cap. xi. p. 5.

CATADUPA, a CATARACT, or water-fall.

The word comes from κατὰ, *downwards*, and δοῦπος, *to make a noiſe by falling*.

The appellation *catadupa* ſeems to have been peculiarly given to a place in Æthiopia joining on Egypt, where the Nile, which here firſt aſſumes that name, ruſhed down a deep rock into a ſubjacent plain, with a noiſe ſo impetuous, that the inhabitants are ſaid to have loſt all ſenſe of hearing. Plin. Hiſt. Nat. lib. v. cap. 9. Ammian. Marc. lib. xxii. cap. 34, &c. Senec. Nat. Quæſt. lib. iv. cap. 2.

CATADUPI, Καταδουποι, an appellation given by the ancients to the inhabitants about the cataracts of the Nile. See CATARACT.

The *catadupi* are repreſented as all deaf: being made ſo by the continual din of the falling waters.

CATAFALCO, an Italian term, literally ſignifying *ſcaffold*. It is chiefly uſed for a decoration of architecture, ſculpture, and painting; raiſed on a timber ſcaffold, to ſhew a coffin, or tomb, in a funeral ſolemnity.

CATAGMATICS, medicines proper to ſolder, and unite broken bones; by promoting the formation of a callus.

The word comes from κατὰ *againſt*, and ἄγνυμι, *I break*.

The principal *catagmatics*, are the Armenian bole, gum tragacanth, oſteocolla, Cyprus nuts, frankincenſe, aloes, and acacia. See CONSOLIDATION.

CATAGOGION, Καταγωγιον, a heathen feſtival at Thebes, celebrated on the twenty ſecond of January, in which the devotees run about the ſtreets dreſſed in divers antic and unſeemly manners, with huge cudgels in their hands, and carrying with them the images of their gods in which guiſe they ravithed the women they met with, abuſed, and often killed the men, and committed many other diſorders, to which the religion of the day gave a ſanction. Du-Cange.

CATAGRAPHA, Καταγραφὰ, in *Antiquity*, denote oblique figures, or views of men's faces; anſwering to what the *moderns* call PROFILES.

Catagrapha are ſaid to be the invention of Simon Cleonæus, who firſt taught painters to vary the looks of their figures, and ſometimes direct them upwards, ſometimes downwards, and ſometimes ſidewards or backwards. Plin. Hiſt. Nat. lib. xxxv. cap. 8. cum. Not. Hardouin.

CATALECTIC, a term in poetry.—The ancients called *catalectic verſes*, thoſe which wanted either feet or ſyllables; in oppoſition to *acatalectics*, which are complete verſes wanting nothing.

The word comes from κατὰ and λῆγω, *I end*.

CATALEPSIS, CATALEPSY, from καταλαμβάνω, *to ſeize*, in *Medicine*, a kind of apoplexy; or drowſy diſeaſe, wherein the patient is taken ſpeechleſs, ſenſeleſs, and fixed in the ſame poſture wherein the diſeaſe firſt ſeized him; and his eyes open, without ſeeing, or underſtanding.

Catalepſis is the ſame with what is otherwiſe denominated CATOCHE, or *catochus*, and *galetia*, or *rongedia*.

Some alſo make it the ſame with COMA *vigil*; others will have it different; though wherein the diſtinction lies it is not eaſy to aſſign.

This diſeaſe is very rare, nor is it eaſy to aſſign its cauſe. Boerhaave takes the immediate cauſe to be an immobility of the common ſenſory, in the ſituation of the firſt aceſs; whence comes an abſolute ſtagnation of the blood in the brain, and a ceſſation of all the functions of the brain, as well as thoſe depending thereon; the muſcles alone remaining in their firſt tenſion; and reſpiration, and the pulſe, preſerved, though generally weak.

It is uſually preceded by a long intermitting fever, a melancholic dry temperature, a ſuppreſſion of the menſes, or hæmorrhoids, great frights, and intenſe, continued meditation on one object.

Upon diſſection, the arteries and veins of the cerebrum are found very turgid, and the blood cloſe rammed in them: it is ſometimes cured by copious hæmorrhages of

the

the nose; sternutatories, vomitives, and vesicatories, are likewise applied to good purpose.

It seldom passes into any other disease; though sometimes into an epilepsy, convulsions, madness, or atrophy; but it commonly ends in death.

In the History of the Royal Academy of Sciences at Paris, we have an account of a woman who had a surprising *catalepsy*, her members keeping all the postures they were put into, as if she had been made of wax. Ann. 1738. See VALERIAN.

CATALOGUE, a list or enumeration of the names of several books, men, or rather things; disposed according to a certain order.

Catalogues of books are digested in different manners, some according to the order of the times when the books were printed, as that of Maittaire; others according to their form and size, as the common booksellers *catalogues*; others according to the alphabetical order of the author's name, as Hyde's *Catalogue* of the Bodleian Library; others according to the alphabetical order of matters or subjects, which are called real or classical *catalogues*, as those of Epernius and Draudius; lastly, others are digested in a mixed method, partaking of several of the former, as M. Seine's *catalogue* of cardinal Sfondrate's library, which is first divided according to the subjects of sciences, and afterwards the books in each are recited alphabetically.

The most applauded of all *catalogues* is that of Thuanus's library, in which are united the advantages of all the rest. It was first drawn up by the two Puteani in the alphabetical order, then digested according to the sciences and subjects, by Hhm. Bullialdus, and published by F. Quetif at Paris in 1679; and reprinted, though incorrectly, at Hamburgh, in 1704. The books are here ranged with justness under their several sciences and subjects, regard being still had to the nation, sect, age, &c. of every writer. Add, that only the best and choicest books in every subject are found here, and the most valuable editions. Yet the *catalogue* of M. le Tellier, archbishop of Rheims' library, made by M. Clement, is not inferior to any published in our age, either on account of the number and choice of the books, or the method of its disposition. One advantage peculiar to this *catalogue*, is the multitude of anonymous and pseudonymous authors detected in it, scarce to be met with elsewhere. Some even prefer it to Thuanus's *catalogue*, as containing a greater variety of classes and books on particular subjects. Bibliotheca Thuana, Par. 1679, 8vo. 2 vols. and Hamb. 1704, fol. and 8vo.

The conditions required in a *catalogue* are, that it indicate at the same time the order of the authors and of the matters, the form of the book, the number of volumes, the chronological order of the editions, the language it is written in, and its place in the library; so as that all these circumstances may appear at once, in the shortest, clearest, and exactest manner possible. In this view, all the *catalogues* yet made will be found to be defective.

An anonymous French writer has laid down a new plan of a *catalogue*, which shall unite all the advantages, and avoid all the inconveniencies of the rest. Let. à l'Abbé***, sur un Nouveau Projet de *Catalogue* de Bibliotheque. Par. 1732.

The Jesuits of Antwerp have given us a *catalogue* of the popes; which makes what they call their *Prophecies*.

CATALOGUS *of the stars*, is a list of the fixed stars, disposed in their several constellations; with the longitudes, latitudes, &c. of each.

The first who undertook to reduce the fixed stars into a *catalogue*, was Hipparchus Rhodius, about one hundred and twenty years before Christ; in which he made use of the observations of Timocharis and Aristyllus, for about one hundred and eighty years before him. Ptolemy retained Hipparchus's *catalogue*, containing 1026 fixed stars; though he himself made abundance of observations, with a view to a new *catalogue*, A. D. 140. About the year of Christ 880, Albategni, a Syrian, brought down the same to his time. Anno 1437, Ulugh Beigh, king of Persia and India, made a new *catalogue* of 1092 fixed stars; since translated out of Persian into Latin, by Dr. Hyde. The third who made a *catalogue* from his own observations, was Tycho Brahe; who determined the place of seven hundred and seventy-seven stars, for the year 1600, which Kepler, from other observations of Tycho, afterwards increased to the number of one thousand, in the Rudolphine tables: adding those of Ptolemy, omitted by Tycho, and of other authors, so that his *catalogue* amounts to above 1160. At the same time, William landgrave of Hesse, with his mathematicians, Christopher Rothmannus and Justus Byrgius, determined the places of four hundred fixed stars, by his own observations, with their places rectified for the year 1593; which Hevelius prefers to those of Tycho's. Riccioius, in his Astronomia Reformata, determined the places of one hundred and one stars, for the year 1700, from his own observations: for the rest he followed Tycho's *catalogue*; altering it where he thought fit. Anno 1667, Dr. Halley, in the island of St. Helena, observed three hundred and fifty southern stars, not visible in our horizon. The same labour was repeated by F. Noel, in 1710, who published a new *catalogue* of the same stars constructed for the year 1687.

Bayer, in his Uranometria, published a *catalogue* of 1160 stars, compiled chiefly from Ptolemy and Tycho, in which every star is marked with some letter of the Greek alphabet; the biggest star in any constellation being denoted by the first letter, the next by the second, &c. and if the number exceeds the Greek alphabet, the remaining stars are marked by letters of the Roman alphabet, which letters are preferred by Flamsteed and by Senex on his globes. The celebrated Hevelius composed a *catalogue* of 1888 stars, 1553 of which were observed by himself: and their places were computed for the year 1660.

The last, and greatest, is the Britannic *catalogue*, compiled from the observations of the accurate Mr. Flamsteed; who for a long series of years devoted himself wholly thereto. As there was nothing wanting either in the observer, or apparatus, we may look on this as a perfect work, so far as it goes. It is a pity the impression had not passed through his own hands: that now extant, was published by authority, but without the author's consent: it contains 2734 stars. There was another published in 1725, pursuant to his testament; containing no less than 3000 stars, with their places rectified for the year 1689: to which is added Mr. Sharp's *catalogue* of the southern stars not visible in our hemisphere, adapted to the year 1726. See vol. iii. of his Historia Cœlestis, in which are printed the *catalogues* of Ptolemy, Ulugh Beigh, Tycho, the Prince of Hesse, and Hevelius; together with an account of each of them in the Prolegomena.

CATALONGAY, in *Botany*, the name given by some authors to the plant which produces the *faba sancti Ignatii*, or St. Ignatius's beans, of the shops.

CATALLIS *capta nomine districtionis*, in *Law*, a writ, which lies where a house is within a borough, for rent issuing out of the same, and warrants the taking of doors or windows by way of distress.

CATALLIS *reddendis*, in *Law*, a writ that lies where goods being delivered to persons to keep till a certain day, are not on demand delivered on that day.

CATALS, *Catalla*, denote goods or CHATTELS.

CATAMARAN, *Catimaran*, in *Sea Language*. See FLOAT.

CATAMENIA, from κατα and μην, *month*, in *Medicine*, women's monthly purgations, called also MENSES.

CATANADROMI, in *Ichthyography*, a term of the same signification with the more common word *anadromi*, the distinctive term of a set of fishes, which at times leave the fresh water for the salt, and afterwards return to the fresh water again. See ANADROMOUS.

CATANANCHE, in *Botany*. See *Cupid's Dart*.

CATAPAN or CATTIAN, a name the later Greeks, about the twelfth century, gave the governor of their dominions in Italy.

Ughellus and others say, *catapan* was the same with *capitaneus*; formed therefrom by metathesis, or transposition; others derive it from κατα, *juxta*, and πας, *omnis*; in which sense, *catapan* was a governor-general, or magistrate, who had the direction of all: others will have it derived from κατα καιτοχαρχα, that is *next after the emperor*. In which sense, *catapan* was a second master, *secundus dominus*. Du-Cange derives it from κατεχων, *captain*; which the Greeks applied to every governor, and even every man of quality.

CATAPASM, a dry medicine, composed of a mixture of powders to be sprinkled on the body.

The word comes from κατα, *in*, and πασσω, *I sprinkle*. There are *catapasms* of divers kinds; some odoriferous, used in the way of perfume; others fortifying, applied to the stomach, heart, or head; and others escharotic, for eating off dead flesh.

CATAPELTA, an instrument of punishment, in use among the ancients. It consisted of a kind of piers, composed of planks, between which the criminal was crushed to death.

CATAPELTÆ, in *Ancient Writers*, sometimes denote arrows, and sometimes engines wherewith either arrows, stones or even huge pieces of timber were cast. Pliny ascribes the invention of the *catapultæ* to the Syrians; Plutarch and Diodorus to the Sicilians.

It is more frequently written CATAPULTA.

CATAPHORA, in a theme of the heavens, an appellation

given to the houses falling from the third, fifth, ninth, and twelfth angles. In which fenſe the word ſtands oppoſed to *anaphora*.

CATAPHORA, a kind of lethargic, or drowſy diſeaſe; the ſame with what is otherwiſe called COMA. See alſo CARUS.

The word is compounded of *κατὰ*, or *κατ᾽*, *downwards*, and *φερω*, *to bear*.

CATAPHRACTA, from *κατὰ*, and *φραττω*, *I fortify*, or *arm*, in the *Ancient Military Art*, a piece of heavy defenſive armour, formed of cloth or leather, fortified with iron ſcales or links, wherewith ſometimes only the breaſt, ſometimes the whole body, and ſometimes the horſe too was covered.

It was in ancient uſe among the Sarmatians, Perſians, and other Barbarians. The Romans alſo adopted it early for their foot; and, according to Vegetius, kept to it till the time of Gratian, when the military diſcipline growing remiſs, and field exerciſes and labour diſcontinued, the Roman foot thought the *cataphractæ*, as well as the helmet, too great a load to bear, and therefore threw both by, chooſing rather to march againſt the enemy bare-breaſted: by which, in the war with the Goths, multitudes were deſtroyed. Tacit. Hiſt. lib. i. cap. 79. Veget. de Re Mil. lib. i. cap. 20.

CATAPHRACTA, among *Surgeons*, denotes a BANDAGE of the thorax; thus denominated from its reſemblance to a Roman breaſt-plate, called *cataphractæ*.

CATAPHRACTÆ *naves*, thoſe armed and covered in fight, ſo that they could not be eaſily damaged by the enemy. They were covered over with boards or planks, on which the ſoldiers were placed to defend them: the rowers ſitting underneath, thus ſcreened from the enemies weapons.

CATAPHRACTUS, denotes a thing defended or covered on all ſides with armour.

CATAPHRACTUS, or CATAPHRACTARIUS, more particularly denotes a horſeman, or even horſe armed with a CATAPHRACTA.

The *cataphracti equites* were a ſort of cuiraſſiers, not only fortified with armour themſelves, but having their horſes guarded with ſolid plates of braſs or other metals uſually lined with ſkins, and wrought into plumes of other forms. Their uſe was to bear down all before them, to break in upon the enemies ranks, and ſpread terror and havock wherever they came, as being themſelves invulnerable and ſecure from danger. But their diſadvantage was their unwieldineſs, by which, if once unhorſed, or on the ground, they were unable to riſe, and thus fell a prey to the enemy.

CATAPHRACTUS *piſces*, in *Zoology*. See PODGE.

CATAPHRYGIANS, a ſect in the ſecond century, ſo called as being of the country of Phrygia.

They were orthodox in every thing, ſetting aſide this, that they took Montanus for a prophet, and Priſcilla and Maximilla for true prophetteſſes, to be conſulted in every thing relating to religion; as ſuppoſing the Holy Spirit had abandoned the church. See MONTANIST.

CATAPLASM, popularly called *poultice*, an external medicine, in form of a pulp; of a ſoft conſiſtence, like an unguent, or cerat; compoſed of various liquors, parts of plants, oils, unguents, &c. according to the variety of intentions.

The word comes from the Greek *καταπλασσω*, *illino*, *I ſmear* or *apply outwardly*.

Its ordinary uſes are, to aſſuage pain, and ſoften, reſolve, diſcuſs, or ſuppurate, matter collected in the external parts of the body.

The common *cataplaſm* for theſe intentions, is compoſed of white bread, milk, yolks of eggs, ſaffron, and oil of roſes.

CATAPLASMA *cymino*, *the cummin-ſeed cataplaſm*, a form of medicine preſcribed in the late London Diſpenſatory, and meant as a ſubſtitute for the London treacle of former Diſpenſatories, which has of late been uſed only externally, and for ſuch purpoſes as it is thought this will better ſerve for. The compoſition is this: take cummin-ſeeds, half a pound; bay-berries and leaves of ſcordium dried, of each three ounces; of cloves, one ounce; honey, three times the weight of the whole: mix all together into a *cataplaſm*.

CATAPLASMA *matarum*, a form of medicine in the late London Pharmacopœia ordered to be made in the following manner: take dried figs, four ounces; yellow baſilicon, one ounce; ſtained galbanum, half an ounce: beat well the figs in a little wine or ſtrong ſtale beer, and then carefully mix in the ointment, firſt melted with the galbanum.

CATAPOTIA, from *καταπινω*, *I ſwallow*, dry medicines, in a form fit to be ſwallowed whole: otherwiſe called *pilæ*.

CATAPULTA, a military machine, uſed among the ancients, for throwing huge ſtones, and ſometimes, large darts and javelins, twelve or fifteen feet long, on the enemy.

The word is originally Greek, from *κατὰ* and *πελτη*, and according to Heſychius, denotes a ſpear or dart. Hence it is ſometimes alſo written *catapeltes*.

The *catapultæ* were alſo denominated *ſcorpiones*, becauſe they threw ſharp wooden weapons; whereas thoſe caſt by the *balliſtæ* were obtuſe, viz. ſtones.

The *catapultæ* conſiſted of two huge timbers, like maſts of ſhips, placed againſt each other, and bent by an engine for the purpoſe; theſe being ſuddenly unbent again by a ſtroke of a hammer, threw the javelins with incredible force. Its ſtructure, and manner of working it, are deſcribed by Vitruvius; and a figure of it is alſo given by Perrault. M. Folard aſſerts, that the *catapultæ* made infinitely more diſorder in the ranks, than our cannon loaded with cartridges. Vide Vitruv. de Archit. lib. x. cap. 15. & cap. 18. Perr. Not. ad eund. p. 335.

The *catapultæ* is ſaid to be the invention of the Syrians. Some authors make it the ſame with the *balliſtæ*; others different.

CATAPUTIA, a medicinal plant, commonly called the *leſſer ſpurge*. It purges with ſuch violence, both upwards and downwards, that few phyſicians now venture to preſcribe it.

CATARACT *of water*, a fall, or precipice, in the channel, or bed of a river; cauſed by rocks, or other obſtacles, ſtopping the courſe of its ſtream; from whence the water falls with a noiſe and impetuoſity.

The word comes from *καταῤῥησσω*, *I tumble down with violence*; compounded of *κατα*, *down*, and *ῥησσω*, *deſcio*, *I throw down*.

Such are the *cataracts* of the Nile, the Danube, Rhine, &c.

In that of Niagara, the perpendicular fall of water is 137 feet: and in that of Piſſill Rhaiadr, in North Wales, the fall of water is near 240 feet from the mountain to the lower pool.

Strabo calls that a *cataract*, which we call a *cascade*: and what we call a *cataract*, the ancients uſually called a *catadupa*. Herminius has an expreſs diſſertation De admirandis mundi *Cataractis* ſupra & ſubterraneis; where he uſes the word in a new ſenſe; ſignifying, by *cataract*, any violent motion of the elements.

CATARACT, from *καταῤῥησσω*, *I confound*, in *Medicine*, a ſuffuſion of ſight, ariſing, according to the opinion of the ancients, from a little film or pellicle, which, ſwimming in the aqueous humour of the eye, and getting before the pupil, intercepts the rays of light.

They ſuppoſed that the *cataract* was formed by a condenſation of the more viſcous parts of the aqueous humour, between the uvea and the cryſtalline: though ſome take it to be a pellicle, detached from the cryſtalline itſelf; which is only an aſſemblage of ſeveral little pellicles laid over one another.

There are two kinds of *cataracts*, the *genuine*, and *ſpurious*: the firſt owing to an humour amaſſed in the eye, coagulated and fixed therein, and deſtroying its uſe: the latter ariſing from fumes or vapours thrown upon the eye by ſome accident; as in a fever, &c. The genuine *cataract* has ſeveral degrees and ſeveral names: at firſt the patient ſees, as it were, clouds, moats, flies, &c. diffuſed over the objects in view: thus far the *cataract* is called *incipiens*: there being nothing yet appearing to the eye of another perſon. As the ſuffuſion increaſes, the pupil begins to appear of a ſea-green colour; ſometimes like the air full of clouds; and then the *cataract* is called *mater* or *mater-ſuffuſa*: when the evil is arrived at its height, and the matter is ſufficiently coagulated, the patient loſes all ſight; the pupil ceaſes to be tranſparent, and becomes white, or brown, or of ſome other colour: this laſt ſtate is what we properly denominate a *cataract*.

But the modern anatomiſts and ſurgeons, ſuch as Heiſter, Briſſeau, and others, have adopted and eſtabliſhed a new ſyſtem, with reſpect to the cauſe and ſeat of this diſorder. Obſerving the beginning and progreſs of a *cataract*, it has been found, that at firſt it lies ſo deep as ſcarcely to be diſtinguiſhed; whereas, if it was a membrane or an inſpiſſation of the aqueous humour, and ſituated in the poſterior chamber of the eye behind the *iris*, it might be eaſily perceived, nor would it appear to lie ſo far within the eye. In the progreſs of the diſorder, and when the patient complains of dimneſs of ſight, a whiteneſs is obſerved very deep on the inſide, without any apparent inſpiſſation of the aqueous humour: a circumſtance which ſeems to prove, that the cryſtalline humour begins to become opake: afterwards the cryſtalline advances towards the hole of the pupil, and the ſight leſſens gradually, till the *cataract* comes near the pupil and cloſes it. No ſuch change of ſituation, it has been obſerved, could take place, were the diſeaſe occaſioned by a membrane produced in the aqueous humour, or by an inſpiſſation of this humour. It has alſo been found in the operation

for the *cataract*, that, after it has been depressed and the needle raised, an opake body, in the form of the crystalline humour, appears through the hole of the pupil, adhering to the end of the needle. To which we may add, that, in an operation of this kind, when the eye was drawn out of the orbit and opened, the crystalline humour was found in the bottom of the globe of the eye at the posterior and inferior part of the pupil, to which place the operator had depressed it: it is likewise added, that after the *cataract* is depressed, the patient cannot see without the assistance of a lens to supply the defect of the crystalline.

A true *cataract* is therefore defined to be an alteration of the crystalline humour, which loses its natural transparence, becomes opake, and at length hinders the rays of light from passing to the bottom of the eye, to make the necessary impression on the retina. It must be remembered, however, that, though the *cataract* is impervious to the rays of light, some of them pass obliquely between the iris and *cataract*, so that the eye is still able to distinguish light and glaring colours. The crystalline, in this disease, is changed into a cream colour, a pearl colour, a yellow colour, or a darkish grey, &c. It has been said that it sometimes becomes greenish, though Mr. Sharpe in a great number of *cataracts*, never met with a single instance of this kind: and on this account, it is called by the Greeks *glaucoma*, which is the same disease with the *cataract*.

In some cases, the *cataract* adheres to the iris; and if there be a complete adhesion of these parts, the eye is incapable of seeing at all; and, therefore, as no judgment can be formed of the state of the retina or of the vitreous humour, Mr. Warner thinks, these are sufficient reasons for forbidding the operation of *couching*: and he observes, with respect to the operation of dividing the iris from the *cataract*, which was invented and recommended by Mr. Cheselden, that he never saw a single instance of success from it, and therefore that it is in no circumstance advisable.

Cataracts arising from very different causes: sometimes they are the consequence of blows, wounds, or punctures; but not often. When they are produced by external causes, little relief can be obtained from manual operation, because other parts of the eye may be injured, and the disease is truly complicated. When the *cataract* arises from an internal cause, it is always the consequence of obstructions in the nutriment and secreting vessels of the crystalline humour; and when this is the only visible defect in the eye, the patient derives great advantages from an operation.

Though it be, generally speaking, true, that the cause of *cataracts* is the opacity of the crystalline humour; yet it is certain, that a real membrane has been sometimes, though rarely, found, covering the pupil, or the socket of the vitreous humour which lies behind the crystalline, or formed by a kind of pus extravasated into the aqueous humour, in consequence of an inflammation of the choroides.

Cataracts have been distinguished, by surgeons and oculists, into various sorts; as into recent and inveterate, incipient and confirmed, mature and immature, simple and complicated, immoveable and shaking, milky and purulent, true and spurious, curable and incurable: but most of these distinctions, as far as they relate to the nature of the disease, have no sufficient foundation in nature, owing their diversity of character more to the imagination of writers, than to any variety of the disease itself.

Celsus, and after him Heister, have recommended the use of medicinal remedies in an incipient *cataract*. In a case of this kind, whatever is capable of attenuating the juices, of unloading the distended vessels, and of driving a portion of their juices to distant parts of the body, appears to be capable of doing considerable service, though it may be little depended on in a confirmed *cataract*. But when the disorder is grown mature and inveterate, recourse must be had to manual operation: in order to the success of which, much depends on the nature of the disease, and the degree of its maturity. If the adhesion of the *cataract* to the uvea partial, and the retina be perfect, there will be a sufficient quantity of the rays of light transmitted obliquely, between the iris and the *cataract*, to the lateral parts of the retina, to enable the patient to distinguish light, and sometimes too such bodies as are white or red. To judge of this, when the operator cannot distinguish it by his sight, let him shut the patient's eye, and rub the lids a little; then suddenly opening it, he will perceive the pupil to contract, if the crystalline humour does not prevent the action by its adhesion. The general criterion of the fitness of *cataracts* for the operation is taken from their colour; the pearl-coloured, and those of the colour of burnished iron, are esteemed proper to endure the needle, and the maturity of the *cataract* may be judged of by its appearing in every part of an equal opacity; by the patient's not distinguishing an object presented to him, when he is placed with his back to the light, provided the disease be not one of those *cataracts*, in which the crystalline remains in the middle of the posterior chamber of the eye. The operator should likewise examine the diseased eye exposed to the light; if he finds the crystalline of an equal opacity, let him close the patient's eye with his thumbs, then rub the upper lid of that eye which has the *cataract*, and, keeping the other eye shut, let him open the lids: if he finds the light, which falls on the pupil, makes the iris contract; and though exposed to the same light, it dilates to the half, or the quarter, of that degree to which it was contracted; he may be assured the *cataract* is ripe.

CATARACTA, *couching of*. This operation is performed by penetrating the globe of the eye with the *couching* needle through the *tunica conjunctiva*, and *albuginea*, at a very small distance beyond the circumference of the *cornea cornea*, and as exactly as possible in a line with the most external part of the circle of the pupil. The needle should be introduced through the coats of the eye, viz. the *tunica conjunctiva*, *albuginea*, *sclerotica*, *choroides*, and *tunica retina*, with the flat surfaces of the instrument directed upwards and downwards, as less violence will be done to the coats of the eye in this way, than if the blade had penetrated the eye in a transverse direction. The instrument should be then cautiously pushed forwards, till it appears behind the pupil, which it will always do, when the eye remains transparent, and the eye-lids are kept open. The operator next endeavours to press the *cataract* gently downwards, and a little outwards, with the flat surface of the instrument; and if the *cataract* should not readily submit, the needle must be carefully moved under it, and gently raised up, by which means the *cataract* may be separated from the *processus ciliares*, and *uvea* below, and at the same time be disengaged from the inferior portion of the *tunica iris*, supposing it to be slightly connected with that membrane. After the *cataract* is thus lifted up, the position of the *couching* needle must be altered, and directed a little above the upper portion of the circle of the pupil; afterwards inclining the instrument downwards, and obliquely outwards. Great care should be taken not to wound the *iris* or the *processus ciliares*. Thus the *cataract* will sometimes be so effectually dislocated from the bed of the vitreous humour, and its nutrient vessels so perfectly destroyed, as to bring on its gradual decay. When the operation is finished, the patient's eye-lids must be shut, and covered with a rag, dipped in a solution of *saccharum saturni*, or the *goulard's extract compos.* in cold rose-water, or the *aqua vitæ simplex* mixed with brandy, which must be very gently bound on with a soft linen roller. The patient should be let bleed, and kept in a dark place during the continuance of the inflammation. He should sit up for some hours after the operation, in order to prevent the ruling of the *cataract*, and live abstemiously, taking only such food as requires little chewing. The *cataract* is sometimes apt to rise again, after it has been depressed, so that it has been necessary to repeat the operation; for the prevention of which, particular care should be taken to destroy as effectually as possible the *uvea*, by moving the blade of the instrument in different directions. Watzer. See *Couching* NEEDLE, and SPECULUM *oculi*.

CATARACTA, *extracting of*. M. Daviel, in 1745, first began this operation to the cure of the *cataract*; and out of a hundred and fifteen different operations, a hundred succeeded. Though it is said that Mr. St. Yves practised it about forty years before. It is thus described by Dr. Hope, who saw M. Daviel perform it. After having placed the patient in a right line in the chair, he places himself over against, and somewhat higher than the patient: an assistant holds the head steady, and another keeps the upper eye-lid open whilst he with his left hand, keeps open the lower eye-lid. Then he takes an instrument like a lancet, of a myrtle-leaf point, a little crooked upwards, and fixed in a handle; and, making the patient look upwards, he pierces the *cornea* transparent at its lower circumference, just where it joins the *sclerotica*, and conveys the point of the instrument between the cornea and *iris* upwards, beyond the pupil. He enlarges this opening on each side by the same instrument; taking out this instrument, he introduces another in the shape of a narrow knife, made round at the point and fixed in a handle; with this he enlarges the opening. When this is removed, he introduces a pair of crooked scissars, with which the opening is enlarged on each side by different snips, always as near as possible to the circumference of the cornea, until he has made the opening round two thirds of the corner. He then takes out the scissars, and with

with a small instrument like an ear-picker raises the cornea, and with a *cataract* needle in his hand, broader and stronger than common, and pointed like a lancet, he cuts the capsula of the crystalline through the pupil: then pressing gently the globe of the eye with his finger from below upwards, the crystalline flips out of the capsula, and drops out of the eye. The aqueous humour is discharged upon the first puncture, and the cornea and iris join together. Great skill and care are necessary, in order to avoid wounding the iris, which would endanger the eye. The whole operation requires about two minutes, and is attended with little or no pain. This operation is in many respects preferable to *couching*; as it may be performed at all times, and in all kinds of *cataracts*, whether they are come to maturity or not, and many accidents are avoided. The principal accident to which this operation is liable, is an excessive evacuation of the vitreous humour at the time of performing it, which may occasion a sinking down of the globe of the eye, a deformity, and an irrecoverable loss of sight. Phil. Trans. vol. xlvii. p. 530; vol. xlviii. p. 322 and Warner's Description of the human Eye, &c. and Diseases, &c. p. 200, &c.

Those who would be farther informed on this subject, may consult Heister, Sharp, Warner, &c.

CATARACTA, in *Ornithology*, the name of a bird of the LARUS or *sea-GULL* kind, very much approaching to the nature of our *gannet*, but smaller, and with shorter and weaker claws. It much resembles the *gannet*. Its back and wings are variegated with brown, yellow, and white; its breast and belly are white, variegated with brown spots; its wings are long, and, when folded, reach to the end of the tail; its legs are grey; its feet webbed, and its claws crooked and small. Aldrovand. de Avibus. See SKUA.

CATARACTES, in *Ornithology*, a name by which some authors have called the large SEA-*gull*, called in Cornwall, where it is very common, the CANNET.

CATARRH, in *Medicine*, an extraordinary distillation, or defluxion of a sharp, serous humour, from the glands, especially about the head and throat, upon the parts subjacent.

The word is formed from *κατα῾ιω, defluo, I flow down*. *Catarrhs* are generally occasioned by a diminution of insensible perspiration on taking cold; the effect whereof is, that the lymph, that should pass by the skin, oozes out upon those glands; and being thus extravasated, occasions irritations, coughs, and all the usual symptoms. See COUGH.

Degory discloses all diseases from *catarrhs*, which he looks upon as the seminary of most disorders of the body.

Catarrhs are of as many species as the parts on which the rheum or matter falls. Hippocrates enumerates eight kinds of defluxions from the head, viz. on the eyes, nose, ears, breast, abdomen, spinal marrow, *vertebræ*, and muscles of the loins, and *os sacrum*. The moderns allow only of three sorts under the name of *catarrhs*; the first, wherein the matter falls on the nose, more properly called CORYZA; the second, on the *fauces*, called *BRANCHUS*; and the third on the *thorax*, or breast, more particularly denominated a *catarrh*. The sum of which is couched in the following distich:

Si fluit ad nares, dicatur rheuma catarrhus,
Ad fauces branchus, ad pectus ipse coryza.

Sauvages distinguishes a *hot* and a *cold catarrh*; the first attended with an unnatural heat and pain, and a phlogosis of the whole body; the excreted lymph being exceeding thin and sharp: in the cold kind, all the symptoms are more remiss.

Catarrhs are cured by softening the serous humours, and augmenting transpiration, by means of diaphoretics, narcotic medicines, and diuretics. Smoaking of tobacco is recommended as excellent to all *catarrhal* affections in obstinate *catarrhs*, recourse is sometimes had to issues and blisters.

Catarrhous disorders, as well as all other feverish indispositions, are to be treated in a very mild and gentle manner. The patient is to be kept moderately warm, either in bed, or by means of a fire; he is to abstain from medicines which are too hot, drastic, and productive of commotions, as also from hot regimen; because by these the acrid matter is put into commotion, and a fervid disposition conveyed to the parts. The diet is to be spare, and the drink tepid and wholesome. In the decline of the disease, however, when the excretions are begun, it has been observed, that good wine, freely drunk, has proved beneficial; as it promotes the circulation of the blood, and maintains an equable perspiration.

When during the disorder the faeces are indurated, and the patient costive, besides water-gruel, decoctions of manna, prunes, and raisins, nothing is more proper than emollient clysters. When the cough is violent and racking, it is to be allayed with recent oil of sweet almonds, mixed with syrup of maidenhair.

Catarrhs do not arise from the head only, but sometimes also from other parts of the body; the lymphatic vessels, wherein the serosities are contained, as well as the glands that separate them, being distributed all over the body.

CATARRH, *suffocative*, in *Medicine*, the name of a disease, which consists in a copious eruption of a serous and mucous humour into the vesicles of the lungs; which alter its origin from a sudden congestion of humours about the breast, and a flaccid and weak state of the breast and lungs.

CATARRH, *fits of a suffocative*. This disease always seizes the patient at once, without any previous notice; his breath becomes extremely difficult, and the fulness of the breast is easily distinguished by a sound of rattling of a frothy matter at the time of drawing in the breath. There is an immediate debility and loss of strength and spirits, at the patient calls it, but there is in reality a spasmodic tension; this is followed by a restlessness, so that the patient cannot suffer his limbs to be a minute in the same posture or place; and there is always a despondency in the mind, and the patient thinks he is certainly going to die. There is usually either no cough at all, or at utmost, only a very slight and insufficient one, and the very strength to cough is wanting. The breast, and even the ribs are sensibly affected by this disease, and the eyes always look red and tumid.

Persons subject to it. Scarce any one is ever seized with this disease, except such as are, according to the common acceptation of the word, troubled with habitual *catarrhs*, or have for many years been subject to defluxions from the head upon the fauces and lungs; and the persons most of all subject to it, are old men of a phlegmatic and plethoric habit, and who are of that kind of temperament which subjects people, at other times, to gutta and apoplexies. Lean persons are scarce ever afflicted with this disorder, unless they have long laboured under a violent cough, or have ulcerous affections of the lungs.

Young people are also very little subject to this disease, excepting only such as are very corpulent and phlegmatic, and already habituated to large defluxions of this kind. Infants also, which are very fat, and have had a sudden suppression of their natural sweats, sometimes fall into this disease, but with them it is not so violent.

Causes of it. The occasional causes of this disease are seen in what has been already observed, but its true origin is to be sought for in the head, not in the breast or lungs; yet, though it is easy to see what may occasion a congestion of such serous humours in the upper parts, it is difficult to say how the lungs become rendered fit to receive it all at once in this dangerous manner. It is accidentally brought on in children, as well by the repulsion of their cutaneous eruptions, as by the stopping their sweats; and in grown people, from the omission of habitual bleedings, from coldness and dampness in the air, from frequent drunkenness, and from an injudicious treatment of cutaneous humours, and particularly from drying up runnings of the eyes. Junker's Consp. Med. p. 509.

Prognostics in it. It is a very terrible disease, and very speedily proves fatal; for the patient, if not relieved, usually dies in twenty-four hours. Sometimes it degenerates into a fever, and the person seems cured by the change; but the remedy in this case proves as bad as the disease; for the fever proves incurable, and becomes a settled hectic, attended with terrible difficulty of breathing, and finally carries off the patient, after making him endure, for some time, a life of terrible pain. Sometimes it goes off into an asthmatic laxity of the breast, attended with a cough, and a continual discharge of large quantities of mucous matter by spitting; and sometimes into an absolutely cachectic laxity of the body and in general, if not carefully treated from the beginning, it either entails some of these disorders upon the patient, or leaves him in so poor and weak a constitution, that he becomes easily liable to all the diseases of this kind from the slightest occasions.

Grown persons are sooner taken off by this disease than young children, with whom it sometimes continues above a week or a fortnight. In old people, the fatal event of the disease is so sudden, that it is often dubious whether it were this disorder, or an apoplexy; and in general it seems probable, that many of the persons said to die of apoplexies, &c. in reality, of the violent attacks of this terrible disease.

Method of cure. In the time of the fit a stimulating clyster must be given, made of a decoction of marjoram, and other warm herbs, with colocynth, and a few grains of euphorbium, in order to abate the infarction of the breast, and give a new course to the matter that might add to it;

and

and when there appears to be a plethora beſides, a vein muſt be immediately opened after the cliſter. After this, if the ſtomach be nauſeating and uneaſy, let a ſcruple of ſalt of vitriol be given as a vomit, with a large quantity of warm water; and if the patient is of a very phlegmatic habit, a few grains of gamboge may be added to this, to carry the humour off downward; or, if the caſe be very preſſing, a draught of a decoction of aſarum, or of tobacco, may be taken, the bad effects of which laſt are taken off by a draught of wine with the ſpices; and all this time there may be frictions and ſinapiſms applied to the lower extremities: and finally, to attenuate and diſcuſs the mucous ſtaſis, gentle alexipharmics and ſudorifics may be given, ſuch as the eſſence of amber, tincture of ſalt of tartar, and tartarized tincture of antimony; and all nitrous medicines are alſo of the greateſt uſe, as they partly mitigate the cauſes, and partly prepare the humours for evacuation; and after all theſe, the *cortex cinchonæ* is of great uſe in diſcuſſing and mitigating the pain.

As ſoon as the fit is over, the corroborating medicines are to be given, and all things that can reſtore the parts to their due tone: of this number are the milder chalybeats, and the like; and with theſe analeptics are to be given, to recruit the fleſh and ſtrength, ſuch as emulſions, and a proper diet; and in ſuch as are uſed to wine, the richeſt wines, in moderate quantities, and the higheſt foods will be of ſervice. If there be perceived a fever after the other ſymptoms are gone off, this muſt be cured by the gentle alexipharmics, and by powders of nitre, and the abſorbents; and if a chronic indiſpoſition ſeems left behind, then the gums, which act as diſcutients, are to be given for ſome time, ſuch as the ammoniacum and ſagapenum, and a warm regimen is to be recommended. And finally, to prevent a return of the diſeaſe, bleeding is very proper in the ſpring and autumn, and purging medicines taken in the intermediate time; the patient muſt alſo avoid all violent paſſions of the mind, and muſt never ſleep in a damp air. We are not to fear bleeding in the time of the fit, becauſe of the patient's complaining of want of ſtrength; for as the danger of ſuffocation is ſudden and imminent, it muſt be ſuddenly removed, and when that is done, the patient's ſtrength will return in good time: the ſame is alſo to be alleged in favour of the violent vomits. In people of a very phlegmatic habit, bleeding is not neceſſary nor proper; but in theſe caſes a vomit is ſafe and right, and uſually gives great relief, eſpecially if the patient has eaten heartily ſome little time before. Juncker. Conſp. Med. p. 513.

CATARRHAL *fever*, a ſecondary or ſymptomatic fever, by means whereof nature endeavours to correct the vitious quality of the lymph, and expel it from the body.

There is alſo a malignant *catarrhal fever*, nearly akin to the *petechial* FEVER.

CATASARCA, from κατὰ, *under*, and σὰρξ, *fleſh*, in the Greek *Church*, denotes the undermoſt alter-cloth, or that next the ALTAR.

Over the *cataſarca* is the ANTIMENSE.

CATASCOPIUM, from κατασκοπεω, *I explore*, in *Antiquity*, an exploratory veſſel, anſwering in ſome meaſure to a brigantine among us. See BRIGANTINE.

We find *cataſcopium* uſed in this ſenſe by Cicero, ad Attic. lib. v. ep. 11.

CATASCOPUS, in *Antiquity*, denotes a SPY.

In *Eccleſiaſtical Writers*, *cataſcopus* is ſaid ſometimes to denote an archdeacon.

CATASTA, from κατηεμι, *I place*, in *Antiquity*, a wooden ſcaffold wherein ſlaves were placed for ſale naked, that thoſe diſpoſed to purchaſe might ſee every limb and part. The word was alſo uſed for an elevation, on which perſons were executed; and for an engine of torture, otherwiſe called EQUULEUS.

The *cataſta* does not appear to have been the ſame with the *equuleus*, but rather a kind of frame or ſcaffold, on which the *equuleus* was mounted, to render the executions more public and viſible. Prudentius calls the *craticula*, or grid-iron, on which ſome of the martyrs were broiled, *ignea cataſta*.

CATASTASIS, in *Poetry*, the third part of the ancient drama; being that wherein the intrigue, or action, ſet on foot in the epitaſis, is ſupported, carried on, and heightened, till it be ripe for the unravelling in the cataſtrophe.

The word comes from κατασταω, *conſtitution*; this being, as it were, the mean, tenor, ſtate, or conſtitution, of the piece.

CATASTROMATA, from κατασρωμα, *I cover*, in *Ancient Military Writers*, a ſort of ſcaffolds or flootings in ſhips of war, whereon the ſoldiers were poſted for their defence in fight.

The *cataſtromata* appear to have been chiefly erected over the head and ſtern of the veſſel, it being in theſe parts that the ſoldiers were moſt commonly poſted.

CATASTROPHE, from κατασρεφω, *I turn*, in *Poetry*, the change or revolution of a dramatic poem: or the turn which unravels the intrigue, and terminates the piece.

The *cataſtrophe* made the fourth and laſt part in the ancient drama; or that immediately ſucceeding the catalaſis.

The *cataſtrophe* is either *ſimple*, or *implex*; whence alſo the fable and action are denominated.

In the firſt there is no change in the ſtate of the principal perſons, nor any diſcovery, or unravelling; the plot being only a mere paſſage out of agitation, to quiet and repoſe. This *cataſtrophe* is rather accommodated to the nature of the epopea, than of tragedy. Indeed we meet with it in ſome of the ancients, but it is rejected by the moderns. In the ſecond, the principal perſon undergoes a change of fortune; ſometimes by means of a diſcovery, and ſometimes without.

The qualifications of this change, or peripetia, are, that it be probable and neceſſary; in order to be probable, it is required to be the natural reſult or effect of the foregoing actions; i. e. it muſt ſpring from the ſubject itſelf, or take its riſe from the incidents; and not to be introduced merely to ſerve a turn. The diſcovery in the *cataſtrophe* muſt have the ſame qualifications as *the cataſtrophe* itſelf, whereof it is a principal part: it muſt be both probable and neceſſary. To be probable, it muſt ſpring out of the ſubject itſelf; not be effected by means of marks, or tokens, rings, bracelets, or by a mere recollection, as is frequently done, both by the antients and moderns. To be neceſſary, it muſt never leave the perſons it concerns in the ſame ſentiments they had before, but always produce either love or hatred. Sometimes the change conſiſts in the diſcovery; ſometimes it follows at a diſtance; and ſometimes reſults immediately from it, which laſt is the moſt beautiful kind; and thus it is in Œdipus.

Mr. Dryden thinks a *cataſtrophe* reſulting from a mere change in the ſentiments and reſolutions of a perſon, without any farther machinery, may be ſo managed as to become exceeding beautiful, nay preferable to any other. It is a diſpute among the critics, whether the *cataſtrophe* ſhould always fall out happily, and favourably on the ſide of virtue, or not? i. e. whether virtue is always to be rewarded, and vice puniſhed, in the *cataſtrophe*? But the reaſons on the negative ſide ſeem the ſtrongeſt. Ariſtotle prefers a ſhocking *cataſtrophe* to a happy one; becauſe the moving of terror and pity, which is the aim of tragedy, is better effected by the former than the latter.

Boſſu divides the *cataſtrophe*, at leaſt with regard to the epopea, into the unravelling, or *denouement*, and the *achevement*, or finiſhing; the laſt of which he makes the reſult of the firſt, and to conſiſt in the hero's paſſage out of a ſtate of trouble and agitation, to reſt and quiet. This period is but a point without extent, or duration; in which it differs from the *firſt*, which comprehends every thing after the knot, or plot laid. He adds, that there are ſeveral unravellings in the piece; becauſe there are ſeveral knots, which beget one another: the finiſhing is the end of the laſt unravelling.

CATCH-FLY, *Silene*, in *Botany*. See CAUTION.

CATCH-LAND, ſuch land, particularly in Norfolk, with reſpect to which it is not certainly known to what pariſh it belongs; ſo that the perſon who firſt gets the tythes there, enjoys it for that year, by right of preoccupation.

CATCH-POLE, or CATCH-POLL, a term now uſed, by way of reproach for a BAILIFF's follower, or aſſiſtant. Anciently, it was a term of credit, applied to thoſe we now call *ſergeants of the mace*, *bailiffs*, or any other that uſe to arreſt men on any action.

CATCH-WORD, among *Printers*, denotes the firſt word of a page, which is put alſo at the bottom of the preceding page, in order to ſhew how the ſheets and ſheets follow each other, and facilitate the folding and binding.

The French ſometimes only put the *catch-words* at the end of each ſheet, or even quire or gathering.

CATCHES, in *Clock-Work*, thoſe parts of a clock that hold by hooking, and *catching* hold.

CATE, in *Botany*, a name given by ſome authors to the LYCIUM *Indicum*, or Indian thorn.

CATECHESIS, from κατηχεω, *I teach firſt principles*, in a general ſenſe, denotes an inſtruction given any perſon in the firſt rudiments of an art or ſcience, but more particularly in the principles of the Chriſtian religion.

Thoſe who give ſuch inſtructions are called CATECHISTS, and thoſe who receive them CATECHUMENS.

CATECHESIS is alſo uſed for a book containing the rudiments of the Chriſtian religion, adopted to the uſe and inſtruction of novices. See CATECHISM.

The *Catecheſes* of St. Cyril, are the principal works of that father.

CATECHETIC,

CATECHETIC, or CATECHETICAL, something that relates to oral instruction in the rudiments of Christianity. In the early ages of the church there were *catechetic* schools, wherein sacred learning and philosophy were taught. These were public auditories, distinct from the church, but probably adjoining thereto. In a novel of the emperor Leo, they are called κατηχουσεις, and represented as a sort of edifices belonging to the church. St Ambrose speaks of these auditories as held in the baptistery. Bingh. Orig Eccles. lib. iii. cap. 10. § 4.

CATECHISM, *Catechismus*, in its primary sense, an instruction or institution in the principles of the Christian religion, delivered *viva voce*, and so as to require frequent repetitions from the disciple or hearer of what had been said.

Anciently the candidates of baptism were only to be instructed in the secrets of their religion by tradition, *viva voce*, without writing; as had also been the usage among the Egyptian priests, and the British and Gaulish druids, who only communicated the mystery of their theology by word of mouth. Shafteb Charact. vol. iii. p. 241. not.

CATECHISM is more frequently used, in modern times, for an elementary book, wherein the principal articles of religion are summarily delivered in the way of question and answer.

CATECHIST, *Catechista*, he that catechises, i. e. instructs novices in the principles of religion.

CATECHIST more particularly denotes a person appointed by the church to instruct those intended for baptism, by word of mouth, in the fundamental articles of the Christian faith.

The *catechists* of churches were ministers usually distinct from the bishops and presbyters, and had their auditories or *catechumen* apart. Their business was to instruct the catechumens, and prepare them for the reception of baptism. But the *catechists* did not constitute any distinct order of the clergy, but were chosen out of any other order.

CATECHU, a medicinal aromatic substance brought from the East Indies; called also *cachou*, and *japan earth*, and, when prepared, ranked in the number of perfumes. It is of a dark purple colour; very austere upon the palate, seeming to melt in the mouth and leaving somewhat of a sweetish taste behind it. It is the juice of a vegetable, not an earth, as its name imports.

Notwithstanding the great use of *catechu*, before that of coffee and tea, and its being still frequently used by many people, especially in France, its nature and origin were long but little known, even among the ablest physicians. Some, from its being called JAPAN *earth*, ranked it among the medicinal earths, and pretend it is found on the tops of mountains, covered with the roots of cedars, serving, as it is said, for their nutrition; and that being washed in the rivers, and dried in the sun, it was formed into a kind of paste, which, brought into Europe, served as the basis of several pastels, or lozenges, called *cachou*. Others, with more probability, rank it among the gums; and maintain it to be formed of the inspissated decoction of a tree in the East Indies, called *cachou*; growing chiefly in the kingdom of Cochinchina. Lastly, others took it to be a factitious compolition of several other drugs; especially of the juice of *areca*, extract of liquorice and calamus aromaticus, and the bark of a tree called by the Indians *catchu*.

Cachou, or *cachu*, is of much esteem in medicine. It is famous for stopping fluxes of all kinds; and among other effects attributed to it, it is supposed to stop a cough, and fortify the stomach: besides its sweetening and perfuming the breath, when taken in an impalpable powder, mixed with gum tragacanth.

CATECHUMEN, a candidate of baptism; or a person who prepares himself for receiving it.

The word is compounded of κατα, and ηχεω, *I sound*.

The catechumens were distinguished from the *fideles*, not only by name, but also by their place in the church: they were disposed, with the penitents, in the portico, or gallery, at the extremity of the church, opposite to the choir. They were not allowed to assist at the celebration of the eucharist, but after sermon, the deacon dismissed them with this formula, proclaimed three times, *Ite, Catechumeni; missa est.*

There were divers orders or degrees of *catechumens*, in those churches and ages where the term of catechising for two or three years was observed: but what the precise number and appellations of these orders were, is not agreed on. See BELIEVERS.

CATECHUMENUM, a name given to an upper gallery in the ancient churches.

The name *catechumenon* was also given to a sort of schoolhouse near the church, where the *catechumens* met to receive the instructions of the catechists.

CATEGOREMA, from κατηγορεω, *I declare*, is defined a noun substantive, so absolute and independent, that it may stand as the head of a class apart.

CATEGOREMA properly denotes the name whereby a CATEGORY, or class of beings is represented.

CATEGORIÆ, in *Literary History*. Aristotle has a book extant under the title of Κατηγοριαι, which Curio, Tomasius, Vives, and others, deny to be written by him, and ascribe to Andronicus; but without much foundation, since that work is cited as Aristotle's by Simplicius, Ammonius, and Lucianus.

CATEGORIARES, a minister in the Greek church, whose business it is to publish or proclaim the feast days. He had also the care of the lights, and to see the church kept clean.

CATEGORICAL, in a general sense, is applied to those things ranged under a CATEGORY.

CATEGORICAL also imports a thing to be ABSOLUTE, and not restrained to conditions.

In which sense it stands opposed to HYPOTHETICAL and CONDITIONAL.

A *categorical* answer denotes an express and pertinent answer, made to any question or objection proposed.

CATEGORUMENUM, denotes the PREDICATE, or that part of a proposition which is affirmed of the subject.

Some unskilfully call this *categorema*.

CATEGORY, in *Logic*, a system or assemblage, of all the beings contained under any *genus*, or kind; ranged in order.

The word *category* was borrowed by the schools from the *forum*, or courts of justice: for as in a trial, the plaintiff, or prosecutor, in accusing the criminal, or prisoner, must charge him expressly, or affirm that he did, this or that, in positive terms: whence the word *category*, viz. from κατηγορεω, *to accuse, or declare a charge of accusation*: so in the doctrine of *categories* every higher may be expressly and absolutely predicated, or affirmed, of every lower.

The school philosophers distribute all beings, all the objects of our thoughts or ideas, into certain genera, or classes, in order to get a more distinct or precise notion thereof; which classes the Greeks call *categories*, and the Latins *predicaments*.

The ancients, after Aristotle, generally make ten *categories*: under the first all substances are comprised; and all accidents under the nine last; viz. quantity, quality, relation, action, passion, time, place, situation, and habit; which are usually expressed, or signified, by the following technical distich:

Arbor, ſus, ſurcus, ardens, refrigerat, oſtia,
Rura, vias, ſtabo, nec tunicatus ero.

But as these ten *categories* of Aristotle, which logicians make such mysteries of, are arbitrary, they are now almost excluded. Accordingly, some philosophers think all nature may be better considered under these seven things, spirit, matter, quantity, substance, figure, motion, and rest: and others make but two *categories*, substance and attribute, or subject and accident. See on the subject, and in vindication of the *Categories* of Aristotle, Harris's Philosophical Arrangements, chap. ii.

CATELLI, in *Ancient Writers*, a kind of dart or javelin, in use among the ancient Gauls and Germans, made of heavy matter, and therefore not fitted to fly far, but doing great execution where it did reach, having withal an apparatus by which the person who threw it might draw it back again. It is spoken of by Virgil, *Æn.* lib. vii. ver. 741.

Tentatos vitæ pelli vibrare catellos.

CATEMIA, a name given by some of the writers of the middle ages to a soft black stone used in the soldering of silver, and some other metals, and more commonly called *borax fapit.* We do not at this time know what stone they mean.

CATENA, in a general sense, a CHAIN.

CATENA, in *Anatomy*, a muscle, otherwise called TIBIALIS *anticus*.

CATENA *patrum*, in *Ecclesiastical Writers*, denotes a sort of commentary on Scripture, composed of separate passages or interpretations of the fathers, reduced to the order of chapters and verses of the book.

The first who used *catenæ* in this sense was Thomas de Aquinas. The reason of the appellation seems to be this: that as a chain consists of several links connected together, so do these commentaries consist of a number of different passages, or the sentiments and expositions of different writers, tacked together so as to form one work. Fabr. Bibl. Græc. tom. vii. fib. v. cap. 17.

CATENARIA, in the *Higher Geometry*, a mechanical curve line, which a chain, or rope, forms itself into, by its own weight, when hung freely between two points of suspension, whether those points be horizontal or not.

The nature of this curve was investigated by Galileo,

who ſuppoſed it to be the ſame with the parabola; but though Jungius detected this miſtake, it was not diſcovered till the year 1691, when M. J. Bernouilli publiſhed it as a problem in the Acta Eruditorum. Dr. D. Gregory, in 1697, publiſhed a method of inveſtigating the properties before diſcovered by Bernouilli and Leibnitz. Phil. Tranſ. abr. vol. i. p. 39, &c. Where he ſhews, that an inverted *catenaria* is the beſt figure for an arch. Bernouilli Opera, vol. i. p. 48, &c. and vol. iii. p. 491, &c. To conceive the general nature or character of this curve, ſuppoſe a line heavy and flexible (See *Tab. Geom. fig.* 25.) the two extremes of which, F and D, are firmly fixed in thoſe points; by its weight it is bent into a certain curve FAD, which is called the *catenaria*.

Let BD and *bd* be parallel to the horizon, AB perpendicular to BD, and D*d* parallel to AB; and the points B, *b* infinitely near to each other. From the laws of mechanics, any three powers in equilibrio, are to one another, as the lines parallel to the lines of their direction (or inclined in any given angle), and terminated by their mutual concourſes: hence if D*a* expreſs the abſolute gravity of the particle D*d* (as it will, if we allow the chain to be every way uniform), then D*e* will expreſs that part of the gravity, that acts perpendicularly upon D*d*; and by the means of which, this particle endeavours to reduce itſelf into a vertical poſition; and as it proceeds from the ponderous line DA, it is, *cæteris paribus*, proportional to the line AB, which is the cauſe of it. Farther, the lincola *d e*, will expreſs the force which acts againſt that conatus of the particle D*d*, by which it endeavours to reſtore itſelf into a poſition perpendicular to the horizon, and hinders it from doing ſo. This force is conſtant, being no other than the reſiſtance of the point A; and may therefore be expreſſed by any given right line *a*. Suppoſing the curve FAD, therefore, as before, whoſe vertex (the loweſt point of the *catena*) is A, axis AB, ordinate B D; fluxion of the axis D*d*=B*b*; fluxion of the ordinate *d b*; the relation of theſe two fluxions is thus, viz. D*d*: B*b*:: DA curve: *a*; which is the fundamental property of the curve and may be thus expreſſed (putting AB=*x*, and BD=*y*, and AD=*z*)

$$\dot{y} = \frac{a\dot{x}}{z}.$$

CATERER. See PURVEYOR.

CATERGI, the name of the public carriers in the Grand Seignior's dominions, who give earneſt to the merchants, and others, as a ſecurity that they will carry their goods, or not ſet out with them.

CATERPILLAR, *Erucæ*, in *Inſectology*. The *caterpillar* ſtate is that through which every butterfly muſt paſs before it arrives at its perfection and beauty, and in the ſame manner all the known winged animals, except only the PUCERON, paſs through a reptile ſtate, none of them, except this, being produced in their winged form. The change from caterpillar to butterfly was long eſteemed a ſort of metamorphoſis, a real change of one animal into another; but this is by no means the caſe. The egg of a butterfly produces a butterfly, with all the lineaments of its parent, only theſe are not diſcloſed at firſt, but, for the greater part of the animal's life, they are covered with a ſort of caſe, or muſcular coat, in which are legs for walking which only ſuit it in this ſtate; but its mouth takes in nouriſhment, which is conveyed to the included animal, and after a proper time, this covering is thrown off, and the butterfly, which all the while might be diſcovered in it by an accurate obſerver, with the help of the microſcope, appears in its proper form. Before it paſſes into this ſtate, however, there requires a time of reſt for the wings to harden, and the ſeveral other parts to acquire their proper firmneſs; this is tranſacted in a time of perfect reſt, when the animal lies in what is called the nymph or chryſalis ſtate, in appearance only a lump of unenlivened matter. There is a ſettled and determinate time for each of theſe changes in every ſpecies; but in the ſeveral different kinds the periods are very different. Some *caterpillars* are produced from the eggs of their parent butterfly in ſpring, as ſoon as the trees, on whoſe leaves they are to feed, begin to bud; after a life of thirteen days, they paſs into their chryſalis ſtate; and, after remaining at reſt three weeks in that, they iſſue forth with wings, with all the beauty of their parents.

As ſoon as they arrive at this their final ſtate, their wings are ſcarce dry before they ſeek to copulate or propagate their ſpecies; this done, the male dies, and the female only lives to depoſit her eggs, and then follows him. This is their whole buſineſs; nature never intending that they ſhould eat in this ſtate, has given them no organs for that purpoſe; ſo that they muſt neceſſarily die of hunger ſoon, could they eſcape their natural death, or the great devourers of them, the birds. Many ſpecies of theſe ſpring butterflies have no farther being, except in the embryo included in the egg, till the ſucceeding ſpring; they lay their eggs very carefully, and in extremely nice order, round about the ſtalk of a perennial plant, or the young branch of a tree, and there they remain through the heats of the ſummer, and colds of the winter, and are never hatched till the ſucceeding ſpring; and though thus expoſed, it is obſervable that the ſevereſt winters do them no harm. Other ſpecies of theſe are ſooner hatched from the egg, and live the remainder of the ſummer on the leaves of the trees. They, after this, paſs the whole winter in the caterpillar-ſtate, uſually hiding themſelves in ſome ſheltered place, covered with webs of their own ſpinning. Theſe remain torpid all the winter, and, at the return of ſpring, leave their webs as the others do their eggs, and feed a few weeks longer, after which they paſs through the chryſalis ſtate to their perfect form. The butterfly of this ſpecies, therefore, enjoys a much longer time of life than the other which remains ſo long in the egg; though the ultimate duration of the animal from its exceluſion from the parent, till its death, is much the ſame; ſo great a part of it being paſſed in the egg-ſtate by the one, and ſo ſmall a part by the other.

Other ſpecies of theſe animals remain the whole winter in the chryſalis ſtate, and are butterflies in ſpring, and, after paſſing the middle of ſummer in the egg, are *caterpillars* in the autumn. The difference of this ſtage of life is remarkable great, in proportion to the whole duration of the animal; in ſome ſpecies it does not exceed a fortnight, and in others continues eleven months.

There is no ſign of ſex in the animal, while in the caterpillar ſtate; the propagation of the ſpecies is the buſineſs of the creature in its ultimate perfection, and, till that, theſe parts are never excluded. One female butterfly, when ſhe has been impregnated by the male, will produce three hundred or four hundred eggs, or even more.

There is no way of knowing the different ſexes of theſe little creatures, by viewing the parts; but the whole figure and manner of the animal makes the difference. The females are always larger than the males; they are alſo more ſlow in their motions; and ſome of them have no wings, or, at the utmoſt, only very ſmall ones. The males, however, have a ſort of beards, more beautiful than the *antennæ*, or horns of the females; the female is much ſtronger, as well as bigger, than the male, and not unfrequently at the approach of danger or diſturbance, flies away with him in the time of copulation.

On diſſecting the female, her *uterus* affords an aſtoniſhing ſight; the number of eggs in the tubes is amazing; but theſe have not all the ſame figure; and in ſome ſpecies, as the ſilk-worm, &c. the eggs are of a beautiful blue; if any yelloviſh ones are ſeen among them, they are judged to be defective. See STIGMATA.

The care of all the butterfly-tribe, to lodge their eggs in ſafety, is ſurpriſing. Thoſe whoſe eggs are to be hatched in a few weeks, and are to live in the *caterpillar* ſtate during part of the remaining ſummer, always lay them on the leaves of ſuch plants as will afford them a proper nouriſhment; but, on the contrary, thoſe whoſe eggs are to remain unhatched till the following ſpring, always lay them on the branches of trees and ſhrubs, and uſually are careful to ſelect ſuch places as are leaſt expoſed to the rigours of the enſuing ſeaſon, and frequently cover them from it in an artful manner. Some make a general coat of hairy matter over them, taking the hairs from their own bodies for that purpoſe; others hide themſelves in hollow places in trees, and in other ſheltered cells, and there live in a ſort of torpid ſtate the whole winter, that they may depoſit their eggs in the ſucceeding ſpring at a time when there will be no ſeverities of weather for them to combat. The day-butterflies only do this, and of thoſe but a very few ſpecies: but the night ones, or *phalenæ*, all without exception, lay their eggs as ſoon as they have been in copulation with the male, and die immediately afterwards.

It is well known that the common and natural food of theſe creatures is the leaves and verdure of vegetables; yet as weak and harmleſs as they ſeem, they will many of them deſtroy their fellows whenever they get an opportunity. Reaumur gives us an inſtance of this in twenty *caterpillars* of the oak, which he kept in a box, with a ſufficient quantity of their natural food, yet their numbers daily decreaſed, till at length there remained only one. This is, however, only the caſe in ſome few ſpecies, the generality of theſe animals being very peaceable, many ſpecies living together in the ſame place, without moleſting one another. Theſe ſpecies, however, though freed from theſe dangers, are expoſed to others of a much more terrible kind; the worms or maggots of ſeveral ſorts of flies are frequently found about them, ſome preying upon their outſide, others lodged

within them, under the skin, but both kinds eating the poor defenceless creature up alive. Those which feed on the outsides are easily discovered, the others are more hid, and frequently the *caterpillar*, which seems very hearty and vigorous, and very fleshy, shall be found, upon opening, to be a mere skin, the internal parts being all eaten away, and all the food that he swallows serving only to feed a vast number of worms, or maggots, which crawl about at liberty within him. These devouring worms are of many different species, some being of the gregarious, some of the solitary kinds, and some spinning webs of their own silk to transform themselves in, others undergoing that change without any such covering. The beautiful *cabbage-caterpillar* is one of those unhappy kinds which frequently are infested with the gregarious kinds, large numbers of which spin themselves webs one after another, and afterwards come out in the shape of the parent-fly, to whose eggs they owed their origin.

These intestine enemies are a sure prevention of the butterfly's appearing at its proper time; and as many of the former naturalists, who knew what butterfly to expect from a peculiar species of *caterpillar* which they preserved, often saw a parcel of flies come out in the place of it, they having no idea that the fly had laid its eggs in the flesh of the poor creature, supposed that this was one of the natural transformations of the creature, and that certain species of *caterpillars* sometimes produced butterflies, sometimes small flies.

These, and many other destroyers, among which the birds are to be reckoned in the principal place, serve a noble purpose in preventing the too great numbers of these mischievous animals. Their usual habitation being the leaves and flowers of plants, they are, in their feeding, much exposed to all those destroyers; yet nature has taken care to preserve a great number, by making many of them so exactly of the colours of the leaves they feed on, that they are not easily distinguished from them, and by giving others a caution of keeping on the under part of the leaves, and being, by that means, out of sight. But some species are much less exposed, and of much more mischief to the plants they feed on, by devouring more essential parts of them. Of these some eat the roots, and others the interior part of the trunk, destroying the vessels that imbibe, and those that distribute the juices. These are different from the common *caterpillars*, in that their skin is much less tough and hard, and these are secure from our observation, and, in general, from their great destroyers the birds. They are not, however, absolutely safe from the common dangers of the other species; for there are a kind of worms that find their food and habitation even in the bodies of these.

The root-*caterpillars*, and those which live within the branches of plants, are much more easily found out. The roots of scorpholastis, and the stalks of lettuces, and some other plants, afford *caterpillars* which feed all of the same species. Those found in the lettuces are extremely plentiful some years, and destroy vast quantities of that plant. These usually have their first habitation in the stalk, near the root.

Nothing more surprises us, in regard to insects, than their industry; and in this the *caterpillars* yield to no kind, not to mention their silk, the spinning of which is one great proof of it. The sheaths and cases which some of these insects build for the passing their transformations under, are, by some, made of the silk, with their own hair, mixed with pieces of bark, leaves, and other parts of trees, with paper, and other materials; and the structure of these is well worthy our attention.

There are others, whose workmanship, in this article, far exceeds these. There is one which builds in wood, and is able to give its case a hardness greater than that of the wood itself in its natural state. This is the strange horned *caterpillar*, of the willow, which is one of those that eat their *nymphæ*. This creature has extremely sharp teeth, and with these it cuts the wood into a number of small fragments; these fragments it afterwards unites together into a case, of what shape it pleases, by means of a peculiar silk, which is no other than a tough and viscous juice, which hardens as it dries, and is a strong and firm cement. The solidity of the case being thus provided for, we are to consider, that the *caterpillar* inclosed in it is to become a butterfly, and the wonder is in what manner a creature of this helpless kind, which has neither legs to dig, or teeth to gnaw with, is to make its way out of so firm and strong a lodgment as this, in which it is hatched. It has been supposed by some, that the butterfly, as soon as hatched, discharged a liquor which softened the viscous matter that holds the case together, and so its several fragments falling to pieces, the way out lies open. This is evidently the truth of the case, though those who supposed it, did it by mere conjecture; for, on a strict examination, this liquor is always to be found in the animal, and is of the most proper kind for such a service. Reaumur judged, from the effects, that this liquor must be of a singular nature, and very different from the generality of animal fluids: and in dissecting this creature in the *caterpillar* state, there will always be found near the mouth, and under the *œsophagus*, a bladder, of the bigness of a small pea, full of a limpid liquor, of a very quick and penetrating smell, and which, upon divers trials, proves to be a very powerful acid; and, among other properties, which it has in common with other acids, it sensibly softens the glue of the case, on a common application.

It is evident that this liquor, besides its use to the *caterpillar*, remains with it in the chrysalis state, and is the very thing that gives it a power of dissolving the structure of the case, and making its way through in a proper manner, at the necessary time. Dr. Boerhaave has adopted the opinion, that there are no true acids in animals, except in the stomach, or intestines: but this familiar instance proves the error of that determination. Phil. Trans. abr. vol. ix. p. 39, &c.

Another very curious and mysterious artifice, is that by which some species of *caterpillars*, when the time of their changing into the chrysalis state is coming on, make themselves lodgments in the leaves of the trees, by rolling them up in such a manner as to make themselves a sort of hollow cylindric case, proportioned to the thickness of their body, well defended against the injuries of the air, and carefully secured for their state of tranquillity.

Besides these *caterpillars*, which in this manner roll up the leaves of plants, there are other species which only bend them once, and others which, by means of thin threads, connect many leaves together to make them a case. All this is a very surprising work, but all much inferior to this method of rolling.

The different species of *caterpillars* have different inclinations, not only in their spinning and their choice of food, but even in their manners and behaviour one to another. Some never part company from the time of their being hatched to their last change, but live and feed together, and undergo together their last change into the chrysalis state. Others separate one from another as soon as able to crawl about, and each hunts its fortune single; and there are others which regularly live to a certain time of their lives in community, and then separate each to shift for itself, and never to meet again in that state. Reaumur, Hist. Insect. vol. ii. *passim*.

Caterpillars are very destructive and pernicious to gardens, particularly those of two species. The one of these is that which afterwards becomes the common white butterfly. This is of a yellowish colour, spotted with black, and infests the leaves of cabbages, cauliflowers, and the Indian cress, of which it eats off all the tender parts, leaving only the fibres entire, so that whole plantations are often seen destroyed by them in autumn, especially such as are near large buildings, or are crowded with trees. There is no remedy against this evil, but the pulling of the creatures off before they are spread from their nests, and watching the butterflies, which are daily, in the hot weather, depositing their eggs on these plants. These, however, feed principally on the outside of the leaves of the plants, and are therefore the easier taken off; but the other kind lives near the center, and therefore is with much more difficulty discovered. This is much larger, and the skin is very tough, and of a brown colour. It is called, by the gardeners, a grub, and is extremely pernicious. The eggs which produce it are usually deposited in the very heart, or center, of the plant, particularly in cabbages; and the creature, when formed, and grown to some size, eats its way through all the leaves, and leaves its dung in great quantity behind it, which spoils the cabbage. This insect also burrows under the surface of the ground, and makes sad havock among young plants, by eating off their tender shanks, and drawing them into the holes. This mischief is chiefly done in the night; but wherever a plant is seen thus destroyed, if the earth be stirred with a finger an inch deep, the creature will be certainly found, and this is the only way of destroying them. Miller.

When these insects attack fruit-trees, the best method of driving them off is to boil together a quantity of the wormwood, and the common tobacco, of each equal parts, in common water; to make the liquor very strong, and sprinkle it on the leaves and young branches every night and morning, during the time when the fruit is ripening.

In Dr. Hawkesworth's Account of the Voyages to the South Seas, vol. iii. p. 520. we have the following account of a kind of small green *caterpillar*, which the

voyagers

voyagers found in great numbers, on the true West Indian mangroves. Their bodies were thick-set with hairs, and they were ranged on the leaves side by side like flies of soldiers, to the number of twenty or thirty together. When they touched them, they found that the hair on their bodies had the quality of a nettle, and gave them a much more acute, though less durable pain.

CATERPILLAR, *Connaught*. See *Connaught* WORM.

CATERPILLARS, *water, Greek aquatics*.—It might seem incredible that there is any such creature as a *caterpillar* whose natural habitation is under water; but experience and observation prove that there are such, and that they feed on the water-plants as regularly as the common kinds do on those at land. These are not named at random, like many of the aquatic animals of the larger kinds, the sea-wolf, and the sea horse, &c. which might as well be called any thing else as wolves and horses, but they are properly what they are called, and do not acquire in the manner of the fish-tribe, but by their migrations, as other *caterpillars*. M. Reaumur, in his observations, met with two species of these, the one upon the potamogiton, or pond-weed, the other upon the lenticules, or duck-meat. These are both very industrious animals; but the first being much the larger, its operations are more easily distinguished.

This, though truly an aquatic animal, swims but badly, and does not at all love to owe itself. The parent-butterfly lays her egg on a leaf of the potamogiton, and, as soon as the young *caterpillar* is hatched, it gnaws out a piece of the leaf of a roundish shape. This it carries to another part of the same leaf, and lays it in such a manner, that there may be a hollow between, in which it may lodge. It then fastens down this piece to the larger leaf with silk of its own spinning, only leaving certain holes at which it can put out its head, and get to gnaw any of the leaves that are near. In this gets out, though the aperture be naturally small, since a little force from its body bends up the upper leaf, and bends down the lower, both being flexible; and when the creature is out, it has a power of down their defends itself from being wetted, and the natural elasticity of the leaves, and of the silk, join the aperture up again, so that no water can get in. The leaves of this kind of plant are also naturally very slippery, and not easily wetted by water. It soon happens, that this habitation becomes too small for the animal, in which case it makes just such another, and after that, at times, several others, each being only made fit for it at the size it is then of. The changes of this creature into the chrysalis and butterfly state, are in the common method. The butterfly gets out of a chrysalis which was placed on the surface of the water, the lightness of the animal easily sustains it on the water till its wings are dried, and it then leaves that element never to return to it again. Mem. Acad. Par. 1736.

CATERPILLARS, *wood, Bruce finds first*, the name of a genus of *caterpillars* which do not live in the manner of others on leaves of trees or plants, or open to our observation, but under the bark, in the trunk and branches, and in the roots of trees, and sometimes in the body of fruits.

These are easily distinguished from those worms and maggots which are found in roots and fruits, and owe their origin to that of another kind; but are subject to be confounded with a sort of animals, called by M. Reaumur, *fausse or bastard caterpillars*, which carry a great resemblance in their figure to the real *caterpillars*, but which have more legs than any of the true ones have, and are finally transformed into four-winged flies, which are not true butterflies.

The butterflies which are the parents of those *caterpillars* which live unmured on trees or trunks, lay their eggs on the surface, and the young *caterpillars*, when hatched, eat their way in.

What appears something surprising, however, in this is, that there usually is only one *caterpillar* in a fruit, which is large enough to afford food to a large number; and if there are sometimes found two creatures within, one is usually a *caterpillar*, the other a worm of some other kind. The whole occasion of which is, that the operation of penetrating into the fruit, is so difficult to the young animal, that it seldom succeeds in it; and though the butterfly deposits many eggs on each fruit, and these all hatch, yet it is only here and there one on a fruit that can find its way into it.

These creatures, when once lodged in their prison, have nothing to do but to eat up the substances which inclose them, leaving the outer hard shell unhurt, which still serves as a case for them: this is a very frequent case in the grains of corn, where the farinaceous substance serves as aliment, and the hard outer skin becomes a firm hollow case afterwards for the animal. The farinaceous substance in this case usually proves enough for the animal in its *caterpillar* state, but if it does not, the creature has recourse to a very singular expedient; it eats again its own excrements, and finds its now stronger stomach able to separate nourishment from that very matter, which had before passed off from its weaker stomach undigested.

Of these species of *caterpillars*, some go out of their prison in order to change into their chrysalis, and thence into their butterfly state; but the greater number remain there, and pass through all their changes within.

These *caterpillars*, like all the other kinds, have certain flesh-eating worms, whose parents are of the fly-kind, for their terrible enemies and destroyers; and it is not unfrequent, on opening one of these spoiled fruits, instead of the expected *caterpillar*, to find a fly just ready to come out; this has been produced from the chrysalis of a worm, which had before found its way into the fruit and eat up the *caterpillar*, which was the original possessor of the place. A. D. S. an. 1730; and Reaumur, Hist. des Inf. tom. ii.

CATERPILLAR-*roters*, a name given by some authors to a species of worms which are bred in the body of a *caterpillar*, and eat its flesh: these are owing to a certain kind of fly which lodges her eggs in this animal, and they, after their proper changes, become flies like their parents.

M. Reaumur has given us, in his History of Insects, some very curious particulars in regard to these little worms. This insect is called the ICHNEUMON of *caterpillars*.

CATERPILLARS, *Scorpion*, in *History*, a genus of the *diadelphia decandria* class. Its characters are these: the emplacement of the flowers is of one leaf, erect, blown up, lightly compressed, ending in five acute points. The flower is of the butterfly-kind: it has a roundish standard, indented at the point, where it is reflexed and spreading: the wings are long, almost oval, having obtuse appendages: the keel is half-moon shaped: the belly is gibbous, pointed, and erect, cut in two parts below. It hath ten stamina, nine joined, and one separate, terminated by small summits; and an oblong taper germen a little reflexed, supporting a rising inflexed style, terminated by a point for a stigma; the germen afterward becomes an oblong, taper, feathery, rough, channelled pod, twisted in many longitudinal coils, in size and appearance of a large *caterpillar*, from whence it had this title, divided within, and on the outside contracted into knotty joints, each cell containing one seed. There are four species.

All these plants are annual, and grow naturally in most of the warm countries in Europe, but have been long cultivated in the English gardens.

CATERPILLAR-*shell*. See TURBO.

CATERVA, in *Ancient Military Writers*, a term used in speaking of the Gallish or Celtiberian armies, denoting a body of 6000 armed men.

The word *caterva*, or *catervarius*, is also frequently used by ancient writers to denote a party or corps of soldiers in disorder or disarray; by which it stands distinguished from COHORS or *cornu*, which were in good order.

CATESBÆA, in *Botany*. See *Lily*-THORN.

CATHARETICS, or CATHARTICS, *medicines*, are such as serve to consume, and eat off, fungous or proud flesh growing in wounds, ulcers, and the like.

The word is formed from καταιρω, sometimes used for *deponere*, or *abstergere*, *I take away*, *I cleanse*, &c. of κατα, and αιρω, *I take away*.

Catharetics are otherwise denominated ESCHAROTICS *medicines*, q. d. *ferberentes*.

Such are red precipitate, burnt alum, ἀλας ὁμ, blue vitriol, &c.

Cathartic only differs in degree from CAUSTIC or septic, which are more violent in their operation.

CATHALOGOS, in the *Materia Medica*, a name by which some call the fruit we know by the name of Saint IGNATIUS's *bean*.

CATHARI, in *Ecclesiastical Writers*, ancient christians, who made profession of greater purity in discipline and sanctity of life than others.

The appellation *Cathari* was chiefly given to the sect of NOVATIANS.

In after-times, however, the name was also applied to several other sects, who pretended to extraordinary purity, and particularly to a fanatical sect, who came from Greece into Italy, and were first discovered in the Milanese about the middle of the eleventh century. They were called in France, and other countries, ALBIGENSES, PATERINI, and PUBLICANS. See PAULICIANS and PURITANS.

CATHARINE, *Knights of St.* CATHARINE *of Mount Sinai*, an ancient military order, erected for the assistance and protection of pilgrims going to pay their devotions to the

body of *St. Catharine*, a virgin of Alexandria, distinguished for her learning, and said to have suffered martyrdom under Maximin.

The body of the martyr having been discovered on mount Sinay caused a great concourse of pilgrims, and travelling being very dangerous, by reason of the Arabs, an order of knighthood was erected in 1063, on the model of that of the Holy Sepulchre, and under the patronage of St. Catharine: the knights of which obliged themselves by oath to guard the body of the saint, keep the roads secure, observe the rules of St. Basil, and obey their grand-master. Their habit was white, and on it were represented the instruments of martyrdom whereby the saint had suffered, viz. a half-wheel armed with spikes, and traversed with a sword stained with blood.

CATHARINE, *Fraternity of St. Catharine at Sienna*, a sort of religious society instituted in that city, in honour of St. *Catharine*, a saint famous for her revelations, and for her marriage with Jesus Christ, whose wedding-ring is still preserved as a valuable relic. This *fraternity* yearly endows a certain number of destitute virgins, and has the privilege of redeeming annually two criminals condemned for murder, and the same number of debtors, by paying their debts.

CATHARINE, *Order of St.* in *Modern History*, belongs to ladies of the first quality in the Russian court. It was instituted in 1714, by *Catharine* wife of Peter the Great, in memory of his signal escape from the Turks in 1711. The emblems of this order are a red cross, supported by a figure of St. *Catharine*, and fastened to a scarlet ribbon edged with silver, on which are inscribed the name of St. *Catharine*, and the motto, *Pro fide et patria*.

CATHARMA, from καθαιρω, *I expiate*, in *Antiquity*, some miserable or flagitious wretch, sacrificed to the gods as an expiation for the plague, or other calamity. Such was the prophet Jonas, cast into the sea; and such does St. Paul with himself to be. See ACCURSED.

CATHARMA, *Kathapma*, from καθαιρω, *to purge*, in *Medicine*, imports the excrements purged from any part of the body; as the stomach, intestines, or bladder.

CATHARMOS, in *Medicine*, of the same derivation, implies purgation by medicines, or the cure of a disorder by superstitious ceremonies or sacrifices. The cure of the king's evil by the royal touch, if such a thing had been effected, might be said to be performed by a *catharmos*.

CATHARTICS, or CATHARTIC *medicines*, are remedies which promote evacuation by stool.

Cathartics are the same with what we otherwise denominate *purgatives*.

Cathartics are of three principal kinds, *mild*, *moderate*, and *violent*: the first purge gently, as cassia, manna, tamarinds, rhubarb, senna, &c. the second pretty briskly, as jalap, scammony, &c. the third severely, as colocynth, hellebore, laurcola, &c. See each under its proper article.

Cathartics are likewise divided by some into chologogues, phlegmagogues, melanagogues, and hydragogues; the first supposed to purge bile, the second pituita, the third melancholy, and the fourth serosities.

For the theory of *cathartics*, and the manner wherein they operate, see PURGATIVES.

A safe, pleasant, gentle, and effectual purgative or *cathartic* may be at any time prepared in the following manner. Take a quart of Dulwich water, or any other water of a like kind, diffolve in this over the fire an ounce of manna, and half an ounce of black tamarinds; strain off the liquor, and let it be taken at several draughts, at an half hour's distance or less, the whole being drank in an hour and half, or two hours.

The purging mineral waters act with more ease, genuineness, and safety, than any of the shop medicines; all that they require is to be either concentrated by boiling away a part, as is done with sea water in this manner; and a general rule for a purge of this kind would perhaps run, to the practice of physic to reject almost all the common rough purges in use.

CATHARTIC *wood*. See EXTRACTUM *catharticum*.

CATHARTIC, *or purgative, amulet*, a denomination given to what we improperly call *Roman salt*.

CATHEDRA, in a general sense, a *chair*.

The word is more particularly used for a professor's chair, and a preacher's pulpit.

CATHEDRA *cardinalitia* used for the bishop's see, or throne, in a church.

CATHEDRA, *ex*, a phrase used in speaking of the solemn decisions or decrees of prelates, chiefly the popes, delivered in their pontifical capacity.

The occasion for the papist maintains, that the pope is infallible when speaking *ex cathedra*, a term of modern theology entirely unknown to the ancients. Even those who will not agree in the explanation of it.

CATHEDRAL, a church wherein is a bishop's see, or seat.

The word comes from the Greek καθεδρα, *chair*, of καθημαι, *sedeo*, *I sit*.

The denomination *cathedral* seems to have taken its rise from the manner of sitting in the ancient churches, or assemblies of primitive Christians: in these, the council, i. e. the elders and priests, was called *presbyterium*; at their head was the bishop, who held the place of chairman, *cathedrali*, or *archiereatica*; and the presbyters, who sat on either side, were also called by the ancient fathers, *assessores episcoporum*. The episcopal authority did not reside in the bishop alone, but in all the presbyters, of whom the bishop was president.

A *cathedral* therefore, originally, was different from what it is now; the Christians, till the time of Constantine, having no liberty to build any temples by their churches, they only meant their assemblies; and by *cathedrals*, nothing more than consistories. Whence appears the vanity of some authors, especially the Spaniards, who pretend their *cathedrals* to have been built in the times of the apostles.

CATHEDRATIC *acts*, *duties ecclesiastical*, denotes a doctor possessed of a chair or professorship in some of the universities of Spain.

They say a *cathedratic duke* of Salamanca, of Alcala, &c.

CATHEDRATICUM, in *Ecclesiastical Writers*, denotes a sum of money, amounting to two shillings, ancently paid annually by the inferior clergy to their bishops, or as often as he visited his diocese, *in honorem cathedræ*, i. e. as an argument of their subjection, and for the honour of the bishop's see or CATHEDRA.

This was otherwise denominated *synodicum*, and in modern writers PROCURATION.

CATHEDRATICUM also denotes a sum which bishops newly ordained gave partly to bishops or patriarchs, by whom they were consecrated, and partly to the clerks and monks who officiated on the occasion.

This was also called *synaxium*, as being given on account of the throne, or chair, they had now obtained, and *synodium*, or SYNODAL.

Bishops consecrated by patriarchs or metropolitans, provided their church was not worth less than thirty pounds of gold, were to pay an hundred folidi by way of *cathedraticum*.

CATHERETIC. See CATHARTIC.

CATHERINE. See CATHARINE.

CATHETER, among *Surgeons*, a hollow probe, or instrument, chiefly of steel, somewhat crooked, to be introduced into the bladder, in order to search for the stone, or to discharge the urine when suppressed. See *Table Surgery*, *fig.* 2, 3, 4.

The word is formed from κατιημι, *immitto*, in regard this instrument is used to be impelled into the bladder.

Heister rejects the common metalline *catheter* used by Galen and his followers, as cruel, and even noxious; and substitutes another in its place made of leather. Others have provided a flexible *catheter* made of slitted silver, and convoluted, in order to give a continual passage to the urine, and to prevent the repetition of the painful operation of pulling the *catheter* for this purpose. Dr. Hales describes a *catheter* of a new structure contrived for the more advantageous injection of lithontriptic into the bladder: its cavity is divided lengthways, by a thin partition into two separate channels, which end in two divarishing branches. By one of these branches the *menstruum* is to be injected into the bladder, in the common, or rather in the hydrostatical way, while it returns mixed with urine by the other. Hales, Haemastat. p. 212. See STAGE, and LITHONTRIPTIC.

Dr. le Cat, surgeon of Rouen, has invented a new *catheter*. See *Table Surgery*, *fig.* 1. A is a crooked cane, which is split lengthways into two pieces; the concave piece A is fixed, and at the same piece with the rest of the instrument, and the convex piece C is moveable, having its hind point joined by a hinge to the end a of the piece A, and its forwarder part pointed at b, with a piece which makes the end of a strong fullet, or wire, that runs through the centre of the piece B, where it is received down. The piece B, the wire, and the piece C are held in the situation which the operator pleases, by the screw E; the end of which bears against the piece B. This is made of two solid plates of silver soldered together, in the middle of which a groove has been made to lodge the wire. The handle D is square; the piece B is almost entirely solid, leaving in its centre but just room enough for the passage of the wire; this part is lodged in the piece D of the *Catheter* is made of silver from the rings inclusive to E, all the rest, together with the wire, ought to be of the hardest gall. See, exhibits the whole mechanism of this *catheter*, by repreſenting it open, and such as it is in the bladder, while the incision is making. See a fuller description and account of its use in the Phil. Trans. vol. xlvii. p. 472.

CATHETERISMUS, a chirurgical operation, whereby either stimulating medicinal is injected into the bladder, or some foreign body prejudicial to the making of urine, as congealed blood, a stone, or the like, is drawn away, by means of a crooked, tubular instrument, called a CATHETER.

CATHETOLITES, in *Natural History*, the name of a genus of fossils of the class of the *lithoides*, but differing from the common kinds in the disposition of the constituent plates. *Trans. Philos. Class* 2.

The word is derived from κάθετος, *perpendicular*, and λίθος, a *stone*, or *plate*, and expresses a set of these bodies whose plates are ranged perpendicularly. All the known *lithoides*, except those of this genus, are composed of a number of parallel plates, or thin flakes, ranged evenly horizontally on one another.

CATHETO-PLATUS, in *Natural History*, a term, with its opposite, which is *parallelopipedus*, very much used by Arcæus, and others who adopt his system, in the description of fishes; they may be very well explained in English, by the two familiar words, *compressed* and *depressed*. The heads of fishes are the principal part characterized by these terms.

CATHETUS, in *Geometry*, a perpendicular, or a line, or radius, falling perpendicularly on another line, or surface.

Thus, the *cathetus of a rectangle triangle*, are the two sides that include the right angle.

CATHETUS *of incidence*, in *Catoptrics*, is a right line drawn from a radious point, perpendicular to the reflecting line, or the plane of the speculum, or mirror.

CATHETUS *of reflexion*, or *of the eye*, a right line drawn from the eye, or from any point of a reflected ray, perpendicular to the plane of reflexion, or of the speculum. See REFLEXION.

CATHETUS, in *Architecture*, is a perpendicular line, supposed to pass through the middle of a cylindrical body, as a column. See *Tab. Architect. fig.* 29. and 30.

Cathetus is sometimes applied to a line in the ionic capital, passing perpendicularly through the eye or centre of the VOLUTE.

This is otherwise called the axis of the *cornua*.

CATHOLIC, from καθὰ and ὅλος, *whole*, denotes a thing that is universal, or general.

Some have said, that Theodosius the Great first introduced the term *catholic* into the church; appointing by an edict, that the title should be applied, by way of preeminence, to those churches which adhered to the council of Nice, in exclusion of the Arians, &c. *Catholicism*, however, soon changed hands; for under the emperor Constantius, Arianism became so predominant, that the Arians were called the *catholics*. But the term was used much more anciently, as by Polycarp and Ignatius. *Ubi fuerit Jesus Christus*, (says the latter) *ibi ab ecclesia* CATHOLICA. The Romish church now affumes the distinguishing appellation of the *catholic* church.

CATHOLIC *kings*, is a title which has been long hereditary to the king of Spain. Mariana pretends, that Reccaredo first received this title after he had destroyed Arianism in his kingdom, and that it is found in the council of Toledo of the year 589. Vafeo ascribes the origin of it to Alphonsus in 738. Some allege that it has been used only since the time of Ferdinand and Isabella. Colombiere says, it was given them on occasion of the expulsion of the Moors. The Bollandists pretend, it had been borne by their predecessors, the Visigoth kings of Spain; and that Alexander VI. only renewed it to Ferdinand and Isabella. Others fay, that Philip de Valois first bore the title; which was given him after his death, by the ecclesiastics, on account of his favouring their interests.

In some epistles of the ancient popes, the title *catholic* is given to the kings of France, and of Jerusalem, as well as to several patriarchs and primates.

CATHOLIC *sermon*, is a little sermon, so contrived, as to be fit for all kinds of operations, which do not require an infenfe fire.

CATHOLICASI, in *Middle Age Writers*, the officials or ministers of the CATHOLICI, or receivers of the taxes of a sovereign overlord; also denominated CASARENSES.

CATHOLICON, in *Pharmacy*, a kind of fort purgative electuary, so called, as being supposed universal, or a purger of all humours.

Different authors give different recipes for it: that called *Catholicon Nicolai* was long in use; it consists of sixteen ingredients, the chief whereof are tamarinds, cassia, senna, and rhubarb. It was called the double *catholicon*, when there was a double portion of senna and rhubarb.

The CATHOLICON *for* CLYSTERS only differs from this, in that it had no rhubarb, and that honey was used in it instead of sugar.

CATHOLICUS, the title of a dignitary, or magistrate, under the Roman emperors, who had part of the administration, and particularly the care and receipt of the revenues and taxes in Roman dioceses.

The *catholicus* was the same with what was denominated by the Latins *procurator*, and *rationalis Caesaris*. Such was the *catholicus* of the diocese of Africa, mentioned by Eusebius, and other ancient writers.

CATHOLICUS, among *Ecclesiastical Writers*, an appellation given to the primates of ARMENIA: as prelates of several churches in Asia, subject to the see of Antioch but whose jurisdiction and dioceses are of such extent that they have assumed the title of *catholici*, q. d. *universal bishops*. See PRIMATE.

CATKIN, among *Botanists*, a cluster of flowers affixed to an axis: in some cases, there are squamæ on the axis which do the office of cups; in others the flowers are naked. This is otherwise called *julus*, and *amentum*.

CATLIN, among *Surgeons*, is a dismembering knife, for cutting off any corrupted part of a body.

CATMINT, *Nepeta*, in *Botany*, a genus of the *didynamia gymnospermia* class. Its characters are these: the empalement of the flower is cylindrical, indented into five acute parts at the top. The flower is of the lip kind, with one petal, having an incurved cylindrical tube, gaping at the top. The upper lip is erect, roundish, and indented at the point. The under lip is large, concave, entire, and fawed on the edge: it hath four awlshaped stamina, situated under the upper lip; two of which are shorter than the other. In the bottom of the tube is situated a quadrifid germen, which afterward turns to four oval seeds, sitting in the empalement. Linnæus enumerates fourteen and Miller twelve species.

The species called *nepeta cataria* by Linnæus, has a strong scent between mint and penny-royal. It is called *catmint*, because cats are very fond of it, especially when it is withered; for then they will roll themselves on it, and tear it to pieces, chewing it with great pleasure. Miller's Gard. Dict.

It consists of warming and attenuating parts, somewhat like penny-royal; and like that is of great service in opening obstructions of the womb, and helping in the green sickness: it also hysteric fits and vapours. It promotes the birth and lochia, and is by some authors commended against barrenness.

CATOCHE, or CATOCHUS, from κάτεχω, *I retain*, in *Medicine*, a kind of waking sleep; or a vehement disposition of the body to sleep, without being able to attain it; the eyes still remaining open, and the breath entire, but the body motionless, and in the same posture wherein the patient was first seized.

The *catoche* is the same with CATALEPSIS. It differs from the COMA and APOPLEXY, in that the eyes are open in the former, and closed in the latter. See COMA.

CATOCHITES, in *Natural History*, the name of a fossil mentioned among the ancients, as having great virtues in medicine, and in the cure of wounds. It is said to have been found in Cerfica; and Pliny records this remarkable property of it, that if the hand were held upon it for some time, it would stick to it in the manner of glue. Hence it appears to have been a bitumen.

CATOCYSTUS, in *Natural History*, a name given to one of the general divisions of the *echinodermata*, or *sea hedgehogs*. These have their aperture for the anus not at the top of the shell, as the *anocysti* have it, but in some part of the base.

For the more accurately distinguishing these into genera, the bases of the shell are to be divided into the *regular* and *irregular*. The *regular* are those which are round or oval; the *irregular*, those which are made with sinuses and angles.

CATODON, in the Artedian system of *Ichthyology*, the name given to a genus of the *pleuronectes*, or cartilaginous fishes, the characters of which are these: the teeth are placed only in the lower jaw; there is no fin upon the back; and the fistulæ is placed either in the nose or the snout.

The species of this genus are only two.

This, in the Linnæan system, is the name of a species belonging to the genus denominated *pleuronectes*, in the order of *apodes*, and class of *amphibia*.

The word *catodon* is derived from κατὰ, *below*, and ὀδὼν, a *tooth*; and expresses that the fish has teeth only in the lower part of the mouth.

CATOMUM, or CATOMUS, from κατὰ and ὄμος, *shoulder*, in *Middle Age Writers*, denotes that part of the body below the neck, and between the shoulders.

CATOPSIS, in *Medicine*, a disorder of the sight; more usually called SCOTOMIA.

CATOPTRICS, the science of reflex vision; or that branch of optics, which delivers the laws of light, reflected from mirrors, or speculæ.

The doctrine and laws of *catoptrics* are laid down under the head of OPTICS.

The word comes from κατοπτρον, *speculum*; of κατὰ, and ὀπτομαι, *video*, *I see*.

CATOPTRICAL *Dial*, a dial which exhibits objects by reflection. *See* REFLECTING *Dial*.

CATOPTRIC *Telescope*, a telescope that exhibits objects by reflexion. *See* REFLECTING TELESCOPE.

CATOPTRIC *Cistula*, a machine, or apparatus, whereby little bodies are represented extremely large; and were once extremely wide, and diffused through a vast space; with other agreeable phenomena: by means of mirrors, disposed after the laws of *catoptrics*, in the concavity of a kind of chest.

Of these there are various kinds, accommodated to the various intentions of the artificer: some multiply the objects; some deform them; some magnify, &c. The structure of one or two of them will suffice to shew how many more may be made.

To make a CATOPTRIC *Cistula to represent several different scenes of objects, when viewed at different foramina, or holes.*

Provide a pasteboard cistula, or chest, of the figure of the multilateral prism ABCDEF (*Tab. Optics, fig.* 193), and divide its cavity by diagonal planes EB, FC, DA, intersecting each other in the centre, into as many triangular locules, or shells, as the chest has sides. Line the diagonal planes with plain mirrors; in the lateral planes make round holes, through which the eye may peep within the locules of the chest. The holes are to be covered with plain glasses, ground within-side, but not polished, to prevent the objects in the locules from appearing too distinctly. To each locule are to be placed the different objects, whose images are to be exhibited; then covering up the top of the chest with a thin transparent membrane, or parchment, to admit the light, the machine is complete.

For, from the laws of reflexion, it follows, that the images of objects, placed within the angles of mirrors, are multiplied, and appear some more minute than others; whence the objects in one locule will appear to take up more room than is contained in the whole chest. By looking, therefore, through one hole only, the objects in one locule will be seen, but those multiplied, and diffused through a space much larger than the whole chest: thus every new hole will afford a new scene. According to the different angles the mirrors make with each other, the representations will be different; if they be at an angle greater than a right one, the images will be monstrous, &c.

The parchment that covers the machine, may be made pellucid, by washing it several times in a very clear ley, then in fair water, and bracing it tight, and exposing it to the air to dry. It is be inclined to throw any colour on the objects, it may be done by colouring the parchment. Zahnius recommends verdigrise ground in vinegar, for green; decoction of Brasil wood, for red, &c. He adds, that it ought to be varnished, to make it more pellucid.

To make a CATOPTRIC *Cistula to represent the objects visible in prodigiously small spaces, and diffused through a vast space.*

Make a porpendicular cistula, or chest, as before, but without dividing the inner cavity into any apartments, or locules (*Tab. Optics, fig.* 196); line the lateral planes CBHI, BILA, ALMI, &c. with plane mirrors, and at the foramina, or apertures, pare off the tin and quicksilver, that the eye may see through: place any objects in the bottom MI, e.g. a bird in a cage, &c.

Here the eye looking through the aperture KL, will see each object placed at bottom, vastly multiplied, and the images removed at equal distances from one another. Hence, were a large multangular room, in a prince's palace, lined with large mirrors, over which were glass pellucid glasses to admit the light; it is evident the effects would be very surprising and magnificent.

CATOPTRITES, in *Natural History*, a name given by some writers to a stone of the marble kind, which, when polished, was capable of serving as a speculum, either flat, and so used to represent the images of things; or concave, and used as our reflecting burning-glasses. The hard black marbles were most frequently used for this purpose; but sometimes the reddish ones, and sometimes one or more of the whites. All these were indifferently called by the name *lapis tiburtinus*, when put to this use.

CATOPTROMANCY, a kind of divination among the ancients; so called, because it consisted in the application of a MIRROR.

The word is formed from *κατοπτρον*, *speculum*, and *μαντεια*, *divinatio*.

Particular *lots*, it seems, were made among the Athenians, where those who were sick, and in danger of death, let down a mirror, or looking-glass, fastened by a thread, into a fountain, before the temple of Ceres; then looking in the glass, if they saw a ghastly disfigured face, they took it as a sure sign of death; on the contrary, if the face appeared fresh and healthy, it was a token of recovery. Sometimes glasses were used without water, and the images of things future, they say, were represented in them.

CATROPILÆ. *See* ACONITUM.

CATTECHROMIE, or CATECHROMIE, in the language of the Cophtes, prickly cinnamon. This is a bark very much resembling cinnamon, but produced by a tree which differs very much in the shape of the leaves, and is full of sharp thorns, which the true cinnamon-tree is not. The bark has nothing either of the taste or smell of cinnamon, though so like it externally. The natives use the rind, leaves, and bark of this tree externally, to obtain tumors. Phil. Trans. N° 490. See CASSIA and CINNAMON.

CATTLE, a collective name, importing all quadrupeds, used either in tilling the ground, or for the food of man. *See* BEAST.

Under *cattle* some include all unreasonable animals whatsoever, or go in herds; as sheep, oxen, horses, hogs, &c. Others define *cattle* to be all tame animals which graze. *Cattle* are sometimes divided into *great*, comprehending oxen, bulls, cows, calves, horses, &c. and *small*, including sheep, lambs, goats, and the like.

CATTLE, *black*, more particularly denote the ox kind. There are also denominated *neat cattle*.

The management of *cattle* makes a considerable branch of what is called HUSBANDRY.

The diseases of *cattle* make the subject of that art, called by the ancients *mulo-medicina*, and *veterinaria*, and by us, *farriery*.

Dr. Mandichelli tells us, that in the plague among the *cattle* in Italy, in 1745, rue, wormwood, garlic, and such other strong-smelling plants, hung about their necks and muzzles, were esteemed preservatives against the infection. Nitrous medicines, gunpowder, sulphur, and the sharper aromatics, did hurt. Bleeding, crude antimony with fennel, and a dose of the most valid fattening herbs, did service. Mem. Ed. Econom. vol. ii. p. 302.

The ancient riches consisted wholly in the number of *cattle*; whence it is supposed to be, that the Romans called money by a name formed from that of cattle, *pecunia* from *pecus*.

The importation of *cattle* into England, whether living or dead, is prohibited on pain of forfeiture; the *cattle* may be exported, or even transported, paying the duties. Factors, and those who sell *cattle* for others, are prohibited to buy any, except horse or calves, within eighty miles of London; and none shall be bought and sold again in the same market, on pain of forfeiture. Stat. 5 and 6 Edw. VI. c. 19. 18 Car. II. c. 1. 22 Car. II. c. 13. *See* DROVER.

Stealing of *cattle*, or killing them with an intent to steal any part of the carcafs, or aiding in such offences, are now made felony without benefit of clergy. Stat. 14 Geo. II. cap. 6. and 15 c. 34.

By *cattle*, in this act, is to be understood any bull, cow, ox, steer, bullock, heifer, calf, sheep, and lamb, and no other *cattle* whatsoever. Stat. 15 and 16 Geo. II. c. 34.

CATTUFFUS, or COSSUFFU, in *Ichthyology*, a name given by Aldrovand, and other of the Greek writers, to the fish called by the Latin authors *mæna* and *TRIGLA aspera*. It is a species of the *mæna*, easily known from all the others by its colours, and called by authors who acknowledge the general name *mæna*, the bluish black *mæna*.

CATTUS, or CATUS, in the *Roman Military Art*, a kind of machine or device for covering or screening the men at work, almost entirely the same with *vineæ*. *See* MANTELETS.

CATULUS, in the *History of Fishes*, the name of a fish, of which authors describe three species; the *mare*, *mannulus*, and *mannetus*. It is a species of the CALLIONYMUS kind, and has a narrow pointed head, and a wide and large mouth, furnished with strong teeth, sharp-edged, and bollowed inwards. The first kind is common in our seas, and often caught on the coasts of Cornwall; and the two others principally in the Mediterranean, though sometimes also in our seas. Aldrov. de Pisc. lib. iii. c. 34.

CATURUS, in *Botany*, a genus of the *syngenesia frustranea* class.

CATUS *sylvestris*, in *Zoology*, the name of a beast of prey, called also by some *felis sylvestris*, and by us the cat of the mountain; and, in the Linnæan system, a species of the cat called FELIS *Lybica*. It is of the size of a middling dog; but in other respects is altogether the common domestic cat in shape, except that the tail is, in proportion to the creature's size, considerably shorter.

It has upright pointed ears, marked with two brown converse bars the colour of the head, and whole upper part of the body, a reddish brown, marked with long

hung narrow spots on the back, and with small spots on the sides: the belly, chin, and throat, are white: the tail barred with black. The length of this animal is two feet and a half; and that of the tail eight inches.

It is left farce against the human species than any of the other beasts of prey, and may even be tamed. It naturally grows very fat, and inhabits America. Hays, Syn. Quad.

The *genius* of hunting differs in few particulars from the preceding: the orders are within the same, and the genera are found. It is farce and innumerable; inhabits the woods in the mountainous parts of India; lays and breeds in trees, and leaps with great agility from one tree to another. See *Viverra*, *Sp.* 5.

CATUS MARINUS, *in Zoology*, a name improperly given to the creature which produces the perfume called civet; it is not being of the cat, but of the wolf or dog kind. See CIVET.

CAUT, CAT, or CATTY, an East India weight, used especially in China. It is equivalent to one pound five ounces and two drams Engliſh.

The *tay* is divided into ten *mace*, and the *mace* into ten hundred *candy*.

The *catty* is also used in Japan, Batavia, and other parts of the Indies, where it weighs more or less, according as it contains a greater or less number of *taels*: the *catty* of Java is equivalent to twenty *taels*; that of Camboya, to twenty-four; the *catty* of Siam is double that of China, and amounts to about 160 French pounds.

The Chineſe alſo give the denomination *catty* to the Stamſe *tahil*.

CATTY is alſo a ſmall weight whereby the lightneſs of the Eaſt weigh their commodities, equivalent to three grains.

CAVY is alſo a meaſure of account, uſed in Java, and ſome of the neighbouring iſlands, amounting to about nineteen ſtivers Dutch money.

In the iſland of Sumatra, *cavy* is alſo uſed to denote a piece of money, valued at ſix ſhillings and eight pence ſterling.

CAVA, in anatomy, the name of a vein, the largeſt in the body, terminating in the right ventricle of the heart; where it opens with a large mouth, to convey to it the blood brought from all the parts of the body, by the branches of the other veins which all terminate in the *cava*. See *Tab. Anatomy*, *Fig.* 1. *lit.* i, 12. *Tab.* 60. *Angiol.* *Fig.* 6. *lit.* a.

At its entrance into the right ventricle, it has three membranous valves, called *tricuſpides*, or *valvulæ*, from their triangular figure; for occaſionally, as to allow the blood's paſſage from the *cava* to the heart, and repreſſing its return.

The *cava* is divided into the *aſcendens* and *deſcendens* parts: the *aſcendens cava*, is that which ariſes from the lower parts; ſo called, becauſe the blood hereby conveyed to the heart, mounts, or aſcends. The *deſcendens cava* comes from the upper parts; and is ſo called, becauſe the blood hereby brought from the head, and other parts, deſcends.

CAVAGIBO, in *Ichthyology*, the name of a fiſh common in the Mediterranean, and brought to the markets in many places. It is ſomething of the coal-fiſh ſhape, but thinner and flatter. Ray.

CAVALCADE, a ſolemn, pompous march, or proceſſion of horſemen, equipages, &c. by way of parade, or ceremony, or to grace a triumph, public entry, or the like.

CAVALCADOUR, or CAVALCADOUR, anciently denoted a riding-maſter, but at preſent is diſuſed in that ſenſe, and only employed to denote a lort of equerries, or others who have the direction of princes ſtables. The French *écuyer tranchant* to the king, the duke of Orleans, &c.

Menage writes it *caballicator*, and derives it from the Spaniſh *caballero*, a horſeman.

CAVALET, in the *Glaſs trade*, a ſtrait iron ring which ſurrounds the ſwingle, or hole in the centre of the table to the tower of the *chair*, and ſo forming grit endleſs.

CAVALIER, or CAVALIERO, or horſeman, or perſon mounted on horſe-back: eſpecially if he be alſo richly and for a military appearance.

Anciently, the word was reſtrained to a knight, or order Knighthood.

The French ſtill uſe CAVALIER in the ſame ſenſe.

CAVALIER, in *Fortification*, a mount, or elevation of earth, either round, or oblong; having a platform on the top, bordered with a parapet, to cover the cannon placed on it, and the whole encompaſſed on the outſide with a ſtrait or ſtraight and ſometimes on the outſide with a ſtrait or ſtraight and ſometimes on the outſide with a ſtrait or ſtraight and ſometimes

Swan's tail; called by the Arabs, *Dhnab Adjaze*, or *Alcaphaze*. See a under CEPHEUS.

CAUDA *Delphini*, a fixed star of the third magnitude, in the tail of the Dolphin. See a under DELPHINUS.

CAUDA *Draconis*, the dragon's tail, in *Hevelius*, the name of the moon's southernmost ascending node.

CAUDA *Equini*, in *Aratus*, a denomination given to the lowest part of the fixed stars, from the tail-feathers of the cock to the end of the tail of the horse. It is that determinated from its form, which is supposed to resemble a horse's tail. Its tabulance is 68 stars, and very remarkable.

CAUDA *Equina* also denotes a medicinal herb, whose leaves are reputed to have a strengthening virtue. This in English, is called the *horse-tail*. The officinal kind is more particularly called by botanists, *asperula arvensis*, in English, the great mare's-horse-tail.

CAUDA *Leonis*, a fixed star of the fifth magnitude in the Lion's tail; called also by the Arabs, *Dhaje Elased*. See β under LEO.

It is called *Ob. Lucida Coxæ*.

CAUDA *Ursæ Majoris*, a fixed star of the third magnitude, in the extreme part of the tail of the Great Bear; called also by the Arabs, *Alcaid* and *Benetnasch*. See η under URSA *Major*.

CAUDA *Ursæ Minoris*, a fixed star of the third magnitude, in the extreme part of the tail of the Lesser Bear; called also the polar star, and by the Arabs, *Alrukabah*. See α under URSA *Minor*.

CAUDEBEC, in *Mercantile Affairs* and *Commerce*, a sort of hats, thus called from the town of Caudebec in Normandy, where they manufacture a great number of them. They are made of lamb's wool, of the finest down of wool-cloth, or of camel's hair.

CAUDISONA *Cyprea*, in *Zoology*, a name by which some call the RATTLE-SHELL.

CAUDIVERBA, in *Zoology*, the name of an animal of the lemur kind, called also *semnopithecus*, but more commonly known among authors by the name COLOBUS.

CAVÆ, a fraternal term, used by ancient writers. Some authors distinguish between CAVÆ and *cognati*, making the first the children of one father's name; CAVÆ were described the primitive institutions whereby mankind themselves to civil societies above ground, they took shelter under it. The primitive manner of burial, was also to separate bodies to sepulchres, which appears to have been the origin of the HYPOGEUM. Phil. Trans. N° 244. p. 344.

Badmington CAVE, in Warfare, consists of a treble or row of uniform bows, wherein pieces of amount are laid to have been found, whereof there are by many supposed to have been relics of ancient warriors.

CAVE is also used for the proper habitations of elephants. Among the Romans, CAVE, were next to be considered to the temples, who were worshipped in CAVE, as other gods in their temples.

The Persians also worshipped their god Mithras in a natural cave, similar to that for the purpose by Zoroaster. Kircher, after Vasillarius, enumerates divers species of cave, as, natural, artificial, mixed, and artificial.

Of natural CAVE, some are peopled at a moderate distance, as the Sybil's at Cumæ; others are postponed, or complained; others are replete with metallick exhalations, and others with waters.

Divers mention is made among the ancients, the names of which occasioned the fable, and gendered a fear of them in mankind, which was interpreted inspiration, prophecy, or divination. Such were the Corycian CAVE in Phrygia, and that of the Cimmerians in Italy. Such also was the Delphic cave at Cumæ in Campania, all the avenues to which were so thronged with oracles, that it is as if nature had placed that place for a mansion of fame. It is there celebrated by Virgil. Homer likewise describes the CAVE of Trophonius among the Lebadeans, in Bœotia, and Pausanias, Strabo, and Suidas, have left us the particulars of the ceremonies observed by those who entered the cave to consult the oracle. Vide Potter Archæol. lib. ii. cap. 20. p. 296, &c.

CAVE, coal, pit, in Mining. See LAVE.

CAVEA, the place in the ancient theatres where the spectators were seated.

The cavea, called by the Greeks κοῖλον, *hollow*, consisted, distinguished from the *pulpitum*, which was the place for the actors.

The cavea was divided by partitions into three equal parts, ending one over another; answering appointed for the gentlemen equites, and senatorian; and the meanest, *pedum*, for the commonalty; and the uppermost, *summa cavea*, for the women.

At the three several CAVE, or tiers, stairs were placed behind the cavea, where the audience might enter for their respective seats.

CAVEA also denoted the middle part in amphitheatres, or other such buildings.

CAVEA is also used for the cage or mew of a wild beast, or other animal designed for shows.

CAVEARE, in *Ichthyology*, a kind of GOBIUS or sea-pike, so named from its having a hollow or cavity in the upper part of the head, which receives the humour of the eye, as in a socket. It is likewise from the Italians called *Cavedano*, and *Cavedine*, whence perhaps the Latin Cuck and *cadanus*, of the same.

CAVEAT, in *Law*, is the name, or form of the Entry, or caution or warning, which any person may enter in the Ecclesiastical Court, to stop the proceedings of the Spiritual Judges, in the granting of Administration, Probate of Wills, or Institution to Benefices.

The Caveat is entered in the Prerogative Court of Canterbury, and in the Court of Arches, and in the Court of Peculiars, and in the Court of the Bishop of London, and in the Court of the Bishop of Winchester, and in the Court of the Bishop of Ely, and in the Court of the Bishop of Durham, and in the Court of the Bishop of Chichester, and in the Court of the Bishop of Lincoln, and in the Court of the Bishop of Worcester, and in the Court of the Bishop of Bath and Wells, and in the Court of the Bishop of Exeter, and in the Court of the Bishop of Salisbury, and in the Court of the Bishop of Norwich, and in the Court of the Bishop of Rochester, and in the Court of the Bishop of Hereford, and in the Court of the Bishop of Gloucester, and in the Court of the Bishop of Oxford, and in the Court of the Bishop of Peterborough, and in the Court of the Bishop of Carlisle, and in the Court of the Bishop of Chester, and in the Court of the Bishop of Landaff, and in the Court of the Bishop of St. David's, and in the Court of the Bishop of Bangor, and in the Court of the Bishop of St. Asaph, and in the Court of the Bishop of Litchfield and Coventry, and in the Court of the Bishop of Lichfield and Coventry

Their internal substance is very soft, downy; and when filled with blood and spirits, it arises and swells to such the tension or erection of the great conduit. See Penis.

CAVERNOUS *Corpus Cavernosum*, a third spongeous body of the penis; so called, because the texture, or primary shape of the *penis* is resolved by it. See Penis.

It is figured contrary to that of the two former cavernous, is larger in its extremities, and built in the middle: it appears plain to the forefkin, and is called its *head*, from its figure. Its external membrane is fine, and doubled lengthwise for a space. The middle part of this vessel is very spongeous, but the passage for the urine is no where to be found, but continues to the upper part, near the body of the *penis*; in some extremely dilating itself, forms the *glans*.

CAVERNOUS *Corpora of the Clitoris*, are those nervous or spongy bodies, like those of the *penis*, they have their origin from the lower part of the *pubis*, on each fide; and uniting together, constitute the body of the CLITORIS, as the other do that of the *penis*.

Infects have two permanent analogous to that of the *penis*; but they have a *glans*, or membranous portion, passing out when they would copulate, and drawing them from: among all whom is remarkable that of the *glans* in the *Scarabæus Nasicornis* of the ten *pubis*, where they are called *pincers*.

CAVERNOUS *Corpus of the Prepuce*. See PREPUCE.

CAVERS, in the *Lancaster Mines*, are they that prophesy and go about the mines to find out first out in the mines.

CAVESON, in the *Manege*, a kind of muzzle, put over a horse's nose, which runs on hooks from his cheeks, and serves in breaking, managing, and training him.

The most usual cavesons are those of *cords*, or *ropes*, *leaf*. The *cords* for making cheap cavesons are usually of hemp, twisted smoothly, or two or three pieces running on one; others are twilled, others are flat, others hollow in the middle, and contained like tapes, called *cavesons*, though these last are now humbler the cavesons.—The rope and leather cavesons serve for passing the horse between two pillars.

The iron caveson fpares a young horse's mouth in the breaking. Here by custom he is accustomed to obey the hand, and bend the neck and shoulder, without injuring his mouth. All iron cavesons are mounted with a head-stall, and a throat-lash, and two straps, or reins, with three rings through the middle ring, one rein is pulled to make a horse work round a pillar, and through the two side rings the other two reins are pulled, which the rider holds in his hand, or fastens to his saddle to keep the horse's head in subjection.

CAVETTO, in *Architecture*, a hollow member or moulding, containing a quadrant of a circle, and having an effect just contrary to that of a *quarter-round*.

It is used as an ornament in cornices.—*See Tab. Archit. fig. 6.*

The word is Italian, and is no more than a diminutive of *cavo*, hollow.

M. Perrault observes, that the ancients confound the *cavetto* with a *scotia*, but improperly; the *cavetto* being in their only half a *scotia*: yet he himself is chargeable with the same oversight.

Where in its natural situation, the ancients frequently call it *gula*, or *gutter*; and when inverted *corona*.

Cassiodorus the same writer is otherwise denominated a *cornucopia*. Mercius Capella how to describe the *cavetto* from the *scotia* and the *tenia*.

CAUHQUOY, in *Natural History*, a name given by the natives of the Caribbee Islands to a liquor which they calcine and afterwards put in large tubs in the ha-cienda, and many other compositions. It is also used in dying. The Indians boil it in water, and dye or stain their cloaths with it, to make them appear different from others: it is a kind of ochre, or clayey iron ore, and is found in great abundance in the hills, and from it sometimes extracted iron.

CAVIA. See CAVEAR.

CAVIA *cutea*, in *Zoology*, the name by which the Brasilians, and from them many writers, call the creature commonly known among us by the name of the GUINEA *pig*.

CAVIDOS, or CANTEL, a Portuguese long measure, used in the manufacture of cloth, linen, and the like, equivalent to two feet eleven lines Paris measure.

CAVIL, *sophism*, is defined by some a fallacious kind of reafon carrying about resemblance of truth, which a person knowingly to fallhood, advances in dispute for the sake of victory.

The art or framing fophisms or fallacies is called by Ramus, *cavillatrix*.

CAVIL, in the *Military Art*, a natural hollow, fit to cover a body of troops, and thereby facilitate their approach to a place.

A *cavil* near a place besieged is of great advantage to the besiegers; as by help thereof they can open trenches, make places of arms, keep guards of horse, and the like, without being exposed to the enemy's fire.

CAVING. See CAVILLING.

CAVITY, among *Anatomists* and *Physicians*, make a fpecies of organical conformation, either natural or accidental.

Cavities of the first kind are of two kinds; the first formed from nutrition, called *cells* and *pores*; the second from other purposes, called *ducts*, *vessels*, *fibres*, *fibrils*, and *pores*. Heath Compendium, § 56.

CAUC, CAUK, or CAWK, is defined by *Mortimer in the Trans.* to denote a coarse fort of spar; being a petrifaction, which though generally found near to lead mines, will also be found in other parts of the country. Phil. Trans. N° 470. p. 226. But N° 79. p. 770. it is worthless to mine, and fusible by fire.

The word is formed probably of the German *kauig*, *fpar*.

It is properly no other than a spary matter, rendered very coarse by being mixed with a large portion of earth: in some places it is found more clear and transparent in others: it approaches in this kind to the nature of crystal, and is called ballard cauk, and bright cauk. Phil. Trans. N° 407.

There is a singular process mentioned by Dr. Lister, which is that of studying antimony by its means. This is done with great readiness and speed by it, and the glass thus made, will produce more effect on other metals, which no other glass will; nor indeed can other preparation of antimony. The method of preparing it is this: take a pound of antimony, fuse it over a very violent fire in crucibles as coarse or two of your ordinary ones; put it into the crucible to the melted antimony; and continue it in fusion; then call it into a warm mortar, but grateful, decanting the clear liquor from the dregs of coal. This powder gives more than fifteen ounces of glass of antimony, like polished steel, and bright as the most refined quicksilver. The coal, in the mean time, is found to be diminished, not increased in its weight, and will serve fine with the antimony, though ever so strong fire be given it. This is a very old method, and this learned author supposes it to be effected by the sulphureous, oily, and mineral juices which are found in the mines. The effect of bodies evidently the same; for the sulphur juice of lead mines vitrifies the whole body of antimony, in the same manner that the coal does in this experiment. Phil. Trans. N° 410.

That there is somewhat very peculiar in the coal, or else from this effect on antimony, which no other thing of this kind is possessed of; for fossil salammoniac, sulphur vivum, galenites, emeralds, alum ore, spar, and many other stones have been tried with antimony in the same manner, but not any of them has the effect.

CAUKING, in *Architecture*, figuifies DOVE-TAILING. See DOVE-TAIL.

CAULKING *Iron*, in *Fishery*, a hooked caulking iron.

CAULKING, in CAULKING *of a Ship*, implies the driving in oakum, or fomewhat of that kind, into the seams, or crannies of the planks, to prevent the ship's leaking. When the planks extend over each the design is, to prevent the water's entering.

Kennet derives the word from the barbarous Latin *Calcatura*, *fewing*.

CAULKING-*irons*, proper iron chisels for the purpose of caulking veffels.

CAUL, in *Anatomy*, a membrane in the abdomen, investing the greatest part of the guts, called from its structure *reticulum*, but most frequently *omentum*.

CAUL is likewise a little membrane found in some children, encompassing the head, when born.

Dr. Clement takes this *caul* to be only a fragment of the membranes of the *funis*, which commonly stick at the head of the child.

CAUL, or CAUL, among *Shoemakers*, a coarse pasteboard lined, found in the fronts of the shoemakers. See TAP.

CAULEDON, from καυλος, a *stem*, in *Surgery*, is applied to FRACTURES which happen transversely, whereby the parts of a broken bone fall asunder, so as not to be distinctly against each other.

CAULIAS, an appellation given to the juice drawn from the stalk of the *fig-tree*, concerning which Pliny that drawn from the root of the same plant, which is called SYKITES.

Schroder renders the stalks the same with our ASPARAGUS.

CAULICOLES, CAULICULI, in *Architecture*, a name those eight little brackets, or stalks in the Corinthian capi-

tal,

tal, which rising out from the last greater, produce caules, or stalks.—See Vol. about p. 2.

The next causes from the same root, the stalk, or body, of the plant.

The subsequent of these stalks are followed by the calices or primary branches of leaves, from which spring successively the flowers.

Some authors have joined the cauliculi with the calices themselves; being with the flowers on the middle, and same with the principal stalks whence they arise.

CAULIFLEROUS, *adj.* applied to trees, as those having stalks, or trunks, which a great many have none at the smallest, &c.

They are sometimes divided into *ramiferous*, and ACAULIFEROUS.

The former are either *perfectly ramiferous*, as ashes; or *imperfectly ramiferous*, as palms.

CAULIFLOWERS, a species of *brassica*, are the produce of a kind of cabbage, and have in late years much improved in England, as appears in the soil, generally say that we raise it to the size of Siberia. They are in season in the months of May, June, and July, but the soil of the gardeners sometimes forces much longer.

The manner of propagating them is this:

Having procured some good seed, you must sow it before the middle of August, upon an old cucumber or melon bed, during September. Give it a quarter of an inch thick under the weather proves very hot and dry, it must be shaded with mats, and be plentifully watered at times. In about a week after the plants will appear above ground, and they must be uncovered by degrees, but not entirely at first, for fear of frost. In about a month after coming, they should be pricked out on another bed at two inches distance, and shaded and watered with fresh mould; but you must also duly and not be wasted a second, that sometimes is done two times, which will make them much shorter, or young in the shade. In this bed they are to remain till the end of October, when they are to be planted out for the winter season; they are then to be planted out in rich beds, and their leaves are to be tied up close to be shaded with straw-mats, two under each glass, and the weather be severe or February to be planted again upon the rich bed as before, but not as a greater distance, and to shade.

When the cauliflowers begin to form, they must be carefully watched, and those of the lowest leaves must be bent down over the flower, to shade it from the sun, which would otherwise turn it yellow. The very heart of the cauliflower, which are tender and finely white, and are very much esteemed by Lovers of the Art, and the flowers grown in their first year, be improved still more.

All the varieties of cauliflowers which must not be suffered to stand to seed for sale. Mill. Gard. Dict.

CAULIS, (among *Botanists*). See Stalk.

CAULOCARPUS, among *Botanists*. See Pericarpium.

CAULOS, among *Botanists*. See Pericarpium.

CAULS, among *Botanists*, the HAIR or fibres of an herbaceous plant, or that part which after flowering dies away, and which the principles and leaves shoot upwards.

CAUSAL, a term given by some authors to the genus of those kinds of diseases which arise from the seven *Causes of Diseases* in order.

CAUSE, in *Natural History*, a name given by some to the genus of the cassia, by the generality of writers, particularly of botanical writers. It is from a Latin word, signifying a rod, and is applied to this genus of plants on account of the long, slender, and rod-like pods. See CASSIA.

CAUSINUS, (Nicholas) in *Ecclesiastical History*, a learned Jesuit, born at Troyes in Champagne, in 1583, and became professor of rhetoric at Paris in 1610, and afterwards preacher to the court of Louis XIII. and confessor to the queen mother. He died at Paris in 1651, aged 68 years. He was a man of great learning, and wrote several books, which were much esteemed in their time, but are now little regarded. His principal works are, 1. "Sacra Parallela, sive Thesaurus Concionatorius," 2 vols. fol. 2. "Polyhistor Symbolicus," 3 vols. fol. 3. "Electa Sacra," 1 vol. fol. 4. "De Symbolica Ægyptiorum Sapientia," 1 vol. fol. 5. "De Eloquentia Sacra et Humana," 1 vol. fol. 6. "Holy Court," 3 vols. fol. 7. "Life of Constantine the Great," 1 vol. fol. 8. "Life of Basil the Great," 1 vol. fol. 9. "Life of Julian the Apostate," 1 vol. fol. 10. "Life of Theodosius the Great," 1 vol. fol. 11. "Life of Valentinian," 1 vol. fol. 12. "Life of Valens," 1 vol. fol. 13. "Life of Gratian," 1 vol. fol. 14. "Life of Theodosius the Younger," 1 vol. fol. 15. "Life of Marcian," 1 vol. fol. 16. "Life of Leo," 1 vol. fol. 17. "Life of Zeno," 1 vol. fol. 18. "Life of Anastasius," 1 vol. fol. 19. "Life of Justin," 1 vol. fol. 20. "Life of Justinian," 1 vol. fol. 21. "Life of Tiberius," 1 vol. fol. 22. "Life of Maurice," 1 vol. fol. 23. "Life of Phocas," 1 vol. fol. 24. "Life of Heraclius," 1 vol. fol. 25. "Life of Constantine Pogonatus," 1 vol. fol. 26. "Life of Leontius," 1 vol. fol. 27. "Life of Tiberius," 1 vol. fol. 28. "Life of Justinian," 1 vol. fol. 29. "Life of Philippicus," 1 vol. fol. 30. "Life of Anastasius," 1 vol. fol. 31. "Life of Theodosius," 1 vol. fol. 32. "Life of Leo," 1 vol. fol. 33. "Life of Constantine Copronymus," 1 vol. fol. 34. "Life of Leo," 1 vol. fol. 35. "Life of Constantine," 1 vol. fol. 36. "Life of Irene," 1 vol. fol. 37. "Life of Nicephorus," 1 vol. fol. 38. "Life of Michael Rhangabe," 1 vol. fol. 39. "Life of Leo," 1 vol. fol. 40. "Life of Michael," 1 vol. fol. 41. "Life of Theophilus," 1 vol. fol. 42. "Life of Michael," 1 vol. fol. 43. "Life of Basil," 1 vol. fol. 44. "Life of Leo," 1 vol. fol. 45. "Life of Alexander," 1 vol. fol. 46. "Life of Constantine," 1 vol. fol. 47. "Life of Romanus," 1 vol. fol. 48. "Life of Constantine," 1 vol. fol. 49. "Life of Romanus," 1 vol. fol. 50. "Life of Basil," 1 vol. fol. 51. "Life of Constantine," 1 vol. fol. 52. "Life of Romanus," 1 vol. fol. 53. "Life of Basil," 1 vol. fol. 54. "Life of Constantine," 1 vol. fol. 55. "Life of Romanus," 1 vol. fol. 56. "Life of Basil," 1 vol. fol. 57. "Life of Constantine," 1 vol. fol. 58. "Life of Romanus," 1 vol. fol. 59. "Life of Basil," 1 vol. fol. 60. "Life of Constantine," 1 vol. fol. 61. "Life of Romanus," 1 vol. fol. 62. "Life of Basil," 1 vol. fol. 63. "Life of Constantine," 1 vol. fol. 64. "Life of Romanus," 1 vol. fol. 65. "Life of Basil," 1 vol. fol. 66. "Life of Constantine," 1 vol. fol. 67. "Life of Romanus," 1 vol. fol. 68. "Life of Basil," 1 vol. fol. 69. "Life of Constantine," 1 vol. fol. 70. "Life of Romanus," 1 vol. fol. 71. "Life of Basil," 1 vol. fol. 72. "Life of Constantine," 1 vol. fol. 73. "Life of Romanus," 1 vol. fol. 74. "Life of Basil," 1 vol. fol. 75. "Life of Constantine," 1 vol. fol. 76. "Life of Romanus," 1 vol. fol. 77. "Life of Basil," 1 vol. fol. 78. "Life of Constantine," 1 vol. fol. 79. "Life of Romanus," 1 vol. fol. 80. "Life of Basil," 1 vol. fol. 81. "Life of Constantine," 1 vol. fol. 82. "Life of Romanus," 1 vol. fol. 83. "Life of Basil," 1 vol. fol. 84. "Life of Constantine," 1 vol. fol. 85. "Life of Romanus," 1 vol. fol. 86. "Life of Basil," 1 vol. fol. 87. "Life of Constantine," 1 vol. fol. 88. "Life of Romanus," 1 vol. fol. 89. "Life of Basil," 1 vol. fol. 90. "Life of Constantine," 1 vol. fol. 91. "Life of Romanus," 1 vol. fol. 92. "Life of Basil," 1 vol. fol. 93. "Life of Constantine," 1 vol. fol. 94. "Life of Romanus," 1 vol. fol. 95. "Life of Basil," 1 vol. fol. 96. "Life of Constantine," 1 vol. fol. 97. "Life of Romanus," 1 vol. fol. 98. "Life of Basil," 1 vol. fol. 99. "Life of Constantine," 1 vol. fol. 100. "Life of Romanus," 1 vol. fol.

CAUSALITY, in *Metaphysics*, the power or virtue of a cause or principle of producing its effect.

Such is the connection between the cause and effect, that the former always precedes the latter in order of time; and the effect always succeeds the cause. Thus, when a stone, or other body, is put in motion by the impulse of another, the motion communicated to the former is the effect of the impulse of the latter, which is the cause of the motion.

CAUSALITY, in *Mechanics*, the faculty or power by which any body acts on another, and produces motion in it, or alters the motion it has already received.

Thus, in the communication of motion by impulse, the causality of the moving body is measured by the quantity of motion it has before the stroke, and the causality of the body struck is measured by the quantity of motion it receives by the stroke. Hence, if the bodies be perfectly hard, the causality of the striking body is measured by the difference between the quantity of motion it has before the stroke, and the quantity of motion it has after the stroke; but if the bodies be perfectly elastic, the causality of the striking body is measured by the sum of the quantities of motion it has before and after the stroke. See Motion, Impulse, Elasticity, &c.

CAUSALITY, in *Mechanics*, the faculty or power by which any body acts on another, and produces motion in it, or alters the motion it has already received.

CAUSE, *Causa*, that which contributes to the existence of something, or which produces some change in something already existing. Thus, the cause of a stone's motion is the force which puts it in motion; the cause of a house is the architect who designed it, and the workmen who built it; the cause of a picture is the painter who drew it, &c.

CAUSE, *Causa*, that which produces or is the principle of any thing, whether substance, mode, or relation. Thus, God is the cause of the universe; a mode is the cause of a mode, &c.

CAUSE, *Causa*, that which produces any effect, and from it is even distinguished as a relation.—In this sense, God is the cause of all things.

CAUSE, *Causa*, in *Physics*, that which moves the power and activity of acting, from a Greek word.

It is certain that philosophers are daringly presumptuous and ridiculous about the nature of their causes: they assume them then at will by their natural figure, and motion; others by a substantial form; many by qualities, or occult qualities; some by matter and form; and others by concurrence, different from all these.

CAUSE, in the *Schools of Physics*, the distinguished last.

CAUSE, *Efficient*, stands for the agents that produce any effects.

CAUSE, *Material*, the subjects whereof the other works, or whereof the thing is formed; that, and that is the matter, or material cause of the same.

CAUSE, *Sine qua non*, the matters which induce a man to act; or the circumstances without which such thing is never done, &c.

CAUSE, *Impulsive*, which is the motive for agent doing, or the reason moved by, which he conducts himself in the matter, or the thing determined to a thing or to do, and determine, or to act every thing else; and the rule which guides, or governs every thing, &c.

CAUSE, *Occasional*, is that which produces a change in the subject, or determines a thing to be, or to act otherwise

CAUSE, *Universal*, is that which by the counsel of his power may produce all effects.

The Catholics esteem all perfect angels true occasional causes.

CAUSES, *Occasional*, are only the instants that the decrees of their effects. See the article.

The Gassendists, Epicureans, &c. are able to act on the body, nor the body on the mind: as from a man to a statue, or between three, four, or more statues. Nor, as to the effects of sin, or instances between them. Nor, as to the effects of a wound in the body, produces a sadness in the soul: a wound in the body, and a sadness in the soul, are only occasional parts of what pass in the union of soul and body, see only occasional parts of what pass in the union of soul and body. Thus, say they, the stroke, or percussion of a sword, is only occasional to the pain that succeeds it; only the occasional cause of the pain produced in the brain thereby: it is God alone that is the true cause. And thus the action of objects on our organs is not the efficient cause of our ideas and perceptions, but merely the occasional cause which determines God to act on the mind, according to the laws of the union of soul and body.

CAUSE, *Sine Materia*, is that which produces a difficulty, is called the most difficult. This operates, either by destroying a connection of the limbs and joints, or by causing some something which is absolutely requisite to the execution of those motions. If a cause pre-existed to have produced the body before the soul produced it, it is called an internal cause: but if it existed out of the body, and by its application to it produced the illness, it is called external.

Internal causes generally injure, first the humours, and then the solid parts: whereas the external cause affects the solids, and by a consequence of that, the humours; and they more generally, which perhaps is from new affluxes produced by pleasure or surprise.

The immediate or proximate cause is that which takes effect upon the immediately conditions the present disease; this is the most expeditious, and sufficient to the formation of the disease, whereas simple is complicated. The presence of this continues and continues the disease; and the absence of it removes the disease, either very little different from the disease itself. The investigation therefore of this is extremely useful and very necessary.

The remote cause is that which changes the body, either in manner, as to interrupt the free reception of a disease upon the occasion of another cause; but it is never also cause sufficient to produce a disease alone: nor would that other cause, the occasion of which is accidental, be of itself sufficient for the production of the disease: but both must remain. The subjects of physic, therefore, is to maintain both together, which in conjunction constitute the proximate or immediate cause.

The causes are inherent in the body, is called predisposing, occasional, and by the Greeks synectic, and consists principally in temperament, habit, and exercise; by the cause which accedes to the former, is evacuations, and by the cause which is between the disease called the procatarctic cause, as the cause or occasion of the disease. It is in manner internal, sometimes external. These four have relation to two states.

First, the regula, or things causing the body; such as drinks, aliments, drink, medicines, poisons; such things as enter by the pores of the skin or clothes; by the several passages of the mouth, lungs, œsophagus, stomach, intestines, and passions of women, whether in a visible or invisible manner; whether by fevers changed, deficient, vitiated, or nutrition. Secondly, the gesta, or things acted, as motion of the whole or any part of the body, affections of the mind, evil habit of the body, evil mind, fevering and watching. Thirdly, things retained or excreted, whether alimentous, excrementitious, or morbid. Fourthly, things applied to the body; as air, exposure, fomentations, cloaths, ointments, unctions, plaster, together with whatever wounds, ruptures, or corrodes.

The division of the non-naturals, as they are called, is different from that of all other writers of reputation.

CAUSES *and Effects*, in Law. In most cases the law bath regard to the cause for bringing of a thing as the principal point on which all other things are found: and therein the first, and not the remote cause is much looked upon, except it be in common and criminal things: and therefore the wreck is not good at law, will not be for abbreviated for that, as in the case, that is the effect. 4. E. if a felon or felon-cause make a will, and publish it, and afterwards die of felony, or not, this will is of no force, on account of the original cause of felony and conviction, &c.

CAUSEWAY, or CAUSEY, a mound or construction of stone, flints, and rubbish, or of earth and gravel, with a ditch on each side, for the convenience of passengers, and for the preservation of the road from being overflowed with water.

CAUSEWAYS, *Roman*, or roads, many already known, continue, and others discovered, and described with stones and rubbish.

CAUSEWAY, *The*, a famous work of the kind which ranges through the county of Northumberland, commonly supposed to be Roman, though Mr. Horsley, and others, are of a different opinion. Horsley, Brit. Rom. lib. iv. cap. 2. in fine.

CAUSEWAY, *Common*, is a denomination given to a passage or floor consisting in the middle of Common or Pasture. See Common.

CAUSIDICUS. See Advocate.

CAUSTICA, in Surgery, a kind of medicine or application called by the Arabians; which was nothing else but cauteries or some instead of cauteries. Mem. Acad. Inscript. tom. i. p. 300.

CAUSTICS, from καυω, I burn, or rather καυστικος, which has the same meaning, are those medicines which by their sharpness and acrimony, burn and corrode the flesh, making incisions of the parts to which they are applied.

Caustics answer to the fame with whatever remedies are called escharotics, and cauteries. They are also called septics, and sometimes corrosives. They are of the weakest kind, such as common spirit of wine, and the strongest, such as the fixed mineral acids, and the strongest of the vegetable acids, as that of vinegar, lemons, &c. and the strongest of the alkalies, such as the fixed vegetable alkali, and the fixed mineral alkali, called by the ancients nitre, and by the latter chemists, nitrum. See the articles Escharotics, Cauteries, and Septics.

Caustics answer to the fame with whatever remedies are called escharotics, and cauteries. They are also called septics, and sometimes corrosives. They are of the weakest kind, such as common spirit of wine, and the strongest, such as the fixed mineral acids, and the strongest of the vegetable acids, as that of vinegar, lemons, &c. and the strongest of the alkalies, such as the fixed vegetable alkali, and the fixed mineral alkali, called by the ancients nitre, and by the latter chemists, nitrum. See the articles Escharotics, Cauteries, and Septics.

Caustics are also of great use in many cases of wounds, ulcers, and other diseases. They are also used in making issues, and in opening abscesses. They are also used in making issues, and in opening abscesses. They are also used in making issues, and in opening abscesses.

CAUSTICS, *Solar*, are a curve, &c. See Solar Caustics.

CAUTERIES, *Actual*, are a kind of cauteries, or instruments of silver, sometimes of copper, usually made by spatula, and the metal with which it is made, according to the kind, and having the end of it very sharp, with which cold grains and. See Actual.

CAUTERIUM. See Cautery.

CAUTERIUM, *Potential*, is a kind of fluid, by which the tissues of the body is destroyed, and by which the red globules are formed.

CAUTERIUM, *Septic*. See Septic.

CAUTERY,

CAUSTIC, *hypothesis.* See Genus CAUSE.

CAUSTIC, *in surgery.* See Genus CAUSE.

CAUSTICITY, *in Chemistry*, consists chiefly belonging to several combinations of the elements of which earthy parts of living animals that are corroded and destroyed. Those which have this property, are, pure alcaly, and true potassa; and the same may be affirmed of pure alcaly, in its fluid state, or when it has been rendered fluid by moisture or attraction.

CAUSTICUS, *antimonium*, the name given on the Continent to Antimony, when it is to be used in the form of Antimonium.

CAUSTICUS, *lapis*, denotes a burning STONE, or a kind of stone containing iron; although with a superficial view, and when considered in its appearance, it has been thought to be a kind of Marcasite.

CAUSWAY. See CAUSEWAY.

CAUTERY, *Cauterium*, a medicine whereby the fire, fire, or through, or corrupt, some solid part of the body.

The word is originally Greek, καυτηρ, of καιω, to burn.

Cauteries are of two kinds, either, and potential.

Cauteries, either, are those which produce an inflammation, eschar, or sore, or a real hot iron: these are applied to the living body, and extirpations of excrescences, ulcerations of legs, or arms, &c. in order to stop the haemorrhage, and produce a desirable suppuration. They are frequently also applied to extract bones, splinters, and such like hard substances, in order to open a passage for the discharge of the present humours. The instrument, on this occasion, are variously crooked at the extremity, and the wounds, according to the various circumstances wherein they are called CAUSTICS, others perforating, others sawing, &c.—M. Heurnius affirms, as did a late part of the institution of the people at Java, and other parts of the East Indies, whether the Javanese, or the Arabians of those countries, with the same, or the appendant of others, were to, with that there is fewer any disease but they will happily cure it readily.

The actual cautery, or hot iron, is frequently applied to the making of issues, in parts where bleeding is dangerous, as when a little deep hole, which is to be filled with a pea, or any thing to keep it open for the humour to issue through. Paracelsus, a famous chemical writer, prefers the actual cautery, as less dangerous; to which, others prefer that gave no pain, as it seems, he guarantied the secret as a less fatal form a certain remedy.

In some places they scarify with burning iron, in others with pointed or sharp, as where with fire easily obtain the desired effect; others prescribe pieces of linen; others gold, or silver. Severinus recommends a Spanish button of gold for this use: it is usually perforated in many parts of the body.

CAUSTICUM *antimonium*, Fixed. See Genus CAUSE.

CAUSTICUM *argentum vivum*, fixed. See Genus CAUSE.

CAUSTICUM *lunare*. See Genus CAUSE.

CAUSTICUM *potentiale*. See Genus CAUSE.

CAUSTICUM *volatile*. See Genus CAUSE.

CAUSTICUS, *lapis*, a name given by the Germans to the stone called by us LUNAR CAUSTIC.

CAUSTICUS, *sal*, a name given by the Germans to the salt called by us SALT OF TARTAR.

CAUSTICUS, *spiritus*, a name given by the Germans to the liquor called by us SPIRIT OF SALT.

CAUSTICUS, *spiritus*, a name given by the Germans to the liquor called by us SPIRIT OF NITRE.

CAUSTICUS, *spiritus*, a name given by the Germans to the liquor called by us SPIRIT OF VITRIOL

The name comes from a vault, formerly made to separate the platforms of the upper and lower batteries, each of which was called, in Italian, one cannon's shot in the breadth, *colpatura*, though others derive the word from *cedo*, *to yield*, *to give way*; *Cedrarius*, from *cedo*, *to cut*, *to hew*, &c.

The *cannons*, sometimes, muffle at three platforms, one above another, the highest being on the ramparts; but they commonly content themselves to mufflee the lack within the bottom.

The *cannons* is also called the *ear piece*, and *low flank*; as being at the bottom of the wall, near the ditch; sometimes the *second flank*, as being that part of the flanks nearest the curtain; and the centre of the bastion, flank nearest the curtain, and the centre of the bastion. It is commonly covered with an epaulement, or a mufflee body, either round or square, which prevents the shot without from entering within the batteries: whence it was also called *covered flank*.

In some fortifications, because the lanterns of the cremaillers are to serve the soldiers in the manner of the loops of the outer bodies, the vestiges thereof, made by the cleavings of the cannon, remain as intolerable to the men.—Hence, instead of the former covered cannons, have engineers have contrived open ones, only guarded by a garret, &c.

CEMENTATORY, is also used for a mill with several hammers sounding, due to the passage of the bullion, till the mixture is beaten to work, and no grain to be found.

CAZERNS, in *Fortification*. See CASERNS.

CAZIL, or Cassiel, a general title given by the Spaniards to the petty kings or princes, and chiefs of the several countries of America, excepting those of Peru, who are Incas *ordinem*.

The French call those subjects, a denomination which they also give to the chiefs of the Canadian tribes.

The *caxes* in some places are the offices of physicians, and auditors of public accounts, &c. explains.

The dignity of *cazique* among the Caribbees, people of South America, and among the Californians, is not to be acquired by any one descend to children, but must be acquired by valour and merit. One of the prerogatives annexed to it is, that the *cazique* have three wives, while the other people are only allowed one.

Mexico contained a great number of provinces and states, which were governed by lords called *caziques*, dependent on, and tributary to the emperor of Mexico: many of these *caziques* or nobles are said to have been so powerful, that they could cause them bring an army of a hundred thousand men into the field.

CAZIMI, among the Arabian astronomers, denotes the centre or middle of the sun. A planet is said to be in *cazimi*, when it is not distant from the Ecliptic in longitude or latitude above 17', or the aggregate of the semi-diameter of the sun's disk and that of the planet.

This amounts to the same with what is otherwise called *in corde Solis*, or in the sun's heart, which place for dignity and fortunate of a planet, equal to that of being in its own house, exaltation, or other rules, a planet's conjunction with the sun is held detrimental, or a dominion to it as to the Lord, by his favour, power, is supposed to absorb the force of the planet, and even fourth of their beings.

CEANOTHUS, in *Natural History*, a name given by some of the ancients to the three more generally known under the name of *soapwort*. It was the *Lana* with our figure herbaceous on the walk and roots of Constantinus Cæsarius; and, from a opinion of the Greeks, that their flower brought forth young ones, which was founded on their having some more daily produced among them, it became a custom to give this ornament to women in labour, as a thing that would, by a sort of sympathy, hasten the time.

CEANOTHUS, in *Botany*, a genus of the *pentandria monogynia* class. Essential Char. Cal. Hort. Mal. Jersey ess. Its characters are these: the flower hath five petals, equal petals, which spread open, and are less than the empalement. It hath five erect stamina, placed opposite to the petals; and a three-cornered germen, which afterward becomes a dry capsule with three cells, in which are lodged three seed-like. There are three species.

CEBELL, in *Gilders*, an ancient English or Anglo-Saxon tax of four hens or sparrows repented at the will of the master, and having been alienated in the grant and the grantee hens or sparrows to the manor of Sudley.

CECROPIA, in *Botany*, a genus of the *dioecia monandria* class.

CEDAR (*Cedrus*, in *Botany*. For the characters, in LARIX.—Linnæus makes three species of the tree.

The *cedar of Lebanon* is a tree celebrated in antiquity, and what is very remarkable, this tree is not found as a native in any other part of the world, as far as hath come to knowledge.

This tree is of great beauty, and bears the severest extremes of cold well; there is a wonder it is not more cultivated in England. The cones of this tree are brought us from the Levant, and, if preserved entire, will keep their fragrance many years; their cones are to be five inches long, and the scales pickled very thick set to be seven and an half broad, and they are set to be three and an half apart in the same manner as the fir; only they have not the square form of those firmly, the leaves being generally inclined to one side, and much narrower to the upward by being a little thrown straight by to that side. They grow generally, and the ends of their branches standing erect, they make very beautiful close upright bushes, which form like a green tower, and as a plant for the small makes a very elegant appearance; and it is therefore a fine tree for planting on an embankment to adorn a wilderness.

They thrive best of all in a poor soil, and are of very quick growth, as appears by many plants of these trees now in the Chelsea garden at Chelsea, which were planted in the year 1683, and were then not above three feet high; and in the year 1760 measured nine yards and an half in height, at two feet above ground.

Cedar wood is reputed almost incorruptible, and a perpetuity which is never attacked by the worm, which the worms cannot endure. For this reason it was, the ancients made use of cedar tables to write on; especially the stamps of commissions are supposed to that exposition of Persius, *Et vera cedro scripta*, Sat. I. ver. 42.

A book was also drawn from cedar, with which they covered their books and writings, as other nations to preserve them from moths; which is affirmed to be likewise the reason of that which is in the Sibyl's verses, written in purple, were preserved entire in the cedar tree. All are mentioned by Pliny. Hist. Nat. Plant. ver. 7. Plin. Sec. Hist. Nat. in allusion to.

The cedar was also used in building, as Solomon's temple, as well as his palace, were built of this wood. That prince gave king Hiram several cities for the same he furnished him on their occasion. Cortez is said to have erected a palace at Mexico, in which were 300 beams of cedar; most of them 120 feet long, and 25 in circumference, as we are informed by Herrera. Some tell us of a cedar tallied in Cyprus 150 feet long, and 18 in diameter. It was used for the same end in the valley of king Demetrius.

Le Bruyn affirms us, that the cave hewed for him on mount Libanon measured one of them 57 palms, and the other 45 in circumference.

In the temple of Apollo at Dium, there were cedar tables of near 1000 years old; which yet were sufficient to that time to an enemy at Dium, at Segovium in Spain, said to have been brought thither 1000 years before the destruction of Troy.

Cedar is of so dry a nature, that it will not endure to be buried with iron nails, from which it usually decays; for that they commonly fallen it with pieces of the same wood.

Thevenot brought from Babylon and Jerusalem to a specimen that, of so precious a nature, that the wood will last through it.

That produced in New England is a shrub greater, and the leaves are prickly, and shooting their fruit something. They mingle their leaves with it, and use it to all their buildings. This is the sequence of Lycia, which Vitruvius describes as having its leaves resembling those of cypress.

The cedar of Greece and Asia was no other than a smaller kind of juniper, which having prickly leaves, was by some called *oxycedrus*, and the common juniper was at that time called also by the name of cedar. The Lycian cedar of the Greeks was the juniper which has the *oxycedrus* and *oxycedrus*, which were a kind of pitch and an oil likewise from it by boiling, were also prepared from this cedar, but from the *oxycedrus* only, which was a larger sort, and resembled the cypress; and therefore was confounded with that tree, being made by some the said cypress. This *oxycedrus* was prepared from this species; but the wood of cedar, or cedar-oil, was made from the fruit of the *oxycedrus* in private houses of juniper, called cedar by the Greeks, and growing in that wild country.

The *abietina* and the *acuta* mentioned in Scripture, are usually supposed to have been kinds of cedar.

Bobadilla, in his Dictionary, is of opinion, the Arabs have mistaken the word *cedar*, or *cedrus*, for that of *cypress*, and *cedrus* and *cypress* are the same.

CEDAR, in *Geography*, a river of Virginia, which runs into the Appomattox province, &c. Its course is not known.

CEDAR, in *Natural History*, a name given by some to the *cedrus* of the ancients, which is also called *cedrus*, and *cedrus*.

CEDAR, in *Botany*, a genus of the *monoecia monadelphia* class. Essential Char. Cal. Hort. Mal. Jersey ess. Its characters are these: the flower hath five petals, equal petals, which spread open, and are less than the empalement. It hath five erect stamina, placed opposite to the petals; and a three-cornered germen, which afterward becomes a dry capsule with three cells, in which are lodged three seed-like. There are three species.

CEDELL, in *Gilders*, an ancient English or Anglo-Saxon tax of four hens or sparrows repented at the will of the master, and having been alienated in the grant and the grantee hens or sparrows to the manor of Sudley.

CECROPIA, in *Botany*, a genus of the *dioecia monandria* class.

CEDAR (*Cedrus*, in *Botany*. For the characters, in LARIX.—Linnæus makes three species of the tree.

The *cedar of Lebanon* is a tree celebrated in antiquity, and what is very remarkable, this tree is not found as a native in any other part of the world, as far as hath come to knowledge.

This tree is of great beauty, and bears the severest extremes of cold well; there is a wonder it is not more cultivated in England. The cones of this tree are brought us from the Levant, and, if preserved entire, will keep their fragrance many years; their cones are to be five inches long, and the scales pickled very thick set to be seven and an half broad, and they are set to be three and an half apart in the same manner as the fir; only they have not the square form of those firmly, the leaves being generally inclined to one side, and much narrower to the upward by being a little thrown straight by to that side. They grow generally, and the ends of their branches standing erect, they make very beautiful close upright bushes, which form like a green tower, and as a plant for the small makes a very elegant appearance; and it is therefore a fine tree for planting on an embankment to adorn a wilderness.

They thrive best of all in a poor soil, and are of very quick growth, as appears by many plants of these trees now in the Chelsea garden at Chelsea, which were planted in the year 1683, and were then not above three feet high; and in the year 1760 measured nine yards and an half in height, at two feet above ground.

Cedar wood is reputed almost incorruptible, and a perpetuity which is never attacked by the worm, which the worms cannot endure. For this reason it was, the ancients made use of cedar tables to write on; especially the stamps of commissions are supposed to that exposition of Persius, *Et vera cedro scripta*, Sat. I. ver. 42.

A book was also drawn from cedar, with which they covered their books and writings, as other nations to preserve them from moths; which is affirmed to be likewise the reason of that which is in the Sibyl's verses, written in purple, were preserved entire in the cedar tree. All are mentioned by Pliny. Hist. Nat. Plant. ver. 7. Plin. Sec. Hist. Nat. in allusion to.

The cedar was also used in building, as Solomon's temple, as well as his palace, were built of this wood. That prince gave king Hiram several cities for the same he furnished him on their occasion. Cortez is said to have erected a palace at Mexico, in which were 300 beams of cedar; most of them 120 feet long, and 25 in circumference, as we are informed by Herrera. Some tell us of a cedar tallied in Cyprus 150 feet long, and 18 in diameter. It was used for the same end in the valley of king Demetrius.

Le Bruyn affirms us, that the cave hewed for him on mount Libanon measured one of them 57 palms, and the other 45 in circumference.

In the temple of Apollo at Dium, there were cedar tables of near 1000 years old; which yet were sufficient to that time to an enemy at Dium, at Segovium in Spain, said to have been brought thither 1000 years before the destruction of Troy.

Cedar is of so dry a nature, that it will not endure to be buried with iron nails, from which it usually decays; for that they commonly fallen it with pieces of the same wood.

Thevenot brought from Babylon and Jerusalem to a specimen that, of so precious a nature, that the wood will last through it.

That produced in New England is a shrub greater, and the leaves are prickly, and shooting their fruit something. They mingle their leaves with it, and use it to all their buildings. This is the sequence of Lycia, which Vitruvius describes as having its leaves resembling those of cypress.

The cedar of Greece and Asia was no other than a smaller kind of juniper, which having prickly leaves, was by some called *oxycedrus*, and the common juniper was at that time called also by the name of cedar. The Lycian cedar of the Greeks was the juniper which has the *oxycedrus* and *oxycedrus*, which were a kind of pitch and an oil likewise from it by boiling, were also prepared from this cedar, but from the *oxycedrus* only, which was a larger sort, and resembled the cypress; and therefore was confounded with that tree, being made by some the said cypress. This *oxycedrus* was prepared from this species; but the wood of cedar, or cedar-oil, was made from the fruit of the *oxycedrus* in private houses of juniper, called cedar by the Greeks, and growing in that wild country.

The *abietina* and the *acuta* mentioned in Scripture, are usually supposed to have been kinds of cedar.

Bobadilla, in his Dictionary, is of opinion, the Arabs have mistaken the word *cedar*, or *cedrus*, for that of *cypress*, and *cedrus* and *cypress* are the same.

CEDAR, in *Geography*, a river of Virginia, which runs into the Appomattox province, &c. Its course is not known.

CEDAR, in *Natural History*, a name given by some to the *cedrus* of the ancients, which is also called *cedrus*, and *cedrus*.

roundish germen succeeding a single style of the length of the petals, crowned by a single stigma. The germen turns to a roundish fruit with two sutures, opening to discover two cells containing two seeds. We have but one species, which grows naturally in most of the islands in the West Indies.

The wood is very fine, white and durable, and is therefore frequently used for cabins; the fruit and leaves are good pickles for cattle.

CEDAR of Barbadoes, or Barbadoes Cedar, in Botany. This is properly a genus of the monadelphia monogynia class in the Linnæan system. Its characters are: Flakes of male flowers, growing in the axe, some very small, with five short stamens, which adhere at bottom to the germen; in the centre is situated the immature pistil, which afterwards becomes an oval seed-bearing pod or capsule, opening in three parts, and filled with four seeds, separated from the bottom of each cell with five valves, having thicker edges, the valves being thicker and sweller, the inner very thin, which continually surrounds the seeds; these are small, oblong, and appear like red seeds, but the wings adhering to the lesser end of the seed.

As the order of Linnæus is by characters very properly referred to the genus of trees, and all the hardy species which are known in this country under that name are comprised in the following, some botanists have thought proper to make a genus of the plants which were mentioned by Linnæus, and by most of the authors who have treated of them; and as the first species is generally known by the appellation of cedar in the countries where it naturally grows, so the following also have come to those places which agree in their essential characters with it will correct their property accordingly.

The cedar of Lebanon. The first is commonly known upon the mountains of Libya, in the British islands of Jamaica, where they are grown naturally, and in one of the largest sizes in the country. The stumps of these trees are so large, that the inhabitants have them hollowed out, for which purpose they are extremely well adapted, the wood being soft, it can with great facility, and being light, will carry a great weight in the water. It has a fragrant odour, from which the name of cedar has been given to it. It is often used for wainscoting of rooms, and to make quills, because the ants do not so frequently breed in it, as in many other sorts of wood. It bears a bitter taste. The fruit is a conical cone, or whatever is put into the chests, boxes or cabinets, wherein cedar is used, will receive a very agreeable scent, because ipermaceti liquors will not taste part of the resin, and thereby acquire a very bitter taste.

The second sort is the cedar-tree, the wood of which is very well known in England. This grows in a variety in the warmest parts of America, growing plentifully on the islands of Cuba, Jamaica, and Hispaniola; there are also some of them on the Bermuda islands. In Cuba and Jamaica they are trees of a very large size, so as to run into planks of six feet in breadth; and rise to a great height, notwithstanding they are commonly found growing on rocks, where there is scarcely any earth for their nourishment. Linnæus has made a distinct genus of this under the name of SWIETENIA.

The excellency of this wood for all cabinet uses, is now sufficiently known; and it is matter of surprize that the tree should not have been taken notice of by any botanist or traveller as yet here. The only author who has mentioned the tree is Sir Hans Sloane, in his Natural History of Jamaica and the Bermuda islands; although the wood has been very generally brought to England in great quantities.

If any curious persons engaged, they will make considerable presents to England; there are one in Chelsea garden eighty or ten feet high, which have not of a few years growth from seeds.

CEDAR of Barbadoes. See JUNIPER.

CEDAR, white. See CYPRESS.

CEDAR-up, a sort of wooden ware brought from the West Indies. They are made out of the wood of the bastard cedar, and appear of a very close and firm grain; but are not easily to please, that when they have been pared into them, is very soon set on the harness.

CEDILLA, in the Spanish and French languages, denotes a kind of small C, to the bottom of which is affixed a little tail resembling a Z, to denote that it is to be pronounced like Z.

The cedilla is used by those of our readers who are acquainted with the Spanish tongue, in the words *cabeça*, *cabeza*, *cara*, *dize*, &c. in the Spanish, as it sometimes is used at the beginning of a word in the French, as *ça*, *ce*, &c.

CEDRA. See CITRON.

CEDRELA, in Botany, a genus of the *Polygamia monœcia* class and order.

CEDRELAUSON, in Botany, a name given by Plinius to an unknown tree, and likewise applied by many authors to the wood known evidently formed of *cedrus*, the *larix*, and some the *fir tree*; and hence the original author of this name has obtained it, as a large and high ornamental branches and shady leaves, have caused their being introduced in gardens of a middle nature, because they thrive and flourish.

CEDRIA, a resinous liquor arising from the great cedar-tree, or cedar of Lebanon. The word is also written *cedrium*, *cedrion*, and *cedrinum*, as above.

Cedria, when genuine, yields a fuming smell, is transparent, of a much finer consistence, in short in every thing, it differs from pitch or tar so greatly, that cannot any be done. It is guilded of two opposite qualities, viz. to preserve dead bodies, by its strong and continuing impregnation, and burn without damaging the least parts, and to preserve the soft and tender parts of living bodies without applying any fire.

The cedria is properly the true of the cedar. Some call it the gum, others the pitch of the cedar. The Greek name cedrion is also given to the cedrium, or oil of the cedar, which differs little from the cedria, except that it is oil of a more consistence.

Pliny, speaking of the cedar, says, that cedar of a solid or consistence was burned out of it by fire, and called it by the name of cedrium. His words are these: *cedrus ardendo exsudat, et ea quæ ex ea colligitur cedria vocatur, quæ est ad condienda cadavera efficacissima.* Cedar of a solid or consistence was burned out of it by fire, and called it by the name of cedrium. His words are these: *cedrus ardendo exsudat, et ea quæ ex ea colligitur cedria vocatur, quæ est ad condienda cadavera efficacissima.* The cedria is also given to the life of the dead, see (as Pliny Lucas, vol. iii. p. 11.

CEDRINUM of Pliny, under Wine, of which there are several sorts, which qualities are to be strong, diuretic, and gently astringent: but the best. It has also a wine, of remarkably healing.

CECIDUS, in Grammar, a word for of the third negative, similar for Cheddar of Rome. See CADENCE, Rhetoric.

CECILIUS, in Natural History, a name by which some authors have called the *lepi fossilia*, or fossil-scales of the ancients.

CEDRA. See CITRON-tree.

CELANDINE GREEN. See RHODIA and SARRADEVERA.

CELERY, in Agriculture, a kind of the third negative, similar for Cheddar of Rome. See CADENCE, Rhetoric.

CELESTIAL, in Natural History, a name by which some authors have called the *lepi fossilia*, or fossil-scales of the ancients.

CELIA. See CITRON-tree.

CELIANDINE GREEN. See RHODIA and SARRADEVERA.

CELLING, in Architecture, the top of roof, of a lower room; or a covering of plaster, less rude adhering on the bottom of the joists that be the floor of the upper room; or to cover them in an upper room, as joists to the garrets, beams called *ceiling joists*.

The word ceiling answers pretty accurately to the Latin *lacunar*, every thing that *lacus*.

Painted ceilings are much used in England, more than in any other countries, nor are they without their advantages, as they make the room lighter, as good as rules of art; stop the leakage of the roof; soften the noise over head; and, in fashion, make the air cooler.

CEILING, in the Language, denotes the inside planks of ships.

CELLULA, from *cæmen*, *to be laid on*, in Antiquity, denotes those ornamental pieces of furniture or ornaments, relieved or laid up for extraordinary occasions and uses.

In which sense, sacred garments, vessels, and the like, are reputed of the number of a church. Medals, antique figures, figures, manuscripts, jewels, &c. are the ornaments of most of letters.

CEMELLARCHIUM, the repository or place where ornaments are preserved.

CEMELLOPHYLAX, from *cæmen* and *φυλαξ*, *I keep*, the keeper or curator of a collection of *cæmelia*; fashioned and ornamental utensils.

The conclusion, or completion, was an effect in the ancient churches or monasteries, answering to what was otherwise denominated *thesophylax*, and *vasa* explained.

CEMIFERA, in *Architecture*, the name of a sub-caught in the Ionic order, and esteemed a very fine and delicate one, though of no enormous size. It grows to nine or ten feet long, and as the thickness of a man's body; but is rarely seen while young. Its body is oblong, and its head flatted. Its mouth is but small for the size of the fish, and it has no teeth in the jaws; but the whole mouth is lined with small tubercles. Its back and sides are black, and its belly of a fine bright azure. Its fins are all black, except the belly ones, which are white with a tinge of black at their edge. Blagrave.

CELARINE, in *Botany*, *Cochineal*, a genus of the *Polygamia monœcia* class. Its characters are these: the flowers have four largish roundish petals; in the centre is situated a cylindrical germen, attended by a great number of stamens. The germen afterwards becomes a cylindrical pod, with one or two cells, opening with two valves, and filled with many small seeds. There are seven species.

The first is the common celandine, which is used in medicine, and is esteemed aperitive and cleansing, opens-

ing obstructions of the fibres and liver; and is of great use in curing the jaundice and dropsy. This gentleman tells us, the lakes of Annan, and in many places in many parts of England, is a balance concerned in gardening. Miller's Gard. Dict.

However has very lately recommended this plant as a specific in the cure of consumption, by properly undertaking it in conjunction with drinking its juice; and says enough in the result to recommend it at least to a fair trial, which would be easily made in a country where consumptions are so common. Jacobs. in Pharm.

CELANDINE, *Sylv.* See Pilewort.

CELANDINE, *Garden*. See Boccones.

CELANTES, in *Logic*, a disputation given by the Peripatetics to the Gabenial syllogism; otherwise called Camestres.

CELARENT, among *Logicians*, a mode of syllogism, wherein the major and conclusion are universal negative propositions, and the minor a universal affirmative.

E. g.

CE — *Nine nobles were standing beheaded and in mourning.*

LA — *Every noble is a gentleman or woman.*

RENT — *Therefore no man is present.*

CELASTRUS, in *Botany*. See Staff-tree.

CELE, in a general sense, denotes any tumour, but more particularly that proceeding from a rupture. See Hernia.

CELEBATE, or Celebacy, the state of a person who lives out of marriage.

Scaliger derives the word from the Greek κοιτη, *bed*, and κατα, *against*, *i. e.* one who lies not. It is formed from *cœlebs*, or *cœlebes*, *i. e.* *living single*.

The ancient Romans held an estate unprofitable to discourage celebacy. Nothing was more usual than for the censors to propose rewards to all bachelors. Thompson Hall mentions an ancient constitution, whereby all old persons in full age were obliged to marry. But the chief tax of this kind, of which we have any certainty, is mentioned under Augustus, called *Lex Julia de maritandis ordinibus*. It was afterwards confirmed by *Papia Poppæa*, and more usually *Julia Papia*, because of some new sanctions and amendments made in it under the consuls Papius and Poppæus. By this law, divers prerogatives were given to persons who had many children. Penalties imposed on those who lived a single life, so that they should be incapable of receiving legacies, except from their nearest relations, and not exceeding a certain proportion, &c.

The custom of the clergy, which is still rigorously kept up among the Romanists, is of a pretty ancient standing. It was much promoted by the council of Nice, but without passing a canon, however, in some measure submitted to the Decretal canons of Elvira, Arles, Trent, &c. and confirmed by the thirty-third canon of the council of Elvira, though it does not appear that it was either generally or rigorously observed. Both among the priests appointed themselves for the facility of communion, took the holy sacrament as towards the close of the fourth century, there were few but made a profession of a voluntary celebacy. Epiphan. Hæres. 59. obliging all priests who succeed to observe celebacy, and it was soon after enjoined by the synods of each particular nation. It was confirmed in most of the western churches in 442; the council of Orange ordered those to be deposed who did not submit here to celebacy; and Leo the Great, in a letter written about the year 442, extended the law of celebacy, which was confirmed by the decree of this council in deacons, and by the letter of Siricius to deacons and presbyters, to subdeacons likewise; and it was Gregory the Great, in 591, who first brought acolythistes to submit to celebacy as a law. In the sessions of Trent, it was proposed to fix the clergy in celebacy again from the rules of ancient; and this was even made an article of the Interim of Charles V. but the people could not be brought into it.

The obligation of celebacy was first imposed on the clergy in England by Henry I. under the influence of pope Calixtus II. and the archbishop Anselm.

CELERES, in *Antiquity*, a body, or regiment, of guards of the ancient Roman kings established by Romulus, consisting of three hundred persons, chosen from the best families of Rome and approved by the suffrages of the curiæ of the people, each of which furnished one.

The name comes from celer, *quick*, *ready*; and was given them, because of their promptness to serve the king.

The celeres always attended on the king's person, to guard him, to be ready to carry his orders, and to execute them. Livy says, they were employed in the engagement which they always began first; in imitation of which the kings of Rome always had a body of horse, yet the particular distinctions and fought on foot; these commanded by a person called *celerum tribunus*, who was the second person in the kingdom. See Cavalry, &c.

Pomp. Lætus, Niebuhr make the *celeres* of this history, were soon re-established; for we find them carrying mes of the succeeding kings against the great Tarquin, who expelled the Usurpers, and who was the author of the *celeres*.

CELERINUS, in *Ichthyology*, a name by which some authors have called the Hirundo; called by others the sea-swallow, and Volatica.

Celerinus are also used by Belonius, and some others, to denote the common herring. See Clupea.

CELERITY, in *Mechanics*, is the velocity of a moving body; or that affection of a body in motion, whereby it is enabled to pass over a certain space in a certain time.

CELERY, in *Botany*. For the characters, &c. See Apium.

The seed of celery should be sown about the middle of March, the latter end of February, or beginning of April, on a moist bed, and is expedited by the ensuing summer; it will be to much the better, but it should not be under the drip of trees. The middle or latter end of the month of May, will be fit to transplant for blanching.

The manner of transplanting it is as follows: after having cleared the ground of weeds, you must dig a trench in a line about six inches wide, and eight or nine inches deep, loosening the earth in the bottom, and throw it level; and the earth that comes out of the trench should be equally laid on each side the trench, to be ready to throw its earth to earth the celery as it advances in height. The trenches should be made at three feet distance from each other; then plant your plants in the middle of the trench, at about four or five inches distance, and draught new, having before trimmed the plants, and cut off the tops of the long leaves; and as they are planted, you must observe to cover the earth well to their roots with your feet, and in water them plentifully till they have taken new root. As their plants advance in height, you must observe to draw the earth to them at times, being careful not to bury their hearts; nor never to do it but in dry weather, wherewith the plants will rot. When your plants have advanced a good while in height above the meadow, and all the earth which was laid on the first trench, hath been employed in earthing them up; you shall then make use of a spade to dig up the earth between the trenches, which must also be made use of for the same purpose, continuing from time to time to earth it up, until it is fit for use. The last sorts should be planted on a north aspect, to prevent its being turned with too much wet in the winter. You will do well to cover your ridges of celery with some boards, or some such light covering, when the frost is very likely, which will secure the sets from the frost, and the over-moisture also, that so the plants may be in a fit condition for eating, they will be very tender and crisp, and quite sweet, and of a fine yellowish white; but if you would have some celery to stand the winter, and to run to seed the next year, you must leave some of the plants in the trenches where they grew, pretty close together, and not to earth up the leaves any more, but to let them grow as they will; and in the spring they will run to seed, and you may save your seed when ripe. The other, when full blanched, will continue good about three weeks or a month before it will run to seed, or grow hot, as some say; but if you would have it to continue longer, you should take up some roots before Sept. and plant them in pots, and set them in a warm glass-case, where they will grow, and be very good eating all the winter; and you may also plant some roots in the middle of a hot-bed frame, and cover the frame at night, and in very severe weather, and they will grow and be very good eating. Some persons have a method of preserving celery in sand, which is the best of all methods, as it will keep very fresh and crisp all the winter. Dr. Hill mentions an ancient custom, whereby old persons in full age were obliged to marry. But the chief tax of this kind, of which we have any certainty, is mentioned under Augustus, called *Lex Julia de maritandis ordinibus*. It was afterwards confirmed by *Papia Poppæa*, and more usually *Julia Papia*, because of some new sanctions and amendments made in it under the consuls Papius and Poppæus. By this law, divers prerogatives were given to persons who had many children. Penalties imposed on those who lived a single life, so that they should be incapable of receiving legacies, except from their nearest relations, and not exceeding a certain proportion, &c.

The custom of the clergy, which is still rigorously kept up among the Romanists, is of a pretty ancient standing. It was much promoted by the council of Nice, but without passing a canon, however, in some measure submitted to the Decretal canons of Elvira, Arles, Trent, &c. and confirmed by the thirty-third canon of the council of Elvira, though it does not appear that it was either generally or rigorously observed. Both among the priests appointed themselves for the facility of communion, took the holy sacrament as towards the close of the fourth century, there were few but made a profession of a voluntary celebacy. Epiphan. Hæres. 59. obliging all priests who succeed to observe celebacy, and it was soon after enjoined by the synods of each particular nation. It was confirmed in most of the western churches in 442; the council of Orange ordered those to be deposed who did not submit here to celebacy; and Leo the Great, in a letter written about the year 442, extended the law of celebacy, which was confirmed by the decree of this council in deacons, and by the letter of Siricius to deacons and presbyters, to subdeacons likewise; and it was Gregory the Great, in 591, who first brought acolythistes to submit to celebacy as a law. The obligation of celebacy was first imposed on the clergy in England by Henry I. under the influence of pope Calixtus II. and the archbishop Anselm.

CELERES, in *Antiquity*, a body, or regiment, of guards of the ancient Roman kings established by Romulus, consisting of three hundred persons, chosen from the best families of Rome and approved by the suffrages of the curiæ of the people, each of which furnished one.

The name comes from celer, *quick*, *ready*; and was given them, because of their promptness to serve the king.

The celeres always attended on the king's person, to guard him, to be ready to carry his orders, and to execute them. Livy says, they were employed in the engagement which they always began first; in imitation of which the kings of Rome always had a body of horse, yet the particular distinctions and fought on foot; these commanded by a person called *celerum tribunus*, who was the second person in the kingdom. See Cavalry, &c.

Pomp. Lætus, Niebuhr make the *celeres* of this history, were soon re-established; for we find them carrying mes of the succeeding kings against the great Tarquin, who expelled the Usurpers, and who was the author of the *celeres*.

CELERINUS, in *Ichthyology*, a name by which some authors have called the Hirundo; called by others the sea-swallow, and Volatica.

Celerinus are also used by Belonius, and some others, to denote the common herring. See Clupea.

CELERITY, in *Mechanics*, is the velocity of a moving body; or that affection of a body in motion, whereby it is enabled to pass over a certain space in a certain time.

CELERY, in *Botany*. For the characters, &c. See Apium.

The seed of celery should be sown about the middle of March, the latter end of February, or beginning of April, on a moist bed, and is expedited by the ensuing summer; it will be to much the better, but it should not be under the drip of trees. The middle or latter end of the month of May, will be fit to transplant for blanching.

The manner of transplanting it is as follows: after having cleared the ground of weeds, you must dig a trench in a line about six inches wide, and eight or nine inches deep, loosening the earth in the bottom, and throw it level; and the earth that comes out of the trench should be equally laid on each side the trench, to be ready to throw its earth to earth the celery as it advances in height. The trenches should be made at three feet distance from each other; then plant your plants in the middle of the trench, at about four or five inches distance, and draught new, having before trimmed the plants, and cut off the tops of the long leaves; and as they are planted, you must observe to cover the earth well to their roots with your feet, and in water them plentifully till they have taken new root. As their plants advance in height, you must observe to draw the earth to them at times, being careful not to bury their hearts; nor never to do it but in dry weather, wherewith the plants will rot. When your plants have advanced a good while in height above the meadow, and all the earth which was laid on the first trench, hath been employed in earthing them up; you shall then make use of a spade to dig up the earth between the trenches, which must also be made use of for the same purpose, continuing from time to time to earth it up, until it is fit for use. The last sorts should be planted on a north aspect, to prevent its being turned with too much wet in the winter. You will do well to cover your ridges of celery with some boards, or some such light covering, when the frost is very likely, which will secure the sets from the frost, and the over-moisture also, that so the plants may be in a fit condition for eating, they will be very tender and crisp, and quite sweet, and of a fine yellowish white; but if you would have some celery to stand the winter, and to run to seed the next year, you must leave some of the plants in the trenches where they grew, pretty close together, and not to earth up the leaves any more, but to let them grow as they will; and in the spring they will run to seed, and you may save your seed when ripe. The other, when full blanched, will continue good about three weeks or a month before it will run to seed, or grow hot, as some say; but if you would have it to continue longer, you should take up some roots before Sept. and plant them in pots, and set them in a warm glass-case, where they will grow, and be very good eating all the winter; and you may also plant some roots in the middle of a hot-bed frame, and cover the frame at night, and in very severe weather, and they will grow and be very good eating. Some persons have a method of preserving celery in sand, which is the best of all methods, as it will keep very fresh and crisp all the winter. Dr. Hill mentions an ancient custom, whereby old persons in full age were obliged to marry. But the chief tax of this kind, of which we have any certainty, is mentioned under Augustus, called *Lex Julia de maritandis ordinibus*. It was afterwards confirmed by *Papia Poppæa*, and more usually *Julia Papia*, because of some new sanctions and amendments made in it under the consuls Papius and Poppæus. By this law, divers prerogatives were given to persons who had many children. Penalties imposed on those who lived a single life, so that they should be incapable of receiving legacies, except from their nearest relations, and not exceeding a certain proportion, &c.

The custom of the clergy, which is still rigorously kept up among the Romanists, is of a pretty ancient standing. It was much promoted by the council of Nice, but without passing a canon, however, in some measure submitted to the Decretal canons of Elvira, Arles, Trent, &c. and confirmed by the thirty-third canon of the council of Elvira, though it does not appear that it was either generally or rigorously observed. Both among the priests appointed themselves for the facility of communion, took the holy sacrament as towards the close of the fourth century, there were few but made a profession of a voluntary celebacy. Epiphan. Hæres. 59. obliging all priests who succeed to observe celebacy, and it was soon after enjoined by the synods of each particular nation. It was confirmed in most of the western churches in 442; the council of Orange ordered those to be deposed who did not submit here to celebacy; and Leo the Great, in a letter written about the year 442, extended the law of celebacy, which was confirmed by the decree of this council in deacons, and by the letter of Siricius to deacons and presbyters, to subdeacons likewise; and it was Gregory the Great, in 591, who first brought acolythistes to submit to celebacy as a law. In the sessions of Trent, it was proposed to fix the clergy to celebacy again from the rules of ancient; and this was even made an article of the Interim of Charles V. but the people could not be brought into it.

The obligation of celebacy was first imposed on the clergy in England by Henry I. under the influence of pope Calixtus II. and the archbishop Anselm.

CELERES, in *Antiquity*, a body, or regiment, of guards of the ancient Roman kings established by Romulus, consisting of three hundred persons, chosen from the best families of Rome and approved by the suffrages of the curiæ of the people, each of which furnished one.

The name comes from celer, *quick*, *ready*; and was given them, because of their promptness to serve the king.

The celeres always attended on the king's person, to guard him, to be ready to carry his orders, and to execute them. Livy says, they were employed in the engagement which they always began first; in imitation of which the kings of Rome always had a body of horse, yet the particular distinctions and fought on foot; these commanded by a person called *celerum tribunus*, who was the second person in the kingdom. See Cavalry, &c.

Pomp. Lætus, Niebuhr make the *celeres* of this history, were soon re-established; for we find them carrying mes of the succeeding kings against the great Tarquin, who expelled the Usurpers, and who was the author of the *celeres*.

CELERINUS, in *Ichthyology*, a name by which some authors have called the Hirundo; called by others the sea-swallow, and Volatica.

Celerinus are also used by Belonius, and some others, to denote the common herring. See Clupea.

CELERITY, in *Mechanics*, is the velocity of a moving body; or that affection of a body in motion, whereby it is enabled to pass over a certain space in a certain time.

CELERY, in *Botany*. For the characters, &c. See Apium.

The seed of celery should be sown about the middle of March, the latter end of February, or beginning of April, on a moist bed, and is expedited by the ensuing summer; it will be to much the better, but it should not be under the drip of trees. The middle or latter end of the month of May, will be fit to transplant for blanching.

The manner of transplanting it is as follows: after having cleared the ground of weeds, you must dig a trench in a line about six inches wide, and eight or nine inches deep, loosening the earth in the bottom, and throw it level; and the earth that comes out of the trench should be equally laid on each side the trench, to be ready to throw its earth to earth the celery as it advances in height. The trenches should be made at three feet distance from each other; then plant your plants in the middle of the trench, at about four or five inches distance, and draught new, having before trimmed the plants, and cut off the tops of the long leaves; and as they are planted, you must observe to cover the earth well to their roots with your feet, and in water them plentifully till they have taken new root. As their plants advance in height, you must observe to draw the earth to them at times, being careful not to bury their hearts; nor never to do it but in dry weather, wherewith the plants will rot. When your plants have advanced a good while in height above the meadow, and all the earth which was laid on the first trench, hath been employed in earthing them up; you shall then make use of a spade to dig up the earth between the trenches, which must also be made use of for the same purpose, continuing from time to time to earth it up, until it is fit for use. The last sorts should be planted on a north aspect, to prevent its being turned with too much wet in the winter. You will do well to cover your ridges of celery with some boards, or some such light covering, when the frost is very likely, which will secure the sets from the frost, and the over-moisture also, that so the plants may be in a fit condition for eating, they will be very tender and crisp, and quite sweet, and of a fine yellowish white; but if you would have some celery to stand the winter, and to run to seed the next year, you must leave some of the plants in the trenches where they grew, pretty close together, and not to earth up the leaves any more, but to let them grow as they will; and in the spring they will run to seed, and you may save your seed when ripe. The other, when full blanched, will continue good about three weeks or a month before it will run to seed, or grow hot, as some say; but if you would have it to continue longer, you should take up some roots before Sept. and plant them in pots, and set them in a warm glass-case, where they will grow, and be very good eating all the winter; and you may also plant some roots in the middle of a hot-bed frame, and cover the frame at night, and in very severe weather, and they will grow and be very good eating. Some persons have a method of preserving celery in sand, which is the best of all methods, as it will keep very fresh and crisp all the winter.

foods will be ripe, at which time it should be eat up, in a dry time, and spread upon cloths in the sun to dry; then beat out the seeds, and preserve it for the use.

The qualities in every species with those of the CELLERY and PARSLEY, which see.

CELERY, *seseli*, *Apium graveolens*, was found in considerable quantities by Sir Hans Sloane, on the coast of Yorkshire, and Dr. Scheuzer, on the coast of Yorkshire and Lincolnshire. It is like the garden celery in the colour and disposition of the leaves, but the leaves are of a deeper green. The taste is between that of anise and parsley. It is a very useful ingredient in the soup for leanness, because of its nutritious quality. Hawkesworth's Voyages, vol. ii. p. 90, &c.

CELESTINS, an order of religious, called also the *congregation of St. Pamfilo*, derived from the Benedictines, established by pope Celestin V. three miles from Sulmona, in 1264, by count de Morone in Naples, and established in 1264, by pope Urban IV. and confirmed by Gregory X. in 1274. They were introduced into France by Philip the Fair, who requested a colony from the general of their order, by his ambassador at Naples, in 1300. They came first into Paris in France and Italy—It is a kind of *cordeliers* with regard to *franciscans*. *Calmet*.

CELESTES, or CELESTS, from *celer*, a *swift horse*, in *Antiquity*, denoted light or battle-chariots, by way of contradistinction from those used in harnessed together, called *biguæ*, *triguæ*, &c.

The first denomination is ascribed to the carriers, or riders on horseback; and hence some distinguish the name of Romulus's guards.

CELEUSMA, or CELEUSIS, in *Antiquity*, the shout or cry of the boatmen, whereby they animated each other to some work or rowing.

The word is formed from κελευω, *to call*, *to give the signal*.

CELEUSMA was also a kind of song or formula, rehearsed or played by the masters, or others, to direct the strokes and movements of the mariners, as well as to encourage them to labour. See CELEUSTES.

Aquinus, without much foundation, extends the *celeusma* to the military shouts in land armies.

When Christianity got footing, hymns and psalms were sung in vessels, by way of *celeusma*, in which the words *ameyned* and *halleluiah* were frequently repeated.

CELEUSTES, in *ancient Navigation*, the boatswain or officer appointed to give the oarers the signal, when they were to pull, and when to stop. See CELEUSMA.

He was also denominated *epopeus*, and by the Romans *portitor*; sometimes simply *hortator*.

CELIAC *affect*. See CŒLIAC.

CELIBATE. See CŒLIBATE.

CELIOSCOPIA, the description of the spots which appear on the face of the sun and planets.

The word is formed from κοιλος, *hollow*, *deep*, and σκοπεω, *I observe*.

Signor Bianchini has published a *celioscopia*, or description of the spots of the sun.

CELIMIA, in the *Materia Medica*, a name given by the modern Greeks to the cadmiæ, or *lapis* CALAMINARIS.

The Arabians called this substance *calmia*, and sometimes *calmia* and *celimia* were but a very small change from *calamina* and *calmia* was but a very small change from this.

CELL, *Cella*, in *Roman Affairs*, denotes a place or apartments chiefly under ground, and vaulted; in which were stored up large jars of necessaries, as wine, honey, wheat, and the like, according to which it was peculiarly denominated *cella vinaria*, *cella olearia*, *cella mellaria*, &c.

The word is formed from *celare*, *to conceal*. See CELLA.

CELLA was also used for the lodge, or habitation of a common workman or peasant, as being under ground; hence also denominated *penita*.

Ingenium cellâ vetet ire relictâ.
Et colligo ramum. Juv. Sat. xi. ver. 121.

On which place an ancient scholiast remarks, that the names of the workmen were written on the doors of their *cellæ*, by which we learn the meaning of *inscripta cella*, in Martial, lib. xii. ep. 56.

CELLA was also applied to the bed-chambers of domestics, and servants; probably as being low and narrow.

Cicero, inveighing against the luxury of Antony, says, the beds in the very *cellæ* of his servants were spread with pompous purple coverlets.

CELLA is also applied to the members or apartments of BAVIA.

Of these there were three principal, called *frigidaria*, *tepidaria*, and *calidaria*. To which may be added a fourth, called *cella olei*, and sometimes *unctuaria*.

CELLA was also applied to the upper, or middle and most retired part of the temples, wherein the images of the gods, to whom the edifices were consecrated, were placed. See TEMPLE.

In this sense, we meet with *cella Jovis*, *cella Cereris*, &c. Pub. Victor calls them *sedes*; and Pliny by a more comprehensive name, *ædes*. Hills Nat. lib. xxxv. cap. 12.

The Roman Capitol, we are told by Dionysius, had three such *cellæ*, or chapels; the middlemost of which was consecrated to Jupiter, that on the right hand to Minerva, and that on the left to Juno.

CELLA is also used for a locker or frame-work for containing, or rather for a place to contain, any thing. Such was that called *cella penaria*, erected by Otho, surnamed the Rich, marquis of Misnia, in the middle of the twelfth century, the most splendid cellary in that country.

CELLAR, *Cellarium*, in *domestic Affairs*, denotes the same with CELLA, viz. a conservatory of eatables, or drinkables.

Cellar differs from VAULT, as the latter is supposed to be over, the former being frequently little below the surface of the ground.

In which case, it differs only in name from *pantry*, as the former was only a store-house for several days, the latter for a long time. Thus it is, the HAGTENBERGERS, a sort of anabaptist Cynics, are said by M. Arnaud to carry their cellar about with them. Hilario, in Matth. cap. 5.

CELLARIUM also denoted an allowance of bread, wine, oil, or other provision, furnished out of the *cella*, or store of the granary of the provinces, and his officers, &c. In which sense, the word answers to much the same with *annona*.

CELLARS, in *Modern Building*, are the lowest rooms in a house, the ceilings of which usually lie level with the surface of the ground on which the house is built.

Cellars and other places vaulted under ground, were called by the Greeks *hypogæa*; the Italians still call them *sotterranei*.

As to the situation of *cellars*, Sir Henry Wotton says they ought, unless the whole house be cellared, to be situated on the north side of the house, as requiring a cool frost all day.

CELLARER, or CELLERER, *Cellarius*, or *Cellerarius*, an officer in monasteries, to whom belong the care and procurement of provisions for the convent.

The denomination is said to be borrowed from the Roman law, where *cellarius* denotes an examiner of accounts and expences. Upon which account Cassiodorus, *lib. iii. var. ep. 28.* calls the *cellarius* a *public witness*.

The *cellarius* was one of the four *dispensators*, or great officers of monasteries, under the superior, viz. the *prior*, the *sub-prior*, and the *almoner*, or *hospitaller*. In the richer houses there were particular lands let apart for the maintenance of his office, called in ancient writings, *cellarium*.

The *cellarius* was a great man in the convent. His whole office in ancient times had a respect to that article he was to find for his lord's own table, and that in groceries; and his appointment consisted in a certain proportion thereof, usually first or a thirteenth part of the whole; together with a liberal gown. The office of *cellarer* thus may differ in name from that of butler and manciple; excepting that the *cellarer* has the service of his lord's table through the whole extent of his jurisdiction.

CELLARER was also an officer in convents, to whom belonged the care of the temporals, and particularly the distributing of bread, wine, and money to convent, on account of their attendance at the choir. In some places he was called *cellarer*, in others *butler*, and in others *caterer*.

CELLEPORA, in *Botany*, the name of a genus of marine plants, or rather animals; and a kind of worms in the Linnæan system. They are of the genus of the *alcyonia*, and have oblong excepting hollows in several parts. See CORAL.

CELLITES, CELLITES, an order of religious, founded at Antwerp in the beginning of the fourteenth century, whose patron was Alexius, a Roman, and confessor. In Italy they are called *fatebenefratelli*, but in Germany, and the Low Countries, where they have monasteries, *Cellites*, i. e. persons inhabiting cells. See LOTHARDS.

CELLS, *Cellæ*, *Cellulæ*, are little houses, apartments, or chambers; particularly those wherein the ancient monks, penitents, and hermits, lived in retirement.

Some derive the word from the Hebrew קלה, i. e. *a garret, or place where any thing is placed*.

The same name is still retained in divers monasteries.

The dormitory is frequently divided into many *cells*, or lodges.

The Carthusians have each a separate house, which serves them as a *cell*.

The hall wherein the Roman conclave is held, is divided, by partitions into divers *cells*, for the several cardinals to lodge in.

CELLS, in *Anatomy*, are little *bags*, or *bladders*, where fluids or other matters are lodged; called also *loculi*, *cellulæ*, &c.

CELLS are also the little divisions, or apartments, in honey combs, where the honey, young bees, &c. are stuffed: these cells are always regular hexagons.

CELLS of *plants*, in *Botany*, are those partitions or hollow spaces in the husks or pods of plants, wherein the seed is lodged.

CELLULAR *Membrane*, in *anatomy*, the small, or little *cells*, wherein the fat or tendon of good habit is contained. See ADIPOSE, and ADIPOUS.

These are so connected with the skin itself, except in the forehead, the eyelids, penis, and *scrotum*. In emaciated bodies, these *cells*, being unfurnished of their fat, appear like a kind of flaccid, membranous membrane.

The *cellular membrane* is reticulate and *simple*. The false name of the reticular part is merely a network of denser fibres and small membranes, whence it derives its fallacious and boastful title, as it is found under the skin of the penis and scrotum; on other parts, as under the skin of the uterus and under the *tunica* of the testes, it is loaded with oil, and into pustules in its inflamed. The former part is dispersed through the whole body, except in the substance of the bones, brain, and membranes of the eye, covering the fibres of the body, the muscles, tendons, ligaments, and nerves, and tying them to one another; and it is every where intermixed with the substance of the skin. About the joints, the *cellular membrane* is chiefly considered, for the ease of easily moving, under the skin in general it is simple, between which flexures and the surface of the muscular mass it is loose, and chiefly reticulated. In the former, the part only of this membrane is adipose, which is upon the outside of the body: as we grow up, the fat is more equally dispersed through the body, and its greater quantity in proportion about the viscera. Dr. Hunter is of opinion, that the fat in the body is lodged in a glandular apparatus superadded to the reticular membrane, consisting of vesicles or bags for this purpose, and of vessels fitted for secretion. See Med. Obs. vol. i. p. 26, &c.

CELLULA, in the COLON, a sort of spaces wherein the EXCREMENTS continue some time before they are voided.

CELLULANUS, a more inhabitant, or resident in a cell, or CELLA.

He is also denominated *cellicolus* and *Trantilla*, by which are imported the relation of fellow-monks, or those who live in the same cell or convent.

CELLULAR, or CELLULOUS, an appellation given by Ruysch, to the second coat of the intellines, in which fat is often found. Hist. Comp. Anat. p. 104.

We also take notice of a *cellular* coat in the ANTHERÆ, wherein fat is contained.

Heister thinks that a *cellular* coat may also be added to the three coats in the human BLADDER, by reason fat is often found between the outermost and muscular coat, where it is formed, collected, and preserved in little adipose cells.

CELOSIA, AMARANTH, in *Botany*, a genus of the *pentandria monogynia* class. Its characters are these: the flowers have five erect, sharp-pointed petals, which are permanent, stiff, and shaped like a scale or cup. It hath a small nectarium joined to the bottom of the germen, to which adhere also the stamina, which are terminated by tuntings. Besides the *compliment* aforesaid becomes a globular capsule with one cell opening horizontally, containing roundish seeds. There are three species.

Linnæus has separated the plants of this genus from the amarantha, which have been generally joined with them, because these have male and female flowers on the same plant, whereas these have only hermaphrodite flowers.

CELSIA, in *Botany*, a genus of the *didynamia angiospermia* class. Linnæus gave it this name in honour of Dr. Celsius, professor at Upsal. We have no English name for this plant. Its characters are these: the flower is of one leaf, with a very short tube, spread open above, and cut into five unequal parts, the two upper being small, and the under largest. It hath four hairy stamina, which incline towards the upper segment of the petal. In the centre is situated a roundish germen, which afterward becomes a roundish capsule compressed at the sides, sitting upon the compliment, and having two cells, which are filled with small angular seeds. We know but one species of this plant, which is a native of Arcturia.

CELTES, in *Roman History*, under this name must be understood, not only the Gallic philosophers, but all those which anciently flourished in other parts of Europe. The history of the Celtic philosophy affords nothing certain; nor is the obscurity in which it is involved to be wondered at, considering the remoteness of the times. We discover nothing either in our own affairs, or from the testimony of Latin authors, by which to refute any doubts concerning this people: all monuments of circumstance being destroyed, and their doctrine not being committed to writing; as it was their custom to transmit them by tradition.

The names of their hymns, however, are reported to be preserved among those northern nations which have been subject to the revolutions which have at other times overrun the southern parts of Europe. Extracts from these *Edda*, a course of poetry for the instruction of the Iceland youth, and last to contain the Celtic mythology, have been lately published: though from whence obtained, does not appear. See DANUBE.

CELTIS, in *Botany*. See NETTLE-*tree*.

CEMENT, or CEMENTE. See CEMENTE.

CEMENTATION, in CHEMISTRY. See CHEMISTRY and CHEMICAL.

CEMETERY, *cœmeterium*, a cœmitory, or sacred place set apart for the burial of the dead.

Churches wherein the ancient *cœmeteria*, *cœmeteries*, from κοιμαω, I *sleep*, originally were comprehended, are only the field *dormitory*, or place where the dead were disposed; but all the lands which encompassed the parish churches, and were contiguous to the real churches. —Perhaps it might be added, that all the lands of dominion were comprised under *cœmeteries*. This will best account for the confiscation of the *cœmeteria*, ordered on Valerian.

In the early ages, the Christians held their assemblies in the *cœmeteria*, as we learn from Eusebius and Tertullian; the latter of whom calls those *cœmeteria* where they met to pray, *areæ*. Valerian seems to have confiscated the *cœmeteria*, and places destined for divine worship, which were restored again to the Christians by Gallien. In the rescripts of that emperor, which is preserved by Eusebius, *cœmeteria* and places of worship are used as synonymous terms. In being here the martyrs were buried, the Christians chose those places to have churches in, when leave was given them by Constantine to build. And hence some derive that rule which still obtains in the church of Rome, never to consecrate an altar, without putting under it the relics of some saint. See RELICS.

The heathen writers frequently upbraid the primitive Christians for their meetings in *cœmeteria*; as if they served other purposes besides those of religion. The council of Elvira prohibits the keeping of tapers lighted in *cœmeteria*, during the day-time; and by another canon, the women from pulling the night watching in *cœmeteria*.

The practice of consecrating *cœmeteria* is of later antiquity: the bishop walked round in procession, with the crosier, or pastoral staff, in his hand, the holy water pot being carried before, out of which aspersions were made.

CENCHRAMIDEA, in *Botany*, a name given by Pitcairn to a genus of plants afterwards called, by Linnæus and Ruyschius, CELTIS.

CENCHRAMUS, in *Ornithology*, a name by which some writers have called the ERMINEA, called in English, the ERMINE.

CENCHRIS, in *Ornithology*, the same given by many writers to the kestrel, or windhover, a species of hawk of the long-winged kind called the TINNUNCULUS, and by some in English, the *stannel*.

CENCHRIS, is also the name of a species of *lacerta*, so called because of the small spots, which resemble millet seeds. It grows to two feet or more in length, and is considerably thick and large, and generally green as the rat. It has a greenish yellow colour, and is yellowish, inward the belly. It is found in the islands of the Archipelago, particularly in Lemnos and Samos Bay.

CENCHRUS, in *Botany*, the name given by Tournefort to a genus of plants, of the *polygamia monœcia* class, of the Linnæan *pentandria*, the characters of which are these: the cup consists of a number of bristles, collected into a sort of head, these are jagged and cultivated, and each of them contains three calyxes: the compound flowers are bivalve glumes of a hollowed and pointed figure, each containing two flowers, and are shorter than those flowers; the flowers are some male, and others of the hermaphrodite kind; each flower is bivalve, the

VALVES

valves being pointed, hollow, and without seeds, and the inner one smaller than the outer. The flowers are cases to each flower, and are long pointed filaments, each containing a tegumentary spear. The pistillum has hermaphrodite flowers in formed of a roundish germen, a slender style of the same length with the stamens, and two oblong hairy stigmata. The fruit is succeeded by a single oblong seed-vessel, which is of a roundish figure. There are six species.

CENEGILI, in the Scots antiquities, an expedient usually put by one who had killed a man, to the kindred of the deceased. The assith is compounded of the lawful composition, ransome, and price, paied.

CENEONTLATOTL, in Ornithology, the name of an American bird described by Nieremberg, and called by that author, *ave convolvulus*. It is famous for the different modulations of its voice, and excels even the nightingale in melody.

CENNING, *Cenning, or Kenning*, in our *Ancient Records*, denotes a note given by the buyer to him of whom he had bought, that the thing purchased was claimed by another, that he might be put to make it good, or warrant his bargain.

The word is formed of the Saxon *cennan*, *cuthcen ahcennan*, *to make known*. Du-Cange.

CENORITE, or CONORITE. See CONORITE.

CENOTAPH, an empty tomb, or a monument without a body under it, erected only by way of honour to the deceased.

The word is compounded of *κενος*, *empty*, and *ταφος*, *tomb*.

It stands distinguished from *sepulchre*, in which a corpse is actually deposited.

Cenotaphs are honorary tombs, erected either to persons buried in another place, or to those who have received no BURIAL, and whose relics cannot be found, as being killed in battle, lost at sea, or the like. Among the ancients, the same privileges and religious regard were allowed to these tombs as to *sepulchres*, as to real tombs. Carl. Scotia has a treatise express on the cenotaphs of the Celtæ, Cimbri, and Lucani, which are still seen at Kilmorenan in Argyle-shire.

CENOTOZOUS, in *Geography*, the name of an American island described by Nieremberg, and called *insula cervina*, because it abounded in very timorous deer, which fled at the sight of a human creature. It is a very beautiful variegated land, and lies as well in the valley as hilly climates, but is principally feed among the mountains. It has a very remarkable way of milking its kind when it is thin, without hurting its body; it rubs five days with round salt. There is another species of it a little differing in the disposition of the colours, which some call bonasi.

CENSAL, in the Mohammedan parts, denotes a regular or established broker, authorized to negociate between merchant and merchant.

CENSER, in *Antiquity*, a kind of vessel wherein incense was burnt to the gods.

Censer is chiefly used in speaking of the Jewish worship. Among the Greeks and Romans, it is more frequently called *thuribulum*, *acerra*, and *arula*.

The Jewish *censer* was a small pan of chasing-dish, covered with a dome, and suspended by a chain. Josephus tells us, that Solomon made twenty-thousand gold censers for the temple of Jerusalem, to other purposes in, and fifty-thousand others to carry fire in.

CENSER, the same with ARA.

CENSIO, in *Antiquity*, the act or office of the CENSOR. See CENSUS.

Censio included both the rating or valuing a man's estate, and the imposing taxes and penalties.

CENSIO *militaris*, a punishment inflicted on a Roman soldier for some offence or baseness of slavery, whereby his *hasta* or spear was taken from him, and consequently his wages, and hopes of preferment stopped.

CENSITUS, a person entered, or entered into the CENSUS *publicus*. See CENSUS.

In an ancient monument found at Aosta, containing the actions of the emperor Octavius, we read,

Qui censa civium Romanorum
Centies tum capita quadraginta
Censum meum fecerunt.

CENSITUS is also used in the *Civil Law* for a female servant of inferior, who pays capitation to the land for the lands of him, and is entered as such in the book of census. In which sense, the word answers to the term *capite census*, or *capitis censitus*. See CAPITE *Censi*.

CENSOR, in *Antiquity*, one of the prime magistrates in ancient Rome, whose business was to survey and rate the people, and to inspect and correct their manners.

The word is derived from *censeo*, because he assessed and valued every man's estate, regulating their names, and placing them in a proper century, that the Romans might know what own strength; though others say, the *censor* were so called on account of their other office; viz. as being conservators, or overseers of manners and policy.

There were two *censors* first created in the year of Rome 311, upon the senate's observing, that the consuls were too much taken up with matters of war, to be at all leisure for looking near enough into private affairs. To remedy this mischief, these new magistrates were authorized to call every person, and their goods and estates before them, and to punish such as they found guilty of any misdemeanor. At first they were taken out of the senate; but after the plebeians had got the consulates open to them, they soon arrived at the *censorship*. M. Rutilius was the first who, having been twice consul and dictator, in the year 400 demanded the office of *censor*. The custom was to elect two, the one of a patrician family, the other a plebeian; and upon the death of either, the other was discharged from his office, and two new ones elected; but not till the next lustrum. In the year 424, a law was made, appointing one of the *censors* to be always elected out of the plebeians, which held for some till the year 622, when both *censors* were chosen from among the people; after which time, it was settled between the senate and people.

This office was so considerable, that some applied to it till they had passed all the rest; for as it was looked on as furnishing the Cretans should be admitted *senators*, without having been either consuls or prætors.—The term of this office was at first established to five years; but that institution only lasted nine; Mamercus Æmilius, in the year 220, made a law, restraining the *censors* to a year and a half; which was afterwards observed very strictly.

The authority of the *censors* was, to register and value the effects, &c. of the Roman citizens; and to impose taxes in proportion to what each person possessed. Certain subjects then functions to the numbering of the people, the correction and reformation of manners, the examining the merits of each citizen, the proportioning of taxes, the superintendence of tributes, the exclusion from the senate, and the care of the public places. They had also a right, some say, to expel from the senate such of their members as they judged unworthy of the dignity, as well as to bring and collect the knights who failed in their duty, by taking from them the public horse, *equus publicus*.

There are many examples of censors expelled by the *censors*, generally for good reasons, yet sometimes through mere peevishness, envy, or revenge; but in such cases, there was always the liberty of an appeal to the final judgment of the people. Neither the confession power, properly speaking, was one that of taking or remaking persons, but of enrolling only those whom the people had made, and of inspecting their manners, and condemning upon their viewers over which they had a special jurisdiction delegated by the people. Their rule of enrolling seems to have been proposed as an axiom of the Roman policy, enjoining, *that the senate should be pure from all blemish, and the manners of senators of the only source of the city*; or we find it laid down by Cicero in his Book of Laws, which were drawn, as he tells us, from the plan of the Roman constitution.

Besides the task of enrolling the citizens, and inspecting their manners, it was a part likewise of the *censorian* jurisdiction to let out to farm all the lands, revenues, and customs of the republic; and to contract with architects for the charge of building and repairing all the public works and edifices, both in Rome and the colonies of Italy. Now on this branch of their office it is certain that they acted merely on the authority of the people, and were prohibited by law to let to any of the revenues, except in the manner under the superintendence and inspection, and in the very presence of the people.

In the general census and review of the city, held by them every five years, though every Roman citizen was particularly concerned and obliged to give in his property tribe by tribe, or from man to man, in their proper names, as Cicero tells us, did not exclude any man's right to a free citizenship, but required only that he had passed his census at that review; because the proper power of determining that right resided always in the people. Cicer. pro Dom. c. 13. Liv. l. 52. Middleton of Rom. Sen. p. 30, 31, 32, &c.

The office continued to the time of the emperors, who assumed the authority of it to themselves, but without the name, calling themselves instead of *censors*, *censors perpetui*, though Vespasian and his sons took a pride to be called *censors*, and put this among their other titles on their coins. Decius attempted to restore the dignity to a particular magistrate. After this we hear no more of it till Constantine's time, who made his brother *censor*; the last who seems to have enjoyed the office.

The

The republic of Venice has at this day a *censor* of the manners of their people whose office lasts 12 months.

CENSORS *of books* are a body of doctors, or other officers, established in divers countries, to examine and give their judgment of all books, before they go to the press; and to see they contain nothing contrary to the faith, and good manners. In England we had formerly an officer of this kind, under the title of *licenser of the press*; but since the Revolution the press has been open.

At Paris, the *faculty of theology* claim the privilege of *censure*, as granted to them by the pope; and it is certain *fact*, as granted to them by the pope; and it is certain *fact*, as granted to them by the pope; and it is certain fact, as granted to them by the pope; and it is certain fact, as granted to them by the pope; and it is certain fact

CENTAURY, *the*, a genus belonging to the SYNGENESIA class of plants. The characters are these: it hath a compounded flower, which is composed of many hermaphrodite florets, and chalmydate, or tuft, of female florets, which are longer and thicker than the hermaphrodite; the seeds are solitary and naked. The genera is divided under the 3d, which afterwards becomes a single seed, that up at the compounded: the female florets have a slender tube, which expands above, where it is enlarged, and has five sharp pointed parts: there are barren. Miller specifies seventy sorts of it.

The roots and leaves of the plant are esteemed vulnerary and astringent: they are given in infusion, in decoction, and powder, in all cases of profuse evacuations of every kind. The common sorts are very fond of common soil in France, and increase by feeders, and the seeds: the tender annual plants are apt to be destroyed by the spring frosts, and so often destroy many of the tenderest plants. He prescribes the root in powder.

CENTAURY, *the lesser*, or CHAMÆDRYS *minor*, is a little annual plant, with leaves growing by pairs, and a flower consisting of a purple tuft, cut into five segments, and a calyx cut in like manner. — It leaves an odour of a rose water, and very ferruginous to the mouth, rather in the composition of that kind, or for a decoction or infusion, which is well made in wine. It is diuretic and astringent: good humours in good against scurvy, and by some also is extolled as an alexipharmic, or cordial. The three subnexes of the leaves is inodorous, or no smell or taste. The green colour exhibits in the infusion and being extolled to spirit or water, but not to water. See CHAMÆDRYS, of which the plant is a species.

CENTAURY, *the lesser*, a genus of the *monogynia* order of plants, having naked and tender flowers. It resembles in the outward form the genus of *gentiana*, and like it the flowers are funnel-shaped, and the limb of the corolla (that is composed of two leaves, each of which is divided into five parts, and a quadrangular capsule, containing small seeds, and have four petals.

CENTURIO, or CENTURION, in the *Roman* affairs, was an officer who had the command of a hundred men, and was frequently called *centurio*.

CENTURIATUS, in the *Roman* affairs, was an officer who had the superintendance of a hundred men.

CENTURIATUS was also used for a person worth a hundred thousand sesterces, otherwise called CENSUS.

CENTURIATUS *Mensis*. See MENSIS.

CENTUM, or CENTRE, in a general sense, denotes a point equally remote from the extremes of a line, figure or body; as the middle of a line, or place, of which a figure is divided into two equal parts.

The word is used, which primarily denotes a point, more common than each sense, however, is true.

CENTRE *of a figure*, is a point in the middle of the space of the figure, whereon the lines drawn from it, and which is contained in the angle of the three parts of the figure. Or it is the point within which the several angles of interest each other.

CENTRE *of a section*, the middle of a section: where is usually two large square figure, for large, and equally and large.

CENTRE *of a circle* is a point in the middle of a circle, or whence lines, from which all lines drawn to the circumference are equal.

CENTRE *of gravity*, that point of the body is divisible to the action of a force, or a single weight by two determinate lines the extremes of which is proportionate to divide the whole by two lines drawn from the extreme to a point in the circumference.

CENTRE *of a sun-dial* is the point in the middle of the plane, or where the gnomon stands.

The point, in the circle, is within the figure; not, as the rectilineal, without.

CENTRE *of gravity*, in *Mechanics*, a term first used by *Archimedes*. For a definition to this we observe it a stick be laid on a supporting power, and drawn by a thread fastened to it, so that the thread always makes the same angle with the stick; if a weight made to the stick will be found to rest on one of the points, which will be immoveable; which point is called the centre of gravity. For the greater part, the thread may be considered fastened to one end of the stick.

The great advantage of the centre of the ball, and the manner wherein it operates: for, imagine the ball moved or rolled, it is certain, that the resistance of the parts of the ball to be in motion, always towards the stick against the point on which the thread is fastened, as in a circle: in the present instance, the ball should not be perfect the greatness of a circle; other wise, the stick would no longer keep the line they would; but in a particular manner, in such manner, as that the end of the stick, and the parts round it, would follow larger orders or circles than the rest, and have a greater velocity. The resistance therefore of the ball, which tends to impress a circular motion upon the stick, round the point to which the thread is fastened, will be greater in this than in the perfect

CENTER *of an ellipſis*, is that point where the two diameters, the tranſverſe and the conjugate, interſect each other.

CENTER *of the equant*, in the *Old Aſtronomy*, a point in the line of the epheſian; being ſuch a diſtance from the *center* of the excentric, towards the aphelion, as the ſun is from the *center* of the excentric towards the perihelion.

CENTER *of gravitation, or attraction*, in *Phyſics*, is that point to which a revolving planet, or comet, is impelled, or attracted, by the force or impetus of gravity.

CENTER, in *Mechanics*, denotes a wooden mould by which to turn an arch.

CENTER *of gravity*, in *Mechanics*, is a point within a body, through which if a plane paſs, the ſegments on each ſide will counterbalance, i. e. neither of them can move the other.

Hence, if the diſtrict of the *center* of gravity be preſerved, if the body be ſuſpended by its *center* of gravity, it will continue at reſt in *equilibrio*, in any poſition.

The whole gravity of a body may be conceived united in its *center*; and therefore, in demonſtrations, it is uſual to conſider the body as conſiſting in that point.

Through the *center* of gravity paſſes a right line, called the *diameter of gravity*: the interſection, therefore, of two ſuch diameters conſtitutes the *center*.

The plane wherein the *center* of gravity is placed, is called *the plane of gravity*: ſo that the common interſection of two ſuch planes determines the diameter of gravity.

In homogeneal bodies, which may be divided lengthwiſe into ſimilar and equal parts, the *center* of gravity is the ſame with the *center* of magnitude. If, therefore, a line be biſected, the point of ſection will be the *center* of gravity.

Common CENTER *of gravity of two bodies*, is a point ſo ſituated, in the right line joining the centers of the two bodies, as that, if the point be ſuſpended, the two bodies will counterbalance, and reſt in any ſituation.—Thus, the point of ſuſpenſion in a common balance, or in a Roman ſteel-yard, where the two weights equiponderate, is the *common center of gravity* of the two weights.

When any number of bodies move in right lines with uniform motions, their common *center of gravity* moves likewiſe in a right line with an uniform motion; and the ſum of their motions eſtimated in any given direction, is preciſely the ſame as if all the bodies, in one maſs, were carried on with the direction and motion of their common *center of gravity*. Nor is the *center of gravity* of any number of bodies affected by their collitions or actions on each other.

Laws of the CENTER *of gravity*.—1. *If the centers of gravity of two bodies* A *and* B (Vide Mechan. Def. 13. N°2.) *be joined by the right line* AB; *the diſtances* BC *and* CA *of the common center of gravity* C *from the particular centers of gravity* B *and* A, *are reciprocally as the weights* B *and* A. See this demonſtrated under BALANCE.

Hence, if the gravities of the bodies A and B be equal, the common *center of gravity* C will be in the middle of the right line AB. Again, ſince A : B :: BC : AC; it follows that A × AC = B × BC; whence it appears, that the powers of equiponderating bodies are to be eſtimated by the product of the maſs, multiplied into the diſtance from the *center of gravity*; which product is uſually called the *momentum* of the weights.

Farther, ſince A : B :: BC : AC, A + B : A :: BC + AC : BC. Therefore the common *center of gravity* C, of two bodies, will be found, if the product of one weight A, into the diſtance of the ſeparate *centers of gravity* AB, be divided by the ſum of the weights A and B. Suppoſe, e. g. A = 12, B = 4, AB = 24; therefore BC = 24 × 12 ÷ 16 = 18. If the weight A be given, and the diſtance of the particular *centers of gravity* AB, together with the common *center of gravity* C; the weight of B will be found = to A × AC ÷ BC; that is, dividing the momentum of the given weight, by the diſtance of the weight required from the common *center of gravity*. Suppoſe, A = 12, BC = 18, AC = 8; then B = 6 × 12 ÷ 18 = 8.

2. *To determine the common center of gravity of ſeveral given bodies, a, b, c, d* (*Fig.* 13.) in the right line AB. Find the common *center of gravity* of the two bodies *a* and *b*, which ſuppoſe in F; conceive a weight *c* + *d*, applied in F; and in the line FE, find the common *center* of the weight *c* + *d* and *c*, which ſuppoſe in G. Laſtly, in BG, ſuppoſe a weight *a* + *b* + *c* applied, equal to the two *a* + *b* and *c*, and find the common *center of gravity* between this and the weight *d*, which ſuppoſe in H; this H will be the common *center of gravity* of the bodies *a*, *b*, *c*, *d*. And in the ſame manner might the common *center* of gravity of any greater number of bodies be found.

3. *Two weights* D *and* E (*Fig.* 14.) *being ſuſpended without mutual motion, to find the center of gravity in* C, *to determine which of them preponderates, and how much.* Multiply each into its diſtance from the *center* of ſuſpenſion; that ſide on which the product is greateſt, will preponderate; and the difference between the two will be the quantity wherewith it preponderates.

Hence, the momenta of the weights D and E, ſuſpended without the *center* of gravity, are in a ratio compounded of the weights D and E, and the diſtance from the point of ſuſpenſion. Hence alſo the momentum of a weight ſuſpended in the very point C, will have an effect at all in reſpect of the weights D, E.

4. *To determine the preponderation where ſeveral bodies a, b, c, d* (*Fig.* 15.) *are ſuſpended without the common center of gravity in* C, *to preponderate towards the right*; *to determine the point* V, *from which the ſum of all the weights being ſuſpended, the preponderation ſhall continue the ſame as before mentioned.*

Find the momentum wherewith the weights *a* and *b* preponderate towards the right; then the momentum of the ſum of the weights to be ſuſpended in F is to be equal to it, the momentum now found will be the product of CF into the ſum of the weights; this, therefore, being divided by the ſum of the weights, the quotient will be the diſtance CF, at which the ſum of the weights is to be ſuſpended, that the preponderation may continue the ſame as before.

5. *To find the center of gravity in a parallelogram and parallelopipedon.* Draw the diagonals AD and EG (*Fig.* 16.) likewiſe CB and HF; theſe each diagonal, AD and CB, divides the parallelogram ACHD into two equal parts, each paſſes through the *center* of gravity; conſequently, the point of interſection I muſt be the *center* of gravity of the parallelogram. In like manner, ſince both the plane CBFH, and ADGE, divides the parallelopipedon into two equal parts, each paſſes through its *center* of gravity; ſo that the common interſection IK is the diameter of gravity, the middle whereof is the *center*.

After the ſame manner may the *center* of gravity be found in priſms and cylinders; it being the middle point of the right line that joins the *center* of gravity of their oppoſite baſes.

6. In regular polygons, the *center* of gravity is the ſame with the *center* of the circumſcribed parallelogram.

7. *To find the center of gravity of a cone, and a pyramid.* The *center* of gravity of a cone is in the axis AC (*Fig.* 17.) If the AP = *p*, ρ AC = *a*, CD = *r*, the periphery of the baſe = *p*, and PN = *y*, we ſhall have, by the well-known property of circles, $r : y :: a - p : \frac{ay - py}{r}$ = the periphery of the circle, whoſe diameter is MN, which being multiplied by $\frac{1}{2}$ will give $\frac{ay - py}{2r}$ = the area of the ſame circle. But, by ſimilar triangles, $r : a :: y : \frac{ay}{r}$, therefore $x = \frac{p \cdot p}{r}$, and $x^2 = \frac{p^2 \cdot p^2}{r^2}$; conſequently the area of the circle, whoſe radius is PN, becomes equal to $\frac{py - p^2}{2r}$, and therefore $\frac{py^2 - p^2y}{2r}$ will be the fluxion of the maſs, or of the content of the cone at the term MN, and $\frac{py^2 - p^2y}{2r}$ will be the fluxion of the momentum, whoſe fluent is $\frac{py^3}{6r} - \frac{p^2y^2}{4r}$, which being divided by $\frac{py^2}{2r} - \frac{p^2y}{2r}$, the fluent of $\frac{py^2 - p^2y}{2r}$, the fluxion of the maſs, will give $\frac{1}{3}y - \frac{1}{2}AP$, for the diſtance of the *center* of gravity of the portion AMN from the vertex A; and when AP becomes equal to AC, *a* will be equal to *y*; and therefore the *center* of gravity of the whole cone is at leaſt from the vertex A of AC. And in the ſame manner is found the diſtance of the *center* of gravity from the vertex of the pyramid ABAC.

8. *To determine the center of gravity in an iſoſceles triangle* BAC (*Fig.* 18.) Draw the right line AD, biſecting the baſe BC in D, which will be alſo perpendicular to it; ſince Δ BAD = Δ DAC, each may be divided into the ſame number of little weights, applied in the ſame manner on each ſide to the common axis AD; ſo that the *center* of gravity of the Δ BAC, will be in AD. To determine the preciſe point in it; let AD = *a*, BC = *b*, AP = *x*, MN = *y*; then will AP : MN :: AD : BC; or, $a : y :: x : \frac{xy}{a}$.

Hence,

Hence, $y = \frac{x^n}{a^{n-1}}$. Consequently $y \propto x$, which translated, the fluxion of the area at the term MN divided by x, expressing the fluxion of the area AMN, will be equal to $\frac{bx^n}{a^{n-1}} \div x = \frac{bx^{n-1}}{a^{n-1}}$, the fluent of which quantity will be $\frac{bx^n}{na^{n-1}} = \frac{A}{n}$, or the area BC, when $x = AD$, $\frac{1}{n}$ AD; and therefore the distance of the center of gravity of the A from the vertex, will be found $\frac{1}{n}x$.

In the very same manner the center of gravity of any other plane triangle will appear to lie at $\frac{1}{3}$ of the altitude from the vertex.

10. *For the center of gravity in a parabola (fig. 10).* Let $AE = x$, $BE = y$, $AB = a$, $PN = z$. Then will xy be the fluxion of the whole area; but from the nature of the parabola, and the parameter being a conftant quantity, $ax = z^2$, whence $x = \frac{z^2}{a}$, and $xy = \frac{z^3}{a} = y$; fubftituting $\frac{z^3}{a}$ inftead of xy in the above expreffion, we fhall have $\frac{z^3}{a}z$ for the fluxion of the area, whofe fluent $\frac{4z^4}{3a^2}$ will be the area itfelf. Then multiplying $\frac{z^3}{a}z$ by x, we fhall have $\frac{z^3}{a}x$ or $\frac{z^3}{a}\frac{z^2}{a}$ for the fluxion of the momentum, whofe fluent $\frac{z^5}{5a^2}$ will be the momentum itfelf. Divide this by the whole weight, and the quotient $\frac{4z^5}{5a^2} \div \frac{4z^4}{3a^2} = \frac{3}{5}z$, will be the diftance of the center of gravity of the fpace NAE from the vertex A; and where AP becomes equal to AE, or $z = x$, or $\frac{3}{5}$ AE, will be the diftance of the center of gravity of the whole parabolic fpace from the vertex A. Now $y^m = x^n$, being a general equation for all kinds of parabolas, we fhall have $y = x^{\frac{n}{m}}$ and therefore $\dot{x}^{\frac{n}{m}}$ will be the fluxion of the whole area, and $x^{\frac{n}{m}}\dot{x}$, the fluxion of the momentum: the fluent of this laft expreffion, viz. $\frac{x^{\frac{n}{m}+2}}{\frac{n}{m}+2}$, being divided by the fluent of $x^{\frac{n}{m}}$, viz. $\frac{x^{\frac{n}{m}+1}}{\frac{n}{m}+1}$, will give $\frac{\frac{n}{m}+1}{\frac{n}{m}+2}x$, for the diftance of the center of gravity of the fpace ZAX from the vertex A; and $\frac{m+1}{m+2}x$ will be the diftance of the center of gravity of the whole parabolic fpace from A. When $m = 1$, as in the common parabola, this expreffion will be $\frac{2}{3}x$. If $m = 2$, as in the cubical parabola, then the expreffion will be $\frac{3}{4}x$, where $x = a$ in a fquadratic parabola, we fhall have $\frac{3}{4}a$ for the diftance; and in a fefquiad parabola, where $m = 3$, the expreffion will give $\frac{4}{5}x$ for the required diftance. If $m = \frac{1}{2}$, which is the property of the cocuars or fupplemental fpace, then the rule becomes a theorem to the vertical point, and $\frac{1}{3}x$ will be the diftance required. In the cafe of parabola AST, as may be eafily found, by reafoning on fimilar principles, the center of gravity is at the diftance AL, equal to $\frac{1}{3}$ AQ. In the cubical parabola, $\frac{1}{4}$ AQ. In a fefquiad parabola, $\frac{1}{5}$ AQ.

11. *The center of gravity of the arch of a circle,* as EHF, (fee fig. N° 4.) is fomewhere in the radius AH that bifects it in H. Let D L be a diameter parallel to the chord of the arch EF, be conceived as the axis of fuſpenſion, and be equal to r; let EF $= z$, AHF $= a$, the perpendicular BC $= y$, the arch CH $= x$, and A E $= v$. When the point C arrives at H, y becomes equal to r, and x and z in their evanefcent ſtate are equally therefore $r \propto x \propto z$; and conſequently $y \propto x$, which is the fluxion of the momentum, is equal to $x \propto x$ and $r \propto x$, will be the momentum itſelf. Divide this by x the whole area, and $\frac{r \propto x}{x} = r$ will be the diſtance of the center of gravity of the arch from the point of ſuſpenſion A. But when the point C arrives at E, $x = \frac{a}{2}$ will be equal to $\frac{ar}{2}$, and therefore the required diſtance will be to the radius as the chord of the arch to the arch itſelf; and if the arch be the circumference, as the diameter to the circumference. In the ſame manner, as CACH ($fig. 10, N° 2.$) the center of gravity of the ſector ACGH. On the center A, with a radius at pleaſure, deſcribe the arches NN, and draw the chords NN and CC. Let AC $= x$, the chord CC $= z$, CAC $= a$, and AN $= r$. The momentum of an arch, with reſpect to the axis of ſuſpenſion, being equal to the chord of that arch multiplied by the radius, the momenta of different arches are in the compound ratio of the chords and radii, or in the reſpective of the radii; therefore we ſhall have $r \propto x$, as the momentum of the arch CH: Conſequently, as the momentum of the arch NPN $= \frac{z \propto x}{r}$, which, multiplied by x, gives $\frac{z \propto x^2}{r}$ equal to the fluxion of the ſector NANP, whoſe fluent $\frac{zx^3}{3r}$ will be the momentum of the ſame ſector. Divide this by xz, the value of the area and $\frac{x^2}{3r}$ will be the diſtance of the *center* of gravity of the ſector NANP; but when x becomes equal to r, $\frac{zx^3}{3r}$ will be $\frac{zr^2}{3r} = \frac{1}{3}r$ for the diſtance of the center of gravity of the ſector CACH, from the point of ſuſpenſion A: therefore this diſtance is $\frac{1}{3}$ of the radius, as the chord of the arch to the arch itſelf. And if the ſector be a ſemicircle, it will be in the ſame manner $\frac{4}{3\pi}r$ from the diameter.

If the ſector be a ſemicircle, it will be in the ſame manner to the ſemicircumference. To find the point of any ſurface or ſolid by means of the *center of gravity*, ſee CENTRE *of gravity*.

For the centre of gravity of ſegments, ſpaces, or ſolids, ſphæres, ſpheroids, conoids, &c. as being rules more ſtrongly and in the ſame time more conciſely, we refer to Wolfius, Hauſbeeius, Simpſon, and others.

12. *To determine the centre of gravity in any body mechanically.* Lay the given body ($fig. 10$) on an extended cord, or on the edge of a triangular prism FG, hanging in the ſame due way, till the parts on either ſides are in equilibrio; the plane which ſides it K he, paſſes through the centre of gravity. Balance it again on the ſame, only changing its poſition; then will the plane or the line MN, paſs through the centre of gravity: and by the interſection of the two lines MN and KE, determines the point O in the ſurface of the body required.

The ſame is likewiſe to be by ſuſpending the body on a horizontal axis in as near the ſame as poſſible, whereon it is falling) in two poſitions, lengthwiſe and breadthwiſe; the common interſection of the two lines correſponding to the edge, will be in centre of gravity. Or it may be done by placing the body on the point of a fine. N° 5. till it will be in equilibrio. It was by this method, Borelli found the centre of gravity in a human body, to be between the ſacrum and pubis; ſo that the whole gravity of the body is there collected, where nature has placed the principal inſtrument of the will, the Creator, in placing the inſtrument with in that place, which to all others is the moſt commodious for copulation.

CENTRE *of an hyperbola*, is a point in the middle of the tranſverſe or tranſverſe axis, through which all the ordinates are biſected.

CENTRE *of magnitude*, is that point which is equally diſtant from all the external parts of a body.

CENTRE *of mean*, is a point round which one or more heavy bodies, that have one common centre of gravity, revolve. $fig. 31$. If the weights P and Q, *The Mechanics, fig. 31.* revolve about the point N, by the wheel P, becauſe Q attends, N is ſaid to be the *centre of mean*.

It is demonſtrated in mechanics, that the diſtance PN, of the centre of gravity, of any particular weight, from the common centre of gravity, of the ſame of number N, is perpendicular to the line of direction PF.

CENTRE *of oſcillation*, is that point, in the axis or line of ſuſpenſion of a vibrating body, into which, if the whole was contracted, the angular velocity, and the time of vibration, would remain unaltered. Hence, in a compound pendulum, its diſtance from the point of ſuſpenſion is equal to the length of a ſimple pendulum, whoſe oſcillations are iſochronal with thoſe of the compound one.

Laws of the CENTRE *of oſcillation.* 1. *If ſeveral weights D, F, H, I, (The Mechanics, fig. 32.) moſt gravely ſuſpended in an inflexible right line A B, oſcillate together round the point of ſuſpenſion A; and the perpendiculars drawn from them to the axis of ſuſpenſion A I, and the perpendicular drawn from the centre of oſcillation of the whole A O, be reſpectively the centres of oſcillation of each of the weights ſeparately, and alſo the centre of gravity of the whole; and the diſtance of the centre of oſcillation O from the point of ſuſpenſion A, be found by multiplying the ſeveral weights into the ſquares of the diſtances, and dividing the aggregate by the ſum of the moments of their weights.* See Simpſon's Fluxions, vol. 1. p. 212. &c.

2. *The diſtance of the centre of oſcillation in a right line A B (fig. 33.)* Let A B $= a$, A D $= x$, then will $x \propto x$ be the fluxion of the momentum, which being multiplied by $\frac{x}{a}$, becauſe the velocity of every point is proportional to its diſtance from the *centre* of motion A, will give $x^2 \propto$ for the fluxion of the force, whoſe fluent $\frac{x^3}{3a}$, being divided by $\frac{x^2}{2a}$, the fluent of $x \propto$, will give $\frac{2}{3}x$ for the diſtance of the *centre* of oſcillation in the part A D from the point of ſuſpenſion A. If then for x be ſubſtituted a, the

the distance of the *centre* of oscillation in the right line AB=$\frac{2}{3}a$. In this manner is found the *centre* of oscillation of a wire, oscillating about one of its extremities.

3. *To determine the centre of oscillation of the rectangle* RHIS (*fig. 19.*) *perfectly similar and equal to the plane* RI, *and oscillating about its axis* HI. Let RI=SH=a, AP=x; then will $a\,x$ be the fluxion of the mass, or whole weight. This, multiplied by x the velocity, will give $a\,x\,\dot{x}$ for the fluxion of the momentum; and multiplying this quantity again by x, the acquired velocity, we shall have $a\,x^2\,\dot{x}$ for the fluxion of the force; whose fluent $\frac{a\,x^3}{3}$, being divided by $\frac{a\,x^2\,\dot{x}}{2}$, the fluxion of $a\,x\,\dot{x}$, will give $\frac{2}{3}x$, which indefinitely expresses the distance of the *centre* of oscillation, from the axis of oscillation in the segment RCD: if then for x be substituted the altitude of the whole rectangle RSIH, we shall have the distance of the *centre* of oscillation from the same=$\frac{2}{3}a$.

For the centre of oscillation in an isosceles triangle SAH, *oscillating about its axis* HI, parallel to its base GH; its distance from the vertex A is found=$\frac{2}{3}$ of AP the altitude of the triangle.

Or in a right triangle SAH oscillating about its base SH, its distance from the vertex A is found=$\frac{2}{3}$ AS the altitude of the triangle.

For the centre of oscillation in an isosceles triangle SAH, *suspended by an inflexible thread* void of gravity, AH, and oscillating about its axis parallel to its base SH; its distance from the vertex is found=$\frac{3}{4}$ the altitude of the triangle.

For the centres of oscillation of parabolic and curves of the 3d kind, oscillating about their axes, parallel to their bases, they are found as follows.

Let AE=x, AP=y, and PN=a, (*fig. 19.*) then will vertically, $\dot{x}=\frac{\dot{y}}{a}$, and therefore $a=\frac{\dot{y}}{\dot{x}}$ will denote the fluxion of the whole mass. This being multiplied by x^n will give $\frac{\dot{y}}{\dot{x}}x^n$ for the fluxion of the force, whose fluent $\frac{y}{n+1}x^{n+1}$, being divided by $\frac{\dot{y}}{\dot{x}}x^{n+1}$, the fluxion of $x^{n+1}=\frac{n+1}{n+2}x$, for the distance of the *centre* of oscillation of the space ZAP from the vertex A; and when n becomes equal to x, $\frac{n+1}{n+2}x$ will become the distance of the *centre* of oscillation of the whole parabolic space SAH, from the point of suspension A, in the axis of motion RA.

In the Apollonian parabola, $n=\frac{1}{2}$, therefore the distance of the *centre* from the vertex=$\frac{3}{5}$ AE.

In a cubical parabola, $n=\frac{2}{3}$, and the distance of the *centre* of oscillation from the axis=$\frac{5}{7}$ AE.

In a biquadratic parabola $n=\frac{3}{4}$, and therefore the distance of the *centre* from the axis=$\frac{7}{9}$ AE.

For the method of determining the distance of the *centre* of oscillation from the axis, suppose it to be the axis about which the parabola revolves, see Hodgson's Fluxions, p. 231, &c.

In solid and plane figures inclosed laterally, i. e. about the axis of oscillation, perpendicular to the plane of the figure, the investigation of the *centre* of oscillation is somewhat difficult; because all the parts of the weight, on account of their unequal distances from the point of suspension, do not move with the same velocity; as is shown by Huygens, in his Horol. Oscill. He found, in this case, the distance of the *centre* of oscillation from the axis in a circle, to be $\frac{5}{6}$ of the diameter; in a rectangle, suspended by one of its angles, $\frac{2}{3}$ of the diagonal; in a parabola, suspended by its vertex, $\frac{6}{7}$ of its axis; and of the parabeloid, suspended from a point in the middle of the base, $\frac{5}{6}$ of the axis, and $\frac{5}{7}$ the parameter; in the ellipse of a circle, $\frac{5}{6}$ of a right line which is to the radius as the arch to the subtended; in a cone, $\frac{3}{4}$ of the axis, and $\frac{3}{5}$ of the third proportional to the axis, and a semidiameter of the base; in a sphere (as is usually the case in pendulums) $\frac{5}{7}$ of a third proportional to two quantities compoled of the semidiameter and length of the thread, and the semidiameter itself; in a cylinder, $\frac{5}{6}$ of the thread, and $\frac{5}{7}$ a right line, which is to the semidiameter of the base, as that is to the thread.

CENTRE *of percussion*, in a moving body, is that point wherein the resistance is the greatest, wherein the whole percussent force of the body is supposed to be collected; or about which the impetus of the parts is balanced on every side: so that it may be stops, by an immoveable obstacle, at this point, and will on it, without acting on the *centre* of suspension.

Laws of the CENTRE *of percussion*.—1. *The centre of percussion is the same with the centre of oscillation*, where the percussent body revolves round a fixed point; and is determined in the same manner, viz. by considering the impetus of the parts, as so many weights applied to an inflexible right line, void of gravity; i. e. by dividing the sum of the products of the rectes of the parts, multiplied by their distances from the point of suspension, by the sum of the forces. What, therefore, has been above shewn of the *centre of oscillation*, will hold of the *centre of percussion*, where the percussent body moves round a fixed point.

2. *The centre of percussion is the same with the centre of gravity*, if all the parts of the percussent body be carried with a parallel motion, or with the same celerity; for the momenta are the products of the weights into the velocities. Wherefore, to multiply equiponderating bodies by the same velocity, is the same thing as to take equimultiples; but the equimultiples of equiponderating bodies, themselves equiponderate; therefore, equivalent momenta are disposed about the *centre* of gravity consequently the *centre* of percussion in this case coincides with that of gravity, and what is shewn of the one, will hold of the other.

CENTRE *of a parallelogram*, or *polygon*, the point wherein its diagonals intersect.

CENTRE *of a sphere* is a point from which all the lines drawn to the surface, are equal.

The centre of the gravities, by whose revolutions the sphere is generated, is also that of the sphere.

Hermes Trismegistus defines God as an infinite sphere, whose *centre* is every where, and circumference no where.

CENTRE-*wheel of a watch*. See WATCH-*work*.

CENTRE *of a squadron*, or *of a fleet*, in the middle of a line, which is always the station of the admiral, or commander in chief, and ought to be proportionably the strongest, because it receives from the two and rear.

CENTERING *of an optic glass*, the grinding it so as that the thickest part it exactly in the middle.

One of the greatest difficulties in grinding large optic glasses is, that in figures of little excess, the least difference will put the centre two or three inches out of the middle. Dr. Hook notes, that though it were better the thickest part of a long object glass were exactly in the middle; yet it may be a very good one when it is so much or two out of it. Phil. Trans. N° 4. p. 57. Id. ibid. p. 62. seq.

Mr. Cassini the younger has a discourse expressly on the *necessity of well centering the object glass* of a large telescope, that is, of grinding them so, that the centre may fall exactly in the axis of the telescope. Mem. Acad. Scien. 1710. p. 295. seq. See OPTICS-*glasses*.

CENTESIMA *usura*, that wherein the interest in an hundred months becomes equal to the principal; i. e. where the money is laid out at one per cent. per month. This is what in our style would be called 12 per cent. for the Romans reckoned their interest not by the year, but by the month.

CENTESIMATION, *Centesimatio*, the punishing every hundredth man.

Mutinies sometimes decimated, and sometimes centesimated the soldiers. The latter term seems to have been introduced by himself to the honour of his clemency, as being contented to centesimate those who deserved decimation, or vice-mation.

CENTGRAVIUS, in *Middle Age Writers*, the same with CENTENARIUS.

CENTILOQUIUM, from *centum*, *a hundred*, and *loqui*, *I speak*, denotes a collection of a hundred sentences, opinions, or sayings.

CENTINODIUM, an officinal plant, popularly called *knot-grass*, by the botanists *polygonum*; reputed an astringent and vulnerary.

CENTITES. See BOETITES.

CENTNER, or *Centuple Hundred*, in *Metallurgy and Assaying*, is a weight divisible, first into a *hundred*, and hence into a greater number of other smaller parts; for though the word is the same, both with the assayers and manufacturers, yet it is to be understood as expressing a very different quantity in their different acceptation of it. The weights of the metallurgists are easily understood, as being of the common proportion, but those of the assayers are a thousand times smaller than theirs, as the portions of metals or ores examined by the assayers are usually very small.

The metallurgists, who extract metals out of their ores, also a weight distant into a *hundred* equal parts, each part a pound; the whole they call a *centner* or *hundred weight*: the pound is divided into *thirty-two parts*, or *forty ounces*; and the half ounces into *two quarters* of ounces, and these each into two drams.

The

Their figures and denominations of the most largely are eafily underſtood; but the same words though they are ufually uſed to diſtinguiſh the ſeveral ſpecies of figures, with three angles or more, yet in different quantities; for as the meaſure of the triangle contains a hundred parts, the meaſure of the figure is really no more than one part, to which the other parts are proportioned.

As the ſeveral triangles are divided into ſides or contents degrees of multitude, and are fo very different from all the other triangles; the ſeveral ſpecies whereof are diſtinguiſhed, in the following manner, according to their ſides, or the number of parts of which the ſides of the triangle conſiſt, according to the diviſion of the ſides, which is very different, or ſometimes more by one part than them. They ſay that the triangle is right, being compoſed of the ſides, which ſtand at right angles to each other. Thus having the three ſides, the firſt of which is 3, the ſecond 4, and the third 5, they put the ſquare of the firſt ſide, and ſecond ſide, that is, 9 and 16, together, which make 25, and then extract the ſquare root of 25, which is 5, and ſo find the ſquare of the third ſide, which is 25. Then having the three ſides, the firſt of which is 3, the ſecond 4, and the third 5, they put the ſquare of the firſt ſide, and ſecond ſide, that is, 9 and 16, together, which make 25, and then extract the ſquare root of 25, which is 5, and ſo find the ſquare of the third ſide, which is 25. Then having the three ſides, the firſt of which is 3, the ſecond 4, and the third 5, they put the ſquare of the firſt ſide, and ſecond ſide, that is, 9 and 16, together, which make 25, and then extract the ſquare root of 25, which is 5, and ſo find the ſquare of the third ſide, which is 25.

CENTO, in Poetry, a work wholly compoſed of verſes or paſſages taken from other authors; they ſometimes alſo change the ſenſe, to render it as to compoſe a new work, and make a new meaning.

The word is Latin, cento, which primarily ſignifies a thick piece of patches, and this from

Antonius has laid down the rules to be obſerved in compoſing cento. The pieces, he ſays, may be taken either from the ſame poet, or from ſeveral; and the verſes may be either entire, or divided into two; but muſt be connected with another half taken elſewhere; and two verſes are never to be taken together, but ſome ſmall part muſt be left out between. Agreeably to theſe rules the firſt cento we meet with is that of Proba Falconia, compoſed out of the works of Virgil; the like is done by Alex. Ros. in Chriſtiados, and by Stephen de Pleteris, Canon Regular of St. Victor at Paris.

CENTURIATE, in the civil law, a diviſion of the people, which before was to make ſenators, or other perſons in dignity and charge, whereby to carry the matter under which the Romans made their approaches, as well as the manner and multitude uſed to order the place, and preſerve their being ſet on fire by the enemy. In the Theodoſian code we have a title, *De centonibus & compoſitis*. And in ancient inſcriptions, the centonarii are mentioned with the quæſtors, *fiſcorum* or tribunes, &c. who made but one company, under the denomination of *negotiatores & centonarii*.

CENTRAL, ſomething relating to centre, or centres.

Thus we ſay, *central motion*, *world*, *ſyſtem*, *forces*, *central rule*, &c.

Central *powers*, or *virtues*, or powers, whereby a moving body either tends towards the centre of motion, or recedes from it.

Central forces are divided into two kinds, with regard to their different relations to the centre, viz. the *centripetal* and the *centrifugal*.

The doctrine of centres, or *centripetal* and *centrifugal forces*, has been much cultivated by mathematicians, as being of extenſive uſe in the theory of gravity and other phyſico-mathematical diſcoveries.

In this doctrine it is ſuppoſed, that a body is not moved merely ſtrait forwards, or by impreſſion made always in the direction of its motion, but that it is alſo drawn from that direction to ſome point or centre, or is impelled towards it, by ſome cauſe or power, which acts continually, and diverts the body from the ſtrait courſe, which it would otherwiſe purſue, and make it deſcribe a curve line, or cauſe it to revolve in a curve, or ſome part of it. Such is the force with which the moon is retained in her orbit, and prevented from flying off in a ſtrait line, by the power of gravity, or attraction, or whatever cauſe it be, which acts upon her, and draws her towards the earth, as a centre.

Now any force by which a body is drawn or impelled towards a point, conſidered as a centre, to which it tends, or is urged, or in any way ſolicited, or has a propenſity of any kind whatever, is called a centripetal force. And in like manner, any force by which a body is driven or impelled, or has a tendency from a centre, is called a centrifugal force. And theſe forces are ſometimes called by the general name of *central forces*, becauſe they have reference to a centre, in the manner as now explained.

Now the centripetal force, by which a body is drawn from a ſtrait courſe, and retained in a curve line, is ſuppoſed to proceed equally from the whole ſphere of ſome greater circle, or ſolid, which may be conſidered either by the preſſure of the ambient body againſt the ſurface of that ſphere or ſolid, or by the mutual attraction of the ſeveral parts of that ſphere or ſolid, or by the mutual attraction of the matter in the ſphere, or by the like cauſes. In the firſt caſe, or by the preſſure of the ambient body againſt the ſurface of the ſphere or ſolid, the centripetal force is called *impreſſed*; in the ſecond caſe, or by the mutual attraction of the parts of the ſphere or ſolid, it is called *attractive*; and in the third caſe, or by the attraction of the matter in the ſphere, or by the like cauſes, it is called *abſolute*. And the body which is retained in its curve orbit by the force of any of theſe kinds, is ſaid to be urged, or attracted, or impelled, or in any way ſolicited towards the centre of the ſphere or ſolid from which the force proceeds.

And as the centripetal force is the cauſe by which bodies are produced, in all other circumſtances, according to the principles of motion; ſo the centrifugal force, or the force of every kind that is oppoſite to the centripetal force, is produced in the reſiſting body by the reſiſtance of the fluid, or by the vis inertiæ of the ſolid body, or by ſome other cauſe, in the ſame manner as the centripetal force is produced in the body which is attracted or impelled towards the centre. For the centripetal and centrifugal forces are to each other as the meaſures of the reſiſtances which the ſame bodies meet with in deſcribing the ſame curve lines, with the ſame velocities, by the ſame laws and methods of reſiſtance, whether they ariſe from the viſcoſity, or from the friction, or from the vis inertiæ of the parts of the fluid, or from any other cauſe whatever, in proportion to the denſities of the reſiſting fluids, and the ſolidities of the reſiſting bodies, and the ſquares of the velocities, conjunctly. For the reſiſtance which ariſes from the viſcoſity of the parts of the fluid, is proportional to the velocity with which they ſeparate from each other, in order to make way for the body that paſſes through the fluid. The reſiſtance which ariſes from the friction of the parts of the fluid, is proportional to the velocity with which they ſlide over each other, before they begin to run off from the ſurface of the body that paſſes through the fluid. And the reſiſtance which ariſes from the vis inertiæ of the parts of the fluid, is proportional to the denſity of the fluid, by the hypotheſis. And the ſum of theſe reſiſtances, or the whole reſiſtance with which the body is retarded in its motion, is proportional to all theſe three together. Now the centripetal force, by which the body is drawn from the rectilineal courſe, and retained in its curve orbit, is equal to the ſum of all the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion. For the centripetal force is employed to overcome all the reſiſtances that are made to the body in its curve orbit, and to retain the body in its orbit, by counteracting all the cauſes that would make it deviate from that orbit. Therefore the centripetal force is equal to all the reſiſtances that are made to the body in its curve orbit, and conſequently is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion.

Hence it follows, that the centripetal force is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion. For the centripetal force is employed to overcome all the reſiſtances that are made to the body in its curve orbit, and to retain the body in its orbit, by counteracting all the cauſes that would make it deviate from that orbit. Therefore the centripetal force is equal to all the reſiſtances that are made to the body in its curve orbit, and conſequently is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion.

Hence it follows, that the centripetal force is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion. For the centripetal force is employed to overcome all the reſiſtances that are made to the body in its curve orbit, and to retain the body in its orbit, by counteracting all the cauſes that would make it deviate from that orbit. Therefore the centripetal force is equal to all the reſiſtances that are made to the body in its curve orbit, and conſequently is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion.

Hence it follows, that the centripetal force is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion. For the centripetal force is employed to overcome all the reſiſtances that are made to the body in its curve orbit, and to retain the body in its orbit, by counteracting all the cauſes that would make it deviate from that orbit. Therefore the centripetal force is equal to all the reſiſtances that are made to the body in its curve orbit, and conſequently is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion.

Hence it follows, that the centripetal force is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion. For the centripetal force is employed to overcome all the reſiſtances that are made to the body in its curve orbit, and to retain the body in its orbit, by counteracting all the cauſes that would make it deviate from that orbit. Therefore the centripetal force is equal to all the reſiſtances that are made to the body in its curve orbit, and conſequently is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion.

Hence it follows, that the centripetal force is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion. For the centripetal force is employed to overcome all the reſiſtances that are made to the body in its curve orbit, and to retain the body in its orbit, by counteracting all the cauſes that would make it deviate from that orbit. Therefore the centripetal force is equal to all the reſiſtances that are made to the body in its curve orbit, and conſequently is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion.

Hence it follows, that the centripetal force is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion. For the centripetal force is employed to overcome all the reſiſtances that are made to the body in its curve orbit, and to retain the body in its orbit, by counteracting all the cauſes that would make it deviate from that orbit. Therefore the centripetal force is equal to all the reſiſtances that are made to the body in its curve orbit, and conſequently is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion.

Hence it follows, that the centripetal force is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion. For the centripetal force is employed to overcome all the reſiſtances that are made to the body in its curve orbit, and to retain the body in its orbit, by counteracting all the cauſes that would make it deviate from that orbit. Therefore the centripetal force is equal to all the reſiſtances that are made to the body in its curve orbit, and conſequently is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion.

Hence it follows, that the centripetal force is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion. For the centripetal force is employed to overcome all the reſiſtances that are made to the body in its curve orbit, and to retain the body in its orbit, by counteracting all the cauſes that would make it deviate from that orbit. Therefore the centripetal force is equal to all the reſiſtances that are made to the body in its curve orbit, and conſequently is proportional to the ſum of the reſiſtances, or to the whole reſiſtance with which the body is retarded in its motion.

CENTRIPETAL force is that power wherein a centripetal body is impelled to the right line AG (Plate XV. Mechanics, fig. 3.) by the primitive motion and the centripetal force, and is continually drawn off from the right line DE, suppose to the curve line AB, whose concavity faces the centre C, and is always in the curve.

CENTRIPETUM, in Gardening, a name of the order of arrangement, the characters of which are taken from the centre of the flower, and the disposition of the parts round it.

CENTROBARIC method, from κεντρον and βαρος, a centre and weight, is a method of investigating the centres of gravity of figures, or solids, by considering it as formed of matter, and finding out how the parts of it balance each other.

This doctrine is comprised in the following theorems, which are demonstrated.

Theorem I. If any *number of points* be considered as gravitating in the centre of gravity of the whole system, and the sum of the products of each of the gravitating points into the square of its distance from any given plane be equal to the sum of the products of the same gravitating points into the squares of their distances from another given plane, the centre of gravity of the system will be in a plane parallel to the two former, and at a distance from them which is to the distance between the two former planes, as the sum of the gravitating points is to the sum of the products of the gravitating points into their distances from the first plane.

Theorem II. If the weight of the whole gravitating system be collected in the centre of gravity of the whole system produced by its motion, and the sum of the products of the weights of the gravitating points into the squares of their distances from any given plane be equal to the sum of the products of the same gravitating points into the squares of their distances from another given plane, the centre of gravity of the system will be in a plane parallel to the two former, and at a distance from them which is to the distance between the two former planes, as the sum of the gravitating points is to the sum of the products of the gravitating points into their distances from the first plane.

Theorem III. If any *plane figure* be considered as gravitating in the centre of gravity of the figure, and the sum of the products of each of the gravitating points into the square of its distance from any given plane be equal to the sum of the products of the same gravitating points into the squares of their distances from another given plane, the centre of gravity of the figure will be in a plane parallel to the two former, and at a distance from them which is to the distance between the two former planes, as the sum of the gravitating points is to the sum of the products of the gravitating points into their distances from the first plane.

Theorem IV. If the weight of the plane figure be collected in the centre of gravity of the figure produced by its motion, and the sum of the products of the weights of the gravitating points into the squares of their distances from any given plane be equal to the sum of the products of the same gravitating points into the squares of their distances from another given plane, the centre of gravity of the figure will be in a plane parallel to the two former, and at a distance from them which is to the distance between the two former planes, as the sum of the gravitating points is to the sum of the products of the gravitating points into their distances from the first plane.

Theorem V. If any *solid figure* be considered as gravitating in the centre of gravity of the solid, and the sum of the products of each of the gravitating points into the square of its distance from any given plane be equal to the sum of the products of the same gravitating points into the squares of their distances from another given plane, the centre of gravity of the solid will be in a plane parallel to the two former, and at a distance from them which is to the distance between the two former planes, as the sum of the gravitating points is to the sum of the products of the gravitating points into their distances from the first plane.

Theorem VI. If the weight of the solid gravitating system be collected in the centre of gravity of the whole system produced by its motion, and the sum of the products of the weights of the gravitating points into the squares of their distances from any given plane be equal to the sum of the products of the same gravitating points into the squares of their distances from another given plane, the centre of gravity of the solid will be in a plane parallel to the two former, and at a distance from them which is to the distance between the two former planes, as the sum of the gravitating points is to the sum of the products of the gravitating points into their distances from the first plane.

Theorem VII. If any *plane figure* be considered as gravitating in the centre of gravity of the figure, and the sum of the products of each of the gravitating points into the square of its distance from any given plane be equal to the sum of the products of the same gravitating points into the squares of their distances from another given plane, the centre of gravity of the figure will be in a plane parallel to the two former, and at a distance from them which is to the distance between the two former planes, as the sum of the gravitating points is to the sum of the products of the gravitating points into their distances from the first plane.

Theorem VIII. If the weight of the plane figure be collected in the centre of gravity of the figure produced by its motion, and the sum of the products of the weights of the gravitating points into the squares of their distances from any given plane be equal to the sum of the products of the same gravitating points into the squares of their distances from another given plane, the centre of gravity of the figure will be in a plane parallel to the two former, and at a distance from them which is to the distance between the two former planes, as the sum of the gravitating points is to the sum of the products of the gravitating points into their distances from the first plane.

Theorem IX. If any *solid figure* be considered as gravitating in the centre of gravity of the solid, and the sum of the products of each of the gravitating points into the square of its distance from any given plane be equal to the sum of the products of the same gravitating points into the squares of their distances from another given plane, the centre of gravity of the solid will be in a plane parallel to the two former, and at a distance from them which is to the distance between the two former planes, as the sum of the gravitating points is to the sum of the products of the gravitating points into their distances from the first plane.

Theorem X. If the weight of the solid gravitating system be collected in the centre of gravity of the whole system produced by its motion, and the sum of the products of the weights of the gravitating points into the squares of their distances from any given plane be equal to the sum of the products of the same gravitating points into the squares of their distances from another given plane, the centre of gravity of the solid will be in a plane parallel to the two former, and at a distance from them which is to the distance between the two former planes, as the sum of the gravitating points is to the sum of the products of the gravitating points into their distances from the first plane.

CENTRIPETUM, in Gardening, a name of the order of arrangement, the characters of which are taken from the centre of the flower, and the disposition of the parts round it.

CENTRIPETUM, in Gardening, a name of the order of arrangement, the characters of which are taken from the centre of the flower, and the disposition of the parts round it.

AO=½AD; the sense of gravity will be in O. The solidity of the cone, therefore, will be to that of the cylinder of the same base and height, as the centre of gravity of the triangle CAD was to the centre of gravity described by the right line AO, that is, as PO (or ½AD) to ½PO (or ½AD + ½AD), and OO = ⅓CO. Therefore, OP = ⅓PD = ½AD, and OO = ⅓CO.

If a cone be cut by a plane parallel to the base, the centre of gravity of the frustum will be in the right line which joins the centres of gravity of the two bases. This will be demonstrated by the following lemma.

Let ABCD be a trapezium, whose sides AB, CD are parallel to each other, and let EF be drawn parallel to them, bisecting the other two sides. Then, if the trapezium be conceived to be made up of an infinite number of right lines parallel to AB, CD, the centre of gravity of the trapezium will be in the right line EF. For, if it be not in EF, let it be in the right line GH, and let GK be drawn parallel to EF. Then, because the right lines parallel to AB, CD are bisected in EF, the trapezium ABCD will be equal to the trapezium AEFD, and the centre of gravity of the former will be in GH, and that of the latter in EF. Therefore, the centre of gravity of the whole will be in the middle between GH and EF, which is impossible, unless GH and EF coincide. In the same manner it may be demonstrated, that the centre of gravity of the trapezium cannot be in any other right line but EF.

Let ABCD be a frustum of a cone, and EF a right line joining the centres of gravity of the two bases. Then, if the frustum be conceived to be made up of an infinite number of circles parallel to the bases, the centre of gravity of the frustum will be in the right line EF. For, if it be not in EF, let it be in the right line GH, and let GK be drawn parallel to EF. Then, because the circles parallel to the bases are bisected in EF, the frustum ABCD will be equal to the frustum AEFD, and the centre of gravity of the former will be in GH, and that of the latter in EF. Therefore, the centre of gravity of the whole will be in the middle between GH and EF, which is impossible, unless GH and EF coincide. In the same manner it may be demonstrated, that the centre of gravity of the frustum cannot be in any other right line but EF.

CENTRIPETAL, in *Philosophy*, the name by which the celebrated Sir Isaac Newton distinguished that power by which the bodies move towards the centre of motion, being under the influence of that power, instead of the centrifugal power, formed of the same, and therefore of the same nature as gravity, which tends to the circumference.

The forces of attraction are very numerous, but may be reduced to the following divisions:

1. The centripetal is distributed into the centripetal proper, and the centripetal absolute.

2. The centripetal absolute is called by Kepler, GRAVITY and TENDENCY.

3. The last kind is called by Kepler FACULTY.

4. The last kind, called by Kepler, VIRTUE, by Hooke, and others, ATTRACTION, may be reduced to many genera, according to the different laws observed by the different causes of attraction. But besides the known central powers, we meet with several others, tending, of a very singular kind, to certain points, which we call EXCENTRIC and ECCENTRIC powers.

CENTRUM, in *Geometry*, *Mechanics*, &c. See CENTER.

CENTRUM *gravitatis*, or *gravitas*, is the place where the whole gravity tends to, or by which it is sustained.

CENTRUM *harmonicum*, in the *science of objects*, that is, centre of the voice in an echo.

CENTRUM *harmonicum*, in *Acoustics*, a phrase, or rather, wherein the ratio of the sounds of the corresponding notes.

This centre is generally towards the right line, or the ear, and sometimes towards the right line, or the ear, and sometimes towards the right line, or the ear, and sometimes

increasing their vibrations, by which the nervous fluid circulates more freely.

Cephalic are different, according to the diseases or causes, which may happen to obstruct the circulation of the humours of the brain. If the cause is of a cold and mucous kind, the *cephalic* to be prescribed, must be of a heating, flimulating, fragrant, and aromatic quality: if, on the contrary, the disorder arises from an excess of heat in the body, the *cephalic* to be exhibited must be of a cooling and refrigerating nature.

Cephalics are either *external*, when for inducing they are exhibited by the mouth, in order to produce their effects by the general circulation of the fluids; or by way of clysters, which chiefly produce the most happy consequences, by making a revulsion from the superior and more noble parts: or they are such as are *external*, to which class belong certain proper liquors for washing the head, medicated caps, and other remedies commonly called topics, the materials of which are alfo used against disorders of other parts of the body.

With respect to *cephalic* topics in general, we muft obferve, that the head is lefs capable of bearing much than any application; because the former, by diffending or relaxing the veffels, procure congeftions of humours, which more hurtful to the brain. Nor do moft vegetables applied to the head ever anfwer any valuable purpofe, except in thofe cafes alone where the diforder arifes from an excefs of heat and dryneſs; or from an inflammatory difpofition in the head.

CEPHALIC *Vein*, in *Anatomy*, is a vein of the arm between the fkin and the mufcles, divided into two branches, *external* and *internal*. The external goes down to the wrift, where joining the *bafilic*, and turning up to the back of the hand, the internal branch, together with a fprig of the *bafilic*, unites the *mufculus*. — See *Vein*, *Anatomy*, *Index*, fig. 6, 6, 6, 6.

It is thus called, becauſe the ancients uſed to open it in diſorders of the head; from a miſtaken notion, that it had a nearer concern with the head than any other of the veins.

CEPHALIDES, a denomination given by fome writers, who diſtinguiſh vintages in plants from their figurations, to thoſe which have any reſemblance to a human head; ſuch are the *cynoſbaton*, pliny, and the like.

CEPHALOMANTIA, from κεφαλη, and μαντεια, *divination*, an ancient ſpecies of divination, or method of foretelling futurity, by a dead man's ſkull.

CEPHALONOMANTIA, a method of divination, or revealing *ſecrets*, by means of an aſs's head broiled on the coals.

The word is compounded of κεφαλη, *head*, ονος, *aſs*, and μαντεια, *divination*.

After naming a few powers, the names of ſeveral perſons ſuſpected of a theft, or the like, were repeated over: he at whoſe name the aſs's jaws made any motion, or the teeth began to chatter, was held for convicted.

CEPHALOPHARYNGEI, in *Anatomy*, two muſcles of the *pharynx*, called the *ſtaphylini*.

They have their origin in the articulation of the head with the firſt *vertebra*, and are inſerted into the upper part of the *pharynx*: they ſerve to draw it upwards and backwards.

CEPHALOPONIA, from κεφαλη and πονος, *pain*, a denomination given by ſome to the *cephalalgia*, or HEADACHE.

CEPHALUS, in *Ichthyology*, a name given by Ariſtotle, Ælian, Appian, and others, to the *mugil* or *mullet*, called alſo by ſome *capito*.

CEPHATUS, is alſo a name given by ſome naturaliſts to the *ſargus*, called alſo *grex*, and *gerres*; a fiſh very little, if at all, differing from our *ſmelt*.

CEPHEUS, in *Aſtronomy*, a conſtellation of the northern hemiſphere, whoſe ſtars, in Ptolemy's Catalogue, are thirteen; in Tycho's eleven; in Hevelius's, forty-eight; in the Britannic Catalogue, thirty-five. The order, names, longitudes, latitudes, magnitudes, &c. whereof are as follow:

Names and ſituations of the ſtars.	Conſt. Num.	Mag.	Longitud.		Latitude.		Nebulous.

CEPI *Corpus*, in *Law*, a return made by the ſheriff, upon a capias, or other proceſs to the like purpoſe ſignifying, that he hath taken the body of the party.

CEPION, in *Antiquity*, the name of a particular air, invented by a diſciple of Terpander, and deſigned to be played on the CITHARA.

CEPIONITES, in *Natural Hiſtory*, a name given by Pliny and other ancient writers, to a ſpecies of ſtone, reſembling to approach to the nature of the SAPPHIRE. Pliny tells us, that there were many kinds of it, ſome more poliſhed than others, and ſome colourleſs; others variegated with green, and the other colours of the ſapphire and againſt theſe all uſed in the ornamenting of houſes; and the moſt beautiful ſorted, when well poliſhed, to make ſpeculums of.

CEPITES, in *Natural Hiſtory*, a name uſed by the ancients to expreſs a gem which gave the repreſentation of the ſexual diſtinct of plants and flowers in the beds of a garden, with naked nymphs, ſurrounding the walks between. The common text of Pliny is unintelligible, where he gives the deſcription of this ſtone; but Salmaſius has reſtored it from ſome old copies, ſo as to make it ſenſe and expreſſive of this meaning. The ſtone was probably no other than a peculiar kind of that again which the ancients called *dendrites*, and we the MOCCA *ſtone*.

CEPOLA, in *Ichthyology*, a genus of the *thoracici* in the claſs of fiſhes; the characters of which are, that the head is roundiſh and compreſſed, the mouth flat, the teeth crooked, the branchioſtege membrane conſiſts of ſix ſmall bones, the body uniform and naked, and the abdomen ſcarce as long as the head.

CEPOLAPTES, in *Natural Hiſtory*, a name given by ſome to the ſtone properly called CEPITES, a kind of MOCCA *ſtone*.

CEPPHUS, in *Ornithology*, the name of a kind of the *larus* or gull kind; but, except in its feet and beak, very much reſembling the common duck. It is a moderately large bird, but is ſo much feathered, that it appears much more ſo than it really is. It is of a variegated colour, of a mixture of white, brown, and yellow; but the long wing and tail-feathers are black: its legs are greenith; but the membrane which connects the toes is brown. See PHIL. Tranſ. vol. lii. part I. N° 24.

CEPULA, a name by which Geſner and ſome other authors have called the common *tunny*. It is derived from the Italian *cepa*, the common name of the ſame fiſh in the markets of Rome. It is a ſpecies of the CEPOLA.

CEPUS, in *Zoology*, a name given by ſome to thoſe monkeys of the ſmaller kind, which have more or leſs green among their other colours.

CERACHATES, in the *Natural Hiſtory of the Ancients*, the name of a ſpecies of agate of a plain yellow colour, and very much reſembling yellow wax. We have it from the Eaſt-Indies, as alſo from New Spain and ſome other parts of America; and our jewellers ſometimes work it into toys of ſmall value.

CERAMBYX, in *Zoology*. *See* CAPRICORN BEETLE.

CERAMIUM, in ancient ARCHITECTURE, anſwering to what we now call AMPHORA and CADUS.

CERASTES, the *horned viper*, in *Zoology*, the name of a species of serpent, which has on its head two prominences, that look like horns, but are more solid bodies, and form their resemblance to horns, best given in that name: these are often so large as to appear like the stumps of horns; it is of the number of viviparous serpents, and is remarkable among the tribe for its long sojourning in the womb.

It is found in Lybia and Arabia, particularly about the town of Siout.

CERASTES was also a name given by the ancient Greek to a fig when it first budded, or showed of its fruit.

CERASTIUM, in *botany*. See MOUSE-ear.

CERASUS, in *Botany*. See CHERRY-tree.

CER-TE. See CERATUM.

CERATIAS, among *chemical Naturalists*, denotes a horned comet.

The word is formed from κερας, a horn. Such is supposed to have appeared when XERXES passed his army into Greece.

CERATION. *Ceratio*, in *Chemistry*, the operation of waxing.

CERATITES a name given by many authors to the fossil thunder stone usually called by authors CORNU AMMONIS, and found in great plenty in the environs of Hart's hold in Germany.

CERATONIA, or CERATONIA *siliqua*, a name given by the *Italians* and *Germans* to a small weight.

The ceratonia is properly the name of a tree called the *carob*, or *algaroba*, the fruit pipe-like: this tree bears a long pod, in which are contained several seeds among the pulp: these seeds are also called *ceratonia* and *siliqua* by the Arabians, and being dried, they were used as a weight in proportion the doses of medicines. Thus the small weight, which took its origin from them, was called *ceratonia*; as that small weight, which took its origin from a grain of barley, was called *granum*.

CERATONIA was also a small Silver coin, the third part of an *obolus*, and the same with what the Romans called *siliqua*.

CERATOCARPUS, in *Botany*, a name given by Buxbaum to a new genus of plants, belonging to the class of monœcia monandria in the Linnæan system, the character of which are, that the flowers are hooded and gaping, the flowers apetalous, and having no cup, but standing upon the embryo fruit; the fruit, when ripe, is of extraordinary figure, resembling that of a shepherd's purse, but crowning one into fours, and composed of two valves. Each valve is formed into a cone, or horn, and that of a very singular figure; it is long and slender, and not flat, but semicircular, and each of its circumvolutions is inherent in the contour of another, which are both together in their appropriate circumscription by a membranous rib round the whole circumference of the fruit, and the seeds are solitary, and are lodged in the cells of the valves, and are somewhat kidney-shaped. Act. Petrop. vol. 1. p. 211.

The author intends it to comprise, *horned fruit*, from the fruit-vessels running out into two horns; he observes, that the description of the circumflex of Theophrastus exactly agrees with the plant in many points; but differs in others; in which that author's character must be understood to be mistaken himself, or not correctly by us to him.

CERATOLOSIUS, in *Anatomy*, a pair of muscles of the tongue, thus described by Sir Edward Sharpey: "the tongue has a broad muscle on each side, the superior or part of the *subcutaneus*, partially adherent to the *mylo-hyoideus*, at the root of the tongue. This muscle is pointed, arises above the root of the muscle *hyoideus*, and ends in the middle of the tongue. Each of these muscles, if only one of them act, draws the tongue to one side."

The name is formed from κερας, *horn*, and λοσιος, *angular*, from having some resemblance to a horn.

CERATODES, in *Anatomy*, the CORNEA TUNICA. See CORNEA.

CERATOIDES is also a denomination given to the *os frontis*, or *sinciput*. See HYOIDES.

CERATOMALAGMA, a cerate or ointment.

CERATONIA, in *Botany*. See CAROB.

CERATOPHYLLUS, in *Botany*, the name by which Linnæus calls a genus of plants, of the *monœcia polyandria* class: called by authors *ceratophyllum*, and *hippuroides*.

The characters are, that the flowers are a-sexual; some, others female, or the true plants; in the male flowers the cup is divided into many segments, which are pointed, and equal to the flowers: these are no petals: the stamina are slender filaments, double in number to the segments of the cup, being usually fifteen or twenty, and are scarce conspicuous: the anthers are oblong, erect, and longer than the cup. In the female flowers the cup and corolla are the same as in the male: the germen is an oval, compressed, and of an oval figure: there is no style, but two stigmas, is shaped and obtuse: the fruit is an oval nut, of a pointed figure, and turning the true is an oval nut, of a pointed figure, and turning the fruit is an oval nut, of a pointed figure, and turning the fruit is an oval nut, of a pointed figure, and turning the fruit

four days, which are commonly called HERCULEI or the Herculean days.

CERATIUM, among Conchs, the same with CERAS.

The name is given to the genus by some in allusion to its horny texture, since it really is not a shell, properly speaking, but a horny substance, like the Cornua Ammonis, and Cornu Copiæ of authors.

CERATOIDES, in Natural History, a genus of fossils, or stones, of the crystalline order of the siliceous class, consisting of those which are of a horny texture, and other properties of the substance called cornu.

CERATON, in Antiquity, a name which the ancient poets, &c. give to a vase with three heads and handles. Most of these vases were sacrificial, and used at the feasts of Bacchus. Some have supposed this name to be the same with CERNOS, which was a vase with three heads and handles, but this is a mistake. Cernos were of a different form, and used for other purposes. See CERNOS.

CERATOPHYLLUM, in Botany, the name of a genus of plants, called *Hornwort*. See HORNWORT.

CERATOPHYLLUM, in Natural History, the name of a species of coralloides, called *Horn-Coral*. See CORAL.

CERATOPHYLLUS

which foreigners and their ambassadors are to observe at their interviews, that none of them may either receive more or less marks of respect than they are entitled to. Some stiffness with these occasions when the ceremony is to take place viz. when princes meet in person; when they write to each other, and when they send ambassadors.

There are politick rulers among foreigners about the *ceremonials* these contravening to be neglected, and some to be regarded, to others. Numerous schemes have been proposed for fixing the place and rank of each prince; but they have not been accepted of by any, except some German princes, as they are called in Germany. See PRECEDENCY.

CEREMONIAL, is more particularly used for the ritual and injunctions given to the Jews, relating to the worship of God among the ceremonies.

Of which Jesus is answerable to teach the fulfilling what he which Jesus is answerable to teach the fulfilling what he which Jesus is answerable to teach the fulfilling what he

CEROMA, originally denoted a mixture of oil and wax, with which the ancient wrestlers rubbed themselves, not only to make their limbs more limber, and less capable of being laid hold of, but more pliable, and fit for exercise.

The name *aroma* is sometimes applied by ancient physicians to a cerasine composition.

The champions ready to engage in the palestra, having stripped themselves naked, were first anointed with oil; then thrown over with dust, to which was lastly added water. Hence the last ingredient, this composition was denominated *ceroma*, from *κηρος*, wax.

CEROMANTIA, an ancient method of DIVINATION, by means of wax melted over a vessel of water, and let cool. In these afterwards observing the figure, fineness, diffusion, and composition of the drops.

CEROPEGIA, in *Botany*, a genus of the *pentandria monogynia* class. The flower consists of a single petal; it has two small erect nectary glandule heads, and the limb of the corolla is cremnated.

CEROSTROTUM, in *Roman Writers*, denotes a sort of pictute composed of pieces of bone, answering to what among us is called MOSAIC work.

Some write the word *cerostrota*, and suppose it primarily to denote a kind of pavement composed of pieces of wood, inlaid and joined with flips of horn, variously coloured and figured.

Salmasius will have *ceroftrota* to denote a method of painting, or enamelling with wax, otherwise called CEROCAUSTUM.

CERPASUS, in *Natural History*, a name given by Dioscorides to a poisonous drug of the Abyssines; probably the same with the *zerpa* of the Greeks.

CERRUS, in *Botany*, a name given by many authors to the *ægilops*, or bitter oak; or oak that has large acorns, and a prickly cup.

CERRUTI, in *Ethnology*, a name given by some of the old writers, Pliny, Martial, and others, to the fish called in the generality of writers *scarus*, by some *aurata*, and by all the ancient Greek writers, according to the Attician dyalect, and is distinguished from the other fishes of that genus by having a black spot in the middle of each side, and the pectoral and tail fins red.

CERTHIA, in *Ornithology*. See CERTHIA.

CERTIFICANDO, *de recognoscendo certificando*, is a writ commanding the mayor of the staple to certify to the lord chancellor a statute staple taken before him, when the party himself denies it, and refuseth to bring in the same. Reg. Orig. 152. There is the like writ to certify a statute merchant; and to divers other cases. Fo. 148. 151. 152.

CERTIFICATE, a testimony given in writing, to affirm and verify the truth of any thing in a court of justice, or the like. See TESTIMONIAL.

CERTIORARI, or *Writ of Error*, issues to the court of a plantation, after an action is tried, and judgment given, upon the merits, where the party over whom the mesne process shall complain that the mesne process issued against his body or goods, or the like, or that the cause is not proper to be tried in such court. There are two exceptions to this rule: there are two exceptions. One case is where the plaintiff is an infant. 2 Salk. 553. 1 Ld. Raym. 582. Carth. 471. 1 Salk. 144. 1 Ld. Raym. 396. 12 Mod. 251. 1 Str. 528. 2 Str. 1148. 1 Ld. Raym. 396. 1 Salk. 144. 2 Salk. 553

mitted, and also co-united by several successors of transmission.

See also an ingenious argument, deduced from the doctrine of chances, and applied to enforce the practice of virtue, in the Conclusion to Dr. Price's Review of the principal Questions in Morals.

CERT-MONEY, *Hundredum*, a common fine, paid yearly by the resians of several manors to the lords thereof; sometimes to the hundred, *pro certo leta*, for the certain keeping of the leet.—This, in ancient records, is called *certum letæ*.

CERVICAL, *Cervix*. See *Head's* Hook.

CERVICAL *Nerves*, are seven pair of nerves, so called, as having their origin in the *cervix*, or neck.—See *Tab. Anat. Offteol. fig. 6. lit. dd.*

They are thus called from *cervix*, neck.

The first pair arises between the first and second *vertebræ* of the neck; and, contrary to the rest, comes out before and behind: whereas the other six pair come out laterally from the interstices of the *muscles*, through particular perforations: this first pair goes to the muscles of the head and ear. The second pair, according to Dr. Willis, constitutes the main branch towards the formation of the diaphragmatic nerves; which, according to Vieussens, spring only from the fourth and fifth pair. The three last pair, joining with the two first of the *intercostal nerves*, make the brachial nerves. All the *cervical nerves* send innumerable branches to the muscles, and other parts of the head, neck, and shoulders.

CERVICAL *Veins*, among *Anatomists*, denote the external veins, &c. which pass through the *vertebræ* and muscles of the neck, up to the skull. See SCHELVIAN and VERTEBRAL *vein*.

CERVICALES *Descendentes*, a pair of muscles, antagonists to the *splenii colli*, coming from the third, fourth, fifth, and sixth vertebræ of the neck.

Bidloo and others reckon three, though improperly, a production and part of the *rare muscles*.

CERVICARIA, in *Botany*, a term used by some authors to denote the *plantago* of the shops, or lesser *Asbestos* of Theophrastus.

CERVICARIA is also a name given by some to the *trachelium*.

CERVICEM *flectentium primus*, in *Anatomy*, a name given by Spigelius, and some others, to a muscle of the neck called by Cowper, Winslow, and Albinus, by a much shorter name, the *longus colli*.

CERVICIS *tertius*, in *Anatomy*, a name given by Fallopius and others, to a muscle called by Albinus *transversalis cervicis*; and by Winslow, *transversalis magnus*.

CERVIX, in *Anatomy*, properly denotes the hind part of the neck; as contradistinguished from the fore part, which is called *jugulum*, or the throat.

CERVIX *of the* SCAPULA, denotes the head of the shoulder-blade, or that upper process which first receives the head of the *humerus*.

CERVIX *of the Uterus*, the neck of the uterus, or that oblong canal, or passage between the internal and external orifices, which receives, and includes the penis like a sheath; whence it is also called VAGINA.

The *cervix uteri*, in maids, is very narrow, except in the time of the *menses*; from when, caused to admit a genital spirit to insue: except it is called *gustum veneream*, which is kept locked up with a kind of glutinous matter, issuing from the glands about it.

CERUMEN, a tough, viscous, bitter, excrementitious humour, separated from the blood by proper glands placed in the meatus *auditorius*, or outer passage of the EAR.

This is also called *cerumen auricum*, in English, EAR-WAX. See an account of experiments on *cerumen*, to discover the best method of dissolving it, with the cause of deafness. Lond. Medic. Observ. &c. vol. iv. p. 198.

It is by some ranked in the class of medicines; especially that species of it obtained from the human ears, and which is used both internally and externally.

CERUSSE, CERUSE, a white calx of LEAD, used in painting, and cosmetics; made by calcining that metal, in the vapour of vinegar.

Ceruse is made of thin lamiæ, or plates of lead, made up into rolls, and so placed as to receive and imbibe the fumes of vinegar, contained in a vessel set over a moderate fire.

The lamiæ are thus converted into a white rust; which is gathered together, and ground up with water, and formed into little cakes. Cleaver shews how to make a sort of *ceruse* of tin and urine.

Ceruse makes a beautiful white colour, and is much used by the painters, both in oil and water colours. It makes the principal ingredient in the paste used by the ladies for the complexion. Taken inwardly, it is a dangerous poison; it soon shews its malignity, spoiling the breath and teeth, and hastening wrinkles, and all the symptoms of old age. Even the external use of it as a paint or enamel, for it is said that it has been so used, is attended with very disagreeable, and, in the end, with fatal consequences. Its effects in nervous disorders are terrible; witness the case of Mr. Butler at Moscow. See a curious account of it, in the Phil. Trans. vol. 1. part 1. N° 2. and vol. iv. N° 2. an. 1760.

Cerussa is the only white hitherto found fit for painting in; the discovery of some other white for this purpose is desirable, not only from the faults of *cerussa* as a paint, but also from its injuring the health of its manufacturers, and producing a dreadful disease, which has cost all its preparations frequently occasion, called the COLIC *of painters*, or the COLIC *of Poitou*.

Cerussa, like the other preparations of lead, is drying, sedative, and astringent: as such it is employed, both externally; it is an ingredient in many cosmetics, plasters, and other pharmaceutical preparations designed for external application.

The best *cerussa* is that of Venice; but that is very rarely used, its either English or Dutch, both of which have more chalk in them than VENICE, and the latter, however is the better of the two.

The manner of preparing *cerussa* in quantities at Venice, is described by M. Phil. Vendelin. The plates for this purpose are large, and about the thickness of a knife's back, and rolled up, but so as that the surfaces may not touch. Each roll is put in a separate pot; wherein it is raised by a little bit from the bottom, that it may not touch the vinegar, which is then put into the pot, to effect the conversion. The pots are then covered with a plate of lead as close as may be, and over this with a board; after which they are let down into a bed of horse-dung, big enough to contain four hundred pots. After three weeks continuance the pots are taken up, the plates unrolled, laid on a board, and beaten with knives: till all the flakes come off; which, when they proved good, are hard, thick, and weighty; when otherwise, porous and light, and sometimes black or burned. If the dung proves not well ordered (sometimes also there will be no flakes, or *cerussa* at all. From the beating table it is carried to the mill, ground with water between two stones to an almost impalpable fineness: lastly, it is moulded into small parcels, and exposed to the sun to dry, and harden for use. Vervaux, in Phil. Transf. N° 138. p. 935, &c.

The Chinese make an use of this preparation of lead, which it is safest to see the advantages of, than to comprehend the manner in which they are brought about. The China vessels, when they have been baked and fitted as to the matter, and even covered with their varnish, will yet receive into their very substance, the colours which those people mix up with an addition of *cerussa*, and, as some of the old assayers say, of copperas and salt-petre; but though these latter ingredients had used to be added, the *cerussa* alone supplies their place at this time, as well in very many others. It would be worth while to try an admixture of *cerussa* with the colours used in painting on glass; there, after a second baking, might perhaps be found to incorporate itself in the same manner that it does in China ware, and recover the long secret of fixing in the strongest colours, without hurting the transparence.

CERUSSE *of antimony*. See ANTIMONY.

CERVULA, or CERVULUS, in *Roman Superstitions*, a kind of sport, celebrated by Pagans, and after their example by the Christians, on New-Year's Day; when they ran about in masquerade, dressed in imitation of deers, and other beasts. We find divers councils against the observance of this ceremony. Even bishops were censured, and fasting prescribed, for that day, ad *celebrandum gentilium conjectationem*. Du-Cange.

CERVUS. See STAG.

CERVUS *volans*, in *Natural History*, among the writers to the fly-fly, or flag horned beetle, a very large species of beetle with horns shaped, and somewhat like those of a stag. It is of a blackish colour, and its horns are usually of the same colour; though in some of a purplish cast, and in some few they have been found of the colour of red coral. They are an inch and half or more in length, when full grown.

This is the kind of flag-beetle usually found in Essex, and some other countries; but besides this we have another species, which is produced of a beautiful green, found in the old wood. This species is not a fourth black than the former, and its horns tend out only in front.

CERVUS, in *Natural History*, a name by which Pliny, and other old authors, have called the shell-fishes of the buccinum genus distinguished under the names of MURICES, PURPURÆ, and MURICES. Hist. Nat. Lassi. p. 282.

CERYX, in *Antiquity*. The *ceryces* were a sort of public

ministers, appointed to proclaim, or publish things related in assemblies.

The *heryx* among the Greeks answered to the TRIBUNE among the Romans.

Our *criers* have only a small part of their office and authority.

There were two kinds of *criers*, *civil* and *sacred*.

CRIERS, *civil*, those appointed to call assemblies, and make silence therein; also to go on messages, and do the office of our beadles, &c.

CRIERS, *sacred*, were a sort of priests, whose office was to proclaim silence in the public games, and sacrifices, publish the names of the conquerors, proclaim feasts, and the like.

The priesthood of the *heryces* was annexed to a particular family, the descendants of Ceryx, son of Eumolpius. To them it also belonged to lead solemn victims to slaughter.

Before the ceremonies began, they called silence in the assembly, by the formula, *Εὐφημεῖτε πάντες λαοὶ*, addressing to the *sacred heryces* of the Romans. When the *heryces* was over, they dismissed the people with the formula, *Ἄπιτε λαοὶ· Ἐξέστι οἴκαδε*.

CESAR. See CÆSAR.

CESARE, or *Esse*, a mode of syllogisms in the second figure, wherein the major propositions and conclusion are universal negatives, and the minor an universal affirmative. Such as,

CE *No man who lets go his country deserves praise.*
SA *Every captain must needs do so.*
RE *Therefore no man who lets go his country is virtuous.*

CESARIAN *letters*. See CÆSARIAN *letters*.

CESIS, in *Botany*, a name by which some authors express the common *lotus siliquosa*, *vulgaris*, *sativa*, or bird's-foot.

CESITTORE *pears*, in *Botany*, those which produce many stems from one root.

CESSAMPELUS, in *Botany*, a name given to a botanical species of *convolvulus*. See CONVOLVULUS.

CESSATION, the act of intermitting, discontinuing, or interrupting the course of any thing, work, action, or the like.

CESSATION *of arms*, or armistice, or occasional TRUCE. When the commander of a place finds things reduced to an extremity, so that he must either surrender, or sacrifice the garrison and inhabitants to the mercy of the enemy, he plants a white flag on the breach, or beats the chamade, on which a *cessation* of arms, and hostilities, takes place, to give opportunity for CAPITULATION.

CESSATION, *Ecclesiastical*, in the *Romish Church*, is a penalty inflicted for any notorious injury to the church; by putting a stop to all divine offices, and the solemn function of the sacraments, and by depriving Christians of their churchyard.

CESSAVIT, a writ which lies in divers cases upon the general ground, that he against whom it is brought, has for two years ceased or neglected to perform such services or pay such rent, as he is obliged so by his tenure, that no goods upon his lands or tenements fallen and chargeable can be distrained.

CESSER *bills*, are various; as, *replevin de catallis*, *de averiis*, *de homagio & fidelitate*, *de rationabili parte bonorum*, *de consuetudinibus & servitiis*, *replevin per vadium*.

CESSION, in *Civil Law*, an act whereby a person surrenders up, and transfers to another person, a right which he claims to himself.

Cession is a general term; the species whereof are, a *forisfacture*, *renunciation*, *transfer*, and *surrender*; which see.

CESSION is particularly used in the *Court Law*, for a voluntary and legal surrender of a person's effects to his creditors, to avoid imprisonment.

This practice still obtains in France, and other countries; and is done by virtue of letters patent granted in favour of the poor and honest. The *cession* originally carried with it a mark of infamy, and obliged the person to wear a green cap, or bonnet; at Lyons, an orange one: to neglect this, was to forfeit the privileges of the *cession*. This was originally intended to signify, that the cessionary was become poor through his own folly.

The Italian lawyers describe the ceremony of *cession* to consist in striking the bare breech three times against a stone, called *lapis vituperii*, in the presence of the judge. Formerly it consisted in giving up the girdle and keys in court; the ancients using to carry at their girdles the chief utensils where with they got their living; as the forrenger his escritoire, the merchant his bag, &c.

The form of *cession* among the ancient Romans and Gauls was as follows. The *cessionary* gathered up dust in his left hand, from the four corners of the house; and, shaking on the threshold, holding the door post in his right hand, threw the dust back over his shoulders; then slipping off his shoes, and untying his girdle and linen, he jumped with a pole over a hedge; thereby forsaking the world know, that he had nothing left, and that when he jumped, all he was worth was to the sky with him.

The judicial *cession* is that which is made by a merchant or trader, who is actually kept in prison by his creditors, and who being absolutely incapable to satisfy them, performs a cession of justice for peace to make offer. This judicial *cession* is certainly compulsive on the part of the creditors; since the debtor is commonly starved the benefit of a *cession*, by an order from the judge, notwithstanding the opposition made by the creditors to prevent it; which renders this *cession* more infamous than that which is voluntary.

CESSION, in the *Ecclesiastical Law*, is one manner of resigning or voiding an ecclesiastical benefice.

Cession is an implicit kind of resignation, understood where a person does some act, or takes on himself some charge, which is inconsistent with his holding the benefice he was before possessed of.

By the statute, if a clerk have one benefice of 8*l*. per annum value in the king's books, and take another, of what value soever, with cure of souls, and without dispensation, the former living is void; and this kind of voidance of a living is called *cession*.

What is called *cession* in the benefice, is called *renunciation* in relation to a bishoprick; for if the bishoprick be made a bishop, he renounces it and so he said to *cession*.

CESSIONARY, a PARSERIUS. Sometimes it denotes an ASSIGNEE.

CESSOR, in *Law*, one dilatory, and delinquent in his duty, or service; and who thereby incurs the danger of the law, and is liable to have the writ *cessavit* brought against him.

Where tithes, the tenant refuses, or neglects to do his duty, or service, to which he is bound.

CESTRATION, a work enamelled, or painted with a cestrum. The word is also written CESTRUCTION and *cestructum*.

CESTREUS, or *Sestreus*, the name of a fish of the mullet kind, but having a much smaller and narrower head and its sides variegated with much thinner longitudinal lines. It is eaten in many places, but is accounted much inferior to the mullet. See MULLET.

CESTRON, in *Antiquity*, the instrument wherewith they painted, or enamelled, in lines, or rows.

CESTROPHENDONA, in the *ancient Military Art*, a compound kind of dart, or missive weapon, headed with feathers like an arrow, and cast by a large thong, also called by the Macedonians, as their men under Perdicas, with the Romans.

The word is compounded of *κεστρὸς*, a sort of dart called by the Lesbians *κεστρεὺς*, and *φένδονη*, *funda*, a sling. Liv. lib. xl. p. 676.

CESTRUM, in *Botany*. See *Cestrum Jasmine*.

CESTUS, in the *Materia Medica* of the *ancients*, a name given to a plant of us mentioned, but very ill explained by us by the generality of writers.

CESTUI, a French term, literally signifying *he*, or *him*, frequently used in our law writings.

CESTUI *que Dieu*, he to whom land is given, &c. committed to another for his benefit.

CESTUI *que use*, one for whose use or benefit lands or tenements are granted.

CESTUI *que vie*, he to whose use another man is infeoffed in lands or tenements.

CESTUS, among *ancient Poets*, a sling embroidered girdle worn by Venus, endowed with a beauty of charming, and enchanting love.

The word is also written *cestus*, and *zostus*: it comes from *ζωννυμι*, *I gird*, or other thing embroidered, or wrought with a needle; derived, according to Servius, from *κεστος*, *pungere*; whence also *cestrum*, a term used at first for any instrument in working the girdle, &c. but now restrained to that between persons near akin. See DIET.

CESTUS, in *Antiquity*. See CESTUS.

CÉSURE, or CESURA, in *Poetry*. See CÆSURA.

CETACEOUS, in *Natural History*, a term applied to all large sea-fishes, and beasts, which bear a resemblance to the WHALE.

The word is formed of *κητος*, *a whale*.

Cetacean, in a stricter sense, denotes only those large fish which are viviparous, or breed their young within their own bodies; and have no gills, but lungs, with which they breath like quadrupeds; having but one pair of fins, and giving suck to their young. Hought. Collect. N° 531. tom. iii. p. 272, & seq.

Ta

These scarce differ in any thing from *quadrupeds*, except the want of feet. They have no *diaphragm*; but are enabled by the air they receive into the lungs in respiration, to render their bodies equiponderant to water. *Cetacea*, in the ordinary use, is extended to all larger fish, called by the Latins *belua marina*, or sea beasts.

In which view, *cetaceous* fishes are divided into *greater*, including the whole kind, properly so called; and *lesser*, to which belong the porpus, shark, dog-fish, &c.

These latter are more properly called *cartilaginous* fishes.

The sea-fox is ranked by authors in the richest *cartilaginous* fishes, one that, called also SEA-WOLF; whose specific difference consists in this, that they have two livers, five gills, or *branchiæ*, on each side, and rays hanging from the fins, which in the males are under the belly on each side the navel.

Of the *cetaceous* kind, properly so called, there are divers species; some without teeth, or tube to call up water; others with teeth and a water-tube; and others with a large long horn.

The horn usually called the *unicorn's horn*, is found to be the tooth of a *cetaceous* fish in the icy sea, called *narwal*.

CETERACH, in *Botany*, an officinal, agglutinant plant; the same with what is otherwise denominated *asplenium* and *scolopendrium*.

This plant stands recommended as an excellent diuretic and promoter of the *menses*. The whole plant is to be used, and should be gathered in the month of September. It is given by some in jaundices, in quartan agues, and in obstructions of the spleen; but is much neglected in the present practice. In some parts of Essex, where it is common on the walls of their churches, and on the combs in the chalk-pits, the common people tell us wonders of its effects in the stone.

CETERIS *paribus*. See CATERIS *paribus*.

CETRA, in *Antiquity*, a small leathern shield, used by the ancient Spaniards, Moors, and even Britons.

The African *cetræ* are said by Pliny to have been impenetrable, and made of elephants skins.

The *cetra* was much the same with the PELTA. Whence Livy calls the Macedonians *pelligeri, cetrati*.

CETUS, in *Astronomy*, the *Whale*; a large constellation of the southern hemisphere, under Pisces, and next the stars of Aquarius.

The stars in the constellation *Cetus*, in Ptolemy's Catalogue, are twenty-two; in Tycho's twenty-one; in Hevelius's, forty-five; in the Britannic Catalogue, ninety-seven. The order, names, longitudes, latitudes, magnitudes, &c. whereof are as follow.

In the mandible of *Cetus* is a variable star, which appears and disappears periodically, passing through the several degrees of magnitude, both increasing and diminishing, in about 333 days. Hevel. in Phil. Transf. N° 69. p. 2028. Maraldi, in Mem. Acad. Scienc. an. 1704. p. 172, &c.

CETOS, in *Ichthyology*. See WHALE.

CEVADILLA, in *Botany*, a name used by some authors for the *sabadilla cauliflora Indica*, or Indian caustic barley.

CEURAWATH, the name of a particular sect of Banians in the East Indies, who hold the metempsychosis such so much superstition, that they will not kill the least insect: their priests carry a piece of linen over their mouth, that no flies may enter. All the other sects of Banians have an aversion for this; and continually exhort their auditors to shun all discourse and conversation with them. See BANIANS.

CHA, in *Commerce*, a silk stuff very thin and light, made in China, which most commonly serves the inhabitants for a summer cloth; it is somewhat like our taffaties or lutestrings.

CHAA, in *Botany*, a name given by some authors to the SENSITIVE.

CHABNAM, or KOARA, in *Commerce*, a kind of muslin or cotton linen, very clear and fine: it comes from the East Indies, particularly from Bengal.

CHACE. See CHASE.

CHACING. See CHASING.

CHACK, in the *Manege*, is often in the same sense as *bearing the hand*; it is applied to a horse when his head is not steady, but he tosses up his nose, and flashes with a shaking to avoid the subjection of the bridle.

Horses have this fault frequently. We say, they bear upon the hand; and mention the best bits, nor the best hand, can cure the shaft horse. Coarse, or Cranian horses, are also subject to rest upon the hand, which proceeds from this, that their bars are too sharp and edged, be edged, so that they cannot bear the pressure of a bit, though ever so gentle. If a horse had not too sensible, or too tender a mouth, he would not bear upon the hand: for in order to rest and secure his head, you need only to put under his nose-band a small flat band of iron, bent arch-wise, which answers to a martingale. This will hinder him to bear upon the hand, but will not break him of the habit; for as soon as the martingale is taken off, he will fall into the same vice again.

CHACONE, or CHACONA, a kind of dance, in manner of a passacaille, borrowed from the Spaniards, and by them from the Moors. The last always consists of four notes, with three crotchets to a bar, which proceed in continued descendants wherein they make divers excursions and quavers, with the same burden.

The word is formed of the Spanish *chacona*, which may probably be derived from the Italian *ciacola*, a *song*, tune, intimating that this might have been a royal dance; but, as others pretend, from the Italian *ciacco*, a blunt man, the ignorant.

CHADCHOD, in *Natural Philosophy*, a term sometimes applied among the several meteorological notes which were brought to Pyra. The old interpreters are very well knowing the meaning of this word, continued to us by their translation. Sir Isaac acknowledges that he could not observe the significations of it. The Chaldee interpreter, it seems, renders it carbuncle; the Arabic, ruby, carbuncle; and the Septuagint, emerald; by the Ezek. chap. xxviii. ver. 13. Calmet. Dict. publ. by Rees.

CHALL, nonsense. See CHARA circus.

CHALLOUYLLAM, in *Botany*. See CHARAIL.

CHÆRUS, in *Entomology*, a name given by Strabo, and some other of the Greek writers, to the fly we now call the CHRYSIS. Rondeletius and Salvian were the first who properly examined this fly. See GOLD-FLY.

CHÆTIA, in *Botany*, the name of a species of mitella of the *cistoides* kind, without any visible limbs.

The *cistoides* resembles a hair, or a piece of fine thread; its surface is smooth, its body rounded, and very slender. It is called in English the hair-worm. Hill's Hist. Anim. p. 14.

CHÆTODON, in *Ichthyology*, the name of a genus of the *acanthopterygious* or thorny fishes; the characters of which are these: the branchiostege membrane on each side contains five or six small bones; the body is compressed, broad, thin, and short; the back has but one fin, which reaches all along it: the tail is large, and there are in all six fins besides it: the mouth is small: the lips may be opened and extended, but naturally they cover a part of the teeth: the teeth in the jaws are oblong, contiguous to each other, and slender: the holes we ought to see the eyes are not covered with the skin of the head. There are several species.

The name is derived from *χαιτη*, a *hair*, and *οδους*, a *tooth*; and expresses that the teeth may be divided into fine and fine-pointed, resembling bristles.

CHAFE, or CHAFING *of a rope*, in the *Language*, is that of a rope that is galled or fretted, or when the rope runs against any object.

The easy or *chafing* to the handy signifies that it is fretted or begins to be worn out there.

CHAFE-*Wax*, or CHANCERY-*Wax*, an officer in CHANCERY, whose business is to fit the wax for the sealing of writs, patents, and other instruments there drawn.

CHAFF, in *Husbandry*, the husks of the corn, separated by threshing or winnowing it. It signifies also the straw of corn; and Arabic gum itself for the use of cattle.

CHAFFER, in *Zoology*, a species of beetle. See SCARABÆUS.

CHAFFERCONNERS, in *Commerce*, petted linens manufactured in the Great Mogul's dominions. They are imported by the way of Surat; and are of the number of those linens prohibited in France.

CHAFFERS, in our *Statutes*, from to Lately wares or merchandize. 3 Edw. IV. c. 4.

The original French of the statute is *chaffers*.

CHAFFERY, or CHAFFEY, in the *Iron-Works*, the name of one of the two principal forges. The other is called the *finery*. Where the iron has been wrought at the finery, that work is called the finery of Osmond, made commonly out of the iron as it comes from the mine, but sometimes out of iron made with the Spanish, or the Swedish iron. The Spanish iron is the best for the making the white iron, and the Swedish for the making the black iron. See the articles FINERY and IRON.

CHAFFRON, in *Heraldry*, a species of the CRESCENT, with a Gargoinean head; the wings black, figured with white.

CHAFRELL, or CHAFRE, in *Carpentry*. See CHAMFERING.

CHAIN, *Catena*, a series of several rings, or links, united into one piece.

There are chains of divers matter, size, form, and for divers uses.—Poets, divines, and moralists are wont with much rhetoric to represent the ties by which they chain their slaves, and captives.

The arms of the kingdom of Navarre are *Chains in a field gules*. The occasion thereof is related to be the kings of Spain besieged against the Moors, who having gained a considerable victory against them in Spain, in the unfortunate battle of Tolofa, the magnanimous king of Navarre with fell to the king of Arragon's to bring the first that breach and filled the chains thereof.

CHAIN, *Catena*, is one of the ornaments or badges of the dignity of a lord mayor of London, and remains to the present, after his being installed of that magistracy, as a mark that he has passed the mayor.

Something like this, Chelonis observes, obtained among the ancient Greeks: the principal ornaments of their people in power and authority was a gold chain, which they wore on all occasions; and even in battle, to distinguish them from the common soldiers. Hist. de Daupk. lib. iii. p. 190.

CHAIN *also* denotes a kind of fishing, or rather snare, serving to take waterfowl, sweet-coats, and other valuable sort of game. The invention of this piece of curious work was owing to the English; whence, in foreign countries, it is denominated the *English snare*. It was some time before foreigners could be brought to imitate them, and at last were not even necessary than to make of Paris have obtained secrets. These chains were at first made of cords of divers colours, some of silk-grass, the thickness and size of each kind must be very exact.

For the fabric, or making of this CHAINEL, a part of the wire is folded into little links of as oval form as the largest diamond about three lines the shortest part. These, after they have been exactly fastened, are again folded into two; and then behind together, of which one, by means of several other little threads of the same make, fastened, which part from one end to the other, except the very at a little, and the ends which, are transferred, the wood. There are at last four threaded little links in a transverse line parallel, which are, by the person, bound to equal, and united to firmly together, that the are is decreased, and takes the whole to consist of one entire piece.

CHAIN is also a kind of measure in France, applied to forest-wood, thirteen of corn in eliminating the rythes, bars, and barrios. These measures are divided severally, according to the use for which they are intended.

CHAIN-*pump*. See PUMP, and *Sea*-PUMP.

CHAIN-*Shot*, or *Bar*, two bullets, or balls, half-bullets, linked together by a chain. These are so heated to shoot down masts, or sails, or to cut the rigging of a ship.

CHAIN, in *Seamanship*, is a MEASURE, consisting of a certain number of links of iron wire, usually a hundred; serving to take the dimensions of bulks, &c.

This is what Merlenne calls to be the *arpentation* of the seamen.

The links are of several dimensions, as the length respectively of their wires: that commonly used is measuring about one foot and a half, that is, an length four poles or perches, or fifty-six feet, or a hundred links; each link being seven inches.

Whence also is easy to reduce any number of thole links to feet, or any number of feet to links.

This chain is entirely adapted to English measures; and

its chief convenience is in finding readily the number contained in a given field. Where the proportions of square feet and acres differ, the chain is somewhat: Advantages as Gunter's chain and ought to be varied. Thus in Scotland, the chain ought to be of 24 feet or 24 Dutch ells, if we regard the rod to the difference between the Scotch and English foot; but if regard be had to this difference, the Scotch chain ought to consist of 24 English feet, or 24 feet 4 inches, and 240 an Scotch acre to 272 English acres. The chain being divided into a hundred links, each of these will be 8 inches. See FOOT and ACRE.

That ordinarily used for large distances is in length a hundred feet; each link one foot.

For small pieces, as gardens, &c. is sometimes used a small chain of one pole, or fifteen feet and a half length; each link one inch.

Some is fain of chains of ropes; but these are liable to several irregularities; both from the different degrees of moisture and of the force which stretches them. Schwenterus, in his Practical Geometry, tells us, he has observed a rope fifteen feet long, reduced to fifteen in an hour's time, by the ropes falling off a hook: To obviate these inconveniencies, Wolfius directs, that the three strands whereof the rope consists be twisted contrary ways, and the rope dipped in boiling hot oil; and when dry, drawn through melted wax. A rope thus prepared will not grow or lose any thing in length, even though kept under water all day.

Use of the CHAIN *in surveying.* — The manner of applying the chain in measuring grounds is too popular to need description. In entering down the dimensions taken by the chain, the odd links and fractions are separated by a dot; the figures being integers, and the latter decimals: thus a line forty three *chains* fifty-five links long, is written 43.55. If the links be most of ten, as rather is prefixed, thus 10 *chains*, 8 links, are written 10.08.

To find the area of a field, &c. the sides or diameter of are given in CHAINS *and links.* — Multiply the links by one another, according to the rules referred to under AREA; and from the product cut off two figures towards the right, which is nothing more than dividing by 10000, the number of square links in an acre: those remaining on the left will be acres. Lastly, Multiply the figures cut off by four, the number of roods in an acre; and cutting off two again from the product to the right, those remaining on the left will be roods. Lastly, Multiply the figures cut off by forty, the number of the square perches in an acre; and cutting off five, as before, on the right, those remaining on the left are square perches.

To draw an angle DAE *(Tab. Surveying, fig. 1.) by the* CHAIN. Measure a small distance from the vertex A along each line, as *a*, *a* and *e* then measure the distance *de*: to lay this down, draw A E as pleases, and from your scale lay off the distance measured on it. See SCALE.

Then taking in your compasses the length measured on the other side, set the centre A as a centre, describe an arch *de*; and on the point *a* as a centre, with the measured distance of *ae*, describe another arch *ab*. Through the point where this intersects the former arch, draw a line A D. So is the angle plotted; and its quantity, if required, may be measured on a line of chords. See GUNTER.

To take the plan or plot of any place. — As ABCDE *(fig. 2.) by the* CHAIN. Draw a rough sketch of the place by the eye; and measuring the several lines AB, BC, CD, DE, enter down the lengths on the respective lines; then if the plan is to be taken within-side of the place, instead of measuring triangles, as before, measure the diagonals A D, E B. Thus all the figure be reduced into three triangles, whose sides are all known, as in the former case; and may be laid down on paper, according to the method above.

If the plan be to be taken without-side the place, the angles must be taken: thus, with the angle BCD, produce the lines BC and CD to any certain equal distance, as *c*, *c* to *d* and *b*, five *chains*, and measure the distance of *d b*. Thus have you an isosceles triangle C *d b*, wherein the angle at C is = B C D in opposite one is had: thus is also quantity of BCD found, and the angle laid down as before.

By the CHAIN *to find the distance between two objects inaccessible in respect of each other.* — Fixon some place, as C *(fig. 3.)*, whence the common distance to each object A and B, is accessible in a right line; measure the distance CA, which suppose forty *chains*; and continue the line to D, viz. forty more; measure also BC, which suppose thirty *chains*; and produce the line to E, viz. thirty more. Thus will be formed the triangle CDE, equal and similar to the triangle ABC; consequently the distance DE, being measured, will give the inaccessible distance required.

By the CHAIN *to find the distance of an inaccessible object, N. by the breadth of a river.* — On one side place a pole, four or five feet high, perpendicularly, fixing a fix-peg, with a small piece of wire, or the like, two or three inches long, put through the same. This is to be slipped up or down, till, looking along it, you find it point full on the other side of the river; then turning the pole with the wire in the fame direction, observe the point on the dry land, to which it points when looked along as before: measure the distance from the pole to this last point; it is the same with that of the firft required.

CHAINA, *catena*, in *Ecclesiastical History*, denote collections of such theological opinions and scriptural interpretations, as had been received by the ancient doctors of the church. See CATENA.

CHAINE, *langue de*, a kind of punishment inflicted on malefactors. By 31 & 32 Geo. II. c. 37. the judge shall direct such to be executed on the next day but one, unless he see any intervening; and their bodies to be delivered to the surgeons to be dissected and anatomized: and he may direct them afterwards to be hung in chains. During the interval between sentence and execution, the prisoner shall be kept alone, and allowed only wholesome food and water. The judge, however, hath power to respite the execution, and relax the other restraints of the act. Blackft. Com. book iv. p. 20.

CHAINS, in *Shipbuilding*, are those irons by which the shrouds of the masts are made fast to the *chain-wales*. See CHAIN-WALES, and

CHAIN-WALES, in a ship, are the broad timbers which are made projecting horizontally from her sides, to which, with *chains*, the shrouds are fastened, and by them spread out, the better to secure the masts.

CHAIR, *Cathedra*, was anciently used for the pulpit, or stage from whence the priest spoke to the people.

It is still applied to the place whence professors and regents in universities deliver their lectures, and teach the sciences to their pupils: thus, we say, the professor's *chair*, the doctor's *chair*, &c.

CHAIR, *curule*, was an ivory seat placed on a car, wherein were seated the prime magistrates of Rome, and those to whom the honour of a triumph had been granted.

CHAISE, *fedan*, a vehicle supported by poles, wherein persons are carried, borne by two men. There are two hundred *chairs* allowed by act of parliament; and no person is obliged to pay for a hackney-chair, more than the rate allowed by the act for a hackney-coach drawn two third parts of the said distance. 9 Ann. c. 23. § 8. Their number is since increased by 10 Ann. c. 19. and 19 Geo. I. c. 12. to four hundred. See *Hackney-Coaches*.

CHAIR is also applied by the Romanists to certain feasts, held anciently in commemoration of the translation of the see, or seat of the vicarage of Christ, by St. Peter.

The *perforated chair*, wherein the new-elected pope is placed, F. Mabillon observes, is to be seen at Rome; but the origin thereof he does not attribute, as is commonly done, to the adventure of pope Joan; but says there is a mystery in it; and it is intended, forsooth, to explain to the pope those words of Scripture, that *God draws the poor from out of the duft and mire*.

CHAIRMAN, the PRESIDENT, or speaker of an assembly, company, &c.

We say, the *chairman* of a committee, &c.

CHAISE, a sort of light open chariot, or calash.

Aurelius Victor relates, that Trajan first introduced the use of post-*chaises*: but the invention is generally ascribed to Augustus; and was probably only improved by Trajan, and succeeding emperors. Gell. in Cod. Theodos. tom. iv. p. 366, &c.

CHALAZA, in *Botany* and the *Materia Medica*, is a name given by some writers to the fal gem.

CHALAZA, among *Naturalists*, a white knotty kind of string at each end of an EGG, formed of a plexus of the fibres of the membrane whereby the yolk and white are connected together.

Its use, according to Harvey, is to be as it were the poles of the microcosm, and the connexion of all the membranes twisted and knit together; whereby the liquors are not only conserved, each in its place, but also in its due position to the reft.

D'Acquet adds, that they also serve to keep one and the same part of the yolk uppermost, let the egg be turned which way it will; which is done by the following mechanism: the *chalazæ* are specifically heavier than the whites wherein they swim; and being braced to the membrane

membrane of the yolk, a little out of the axis, they make one side of the yolk to be heavier than the other. The yolk being thus by the chalazæ made buoyant, and kept swimming in the middle of the white, as in its most heavy side kept with the same side always uppermost, which uppermost side he imagines to be that wherein the cicatricula lies.

CHALAZIAS, in *Natural History*, the name of a small stone, described by Pliny and other ancient writers, and said to have been of the size and colour of a common hailstone, and of the hardness of the diamond. It was probably an other than the small pebble-crystals of the Indies, which are at this time frequent on the shores of rivers there, from the bigness of a large pea's head to that of a pea; and as they lie in great clusters together, without any other stones among them, they make a sort of coarse sand, which much resembles a cluster of hailstones.

CHALAZITES, in *Natural History*, a name given by some to the *chalazias*.

CHALCANTHUM, in *Natural History*, a name used by many authors to signify the substance called by others CHALCITIS.

Chalcanthum has been used as the generical name of a set of fossils, the characters of which are, that they are compounded of metallic salts, of a coarse and irregular structure, considerably hard, and naturally impure and opake; in which they differ from the native vitriols, which are fine, of a regular structure, and naturally pure and pellucid.

CHALCANTHUM, in *Medicine*, the same with VITRIOL.

Some have also used *chalcanthum* corruptly for COLCOTHAR, or VITRIOL *rubified*.

CHALCESTHUM *calcinum*, in the *Materia Medica*, a name given by some of the old Greek writers to the *melanteria*, a yellowish turbinate mineral, which turned black on being melted with common water.

CHALCIAS, in *Botany*, a genus of the *decandria monogynia* class, the calyx of which is separated into five segments, and the corolla bell-shaped, with unguiculated petals.

CHALCEDONIUS, the name of a medicine described by Galen, and directed by him to be infused into the ears, in inveterate disorders of that part.

CHALCEDONY. See CALCEDONY.

CHALCEDONY, in the *Glass Trade*. See GLASS-*chalcedony*.

CHALCEMBOLON, in *Antiquity*, a ship, the *rostrum* of which was of brass.

The word is compounded of χαλκος, *brass*, and εμβολον, *rostrum*.

CHALCHUS, in *Ichthyology*, a name given by the ancient Greeks to the fish which we call the DORYS. It seems to have obtained both these names from its colour; the one from the word *chalcus*, *brass*; and the other from *doris*, *gilded*.

CHALCIDIC, CHALCIDICUM, or CHALCEDONICUM, in the *Ancient Architecture*, a large magnificent hall belonging to a tribunal, or court of justice.

Festus says, it took its name from the city Chalcis; but he does not give the reason. Philander will have it to be the court, or tribunal, where affairs of money and coinage were regulated; so called from χαλκος, *brass*, and δικη, *justice*. Others say, the money was struck in it; and derive the word from χαλκος, and κοπτω, *beat*.

In Vitruvius, it is used for the academy of a MAGNIFICA in other of the ancient writers, for a hall, or apartment, where the heathens imagined their gods to eat.

CHALCIDICA *tuccia*, in *Zoology*, a sort of serpent, so called from its resemblance in colour to the calcedony.

Its bite is succeeded by a pallescid tumor, which has a kind of shining blackness at the margins. Drunk in wine, it cures its own bite, according to Paulus Ægineta. It is also called *cybe*.

CHALCIDICUM, in *Antiquity*, sometimes denoted a dining-room. See CHALCIDIC.

CHALCIS, in *Ichthyology*, a name by which some have called the pilchard; called by others *harengus*, and *spratus sardinus*. See PILCHARD.

CHALCIS was also the name given by Aristotle, Ælian, Aspion, and the other Greek writers, to the common herring. See CLUPEA.

CHALCITARIUM, in the *Materia Medica of the Ancients*, a name given by the Greeks of the middle ages to the *colcothar*, or *chalcanthum*. Some have applied it to the CHALCITIS alone, but others make it express the vitriols in general. It is derived from the Arabian word *zacadar*.

CHALCITIS, a kind of vitriolic mineral, reddish like copper, friable, and having yellow shining veins within. It has the taste of the blue vitriol of copper, and dissolves very readily in aqueous liquors. There are two other minerals, called *sory* and *fory*, very much like the *chalcitis*. In effect, the ancients confounded them together; and not only the *sory* and *fory*, but also the MELANTERIA, or rather, they imagined a successive transmutation of the four minerals, which they called *chalcitis*, then *melanteria*, then *sory*, then *misy*, and lastly *fory*, where it fixed. The generality have esteemed it one of the last fossils of the sections, though no name but *misy* stands in the prescription for the various decoctions. This is however, as appears on opening it, the only one of the fossils of the ancients being yet evident, and in the Turkish dominions commonly known, and in frequent use as a medicine. The Turks calinat it in a losing fire, and afterwards give it internally as a powerful astringent; and, it is said, with great success.

There is no doubt but that this is the very substance described by the ancient Greeks, under the name *chalcitis*, the description of Dioscorides perfectly agreeing with, and very well expressing it. The antiseptic nature of the more slightly corrosive medicines, and consequently the external use of it in collyriums, and in lenitives, as an astringent, and in the herpes. But the ancients seem not to have known the use of it internally to exalt us in those times; though among the Romans it was well known also in external preparations, and made an ingredient in the famous *theriaca Andromachi*.

The moderns make three different mixtures; though the chief difference between these is supposed to lie in the different quality or goodness of their substance.

Some say, the MISY is formed on the *chalcitis*, as verdegrise on copper, being properly its rust; and that *melanteria* is formed in the same manner on the MISY.

This is certain, they are all found in copper mines; but the modern druggists know little or any of them.

The *chalcitis* is brought from Germany; it is very sanative and escharotic. Its chief use is in the composition of Venice treacle: to this of it is frequently substituted chalcanthum purified, or colcothar.

Chalcitis and *melanteria* were of the same signification, they expressed a metallic mineral, which Vitruvius tells us was yellow. It was of kinds of what he calls *sandyx*, or *sandaracha*, and very resembling all the various minerals in general: the other *sandyx* was of two sorts, the one pale, which was white; the other dusky, which was green and the rest, which was red.

CHALCOGRAPHY, the ART of ENGRAVING on copper and brass.

CHALCOLIBANON, a word mentioned in the Apocalypse of St John, and very much misunderstood by the interpreters, who generally render it *brass*; but the word will bear no such significations. When the name of a metal is prefixed to some other word, it only denotes the thing mentioned after the metal to be of the colour of that metal. This word is formed of χαλκος, *brass*, and λιβανος, *frankincense*. We have many parallel compounds, and all underlined in the same way, the name of the metal only expressing the thing to be of its colour; thus *chrysanthe* are apples of the colour of gold, &c. This, therefore, can only signify frankincense of the colour of brass, that is, yellow.

CHALCOMUIA, the *brass fly*, in *Natural History*, the name of a fly, whose wings are of the colour of polished brass. It is of the carnivorous kind, feeding on other flies, beetles, and on the bodies of serpents, when dead; whence it has been also called by some *pabulatrix*; others have called it *aurata*.

CHALCOPHTHONGUS, in *Natural History*, a word used by Pliny, and other writers, as the name of a peculiar species of marble, which was very hard, and of a deep black colour, and when struck upon, sounded like brass.

CHALCOSMARAGDUS, in *Natural History*, a name given by the ancients to what they called a species of the emerald, found about the copper mines of the island of Cyprus, and of a dusky appearance, and veined with yellow.

The ancients were very indiscriminate in the characters of the gems, and one or other of them have called almost every green thing in the world emerald. This was probably but a dusky green spar, or spatial tinged with copper, and such as we daily find about our own copper mines.

CHALCUS, among the *ancient Greek Physicians*, a weight of about two grains, the same as *acrinus* or *oxalion*.

CHALDEE, or CHALDAIC *Language*, that spoken by the Chaldæans, or people of Chaldea.

The Chaldee is a dialect of the Hebrew.

CHALDEE *Paraphrase*, in the Rabbinical style, is called TARGUM.

There are three *Chaldee* paraphrases in Walton's Polyglott; viz. that of Onkelos, that of Jonathan son of Uzziel, and that of Jerusalem.

CHALDRON, CHALDER, or CHAUDRON *of coals*, a very English measure, consisting of thirty-six bushels heaped up according to the sealed bushel kept at Guildhall, London.

The

The *chalders* should weigh two thousand pounds.—On Ship-board, twenty-one *chalders* of coals are allowed to the *lasts*. See COAL.

CHALEH, in the botanical writings of the ancient Arabs, the name of a tree often occurring, and seldom explained.

The best account we have of the *chaleh* or *sidr*, is in the writings of Prosper Alpinus on the Egyptian plants, who tells us, that it is a kind of willow, growing in Egypt and in Mesopotamia.

CHALICE, the cup, or vessel, used in administring the wine in the eucharist; and, by the Romanists, in the mass.

CHALICE, or *Cole-Stock*. See SHRUB.

CHALINOS, in *Anatomy*, the bit, or that part of a bridle which is put into the mouth of a horse. But it was, among the ancient physicians, also used to express that part of the cheeks, which, on each side, is contiguous to the angles of the mouth.

CHALIZA, in the *Jewish Customs*, the ceremony whereby a woman who is left a widow, pulls off her brother-in-law's shoes, who should espouse her, and by this means is allowed to be at liberty to marry whom she pleases.

The word signifies *extraction* or *rescue*.

CHALK, the white kind of substance usually reckoned a stone, but of a friable kind, which cannot therefore be polished as marble, &c. It is found also in powder, and has all the properties which characterise calcareous earths; but, by these observers, that, when examined by the hydrostatical balance, it is found to want much of the weight and consistence of a real stone: for that he thinks it more justly ranked among the earths.

This he observes to be the case, not only in *chalk*, but in various other bodies taken for granted to be stones; some wherein are nearer to earth than stones; others nothing but earth, sulphur, and salt, &c.

CHALK, *chalkes or marles*, called *Creta*, from the island of *Crete*, now Candia, where the best was formerly found, is of two sorts; the first, a hard, dry, strong *chalk*, used for making LIME: the other, a soft, unctuous *chalk*, used as manure lands.

The use of *chalk*, pulverised or made by way of levigature, is a very fine improvement for some sorts of land, especially the first time it is laid on: It changes the very nature of the soil, and makes it rich for a time; but it soon exhausts itself, and requires dunging to keep it in heart afterwards. A second dashing will prove of very little benefit to those lands which have been ever so well with the first, unless they have lain a long time to recover themselves after it. It is from hence that the farmers have their rule saying, that *chalk* makes a rich tenant, but a poor landlord.

The best method therefore in using *chalk*, is to mix one load of it with two loads of dung or mud; this will make it not only more sweet, but a lasting advantage to the ground. Or it is the best improvement for sour and cold lands, and is observed always to do much good to those lands that lie farthest off from any natural beds of it; the ground near *chalk*-beds partaking of their nature, though there is no *chalk* distinguished to them by the eye. The common method of *chalking* lands, is to lay twelve or fourteen load of *chalk* upon every acre, and this will sometimes make the land bring very rich crops for fourteen or fifteen years together.

It is best to *carry the chalk* upon a dry year or two before it is plowed up; by this means it will sweeten the surface of the earth, and will not work so much downwards, as it will if plowed up at first. It makes corn yield well; and when laid upon grass ground, it makes the grass sweet and rich; and the cattle that feed upon it grow fat soon. The cows also that feed in these pastures, are observed to give better milk than ordinary.

Chalk is found in large strata, chiefly in the South-east part of Britain: So that if a straight line was drawn on a map from Dorchester to the mouth of Norfolk, it would nearly include the *chalky* strata of this island; for no considerable quantity is dug beyond that line.

They have a very easy way of digging *chalk* in Kent. It lies on the sides of hills, and the workman undermines it as far as he thinks proper; then digging a trench at the top, at far distant from the edge as the undermining goes at bottom, they fill this with *water*, and that soaks through to the room of one night, and the whole falls down at once.

In other parts of the kingdom, *chalk* generally lies deeper, and they are often forced to dig for it in considerable depths, and draw it up in buckets; yet in these places, it lies cheap enough at the mouth of the pit to be worth buying, even to carry a great way, for manure. See SOIL.

Chalk raises an effervescence with acid liquors, and is therefore deservedly looked upon as an alcaline or absorbent earth. It is used with success to allay the too great acidity of the juices of the stomach, particularly in the disease commonly called the heart-burn; as also in vomits arising from a sharp phlegm, hæmorrhages, and is said to kill worms. In a word, the property of all alcaline earths is not only to absorb acidity, but readily by the acrimony of the humors, and vigorously to promote the violent motion of the blood, by dreaming the bile and sulphur thereof, in their fixed parts. Powdered *chalk* is given with milk, to prevent its growing acid on the stomach; and externally it is commended for drying wounds, ulcers, and fissures in the nipples. It is likewise used by ingenious bakers, and in the manufacture of glass, and other mechanical operations.

There are various kinds of *chalk*, usually distinguished by their different colours.

CHALK, *red*, and *yellow*. See MELIA.

CHALK, *black*, a light earthy substance, of a fine black colour, compact and laminated texture, and smooth surface. It is easily reduced into an impalpable fine powder, without having its colour in the least altered: with a reddish cast in the fire, and very friable; and it is neither diffolved, nor loses its colour, in acids. It seems to be of the dary bituminous kind. This substance is used for drawing black lines on paper, and in various ways very convenient for painters both in oil and water colours. This useful earth is said to come from Italy and Germany; but many parts of England and Wales furnish substances, nearly, if not entirely, of the same quality, and equally serviceable both for marking, and as a black paint. Such is the chalky substance called CRAYON. See Lewis's Commercium Phil. Techn. p. 328.

Wallerius says, that in Swedish mine-workings, a black earth is found as diffusible in water as indian ink.

CHALK, *brown*. See TRIPOLI.

French CHALK. See MOROCTHUS.

CHALK, *fungous*. See AGARIC *mineral*, and LAC *lunæ*.

CHALK, *red*, an earth much used by painters and artificers, and common in the colour-shops of London and elsewhere. It is properly an indurated clayey ochre, and is dug in Germany, Italy, Spain, and France, but in the greatest quantity in Flanders. Its characters, by which it is distinguished from other red earths, are these: it is of a fine, even, and firm texture; very heavy, and very hard; of a pale red on the outside; but when broken, of a deep dusky chocolate colour within. It adheres firmly to the tongue, is perfectly insipid to the taste, and makes no effervescence with acids. It makes excellent crayons, but does not mix with oil. It is used in Germany medicinally, in hæmorrhages, dysenteries, and other cases.

CHALK, *silver*, the English name of a kind of earth not properly a *chalk*. See ARGENTARIA *Creta*.

CHALK, *yellow*. See TRIPOLI.

CHALK-*stones*, in *Medicine*, a term used for the concretions of calcareous matter in the hands and feet of people violently afflicted with the gout. Leeuwenhoek has been at the pains of examining these by the microscope. He divides them into three parts. The first part he supposed of various small particles of matter, looking like grains of white sand: this is harder and closer, and also whiter than the rest. When examined with large magnifiers, these are found to be composed of oblong particles, laid orderly and evenly together: through the middle small stones are opake, their component parts of these are pellucid, and resemble plates of horn in their first, only that they are somewhat pointed at both ends. These are so extremely thin, that Mr. Leeuwenhoek computes that a thousand of them placed together would not amount to the size of one hair of an horse's tail. The white stones in the harder part of the chalk are not composed of these particles, but there are confusedly thrown among them some darker parts of other substances, and here and there some globules of blood, and small remains of other parts.

The second kind of *chalky* matter is less hard and less white than the former, and is composed of fragments of irregular parts of their oblong figures which compose the first or hardest kind; and these are mixed among tough and clear matter, interspersed with the small and broken globules of blood discoverable in the former, but in much greater quantity.

And the third kind appeared to the naked eye, and when examined with glasses, is found to be more tough and clammy white matter, in which a great number of globules of blood are interspersed; these give it the red appearance it has. Phil. Trans. N° 288. p. 1066. See an account of a great quantity of *chalk* matter voided by a gouty person with his urine; and observations on the *chalk* of the joints of some gouty people, in the Mem. of the A. D. S. an. 1747. p. 56. and in the Coll. Acad. P. Ext. tom. 11. p. 80.

CHALKING, in our *Old Laws*, seems to be some duty laid on merchandize; what it was particularly we do not find:

fands: but in the rolls of parliament it is faid, the mentenance of the ſtaple require to be eaſed of divers new impoſitions, as *chalidge*, moniage, wharfage, &c.

CHALLENGE, a carol, or antiphon for a feaſt, or other commemoration.

The word *challenge* was originally tranſlated antiphon.

Challenge to fight, either by word or letter, or bearing ſuch *challenge*, are puniſhable, by fine and imprisonment; and if they arife from a duel, the offender ſhall forfeit all his goods to the crown, and be imprisoned two years. 2 Ann. cap. 14.

CHALLENGE, in *Law*, is an exception made to jurors who are returned to paſs on a trial.

Challenge to the array is taken inſide to the array, or to the poll: in the array, as when the whole number is excepted againſt, as partially impannelled. If the ſheriff be of affinity to either of the parties; or if any one or more of the jurors are returned at the nomination of either party, or for any other partiality, the array ſhall be quaſhed. To the poll, as when particulars are excepted againſt, as not indifferent.

Thoſe may be *challenged*, i. e. *Propter honoris reſpectum*, as when a lord of parliament is impannelled. 2. *Propter affectum*, as in the caſe of an alien born, which is defect of birth; or of a ſlave or bondman, which is defect of liberty; or in caſe of inſufficient eſtate. This latter exception has undergone ſeveral alterations by different ſtatutes: but by 4 and 5 W. and M. cap. 24. the qualification is 10 l. *per annum* in England, and 6 l. in Wales, either of freehold or copyhold lands; and by 3 Geo. II cap. 25. the holder of a leaſe for life, or for the term of one hundred years abſolute, of the clear yearly value of 10 l. *per annum*, is qualified to ſerve on juries. 3. *Propter affectum*, or on ſuſpicion of partiality: and this kind of *challenge* is *propter* or *to the favour*, in the former caſe the cauſe of ſuſpicion is obvious; and in the latter, when only ſome probable circumſtances of ſuſpicion are pleaded, which are to be determined by triors. 4. *Propter delictum*, or on account of ſome crime, which diſqualifies the juror, by affecting the credit, or conſtitution of freedom, felony, perjury, or conſpiracy; judgment of the pillory; bleeding or whipping; outlawry or excommunication; attaint of falſe verdict, or forgery, &c.

Challenge to the jurors, is alſo divided into *challenge principal*, and *challenge per cauſe*; i. e. upon cauſe or reaſon alleged.

Challenge principal, otherwiſe called *challenge peremptory*, is what the law allows without cauſe alleged; or further examination: thus, a priſoner at the bar, arraigned on felony, may peremptorily *challenge* twenty, one after another, alleging no cauſe but his own diſlike, and they muſt be ſet aſide, and new ones choſen in their room. 22 Hen. VIII. cap. 14. and 1 and 2 Ph. and Mar. cap. 10. In caſe of high treaſon, no *challenge peremptory* was formerly allowed; but by ſtat. 7 W. III. liberty is given *peremptorily* to *challenge* thirty-five.

Yet there ſeems to be a difference between *challenge principal* and *challenge peremptory*; the latter being only in matters criminal, and without any cauſe alleged; the former moſtly in civil caſes, and with alleging ſome ſuch cauſe, as being found trie, the law allows: v. g. if either party alleage, that one of the jurors is the ſon, brother, couſin, or tenant, of the other, the exception is good. Alſo in the plea of the death of a man, or in any action real or perſonal, where the debt or damages amount to forty ſhillings, it is a good *challenge* to a juror, that he cannot diſpend forty ſhillings *per annum* of freehold.

Challenge upon reaſon to cauſe, is when the party does alledge ſome ſuch exception as is ſufficient upon acknowledgement of the truth of it: v. g. if the ſon of the juror have married the daughter of the other party, or the like.

CHALLENGE, in *Hunting*. When hounds, at firſt finding the beaſt of their game, preſently open, and cry, the huntſman ſay *they challenge*.

CHALYBEATE, in *Medicine*, ſomething that partakes of the nature of ſteel, or iron; or that is impregnated with particles of thoſe metals. See MINERAL *waters*, and WINE.

Chalybeats act chiefly as abſorbents, and deobſtruents. Itm. M. Lemery obſerves, it a mixture of an oily ſubſtance with a metallic matter; but the oil is predominant in the mixture; and between the parts mixed are large pores. Hence iron becomes eaſily diſſolvable; and its oil eaſily diſengages itſelf: but when once decompounded, i. e. when once the oil is ſeparated from the pure, fern. ous, or metallic part, no diſſolvent has any effect on the ſame *mortuum*.

Hence appears the abſurdity of that common practice, of calcining iron to ſuch a degree, as to convert it into what the chemiſts call a *crocus*, or ſaffron. This operation muſt of neceſſity take away all, or moſt of the oily ſubſtance; and leave nothing but the indiſſoluble *terra mortua*. Thus all here ſeparated ſhould properly have been ſeparated by the heat of the ſtomach or ſerum, according to Mr. Lemery. It would have carried into the blood a more ſubtile balſamy juice: he obſerves alſo, that iron acts as an abſorbent, from the largeneſs of the pores, and the eaſe with which all kinds of ſalts, even groſſeſt ones, inſinuate themſelves into them: even ſea-water and urine are abſorbed ſtrongly. Farther, it is not all, that pervade acids enter iron; but in entering they alſo expel and expreſs the balſamy juice, which is alſo put in motion, and diſpoſed to be evacuated by the mineral heat. Thus is the doubly advantageous, both by the oil it ſtrengthens the blood withal, and by the ſalts it frees it from. The aſſent of the particles of a *chalybeat*, by their affinity, together with the motion they give the blood by their ſubtilneſs, make it not only preferable to moſt other medicaments, but alſo proper in other caſes eſpecially, where there is a viſcidity of the juices: the blood decompounded, and where the circulation is languid; as in moſt hectic and hypochondriac caſes.

CHAM, or KHAN, the title given to the ſovereign princes of Tartary.

The word in the Perſian, ſignifies *mighty lord*; in the Sclavonic, *emperor*. Spelman, in his Diſſertation on the Danith term of majeſty, *konig*, *king*, thinks the Tartarian *cham* may be well derived from it; whilſt, that in the North they ſay *kan*, *konne*, *konge*, *konnie*, &c. The term *cham* is alſo applied, among the Perſians, to the great lords of the court, and the governors of provinces.

CHAMA, in *Natural hiſtory*, the name of a large genus of bivalve ſhells, the characters of which are theſe: they are ufually ſmooth, though in ſome places a little rugoſe, and have in ſome few a number of ſpines. The valves of the ſhell are equal, ſolid, and convex, and the mouth gaping, not cloſing tail, and even in all parts, as in the order of fiſhes.

The fiſh contained in this genus of ſhells, have all a hot taſte like that of pepper, and inflame the mouth to a troubleſome manner. The Greeks have ſcarce called them ſhells and *ſcarpes*, and in ſome parts of the Levant nation they are called *angeons* and *gromboles*.

The ancients uſed the ſeveral ſpecies of this ſhell to engrave figures on; and as they chiefly wrought upon the ſeveral parts of the engraved figure the colours of the ſeveral coats of the ſhell, by cutting deeper or leſs deep into it. Thus they could give the ſkin of a man its natural white, and his garments a blue or a yellow, according to the nature of the ſpecies of ſhell they worked on. We find ſeveral of theſe antique works, and it is thought by ſome, that this was the firſt invention of that ſort of engraved gem, which we call *cameo*. The ſpecies of the *chama* are very numerous. *Vide* *Shells*, N°. 1.

CHAMADE, in *War*, a certain beat of a drum, or ſound of a trumpet, which is given the enemy as a ſignal, to inform them of ſome propoſition to be made to the commander, either to capitulate or have leave to bury their dead, make a truce, or the like.

Menage derives the word from the Italian *chiamata*, of *chiamare*, to cry.

CHAMÆSALANUS, in *Botany*, a name given by many of the Greek authors to the apios, from its having ſometimes tubers among its roots, buried under the ground. Some have explained the latter word as a name of the bulbocaſtanum, or earth-nut, but it is wrong to confound two roots of ſuch very different characters together; and it does not appear that the Greek authors of moſt ever uſed it in any other ſenſe but as the name of the apios.

The name pituloſpatha has indeed been given by ſome to the bulbocaſtanum roots, but it was a name founded on ignorance, and likely to produce great errors.

CHAMÆBOTOS, in the *Materia Medica*, the name given by ſome to the common dwarf-elder, or wallwort.

CHAMÆCERASUS, in *Botany*, the Heſperocyris. CHAMÆCERASUS is alſo uſed by Dioſcorides and ſome of the old naturaliſts, for the *alkekengi*, or what we call in the winter-cherry. It had this name from its fruit greatly reſembling a cherry, and the plant not growing up to a tree, but riſing only a little way from the ground. Care muſt be taken in reading the botanical writers, to diſtinguiſh when this plant is meant by the name *chamæceraſus*, and when the firſt.

CHAMÆCLEMA, in *Botany*, a name by which ſome authors have called the GROUND-ivy.

CHAMÆCRISTA, in *Botany*. See CASSIA.

CHAMÆDAPHNE, in *Botany*, a name by which Pliny, and ſome other authors, call the ſame *peraſtera*, or periwinkle, and others the ſpurge-laurel.

It is alſo uſed by Columna, and ſome other authors, for the

the bread-leaved *rupest*, commonly called the Alexandrian bay, LAURUS *Alexandrina*. See BUTCHER'S BROOM.

CHAMÆDAPHNE is also the name given by Buxbaum to a new genus of plants, not observed by former botanists, and found frequently in hilly places, in the northern parts of the world. The flowers consist of one leaf each, and are of the globose campaniform kind; the fruit is dry, and divided into five cells, and contains very numerous, and very small seeds, of a roundish shape; and the whole very small plant, in its manner of growth, much resembles our Sophani, in its manner of growth, much resembles our Solomon's seal. One thing very singular is observed in this plant, which is, that it retains its leaves all the winter, but throws them in the middle of summer. In the latter end of May and beginning of June, the flowers are seen to wither, and at this time there arise a number of new shoots from the axe of the lower leaves: these all rise up to bear leaves, and by the middle of July are well covered with them. In the mean time the old leaves fall off, and the stalks of the former year are left naked, except that they have the fruit on them. The new shoots have, besides leaves, the buds of the next year's flowers; and these so perfect, that on opening them the minute parts of the stamina may be perceived. In August and September, when the cold comes on, the leaves become blackish, and the whole plant seems to be decaying; but in the succeeding spring, as soon as the sun has appeared bright for a few days, the leaves re-assume their former green, the whole plant seems to revive, and is soon seen covered with flowers, and exhibiting a beautiful appearance. The stalks of the former year die down to the origin of these new ones; so that though the plant annually grows several inches in height, yet it is never the taller for its great age, as much dying of the height of a former year as is added anew from the succeeding one. Act. Petrop. vol. i. p. 243.

Buxbaum, who first discovered this plant, called it *chamædaphne*, the dwarf bay, from its low stature, and its resemblance to the common bay-tree in the shape of its leaves, which are oval and pointed. See ANDROMEDA.

CHAMÆDROPE, in *Botany*, a name given by some of the ancient writers to the common GERMANDER.

CHAMÆDRYS. See GERMANDER.

CHAMÆLEA, in *Botany*. See WITHY-wind.

CHAMÆLEON, in *Zoology*. See CAMELEON.

CHAMÆLEON, in *Astronomy*. See CAMELEON.

CHAMÆLEON-*thistle*, in *Botany*, the name of a kind of thistle of which there are two kinds described by Dioscorides, and others of the ancient Greeks, and called the white and the black *chamæleon* thistles. The white *chamæleon* is an innocent plant, its root esculent, and a gum which exsudates from it in the hot countries, not only innocent, but agreeable, the women using it to perfume their breath, and chewing it in their mouths as we do mastic.

It may seem strange to some to find this plant thus mentioned as a safe, esculent, and useful one; whereas Pliny and many other writers have declared it to be a poison. The later authors are to be excused in this, in having followed Pliny. The error of this author, who has misled the others, may be easily discovered by tracing his accounts up to the Greeks, from whom he borrowed the greater part of what we find in him, and whom he often, as in this case, has copied carelessly, and translated badly.

CHAMÆMORUS, in *Botany*, the name of a genus of plants, the characters of which are these: the flower consists of five leaves; and the fruit is composed of many seeds, in form of the mulberry.

There is only one species of this plant known, which grows on the tops of the highest hills in the north part of England, but cannot be cultivated in a garden by any art.

CHAMÆNERIUM, in *Botany*. See WILLOW *Herb*.

CHAMÆPITYS, in *Botany*, *Ground-pine*, a species of GERMANDER.

CHAMÆRIPHES, in *Botany*, a name given by Pontederus to a genus of plants called by Linnæus CHAMÆROPS.

CHAMÆRODODENDROS, *Dwarf Rose-bay*, a species of the KALMIA; according to Miller, and of the RHODODENDRON in the Linnæan system.

CHAMÆROPS. See *Dwarf-Palm*.

CHAMANIM, in the *Jewish Antiquities*, is the Hebrew name for that which the Greeks call *pyræia*, or *pyrethria*; and St. Jerom in Leviticus has translated *simulacra*, in Isaiah, *idola*. Lev. ch. xxvii. ver. 30. Isaiah, ch. xxvii. ver. 9.

These *chamanim* were, according to rabbi Solomon, idols exposed to the sun upon the tops of houses. Abenezra says, they were portable chapels or temples, made in form of chariots, in honour of the sun.

What the Greeks call *pyræia*, were temples consecrated to the sun and fire, wherein a perpetual fire was kept up. They were built upon eminences, and were large enclosures without covering, where the sun was worshipped. Herodotus and Strabo speak of them; and the Guebres or worshippers of fire in Persia and the Indies have still these *pyræia*. Strabo says, that in his time there were many of these temples to be seen in Cappadocia, consecrated to the goddess Anaitis, and the god Hermanus. Anaitis is, in all probability, the moon, and Hermanus the sun. Herod. lib. i. p. 87. Strab. lib. xv.

The word *chamanim* is derived from *chamar*, which signifies to warm. Calmet.

CHAMARIM, a word mentioned in several places of the Hebrew Bible, and generally translated *the priests of the idols*, or *priests clothed in black*, because *chamar* signifies *black*, or *obscure*.

Camar, in Arabic, signifies the *moon*. He is the same deity. Grotius thinks the Roman priests called *camilli*, came from the Hebrew *chamarim*. They, among the heathens, who sacrificed to the infernal gods, were destined to black.

CHAMÆXYLON, in *Botany*, a name by which some authors have called the *graphalium*, or CUDWEED.

CHAMBER, in *Building*, a member of a lodging, or piece of an apartment, ordinarily intended for sleeping in, and called by the Latins *cubiculum*.

The word comes from the Latin *camera*; and that, according to Nicod, from the Greek καμαρα, *camara*, or *carus*: the term *chamber* being originally confined to places arched over.

A complete apartment is to consist of a hall, antechamber, chamber, and cabinet.

As to the proportions of *chambers*, their length should be to the breadth as 1 to 1, or some small matter less, but ought never to exceed that proportion; and as for the height, it should be three fourths of the breadth. The height of the *chambers* of the second story, should be a twelfth part less than the height of those below them, if the height of the first story be fifteen feet, that of the second will be fourteen feet eight inches. As to the height of the third story, it should be only three fourths of the second.

In building bed-*chambers*, regard should be had as well to the situation of the bed, as to that of the chimney. For which reason, the chimney ought not to be placed just in the middle, but distant from it about two feet, or two and an half, in order to make room for the bed, which prevents this inequality from being discerned. See Bed-*Chamber*.

CHAMBER, *privy*.—*Gentlemen of the Privy*-CHAMBER are servants of the king, who are to wait and attend on him and the queen at court, and in their diversions, progresses, &c.

Six of these are appointed by the lord-chamberlain, together with a peer, and a matter of the ceremonies, to attend all ambassadors from crowned heads in their public entries. Their number is fifty.

Their institution is owing to king Henry VII. As a singular mark of favour, they are empowered to execute the king's verbal command, and without producing any written order; their person and character being deemed sufficient authority.

CHAMBER *of peers*, is used for the place where certain assemblies are held; also for the assemblies themselves.

Of these there are various kinds; some established for the administration of justice; others for matters of commerce, &c. Of the first kind among us was the

Star-CHAMBER. See COURT *of Star-Chamber*.

CHAMBER, *Imperial*, is a court of jurisdiction held anciently at Spires, but since transferred to Wetzlar; in which are determined the differences arising among the princes and cities of the empire.

It was at first ambulatory: in 1473, it was fixed at Augsburg, then removed to Frankfort, and thence to Worms; in 1527, afterwards it was removed to Nuremberg and Ratisbon; again to Worms and Nuremberg; and from this last to Ellingen; thence, in 1527, to Spires, where Charles V. rendered it sedentary, in 1530.

At its first institution it consisted of sixteen assessors; but the Reformation ensuing, occasioned the number to be increased: by the treaty of Osnabrug, in 1648, there were appointed fifty assessors; whereof twenty-four were to be protestants, and twenty-six catholics; besides five presidents, two of them protestants, the rest catholics.

As the princes and circles of the empire are not always ready in filling up the vacancies in this *chamber*, the number of the assessors is now reduced to fifteen.

This *chamber* has a right of judging by appeal, and is the last resort of all civil affairs of the states and subjects of the empire, in the same manner as the aulic council residing at Vienna. Processes are here almost endless, on account

account of the infinite number of ceremonies and formalities wherewith they are embarrassed.

The *imperial chamber* is frequently afraid to pronounce Sentence, for fear of exposing its awards to some disgrace, the princes sometimes not permitting such to be executed as displease them.

CHAMBER *of accounts*, is a sovereign court in France, where accounts are rendered of all the king's revenues; inventories and avowals thereof registered; oaths of fidelity taken, and other things relating to the finances transacted. The French have also

CHAMBERS, *ecclesiastical*, which judge, by appeal, of differences arising on the raising of tythes: of these *archiepiscopal chambers* there are nine; viz. at Paris, Bourdeaux, Rouen, Lyons, Tours, Thoulouse, Bourges, Pau, and Aix: they usually consist of the archbishop of the place, as president; other archbishops and bishops, a deputy of each of the dioceses, and three counsellors of parliament. The *chamber* chooses as many counsellors out of the clergy as it thinks proper; as also a promoter.

CHAMBER, *apostolical*, at Rome, is that wherein affairs relating to the revenues and domains of the church and the pope are transacted.

CHAMBER *of audience*, *or grand* CHAMBER, a jurisdiction in each parliament of France.

At the first institution of their parliament, there were two *chambers*, and two kinds of counsellors; the one the *grand chamber* for audiences, the counsellors wherein were called *peers*, who only judged; the other the *chamber of inquests*, the counsellors whereof were called *rapporteurs*; who only reported processes by writing.

CHAMBER, *directum*, is a court instituted in Old Spain, for the regulation of divers affairs relating to their commerce to the Spanish West Indies.

CHAMBER *of the edict*, or *Mi-party*, was a court established by virtue of the edicts of pacification, in favour of those of the reformed religion; wherein the number of judges of either religion were the same; and to which recourse was had in all affairs wherein any of the protestants were concerned. This *chamber* is now suppressed.

CHAMBER *of London*. See CHAMBERLAIN.

CHAMBER *of assurance*, in France, denotes a society of merchants and others, established by a decree of the council of state in 1668, for conducting the business of insuring: but in Holland, it signifies a court of justice, where causes relating to insurances are tried.

CHAMBER *of booksellers*, in Paris, denotes a society consisting of a syndic and assistants, elected by four delegates from the printers, and twelve from the booksellers, whose business is to superintend and regulate the trade of printing, and selling books, prints, &c. In the visitation of books, performed by at least three persons of the society, all libels against the honour of God, and the welfare of the state, and all books printed in violation of their regulations and privileges, are suppressed.

CHAMBERS *of commerce*, are assemblies of merchants and dealers, where they treat about matters relating to commerce. Of these there are several, established in most of the chief cities of France, by virtue of an arret of the 30th of August, 1701. Indeed there were some before this general establishment, particularly one at Marseilles, and another at Dunkirk.

CHAMBERS *of the king*, *regiæ cameræ*, in our old records, are used for the havens or ports of the kingdom.

CHAMBER, *in Mining*, is used for the place where the powder of a mine is lodged.

The *chamber of a mine* is a cavity of five or six cubic feet, generally made of a cubical form.

CHAMBER *of a mortar*, or *cannon*, is a cell, or cavity, at the bottom of the barrel, or chace, where the charge of powder is lodged.

The different form of the *chamber* is found by experiment to have an influence on the range of the piece. A cubical *chamber* carries the ball to a less distance than a circular one; and that less than a cylindrical one.

Mr. Robins, apprehending that the charge of powder is instantaneously fired, conceived, that no particular form of *chamber* can be of any advantage; and this seems to be a just conclusion from his theory. But professor Euler has advanced many strong objections to this theory; and he observes in the result, that the same quantity of powder will fire sooner in a globular space, than in a space of any other form: and accordingly recommends to make the cavity behind the ball as nearly globular as possible. See the True Principles of Gunnery investigated and explained, &c. 1777. p. 93.

Though *chambers* are now disused, Mr. Muller observes, that in large cannons they are an improvement not to be neglected; because pieces, having *chambers*, require a less charge than they would otherwise do; and he recommends a *chamber* in all pieces of twenty-four pound ball and upwards, whose diameter should be two thirds the diameter of the bore, and length equal to that diameter: See *Tak. Gunnery, fig.* 1. And he adds, that though this *chamber* contains but one-ninth part of the shot's weight of powder, yet the effect is sometimes nearly equal to that of a fourth part, which is sufficient in large pieces. Muller's Treat. of Artillery, p. 90.

CHAMBERS, *iron*, in a FIRE *ship*, are ten inches long, and 3 5 in diameter. They are bored to against a piece of wood fixed across the ports, and six into another a little higher. When loaded, they are almost filled with corned powder, and have a wooden tompion well driven into their muzzles. They are primed with a quick-match thrust through their vents into the powder, with a part of it hanging out. When the ship is fired, they blow open the ports; and the port-lids either fall downward, or are carried away, and thus give vent to the fire out of the sides of the ship.

CHAMBERDEKINS, in our *Old Statutes*, a denomination for certain Irish beggars, which by statute 1 Hen. V. cap. 7. and 8. were to leave England within a certain time. They were called in the statute *chamberdekens*, and said to be clerks mendicants. Blount says they are called *chamber-deacons* in the parliament-roll.

CHAMBERLAIN, an officer who has the management or direction of a chamber.

The word *chamberlain*, according to Ragueau, originally signified a gentleman who was to sleep in the king's bed-chamber, at his bed's feet, in the absence of the queen. There are almost as many kinds of *chamberlains* as chambers: the principal are as follow.

Lord great CHAMBERLAIN *of England*, an officer of great antiquity and honour; being ranked the fifth great officer of the crown: a considerable part of his function is at the coronation of a king; when he dresses him, carries the *coif*, sword, and gloves, to be used on that occasion; the gold sword and bolthond to be offered by the king; and the robe royal and crown: he also undresses him, and waits on him at dinner; having for his fee the king's bed, and all the furniture of his chamber, the night-apparel, and the silver bason wherein the king washes, with the towels.

To him likewise belongs the provision of every thing in the house of lords, in the time of parliament; to which end he has an apartment near the lords house. He has the government of the palace of Westminster, and issues out warrants for preparing, fitting out, and furnishing Westminster-hall, against coronations, trials of peers, &c.

He disposes of the sword of state, to be carried by whom he pleases; and when he goes to parliament, is on the right hand of the sword, the lord marshal being on the left. On all solemn occasions, the keys of Westminster-hall, of the Court of Wards, and Court of Requests, are delivered to him.

To him belong livery and lodging in the king's court; and he has certain fees from every bishop at his doing homage to the king, and from every peer at his creation. Under his command are, the gentleman-usher of the black rod, the yeoman-usher, and door-keepers.

This honour was long held by the earls of Oxford; viz. from the time of Henry I. by an estate-tail, or inheritance; but in later conventions by the marquis Lindsey, afterward duke of Ancaster, by an estate or inheritance from a daughter and heir general.

Lord CHAMBERLAIN *of the household*, an officer who has the oversight and direction of all officers belonging to the king's chamber, except the precinct of the BED-*chamber*; which is absolutely under the groom of the stole.

He has the oversight and direction of the officers of the wardrobe, of the removing wardrobes, beds, tents, revels, music, comedians, hunting, messengers, trumpeters, drummers, handicrafts, and other tradesmen retained in the king's service: as also of all sergeants at arms, physicians, apothecaries, surgeons, barbers, the king's chaplains, &c. and administers the oath to all officers above stairs. There is also a *Lord Chamberlain of her majesty's* household.

There are also CHAMBERLAINS *of the king's courts, of the Exchequer, of North Wales, of the city of London, &c.* In these cases, this officer is commonly the receiver of all rents and revenues belonging to the place whereof he is *chamberlain*.

When there is no prince of Wales, and earl of Chester, the *Chamberlain* of Chester hath the receipt and return of all writs coming thither out of any of the king's courts. In the Exchequer, there are two *chamberlains*, who keep a controulment of the pells of receipts, and exitus, and have certain keys of the treasury and records: they also keep the keys of that treasury where the leagues of the king's predecessors, and divers ancient books, as Doomsday Book, and the Black-Book of the Exchequer, remain.

The CHAMBERLAIN *of London* keeps the city-money, which is laid up in the chamber of London, an apartment in Guildhall; he also presides over the affairs of orphans and apprentices; and takes care of the city, &c.

His office lasts but for a year, being chosen annually on Midsummer-day; but the custom usually obtains to re-chuse the same person; unless he has been chargeable with any misdemeanour in his office.

CHAMBERLAIN, *Vice.* See VICE-*Chamberlain.*

CHAMBRANLE, in *Architecture* and *Joinery*, the border, frame or ornament of stone, or wood, surrounding the three sides of doors, windows, and chimneys.

The *chambrasle* is different in the different orders; when it is plain, and without mouldings, it is called *simple*, and properly *head*, *case*, or *frame*.

The *chambrasle* consists of three parts: the two sides, called *ejambages*; and the top, called the *traverse*, or *jambe-parisom*.

The *chambrasle* of an ordinary door is frequently called *door-case*; of a window, *window-frame*.

CHAMELEIA, in *Natural History*, a word used by some authors as a name for a peculiar species of CHAMA, but by others as a name for all those *chamæ* that have smooth surfaces, which are a very great number.

CHAMELLOT, in *Commerce*. See CAMELET.

CHAMFER, or CHAMFERET, in *Architecture*, an ornament consisting of half a flute; being a kind of small furrow, or gutter, on a column; called also *strie*, and *flere*.

CHAMFERING, or CHAMBERAINING, is used for cutting the edge, or any thing slopes, or bevel.

CHAMOIS, in *Zoology*, is used by some, particularly the French, for the creature from whose skin the *chamois* leather is made. See *Tour of Hyperboreans*, N° 8.

It is known among naturalists by the name of RUPICAPRA.

It is very common in the mountains of Helvetia, and in many other places. In the figure of its body it seems to approach very much to the fine kind; its belly, forehead, inner part of its ears and throat, are white; it has a yellow streak on each side near the eyes, and the tail of the body is a deep brown; its tail also is of the same colour, and that equally on all sides, not white on that part next the body, as is the case in the deer.

The male and female both have horns, which are a hand's breadth and an half long, rough towards the bottom, and have what knotty a new knot growing every year; they are nearly straight, but at the top bent into the shape of a hook, black, and not smooth, but longitudinally striated with slender streaks, and their inner cavity is filled up with a solid bone proceeding from the skull.

This creature has two remarkable holes always open behind its eyes: these some have imagined, served for perfuming; and Appian, who had the *perfora chamoise* for whatever he chose to say, seems to have led them into this; but there is no sort of probability of truth in it, since the skull is seen transparent under these holes, and there is no perforation through it, nor any such difference from them. The vulgar have also some remarkable opinions founded on the structure of the horns of this creature; the one, that to expelling them to rub his back, he often gets them to lie within the skin that he cannot get them out again; and the other, that he hangs by the horns to the rocks.

CHAMOMILE, *Anthemis*, in *Botany*, a genus of the *syngenesia polygamia superflua* class. Its characters are these: it is a plant with a compounded flower, the border or rays of the flowers being composed of many female flowers, which are cut or notched at the end like tongues on one side. The middle or disk of the flower is composed of many hermaphrodite flowers, which are funnel-shaped, cut, and cut into five parts at the top. The germen is situated at the bottom, which afterwards becomes an oblong naked seed. There are fifteen species.

The first sort is the common *chamomile*, which grows in plowed upon commons, and other waste lands: it is a trailing perennial plant, which puts out shoots from the branches as they lie on the ground. The flowers of this sort are reckoned for medicinal uses; but the market people generally sell the double flowers, which are much larger, but not so strong as the single.

The second sort is a common annual weed, which grows among corn: it flowers in May, so is called *May-weed*; though some have applied that title improperly to the *ratæ seriole*, which rarely flowers till late in June; this is the third sort.

Another sort is the SPANISH of Spain, the roots of which are used for the toothach; being extremely warm, when they are applied to the part affected, they draw out the cold rheums, and are often serviceable.

The common *chamomile* is digestive, laxative, and emollient; it mitigates pain, and promotes the menses and urine; the flowers dried are said to answer these purposes better than any other part of the plant: for all others, the flowers are used. These are given in infusion, as a gentle emetic, very large quantities of the infusion being drank warm. They are also used in emollient decoctions, and are a general ingredient in clysters. It is very remarkable of the flowers of this plant, that, like those of the common yarrow, they yield by distillation a fine lavender oil.

CHAMOS, or CHEMOSH, the idol or god of the Moabites.

The name of *Chemos* comes from a root, which, in Arabic, signifies *to hate*; *Ashtar* for which reason many believe *Chemos* to be the same with the *Priapus* of the ancients: which conjecture the name of *Peor* in Hebrew particulars may be favourable to. See CHEMOS, *Dissertation on Baal Peor and Chemos*, prefixed to his Comment on the book of Numbers.

CHAMPADA, in *Natural History*, the name of a tree common in the woods of Malabar, and bearing a fruit much valued by the natives. It is a large tree very full of branches, and these are very knotty, and, when cut, shrew forth a thick and acrid juice, like that of the *tithymal*. The fruit grows on the trunk and other branches of the tree: the first appearance toward this is a large button-like bud; this, by degrees, opens into a flower consisting of a great number of leaves; among which, when open, are seen the rudiments of the fruit, like a spear very small at first, but it soon grows to a very considerable bigness, being, when ripe, twelve or fourteen inches long, and as much in circumference; its shape much like a melon. The rind is green, and is when divided into small pentagons, in the centre of each of which is a small black spot. The pedicle is thick and woody, and entering into the substance of the fruit, it divides itself into several branched fibres, which run through the whole substance of it, and meet in a point at the end. Within this large fruit there are contained a large number of kernels, of the size of our common walnuts, all hanging together in bunches, in as to resemble a cluster of grapes; these are contained in a narrow cover, being ground firmly upon one another while the fruit is whole, but as soon as this is cut or burst open, they dry further asunder, and hang on the little fibrous grapes that are placed at a distance on the branch, as none of our strong kinds are. The people of Malabar are very fond of this fruit; they lick the pulpy matter which surrounds the kernels, and which is of a sweet and delicious taste, but of a disagreeable rank smell. The Indians are very fond of this fruit, as well for its pleasure as for its use, for it is very heating, and, when taken in large quantities, will destroy people of a cold and phlegmatic constitution. The kernels are much of the nature of chestnuts, but of a less agreeable taste; they are eaten by way of food, rather than as a delicacy, and the common way of using them is boiled in water. *Mem. Acad. Science. Par.* 1699. p. 140.

CHAMPAGNE, in *Horseman*, a name given by some, and some other writers, to the low flattering from the common trot, and called also TROT, and by Latin writers, from its resemblance to the ends of the figure of that sort of fur which is called *vair*, by *hermine*.

CHAMPAIN. See CAMPAGNE and CHAMPAIGN.

A fine CHAMPAIN, in *Heraldry*, one mark of adhesion, in the coat of arms of him who adds a quarter of wit after he has taken quarter.

CHAMPART, in our *Old Law*, a duty, or tribute, by which the tenant was to pay part of the fruits of the ground to the lord. It is also written *campart*, and in the middle-age Latin is called *campipars*, *campartum*.

CHAMPARTORS, or CHAMPARTORS, are those who move goods, or lands, or chattels from one to be moved, either by their own procurement or others; and for them at their proper cost, to have passed the land, or other matter in variance against whom he a writ of *champerty*.

CHAMPARTY, or CHAMPERTY, in *Law*, a maintenance of any man in his suit, upon condition of having part of the thing in question, or a sum of money to be rewarded.

The word comes from the French *champ*, *field*, and *parti*, *divided*; the field, or thing contested for, being supposed to be divided between the champertor, or champertors, and the person to whom he or they incite by a suit.

This seems to have been an ancient grievance; for notwithstanding several statutes against it, and a course of writ accommodated to them, in the time of Edward I. yet in that of Edward III. it was provided, that whereas orders given for lowest deputy was only to be had for the King's Bench, which then followed the court; for the future it should not be countenanced by the justices of the common pleas, and judges of assize.

CHAMPION, properly signifies a person who undertakes a

COMBAT, in the place or quarrel of another: though the word is also sometimes used for him who fights in his own cause.

Hollman defines *champion, certator pro alio causa in duello, a corpus dictus, qui stricto ense decertandum denunciat*: hence also the word *champ-fight*.

Du Cange observes, that *champion*, in the full sense of the word, were persons who fought in lists or duels who, being obliged by custom to accept the duel, had not a just excuse for declining it, as being too old, or infirm, being ecclesiastics or the like. He adds, that the *champions* were usually retained or hired for sums of money, and were held infamous.

There were also some rascals, who, by the laws and homage sworn to their lord, were obliged to fight for them in case of need.

Some authors hold, that any person was allowed the benefit of a champion, excepting parricides, and those accused of very heinous offences.

The custom of ending differences by combat, was derived from the North; whence it passed into Germany, and with the Saxons into England, and insensibly through the rest of Europe. See DUEL.

Whoever was desirous of vindication to maintain the pre and the con, it was always required there should be a secret of the judge to authorize the combat. When the judge had pronounced sentence, the accused threw a gage, or pledge, commonly a glove, or gauntlet; which being taken up by the accuser, they were both taken into safe custody till the day of battle appointed by the judge.

If either of them fled after this, he was declared infamous, and deemed to have committed the crime in question. Nor were the accuser and accused now allowed to make up the matter, or accord, but without the consent of the judges; which was never granted, without making the best satisfaction for the right of inheritance to the estate of the vanquished.

Before the *champions* took the field, their heads were shaved, and they made oath, that "they believed the "person who retained them was in the right; and that "they would defend his cause to the utmost of their "power." The weapons they used in a combat were a sword and buckler: some lay, in England, only a club and buckler; when on horseback, they were armed at all points. In a civil combat, on a writ of right, the only weapons allowed them were staves, or thaves, of an ell long, and a horn-covered leather target. Their weapons were blessed in the field by the priest, with great ceremony; and each took an oath he had no charm upon him.

In the civil combat, a piece of ground was marked out of forty feet square, enclosed with lists, and in one side a court erected for the judges of the court of common pleas, who attended in their robes. The court was as it were fencing; and proclamation being made, the champions were introduced by two knights, and were placed in a full moment, with red and sable, saint-legged from the knee downwards, bare-headed, and with bare arms to the shoulders.

The solemn music began at the sound of a trumpet they were to go to blows after the number of blows or strokes agreed on by the counsel of both parties, and the champions were enclosed. If it lasted till night, or ended with equal advantage on either side, the accused was to have right.

The punishment of the vanquished was that which the crime amounted, whereof he was accused: if it were a capital crime, the vanquished was dragged, led out of the field, and immediately executed, together with the party whose cause he maintained. If the conquered champion fought in the cause of a woman, she was burnt.

In civil combat, the combatants were bound to fight till the stars appeared in the evening; and if the champion of the tenant was able to defend himself till the stars appeared, the tenant prevailed in his cause: or if victory declared itself for either party, by the death of the other, which seldom happened, or by his craving *corcesus*, and pronouncing the word CRAVEN, judgment was finally given in his favour. Blackst. Com. book iii. p. 339, &c.

CHAMPION *of the king*, is an officer, whose business is, at the coronation of the king of England, to ride into Westminster-hall armed cap-a-pee, when the king is at dinner, and throw down his gauntlet by way of challenge; pronouncing by a herald, "That if any man shall deny, "or gainsay the king's title to the crown, he is there "ready to defend it in single combat." Which done, the king drinks to him, sending him a gilt cup with a cover, full of wine, which the champion drinks, and has the cup for his fee.

This office, ever since the coronation of Richard II. has been continued in the family of Dymocke, who held the manor of Scrivelby in Lincolnshire, hereditary from the family of the Marmions, who held it before, by grand serjeantry, on condition that the lord thereof should be the king's champion.

CHAMPION, or rather CHAMPAIGN, a's lands not inclosed; as large fields, downs, or places without woods or hedges.

CHANCE, a term we apply to events, to denote that they happen without any necessary, or forthknown cause; or is so used to denote the non-pertinency of an event, when nothing is known either to produce or hinder it.

Chance is, to ascribe those things to *chance*, which are not naturally produced by the natural effects of any proper cause, which we can discern; but our ignorance and precipitancy lead us to attribute effects to *chance*, which have necessary and determined causes.

When we say a thing happens by *chance*, we really mean no more, than that its cause is unknown to us, as long as many concurring causes, any *chance* itself can be made of any thing. From this consideration, Dr. Bentley takes occasion to expose the folly of that old story, *that would that man by chance*.

The case of the painter, who, unable to express the foam at the mouth of a horse he had painted, threw his sponge in despair at the picture, and, by *chance*, did that which he could not before do by design, is an eminent instance of the force of *chance*: yet it is obvious, all we have mean by *chance*, is, that the painter was not aware of the effect; or that he did not throw the sponge with such a view; not but that he actually did every thing necessary to produce the effect; insomuch that, considering the direction wherein he threw the sponge, together with its form, specific gravity, the colours wherewith it was smeared, and the distance of the hand from the piece, it was impossible, on the present system of things, that the effect should not follow.

Chance is frequently personified, and erected into a chimerical being, whom we conceive as acting arbitrarily, and producing all the effects, whole real causes do not appear to us: to which senfe, the word coincides with the Τυχη and *Fortuna*, of the ancients.

CHANCE is confounded with *Fate* and *Destiny*; and the word is also used for the manner of deciding things, the conduct or direction of which is left at large, and not reducible to any determinate rules or measures: or where there is no ground for preference; as in cards, dice, lotteries, &c.

CHANCE, *for the laws of, or the proportion of*, see the article GAMING. See also EXPECTATION and PROBABILITY.

The ancient *Sors*, or *chance*, M. Pluche observes, was instituted by God himself; and in the Old Testament we find several standing laws, and express commands, which prelcribed to us on certain occasions to use the scripture *lots*, the *Sors*, or *chance*, *fell* to the Maidens when it was in question who should fill Jesse's place in the sacrifice.

Hence also arose the *sacra sortium*, or method of determining things among the ancient Christians, by opening one of the sacred books, and pitching on the first verse they cast their eye on, as a sure prognostic of what was to befall them. The *sortes Homeri*, *Virgilianæ*, *Prænestinæ*, &c. used by the heathens, were with the same view, and in the same manner. See SORTES.

St. Augustine seems to approve of this method of determining things future; and owns that he had practised it himself; grounded on this supposition, that God presides over *chance*, and on Proverbs xvi. ver. 33.

Many among the modern divines, have chose to be considered in a particular manner by Providence, and esteem it an extraordinary way which God uses to declare his will, and a kind of immediate revelation.

CHANCE-*Medley*, in *Law*, the accidental killing of a man, not altogether without the killer's fault, though without any evil intent.

Bracton calls it, *Homicidium per infortunium*: West calls it *homicidium casuale*; and says, it is when the killer's ignorance or negligence is joined with the *chance*; as supposing a man leaping down by the highway, and a boy falling *chance* to kill a passenger; the party here offends in not having given warning, whereby the slain might have been induced to take more heed; or when a workman, in throwing down rubbish from a house, after warning to take care, kills a person; or a School-master in correcting his scholar, a master his servant, or an officer in whipping a criminal, in a reasonable manner, happens to occasion his death, it is *chance-medley* and misdemeanor. 3 Inst. 56. Hab. 331. But if a man throws stones in a highway where persons usually pass, or shoot an arrow, &c. in a market-place, among a great number of people; or if a workman call down rubbish from a house in cities and towns, where people are continually passing; or a

school-master, master, &c. correct his scholar, servant, &c. in a degree exceeding the bounds of moderation, it is manslaughter; and if with an improper instrument of correction, as with a sword or iron bar, or by kicking, stamping, &c. in a cruel manner, it is murder.

CHANCEL, is properly that part of the choir of a church, between the altar and communion-table, and the balustrade, or rail that incloses it, where the minister is placed at the celebration of the communion.

The word comes from the Latin *cancelli*, which in the lower Latin is used in the same sense, *from cancellus, lattice, or grate-bar*, wherewith the chancels were anciently encompassed, as they now are with rails.

The right of a seat and a sepulchre in the *chancel*, is one of the privileges of the founders of a church. The repairs of the *chancel* belong by usage, in most parishes, to the rector or vicar, or both.

CHANCELLOR, an officer, supposed originally to have been a notary, or scribe, under the emperors, and named *cancellarius*, because he sat behind a lattice, called in Latin *cancellus*, to avoid being crowded by the people.

Nande says, it was the emperor himself who sat and rendered justice within the lattice; the *chancellor* attending at the door thereof whence he took his rule.

Others say, he had it from this, that all letters, addresses, petitions, &c. to the king, being first examined by him, were *cancelled*, where faults: others, because all patents, commissions, and warrants, coming from the king, were examined and cancelled by him. Others, because he *cancelled* and annulled the sentences of other courts.

Du-Cange, from Jeannes de Janua, fetches the original of the word *chancellor* from Palestine, where the houses being flat, and made in form of a terrace, with parapets or pallisadoes, called *cancelli*, those who mounted their houses to exhaust any harangue, were called *cancellarii*; whence the name passed to those who pleaded at the bar, which he calls *cancelli fori*, and at length to the judge who presided; and lastly to the king's secretaries.

This officer is now in great authority in all countries: the person who bears it with us, or the

Lord High CHANCELLOR *of England*, is the first lay person of the realm, next after the king, and princes of the blood, in all civil affairs. He is the chief administrator of justice next the sovereign, being the judge of the court of chancery; and to him belongs the appointment of all the justices of peace in the kingdom.

All other justices are tied to the strict laws; but the *chancellor* has the king's absolute power to moderate the rigour of the written law, to govern his judgement by the law of nature and conscience, and to order all things *secundum equum & bonum*. Accordingly, Stamford says, the *chancellor* has two powers, the one absolute, the other ordinary; meaning, that though by his ordinary power he must observe the same form of procedure as other judges, yet in his absolute power he is not limited by any written law, but by conscience and equity.

The offices of *lord-chancellor* and lord-keeper are by the statute 5 Eliz. made the same thing; till that time they were different, and frequently subsisted at the same time in different persons; sometimes the *lord-chancellor* had a *vice-chancellor*, who was keeper of the seal.

The keeper was created *per traditionem magni sigilli*, but the *lord-chancellor* by patent, though now that he has the keeper's office, he is created in like manner by giving him the seal. The *chancellor* is a privy-counsellor by his office, and likewise speaker of the house of lords. See PARLIAMENT.

Though he be sole judge of the court of chancery, yet in matters of much difficulty he sometimes consults the other judges; so that this office may be discharged by one who is *no* profelled lawyer, as anciently it commonly was, by an ecclesiastic, who presided over the king's chapel, and became keeper of the king's conscience, visitor of the king's right of all hospitals and colleges of royal foundation, patron of all the king's livings under the value of 20*l.* *per ann.* in the king's books, guardian of all infants, idiots, and lunatics; and superintendant of all charitable institutions. He has twelve assistants, or counsellors, anciently called *clerici*, as them being in holy orders, now *Masters in Chancery*, the first whereof is the *Master of the Rolls*. See MASTER *of the Rolls*, MASTERS *in Chancery*, &c.

CHANCELLOR *of a cathedral*. His office is thus described in the Monasticon; viz. to hear the lessons and lectures read in the church, either by himself, or his vicar; to correct and set right the reader when he reads amiss; to inspect schools, to hear causes, apply the seal, write and dispatch the letters of the chapter, keep the books, take care there be frequent preachings, both in the church and out of it, and assign the office of preaching to whom he pleases.

CHANCELLOR *of a diocese*, is a judge of the bishop's court held in the cathedral of each diocese.

He was anciently called *vicedominus*, and *archipresbyter*, the church-lawyer. See *Bishop's* COURT.

CHANCELLOR *of the duchy of Lancaster*, is an officer, the head of that court, whose business is to judge and determine all controversies between the king and his tenants of the duchy-land; and otherwise to direct all the king's affairs relating to that court. See *Duchy* COURT.

CHANCELLOR *of the Exchequer*, is an officer, supposed by some to have been created for moderating extremities in the exchequer.

He sometimes sits in that court and the exchequer-chamber, and, with the rest of the court, orders things to the king's best benefit. He is always in commission with the lord treasurer for letting lands belonging to the crown by diffolutions of abbeys, and otherwise: he has power, with others, to compound for forfeitures on penal statutes, bonds, and recognizances entered into by the king. He has great authority in managing the royal revenue, and in matters of fish-royal.

The court of equity in the exchequer-chamber, is held before the lord-treasurer, *chancellor*, and barons, as that of common law before the barons only.

CHANCELLOR *of the order of the* GARTER, and other military orders, is an officer who seals the commissions and mandates of the chapter, and assembly of the knights, keeps the register of their deliberations, and delivers acts thereof under the seal of the order.

CHANCELLOR *of an university*, is he who seals the dispatches or letters of degrees, provision, &c. given in the university.

The *chancellor* of Oxford is their chief magistrate, elected by the students themselves: his office is *durante vita*, to govern the university, preserve and defend its rights and privileges, convoke assemblies, and do justice among the members under his jurisdiction.

Under the *chancellor* is the *vice-chancellor*, who is chosen annually, being nominated by the *chancellor*, and elected by the university in convocation. His business is to supply the *chancellor's* absence.

At his entrance upon his office, he chooses *four pro-vice-chancellors*, out of the heads of colleges, to one of whom he deputes his power in his absence.

The *chancellor of Cambridge*, is in most respects the same with that of Oxford; only he does not hold his office *durante vita*, but may be elected every three years.

He has under him a commissary, who holds a court of record of civil causes; for all persons of the university under the degree of master of arts.

The *vice-chancellor* of Cambridge is chosen annually by the senate, out of two persons nominated by the heads of the several colleges and halls.

CHANCERON, in *Natural History*, a name given by the French writers to the small caterpillar that eats the corn, and does vast mischief in other public granaries. The butterfly which produces this creature has white wings with black spots in them. The caterpillar, when full hatched, is one of the smallest that we are acquainted with. It joins a great number of fine threads, as soon as hatched from the egg, and in many of these it fastens itself to every thing that lies near it.

Toward the latter end of summer these caterpillars leave the corn and mount up the walls of the granary, where they search for a proper place of rest, and, when they have pitched upon such a one, they eat their way into it, and burying themselves in a hole, they cover their whole body with a web of silk of their own spinning, and there change into a sort of brownish red chrysalides. These remain the whole winter without life or motion; but in the months of April and May the butterflies are hatched out of them, and the males and females couple together, immediately after which the female lays her eggs, and the foundation is laid for a new progeny, who, during the remainder of the summer, are to destroy and spoil the corn, under the form of caterpillars. The female throws out a lots of tube from her tail, by means of which she opens a way into the grain, and lodges her eggs, which in fifteen or sixteen days is hatched into the caterpillar fit soon as hatched, it begins to eat, and consuming greedily, it soon marks the place where it lies, by a quantity of the husks which it leaves there. Derhamm. Trait. Phys.

CHANCERY. See COURT *of Chancery*.

CHANCRE, in *Medicine*, a malignant ulcer, which grows and eats the flesh, usually occasioned by some venereal disorder.

Chancres are reputed among the first symptoms that appear in the venereal disease; and Antonius Musa Brassavolus observes, that the pustles on the prepuce, glans, or body, are occasioned by the impurity of humours which are stirred in the time of coition, and the malignant quality of the venereal taint contained in the virus, or that flows from the adverse party. This being premised, it is certain the *chancre* on the *foreskin* and prepuce

prepuce differ very much from those on the glans, and other parts.

CHANDELIER, or CHANDELIERE, in *Fortification*, a wooden frame, made of two pieces, fixed cross-ways on two other pieces, at about four feet asunder, and on their intersections are erected two vertical pieces of five feet high, each supported by three buttresses; the interval of these two pieces is filled up with fascines, or faggots, to cover the workmen instead of a parapet. See *Tab. Fortif. fig. 25.*

Chandeliers are sometimes also made to prevent the enemy from seeing what passes within.

The difference between *chandeliers* and blinds consists in this, that the former serve to cover the pioneers before, and the latter also cover them over head.

CHANDELIER signifies also a candlestick, lamp, &c.

CHANE, in *Ichthyology*, a name given by Aristotle, Athenæus, and the other Greek writers, to the fish called by other authors *scarus chalcis*, and *chrysophrys*. It is truly a species of the *labrus*, and is distinguished by Artedi by the name of the *labrus* with the lower jaw longer than the upper, and with black transverse lines on the sides.

CHANFRIN, in the *Manege*, is the fore-part of a horse's head, extending from under the ears, along the interval between the eye-brows, down to his nose.

CHANGE, in *Commerce*. See EXCHANGE.

CHANGE, in the *Manege*. To *change* a horse, or *change hand*, is to turn or bear the horse's head from one hand to the other, from the right to the left, or from the left to the right. You should never *change* your horse without pulling him forward upon the turn; and after the turn, push him on straight, in order to a stop.

CHANGE *of species*, in *Husbandry*. See SPECIES.

CHANGER, or CHAUNGER, an officer belonging to the king's MINT, who changes money for gold, or silver bullion.

CHANGER, *money*, is a BANKER, who deals in the exchange, receipt, and payment of moneys.

CHANGES, in *Arithmetic*, &c. the permutations or variations of any number of quantities; with regard to their position, order, &c.

To find all the possible changes of any number of quantities, or how oft their order may be varied.

Suppose two quantities *a* and *b*. Since they may be either wrote *ab* or *ba*, it is evident, their changes are $1=2\times1$.

Suppose three quantities *a, b, c*; their *changes* will be as in the margin; as is evident by combining *c* first with *ab*, then with *ba*; and hence the number of *changes* arises $3\times2\times1=6$. If the quantities be 4, each may be combined four ways with each order of the other three; whence the number of *changes* arise $6\times4=3\times2\times1=24$. Wherefore, if the number of quantities be supposed *n*, the number of *changes* will be $n\times n-1\times n-2\times n-3$, &c. to $n=1$. If the same quantity occur twice, the *changes* of two will be found *ab*, of three *aab, aba, baa*; of four *aabb, abab, baba, abba, baab, bbaa*. And thus the number of *changes* in the first case will be $1=(1\times1)\div2\times1$; in the second, $3=(3\times2\times1)\div2\times1$; in the third, $12=(4\times3\times2\times1)\div2\times1$.

abc	*cab*
acb	*bac*
bca	*cba*

If a fifth letter be added, in each series of four quantities, it will beget five *changes*, whence the number of all the *changes* will be $60=(5\times4\times3\times2\times1)\div2\times1$. Hence if the number of quantities be *n*, the number of *changes* will be $n\times n-1\times n-2\times n-3\times n-4$, &c. $\div2\times1$. From these special formulæ may be collected a general one; viz. if *n* be the number of quantities, and *m* the number which flows from the same quantity occurs; we shall have $n\times n-1\times n-2\times n-3\times n-4\times n-5\times n-6\times n-7$, &c. $\div1\times m-1\times m-2\times m-3$, &c.; the series being to be continued, till the continual subtraction of unity from *n* and *m* leave 0. After the same manner we may proceed further, till putting *n* for the number of quantities, and *l, m, r*, &c. for the number that the same flows oft any of them is repeated, we obtain an universal form $n\times n-1\times n-2\times n-3\times n-4\times n-5$, &c. $\div1\times l-1\times l-2\times l-3\times l-4$, &c. $\times1\times m-1\times m-2\times m-3$, &c. $\times1\times r-1\times r-2\times r-3$, &c.

Suppose, for instance, $n=6$, $l=3$, $r=2$. The number of *changes* will be $(6\times5\times4\times3\times2\times1)\div3\times1\times2\times3\times2\times1)=6\times5\times4)\div2\times1=1\times5\times2=60$.

Hence, suppose thirteen persons at a table, if it be required how oft they may *change* places? we shall find the number $13\times12\times11\times10\times9\times8\times7\times6\times5\times4\times3\times2\times1=6227020800$. See ALTERNATION.

In this manner may all the possible ANAGRAMS of any word be found in all languages, and that without any study. Suppose *e. g.* it were required to find the anagrams of the word *Roma*, the number of *changes* will be $4\times3\times2\times1=24$. Thus,

Roma	*oram*
roam	*omar*
raom	*omra*
rmoa	*oarm*
rmao	*oamr*
ramo	*orma*
raom	*oram*

The ANAGRAMS therefore of the word *Roma*, furnishing any word of known signification in the Latin tongue, are seven, viz. *Roma, roam, raom, mora, mar, arma, amor*. Wallis's Algebra, p. 115.

Whether this new method of anagrammatizing be like to prove of much service to that art, is left to the poets.

CHANGES *of capella*. See *Transformation of Lizards*.

CHANNA, in *Ichthyology*, the name of a fish caught in great plenty in the Mediterranean, and brought to market in Italy, and elsewhere, among the sea-perch, which it greatly resembles.

There is no observation, that in all the 6th of this kind which have been examined by naturalists, there have been found none but females. This is asserted as Aristotle. Whether it be fact, would require many observations to determine; if it should be proved so, the whole seems to end in this, that the *channa* is no distinct species, but only the female of some other fish.

There is another fish, not unlike this, called *channadella*, or rather *channadella*, which at Marseilles is known by the name of *channe*.

CHANNADELLA, in *Ichthyology*, a name given by Belloneus, and others, to a species of the *labrus*, called also *turbettus*, and *bejaune pisois*. See CHANE.

CHANNEL, in *Anatomy*, *Chirurgery*, &c. See CANAL.

CHANNEL, or *bed of a* RIVER. See RIVER.

CHANNEL is also applied to divers arms of the sea, where the waters run within the land, or to certain narrow seas, confined between two adjacent continents, or between an island and continent.

In this sense we say, St. George's *Channel*, the British *Channel*, the *Channel* of the Black Sea, of Constantinople, &c.

CHANNEL, in *Building*. See GUTTER.

CHANNEL *of the volute*, in the Ionic capital, is the face of its circumvolution, inclosed by a fillet. See VOLUTE.

CHANNEL *of the larmier*, is the hollow fillet of a cornice, which makes the *pendant mouldings*. See LARMIER.

CHANNEL, in the *Manege*, is used for that concavity in the middle of the lower-jaw of a horse, where the tongue lies. This hollow being bounded on each side by the bars, terminates in the grinders or maxillary teeth. The barbles grow in this *channel*.

CHANNELLINGS. See FLUTINGS.

CHANT, CANTUS, is used for the vocal music of churches.

In church-history we meet with divers kinds of *chant*, or *song*: the first is the AMBROSIAN *chant*, established by St. Ambrose.

The second the *Gregorian chant*, introduced by pope Gregory the Great, who established schools of *chanters*, and corrected the church-song.

This is still retained in the church under the name of *plain song*; at first it was called the *Roman song*.

The *plain*, or *Gregorian chant*, is where the choir and people sing in unison, or altogether in the same manner. See CHORAL SERVICE.

CHANT *Royal*. See COMEDY.

CHANTLATE, in *Building*, a piece of wood fastened near the ends of the rafters, and projecting beyond the wall, to support two or three rows of tiles, to placed to prevent the rain-water, from trickling down the sides of the wall.

CHANTOR, in the *Jewish Antiquities*. In the temple of Jerusalem there was a great number of Levites, who were employed in singing the praises of God, and in playing upon instruments before his altar. In the reign of David there were four thousand singing men, with their heads and presidents.

The *chanters* and Levites who were employed in singing, playing upon instruments, and other functions of the Temple, had no habits distinct from the rest of the people. Nevertheless, in the ceremony of removing the ark to the Temple of Jerusalem built by Solomon, the *chanters* appeared clothed in robes of BYSSUS, or fine linen. Josephus remarks, that in king Agrippa's time they obtained the favour from that prince of wearing a linen robe in the Temple, like the priests. Agrippa believed it would be for the honour of his reign, to signalize it by so considerable a change as this. The other Levites, employed in different exercises under the command of the priests in the temple, procured likewise commissions to learn to sing, to the end that they might enjoy the same privileges with their brethren.

CHANTOR, or CHAUNTOR, a person who sings in the choir of a cathedral.

All great chapters have *chanters* and chaplains to aid and assist the canons, and officiate in their absence.

St. Gregory first instituted the office of *chanters*, enrolling them into a body, called *schola cantorum*; though Anastasius seems to attribute that title to pope Hilary, who lived a hundred years before Gregory.

But the word grows obsolete in this sense, and instead thereof we use the word *chanter*, or singing-man.

CHANTOR is used, by way of excellence, for the precentor, or master of the choir; which is one of the dignities of the chapter.

The *chantor* bears the cope and the staff at solemn festivities, and gives time to the rest at the beginning of psalms and anthems. At St. David's in Wales, where they were no cean, he is next in dignity to the bishop.

The ancients called the *chantor*, *primicerius cantorum*.

The office formerly belonged to the direction of the deacons, and other inferior ministers.

CHANTRY, or CHAUNTRY. See CHAONTRY.

CHAOLOGY, the history or definition of the CHAOS.

Orpheus, in his *Cosmogony*, first hath the different alterations, secretions, and mixtures forms, which matter went through till it became habitable: this amounts to the same with what we otherwise call *symmetry*, or the creation of the world.

Dr. Burnet likewise gives us a *Chaology*, in his Theory of the Earth. He represents the *chaos*, as it was at first, entire, undivided, and universally rude and deformed; or the *rude lump*: then shews how it came divided into its respective regions; how the homogeneous matter gathered itself apart from all of a contrary principle; and lastly, how it hardened, and became a solid habitable globe.

CHAOMANTIA, among the *Ecclesiastical Chemists*, is the art of making presages from observations on the air.

CHAOS, among the *Natural Philosophers*, was described a dark, turbulent kind of atmosphere; or a disorderly system or mixture, of all sorts of particles together, without any form or regularity; out of which the world was formed.

Chaos is every-where represented as the first principle, or cause, or seed of nature, and the world. All the ancient sophists, sages, naturalists, philosophers, theologues, and poets, hold that *chaos* was the eldest and first principle, or *apxwv* or *αρχη*.

The Babylonians, Phœnicians, Egyptians, Persians, &c. all refer the origin of the world to a rude, mixed confused mass of matter. The Greeks, Orpheus, Hesiod, Alexander, Aristophanes, Eutipides, and the writers of the Cyclic Poems, all speak of the first *chaos*: the Ionic and Platonic philosophers build the world out of it. The Stoics hold that as the world was first made of a *chaos*, so shall it at last be reduced to a *chaos*; and that its periods and revolutions in the mean time are only transitions from one *chaos* to another. Lastly, the Latins, as Ennius, Varro, Ovid, Lucretius, Statius, &c. are all of the same opinion. Nor is there any sect or nation whatever, that does not derive their *beginnings, the structure of the world*, from a *chaos*.

The opinion first arose among the Barbarians, whence it passed to the Greeks, and from the Greeks to the Romans, and other nations.

Dr. Burnet observes, that besides Aristotle, and a few other Pseudo-Pythagoreans, nobody ever allowed, that one world was always, from eternity, of the same matter, form, and structure, as at present; but that it had been the standing opinion of the wise men of all ages, that what we now call the terrestrial globe, was originally an unformed, indigested mass of heterogeneous matter, called *chaos*; and no more than the rudiments and materials of the present world.

It does not appear who first broached the notion of a *chaos*. Moses, the oldest of all writers, derives the origin of the world from a confusion of matter, dark, void, and without form, which he calls *tohu bohu*; which is precisely the same as the Greek and Barbarian philosophers. Moller goes no further than the *chaos*; nor tells us whence it took its origin, or whence it received its form and where Moses stops, there presently, do all the rest.

Dr. Burnet endeavours to shew, that as the ancient philosophers, &c. who wrote of the *cosmogony*, acknowledged a *chaos* for the principle of the world: so the divines, or writers of the theogony, derive the origin or generation of their called gods from the same principle.

His design to prove the ancient *chaos*, the origin of our earth, to resemble the atmosphere of a comet; which, though new, yet all things considered, is not the most improbable assertion. He endeavours to make it out by many arguments, drawn from the agreement which appears to be between them.

So that, according to him, every planet is a COMET, formed into a regular and lasting constitution, and placed at a proper distance from the sun, revolving in a newly circular orbit; and a comet is a planet either beginning to be destroyed, or newly made; that is, a chaos, or planet unformed, or in its primæval state, and placed, as yet, in an orbit very eccentrick.

CHAOS, in the phrase of Paracelsus, *limbeta the star*. It has also some other significations among the alchemists.

CHAOUSES, an order of men in the service of the grand signior. These and the *mutferrites* were originally the guards of the sultans in Egypt, and their leaders were his two vizirs, that always accompanied him. They are always go out with the bashaw.

The body of the *chaouses* seems originally to have been the guard one of whom the sultan used to send perhaps to execute his orders.

CHAP, in *Ornithology*, denotes either of the mandibles of a bird's BEAK; which are distinguished by the epithets *upper and lower*.

CHAPE. See CUTTE PLATE.

CHAPEAU, in a general sense. See HAT.

CHAPEAU is sometimes also used to denote the cap or coronet, armed with crown, borne by dukes; and of late frequently met with above an helmet instead of a wreath, under gentlemen's or noblemen's crests. *Vol. III. Heraldry, pl. 67.*

The crest is borne on the *chapeau*; and by the *chapeau* the crest and cest are separated: it being a rule, that no crest must touch the shield immediately.

CHAPEL, or CHAPPEL, a kind of little church, served by an incumbent, properly under the denomination of a *chapelain*. The word *chapel*, according to some, comes from *cancellus, little rails*, or *cancelli*, set up by masters in fairs to shelter them from the weather: Papias teaches it both from the Greek and Latin, *parva capsula, seu scrinium, seu tabernaculum*: whose letter it from the *cappa*, a cope, which served to cover the body: others, a peculiar consecration, because these places were anciently covered with gentilism. Pithou derives it from *capsa*, St. Martin's cope, which the kings of France carried to war with them as the standard, and preserved very carefully in particular tents, thence called *chapels*.

There are two kinds of *chapels*, the one consecrated, and built as churches; the other secular, being of the nature of oratories.

The first are built apart, and at a distance from the parish-churches being neither parishes, cathedrals, nor priories, but subsisting of themselves.

These are called by the canonists *sub ave*, and by others *chapels of ease*, as being erected at a distance from the mother-church, where the parish is large and wide, for the ease and convenience of some of the parishioners who reside far off.

These are served by some inferior pastor, provided either by the rector of the parish, or by those for whose ease and benefit they are intended, by prayers or preaching merely. Some of these are also parochial, having the parochial rights of christening and burying, and differing from a church only in the want of a rectory, and endowment.

The second kind are frequently built in, or adjoining to a church, as a part thereof; having only a desk, &c. to read prayers in; and, in the Romish churches, an altar, &c. to celebrate mass on; but without any baptistery, or font. These are canonists call *sub tecto*. They are generally erected by some considerable person, for the use of their own families *or distant parishioners separate the conventicle*. The twenty-first canon of the council of Agde, held in 506, allows private persons the use of *chapels*; but with prohibition to all clerks to officiate in them without leave from the bishop.

CHAPELS, *free*, are those *chapels of ease* which have a settled revenue for perpetual maintenance of a pastor, &c. by charitable donations of lands, or rents bestowed on them; so as not to be any charge either to the rector, or the parishioners; and they are thus called, because they are *free* from all ordinary jurisdiction.

There are several collegiate churches in France, which they call *sainte chapelle, holy chapels*; as those of Paris, Dijon, Bourges, Bourbon, &c. These are so denominated from being repositories of certain relics.

Hence all those places where relics were preserved came to be called *chapels*; and the persons who had the care of them *chaplains*.

CHAPEL is also a name given to a prisoner's workhouse; because, by some authors, pleading was first actually performed in *chapels*, or churches; or, according to others, because Caxton, an early printer, exercised the art in one of the *chapels* in Westminster Abbey.

In this sense they say, the orders, or laws of the *chapel*, the secrets of the *chapel*, &c.

CHAPEL-

CHAPEL, *knights of the*, was an order of knights instituted by king Henry VIII. in his testament, to the number of thirteen; though these have been increased to the number of twenty-six; they are called also *poor knights*.

These are not knights of the order of the Garter; but are, as it were, their assistants or deputies, serving to discharge all their offices in the funeral services of the kings of England.

They are subject to the office of the canons of Windsor, and live on pensions which the order assigns them.

They bear the blue or red cloke, with the arms of St. George on the left shoulder; but the cloke is only cloth, and they wear no feet of garter: which distinguishes them sufficiently from the knights of the Garter.

CHAPLET, in the *Manege*, a couple of stirrup-leathers, mounted each of them with a stirrup, and joining at top in a fort of leather buckle, called the head of the *chaplet*, by which they are made fast to the pummel of the saddle, after being adjusted to the rider's length and bore. They are used both to avoid the trouble of taking up or letting down the stirrups every time that a gentleman mounts on a different horse and saddle, and to supply what is wanting in the academy saddles, which have no stirrups to them.

CHAPELING a *ship*, is the act of turning her round to a light breeze of wind, when she is close hauled, to that she will lie the same way she did before. This is commonly occasioned by the negligence of the steersman, or by a sudden change of the wind.

CHAPELRY, *Capellania*, is used for a certain precinct belonging to a chapel, having the same relation to it that a parish has to a church.

CHAPERON, CHAPERONNE, or CHAPERON, properly signifies a sort of hood, or covering of the head, anciently worn both by men and women, the nobles and the populace, and afterwards appropriated to the doctors, and licentiates in colleges, &c.

Hence the name passed to certain little shields, and other fanciful devices, placed on the foreheads of the horses that drew the hearses in pompous funerals, and which are still called *chaperons*, or *shafferons*; because such devices were originally fastened on the *chaperonne*, or hood, worn by those horses, with their other coverings of state.

CHAPERON *of a bit mouth*, in the *Manege*, is only used for beach-mouths, and all others that are not cannon-mouths, figuring the end of the bit that joins to the branch just by the banquet. In beach-mouths the *chaperon* is round, but in others it is oval: and the same part that in beach and other mouths is called *chaperon*, is in cannon-mouths called *frontean*.

CHAPITERS, in *Architecture*, the crowns or upper parts of a pillar. See CAPITAL.

CHAPITERS *with mouldings*, are those which have no ornaments, as the Tuscan and Doric.

CHAPITERS *with sculptures*, are those which are adorned with leaves and carved works, the finest of which is of the Corinthian order.

CHAPITERS, in *Law*, were anciently a summary of such matters as were to be inquired of, or presented before justices in eyre, justices of assize, or of the peace, in their sessions.

Chapiters are now taken for articles delivered by the mouth of the justice, in his charge to the inquest: though it appears from Bracton and Briton, they were formerly written exhortations given by the justices for the good observation of the laws, and the king's peace; first read in open court, then delivered in writing to the grand inquest; which the grand jury, or inquest, were likewise to answer to upon their oaths, either affirmatively, or negatively.

CHAPLAIN properly signifies a person provided with a CHAPEL; or who discharges the duty thereof.

CHAPLAIN is also used for an ecclesiastical person, in the house of a prince or person of quality, who officiates in their chapels, &c.

With us there are forty-eight *chaplains* to the king, who wait four each month, preach in the chapel, read the service to the family, and to the king in his private oratory, and lay grace in the absence of the clerk of the closet. While in waiting they have a table, and attendance, but no salary.

An archbishop may retain eight *chaplains*; a duke or a bishop, six; a marquis or earl, five; a viscount, four; a baron, knight of the Garter, or lord chancellor, three; a duchess, marchioness, countess, baroness, the treasurer and comptroller of the king's house, the king's secretary, dean of the chapel, almoner and master of the rolls, two each; the chief justice of the king's bench, one: all of whom may purchase a licence or dispensation, and take two benefices with cure of souls. Stat. 22 Hen. VIII. c. 13.

Every judge of the king's bench and common pleas, the chancellor and chief baron of the exchequer, the king's attorney and solicitor-general, may each of them have one, entitled to one benefice with cure, and non-residents. Stat. 25 Hen. VIII. c. 16.

And also the groom of the stole, treasurer of the king's chamber, and chancellor of the duchy of Lancaster, may retain each one *chaplain*. Stat. 33 Hen. VIII. c. 28.

A *chaplain* muſt be retained by letters teſtimonial under hand and ſeal, or he is not a *chaplain* within the ſtatute: and a *chaplain* thus qualified may hold his ſtrings, though diſmiſſed from attendance, during life; nor can a nobleman, though he may retain other chaplains in his family, qualify any of them to hold pluralities whilſt the firſt are living. 4 Rep. 60.

The firſt *chaplains* are ſaid to have been thoſe inſtituted by the ancient kings of France, for preſerving the *chape*, or *cope*, with the other relics of St. Martin, which the kings kept in their palace; and carried out with them to the war. The firſt *chaplain* is ſaid to have been Cadoc Mariner, *chaplain* to St. Louis.

CHAPLAIN *in the order of* MALTA, is uſed for the ſecond rank, or claſs, in that order; otherwiſe called *aſpa*.

The knights make the firſt claſs, and the *chaplains* the ſecond.

CHAPLAINS *of the pope*, are the auditors, or judges of cauſes in the ſacred palace; ſo called, becauſe the pope anciently gave audience in his chapel, for the decition of cauſes ſent from the ſeveral parts of Chriſtendom.

He hither ſummoned as aſſeſſors the moſt learned lawyers of his time; and they hence acquired the appellation of *capellani, chaplains*.

It is from the decrees formerly given by theſe, that the body of decretals is compoſed: their number pope Sixtus IV. reduced to twelve.

Some ſay the ſhrines of relics were covered with a kind of *tent*, *cope*, or *capella*, i. e. *little cope*; and that hence the prieſts who had the care of them, were called *chaplains*. In time theſe relics were repoſited in a little church, either contiguous to a larger, or ſeparate from it; and the ſame name, *capella*, which was given to the cover, was alſo given to the place where it was lodged: and hence the prieſt who ſuperintended it came to be called *chaplain*.

CHAPLET, CHAPELET, or a ſtring of beads, uſed in the Romiſh church, to keep account of the number of Paternoſters and Ave-Mary's, to be rehearſed in honour of God and the holy Virgin.

Chaplets are otherwiſe called *Paternoſters*. A ROSARY is a *chaplet* of fifteen decads of Ave-Mary's.

Menage derives the word from *chapeau*, *hat*; becauſe of the reſemblance the thing bears to a hatband, or *couſe* of roſes, *chapeau de roſes*. The modern Latins call it *capellina*; the Italians more frequently *corona*.

Leiroy and P. Viret aſcribe the firſt invention of the *chaplet* to Peter the Hermit, well known in the hiſtory of the croiſades.

There is a *chaplet* of our Saviour, conſiſting of thirty-three beads, in honour of his thirty-three years living on earth, inſtituted by father Michael, the Camaldulenſe.

The Orientals have a kind of *roſaries*, which they call *chains*, and which they uſe in their prayers, rehearſing one of the perfections of God on each link or bead. The great mogul is ſaid to have eighteen of theſe chains, all of precious ſtones, ſome diamonds, others rubies, pearls, &c.

The Turks have likewiſe *chaplets*, which they bear in the hand, or hang at the girdle: but father Dandini obſerves, that they differ from thoſe uſed by the Romaniſts, in that they are all of the ſame bigneſs, and have not that diſtinction into decads; though they conſiſt of ſix decads or ſixty beads. He adds, that the muſſulmen have preſently run over the *chaplet*, the prayers being extremely ſhort, as containing only theſe words, *Praiſe to God*; or theſe, *Glory to God*, for each bead.

Beſides the common *chaplet*, they have likewiſe a larger one, conſiſting of one hundred beads, where there is ſome diſtinction, as being divided by little threads into three parts, one of which they repeat thirty times *Subhan Allah*, i. e. *God is worthy to be praiſed*; on another, *Bilkem Allah*, *Glory be to God*; and on the third, *Allo akbar*, *God is great*. Theſe three thirty times making only ninety, to complete the number one hundred, they add other prayers for the beginning of the *chaplet*.

He adds, that the Mahometan *chaplet* appears to have had its riſe from the *wan heracath*, or *hundred benedictions*; which the Jews are obliged to repeat daily, and which we find in their prayer-books. The Jews and Mahometans having this in common, that they ſeldom do any thing without pronouncing ſome laud, or benediction.

CHAPLET, or CHAPELET, in *Architecture*, a little moulding, cut, or carved into round beads, pearls, olives, or the like.—See *Tab. Archit. fig.* 12.

A *chapel*, in effect, is little else but a BAGUETTE enriched with sculpture.

CHAPOTENSIS, in *Writers of the Middle Age*, a kind of coin. We do not find any certain account of its value.

Du-Cange inclines to think it the same as the CHARTIS.

CHAPPAR, a courier of the king of Persia, who carries dispatches from court to the provinces, and from the provinces to the court.

The word, in the original Persian, signifies *courier*.

The posts, M. Tavernier tells us, are not established and regulated in Persia as among us: when the court sends out a *chappar*, the sophi's master of the horse furnishes him with a single horse, how long soever his journey be, and a man to run after him: when his horse is weary, he takes that of the first horseman he meets with, who gives not over the least refusal, and sends his own horse by the man who follows him.

As for the master of the new horse he has taken, he must run, or at least send after the *chappar*, to retake him, when the *chappar* dismounts some other horseman to change him.

CHAPPE, in *Heraldry*, the partition of an escutcheon, by lines drawn from the centre of the upper edge to the three angles below: as represented in *Tab. Herald. fig.* 14. which may be also two *chapps*, or and vert.

The sections of the sides are to be of a different colour from the rest. Blakeerne calls it, *A chief party per fesse water, or shaller*, or both.

CHAPPEL, or CHAPEL. See CHAPEL.

CHAPTER, *Capitulum*, a community of ecclesiastics belonging to a cathedral, or collegiate church.

The chief, or head of the *chapter*, is the dean; the body consists of canons, or prebendaries, &c.

The *chapter* has now no longer any share in the administration of the diocese, during the life of the bishop; but succeeds to the whole episcopal jurisdiction during the vacancy of the *see*.

The origin of *chapters* is derived from hence, that anciently the bishops had their clergy residing with them in their cathedrals, to assist them in the performance of sacred offices, and in the government of the church; and even after parochial settlements were made, there was still a body of clerks who continued with the bishop, and were indeed his family, maintained out of his *income*.

After the monastic life grew into request, many bishops chose monks rather than secular for their attendants.

These bodies, either monastic or secular, then had the same privilege of chusing the bishop, and being his council, which the whole clergy of the diocese had before; but, by degrees, their dependence on the bishop grew less and less; and then they had distinct parcels of the bishop's estate assigned them for their maintenance; till at last the bishop had little more left than the power of calling them.

On the other hand these capitular bodies by degrees also lost their privileges; particularly that of chusing the bishop, for which the kings of England had a long struggle with the pope: but at last Henry VIII. got this power settled in the crown; and now the deans and *chapters* have only the shadow of it.

The same prince likewise expelled the monks from the cathedrals, and placed secular canons in their room; those he thus regulated, are called *deans and chapters of the new foundation*; such are Canterbury, Winchester, Worcester, Ely, Carlisle, Durham, Rochester, and Norwich: such also are the *chapters* of the four new sees, of Peterborough, Oxford, Gloucester, and Bristol.

CHAPTER is also applied to the assemblies held by religious and military orders, for deliberating on their affairs, and regulating their discipline.

Papias says they are so called, *quod capitula ibi leguntur*.

The establishment of general *chapters* of religious orders is owing to the Cistercians, who held the first in 1116, and were soon followed by the other orders.

CHAPTER is also used for a division of a book; contrived for keeping the matters treated therein more separate, clear and distinct.

The ancients were unacquainted with the division of books into *chapters* and sections. Papias says, the name *chapter*, *caput*, arose hence, *quia ſit alterius ſententiæ caput, ex quo caput totum ſumatur*. St. Augustine compares *chapters* to inns, inasmuch as these refresh the reader, at the to the traveller.

The division of the BIBLE into *chapters* is attributed by some to Stephen Langton, archbishop of Canterbury, in the reigns of king John and Henry III. But it was really done by Cardinal Hugo, who flourished about the year 1240, the author of the first scripture CONCORDANCE, with a view of rendering this work as useful as its to the Scripture. The *chapters* were again subdivided not into verses, but by the letters A, B, C, D, E, F, G, placed in the margin, at an equal distance from each other, according to the length of the *chapters*. In some, all the seven letters were used; in others fewer, as the length of the *chapters* required. In 1445, Rabbi Nathan, a famous rabbi among the Western Jews, framed a concordance to the Hebrew Bible, in the manner of Hugo's above mentioned; and introduced the division of the Hebrew Bible into *chapters*: he also improved on his plan, by using the ancient division into verses, and by numbering them, fixing the numerical letters in the margin at every fifth verse. Athias, in his edition of the Bible, 1661 and 1667, introduced the Indian figures, and placed them at every verse. Variables published a Latin Bible, in which the same kind of division was adopted; though some say this division and distinction by numbers was first used in R. Stephens's Latin Bible, published at Paris 1557. R. Stephens made the same division of the *chapters* of the New Testament into verses, for the sake of a Concordance to the Greek Testament, which was printed by his son H. Stephens.

CHAPTERS, *the three*, is a phrase famous in *Ecclesiastical History*, signifying a volume published by Theodoret, an adherent of Nestorius, against St. Cyril; consisting of a letter of Ibas, priest of Nedessa, to Maris, a bishop of Persia; of extracts from the works of Diodorus of Tarsus, and Theodore of Mopsuestia, wherein the same doctrines were taught, that were contended for by Nestorius; and of two pieces of Theodoret, the one against the council of Ephesus, the other against the anathemas of St. Cyril.

These make the famous three *chapters*; which were first condemned by an edict of Justinian, A.D. 544, and since by various councils, and many popes.

CHAPTREL. See JURRY.

CHAR, in *Ichthyology*. See CHARRE.

CHAR of *land*, denotes the quantity of thirty pigs.

CHARA, in *Botany*, the name given by Linnæus to a genus of plants, of the *monœcia monandria* class; resembling the horse-tails in general appearance, and called by some HIPPURIS. The characters of the genus are: the base of the cup is very small, and consists of two leaves. Vaillant describes a monopetalous flower in this cup; but others say there is no flower or corolla at all. There is no appearance of stamina, but the single anthera or apex is of a globose figure, and is affixed to the cup: the germen of the pistil is of an oval figure: there is no style, but the stigmata are three in number, and are very broad: the seed is single, and of an oblong oval figure.

CHARA, in *Agronomy*, the name of one of the CANES *venatici*.

CHARABE, or CARABE, is sometimes used for AMBER; as also for the juice of the poplar-tree.

CHARACTER, in a general sense, signifies a mark, or figure drawn on paper, metal, stone, or other matter, with a pen, graver, chisel, or other instrument, to signify or denote any thing.

The word is χαρακτηρ; formed from the verb χαρασσω, *incidere, to engrave, impress*, &c.

The various kinds of *characters* may be reduced to three heads, viz. *literal characters*, *numeral characters*, and *abbreviations*.

CHARACTER, *literal*, is a letter of the alphabet, serving to indicate some articulate sound, expressive of some idea, or conception of the mind.

These may be divided, with regard to their nature and use, into *nominal*, *real*, and *emblematical*.

CHARACTERS, *nominal*, are those we properly call *letters*; which serves to express the names of things.

CHARACTERS, *real*, are those, that instead of names, express things and ideas.

CHARACTERS, *emblematical*, or *symbolical*, have this in common with real ones, that they express the things themselves; but they also have this further, that they in some measure personate them, and exhibit their form: such are the hieroglyphics of the ancient Egyptians.

CHARACTERS, *literal*, may again be divided, with regard to their invention and ule, into *particular* and *general*.

CHARACTERS, *particular*, are those peculiar to this or that nation; or that have been so: such are the Roman, Italic, Greek, Hebrew, Arabic, Gothic, Chinese, &c. *characters*.

CHARACTERS, *universal*, are also *real characters*, and make what some authors call a *philosophical language*.

The diversity of *characters* used by the several nations to express the same idea, is found the chief obstacle to the advancement of learning: to remove this, several authors have taken occasion to propose plans of *characters* that should be universal, and which each people should read in their own language. The *character* here is to be

real

real, not nominal; to express things, and notions; not, as the common ones do, letters, or sounds: yet, to be mute, like letters, and arbitrary; not emblematical, like hieroglyphics.

Thus, every one should retain their own language, yet every one understand that of each other, without learning it; only by seeing a real or universal *character*, which should signify the same thing to all people, by what sounds soever each expressed it in his particular idiom. For instance, by seeing the *character* destined to signify *a drink*, an Englishman should read *to drink*; a Frenchman, *boire*; Latin, *bibere*; a Greek, πινειν; a Jew, שתה; a German, *trincken*; and so of the rest: in the same manner as seeing a horse, each people expresses it after their own manner; but all mean the same animal. This real *character* is no chimera; the Chinese and Japanese have already something like it. They have a common *character* which each of those nations understand alike in their several languages; though they pronounce it with such different sounds, that they do not understand a little of one another in speaking.

The first, and most considerable attempts for a real *character*, or philosophical language, in Europe, are those of bishop Wilkins, and Delgarme: but these, with how much art soever they were contrived, have yet proved ineffectual.

M. Leibnitz had some thoughts the same way: he thinks those great men did not hit the right method; and adds, it was probable, indeed, that, by this means, people, who do not understand one another, might easily have a commerce together; but that they have not hit on true, *real characters*.

According to him, the *characters* should resemble those used in algebra: which, in effect, are very simple, yet very expressive; without any thing superfluous or equivocal; and contain all the varieties required.

The real *character* of bishop Wilkins has its just applause: Dr. Hook recommends it on his own knowledge and experience, as a most excellent scheme; and to engage the world to the study thereof, published some fine inventions of his own therein.

M. Leibnitz tells us, he had under consideration *an alphabet of human thoughts*; in order to a new philosophical language, on his own scheme; but his death prevented this from being brought to maturity.

M. Lodwick, in the Philosophical Transactions, gives us a plan of an *universal alphabet*, or *character* of another kind; this was to contain an enumeration of all such single tonnis, or letters, as are used in any language; by means whereof people should be enabled to pronounce truly and readily any language; to describe the pronunciation of any language that should be pronounced in their hearing; so, as others accustomed to this language, though they had never heard the language pronounced, should at first be able truly to pronounce it: and lastly, this *character* to serve as a standard to perpetuate the sounds of any language. Abridgm. vol. iii. p. 373.

In the Journal Litteraire, an. 1720, we have a very ingenious project for an universal *character*: the author, after obviating the objections that might be made against the feasibleness of such schemes in the general, proposes his own: his *characters* are to be the common Arabic, or numeral figures. The combinations of these nine are sufficient to express distinctly an incredible quantity of numbers, much more than we shall need terms to signify our actions, goods, evils, duties, passions, &c. Thus is all the trouble of framing and learning any new *characters* at once saved; the Arabic figures having already all the universality required.

The advantages are immense: for, 1. We have here a stable, faithful interpreter; never to be corrupted or changed, as the popular languages continually are. 2. Whereas the difficulty of pronouncing a foreign language, is such as usually gives the learner the greatest trouble, and there are even some sounds which foreigners never attain to; in the *character* here proposed, this difficulty has no place: every nation is to pronounce them according to the particular pronunciation that already obtains among them. All the difficulty is, the accustoming the pen and the eye to affix certain notions to *characters* that do not, at first sight, exhibit them. But this trouble is no more than we find in the study of any language whatever.

The inflexions of words are here to be expressed by the common letters: for instance, the same *character* shall express a *boy*, or a *colt*, a *horse*, or a *mare*, an *old horse*, or an *old mare*, as accompanied with this or that distinctive letter, which shall shew the sex, youth, maturity, or old age: a letter is also to express the bigness or size of things, thus, v. g. a man with this *o* that letter, to signify a *great man*, or a *little man*, &c.

The use of these letters belongs to the grammar, which once well understood, would abridge the vocabulary exceedingly. An advantage of this grammar is, that it would only have one declension, and one conjugation: those numerous anomalies of grammarians are exercising troublesome, and arise hence, that the common languages are governed by the populace, who never reason on what is best: but in the *character* here proposed, men of sense introducing it, would have a new ground, wherein to build regularly.

The difficulty is not in inventing the most simple, easy, and commodious *character*, but in engaging the several nations to use it; there being nothing they agree less in, than the understanding and pursuing their common interest.

CHARACTERS, *literal*, again, may be divided, with respect to the nations among whom they have been invented, and used, into *Greek characters*, *Roman characters*, *Hebrew characters*, &c.

The *character* now ordinarily used throughout Europe, is the *Latin Character* of the ancients.

The Latin *character* was formed from the Greek, and that from the Phœnician, which Cadmus brought into Greece.

The Phœnician *character* was the same with that of the ancient Hebrew, which subsisted to the time of the Babylonish captivity; after which they used that of the Assyrians, which is the square Hebrew, now in use; the ancient being only found on some Hebrew medals, commonly called *Samaritan medals*.

Pollellus, and others, shew, that beside the Phœnician, the Chaldee, Syriac, and Arabic *characters*, were likewise formed from the ancient Hebrew.

The French were the first who, with the Latin of St. Gregory, admitted the Latin *characters*. And in a provincial synod, held in 1091, at Leon in Spain, the use of the Gothic *characters* invented by Ulphilas, was abolished, and the Latin ones established.

Medallists observe, that the Greek *character*, consisting only of majuscule letters, has preserved its uniformity on all medals, as low as the times of Gallienus; there being no alteration found in the turn of the *character*, notwithstanding the many considerable ones both in the use and pronunciation. From the time of Gallienus, it appears to have been weaker and rounder; from the time of Constantine to Michael, the space of five hundred years, we find only Latin *characters*; and after Michael, the Greek *characters* recommence; but from that time they began to alter with the language, which was then a mixture of GREEK and LATIN.

The LATIN medals preserve both their *character* and language, as low as the translation of the seat of the empire to Constantinople. Towards the time of Decius, the *character* began to alter, and to lose of its roundness and beauty: some time after it recovered itself, and subsisted tolerably till the time of Justin; when it fell into the last barbarity mentioned, under Michael; though it afterwards grew worse, and degenerated into the Gothic: so that the rounder and better formed the *character* is on a medal, the greater preference it has to antiquity.

CHARACTERS, *numeral*, are those used to express numbers. *Numeral Characters* are either *letters*, or *figures*, otherwise called *digits*.—The kinds now chiefly in use, are, the Common, and the Roman: to which may be added the GREEK, and another called the FRENCH *character*; as also the letters of other alphabets which have been made use of to express numbers.

COMMON *character* is that ordinarily called the *Arabic*, as supposed to have been invented by the Arab astronomers: though the Arabs themselves call it the *Indian character*; as if they had borrowed it from the people of India.

The *Arabic characters* are ten, viz. 1, 2, 3, 4, 5, 6, 7, 8, 9, 0; the last is called *cipher*.

The *Arabic character* is used almost throughout Europe, and that on almost all occasions; in commerce, in measuring, in astronomical calculations, &c.

Roman character consists of the majuscule letters of the Roman alphabet; whence probably its name: or perhaps, from its being used by the ancient Romans on their coins, and in the inscriptions of their public monuments, engraved in honour of their gods, and great men; on their sepulchres, &c.

The numeral letters that compose the Roman *character* are in number seven, viz. I, V, X, L, C, D, M.

The I denotes one, V five, X ten, L fifty, C a hundred, D five hundred, and M a thousand.

The I, repeated twice, makes two, II; three, three, III; four is expressed thus, IV, I before V or X taking as much from the number expressed by each of those letters.

To express six, an I is added to a V, VI; for seven, two, VII;

VII; and for eight, three, VIII: nine is expressed by an I before X, IX; agreeable to the preceding remark.

The like remark may be made of the X before L or C, except that the diminution is by tens, not units: thus, XL signifies forty, and XC ninety; an L followed with an X, sixty, LX, &c. The C before D or M, diminishes each by a hundred.

Besides the letter D, which expresses five hundred, that number may also be expressed by an I before a C inverted, thus, Ɔ; and thus, in lieu of the M, which signifies a thousand, is sometimes used an I between two C's, the one direct, the other inverted: agreeable to this, six hundred may be expressed IↃ; and seven hundred, IↃC, &c.

The addition of C and Ↄ before, or after, raises CIↃ by ten times that, CCIↃↃ, 10000; CCCIↃↃↃ, 100,000, &c. This is the common way of notation, formerly used by the Romans; who also expressed any number of thousands by a line drawn over any numeral less than a thousand; e.g. V, 5000; LX, 60,000: so likewise M is 1,000,000; MM is 2,000,000, &c.

Besides which (1.) certain liberties or variations have been admitted, at least by some modern writers; e.g. IIX, 8; IIIX, 9. (II.) And certain *characters* have been used, which seem to have been derived from the letters: e.g. M, by which they express (Mille) 1000, was formed from CXↃ, or CIↃ; half of which, viz. IC, stood for 500. (III.) And the easier writing of these *characters*, I. Ↄ seems to have been altered into D: 2. ↃↃ into A, or V: 3. CIↃ into ⋔ or Λ: whence Ψ, 1000; Ψ Ψ, 200, V. V.

In Roman inscriptions, we meet with the *characters* ⊂ and Ↄ, used to express a thousand. The usual note of a thousand, is either I between two CCↃ (direct and reversed) thus, CIↃ; or else X, thus, CXↃ. The former figure, when closed at top, exactly resembles an ancient M, thus, Ⓜ; and the latter, when thus up, the figure of 8, inclined thus ∞.

We also find, in some inscriptions, the *character* ⊕, which is X between two CↃ's but closed on all sides. But the learned Dr. Taylor seems to suspect the accuracy of the copy of the inscription from whence this *character* is taken. See *Phil. Trans.* N° 482. 5. 2.

As to the origin and use of the *character* X, so often met with on the coins, utensils, and manuscripts of the ancients; see X.

CHARACTERS, *Hebrew*. See HEBREW.

Greek numerals. The Greeks had three ways of expressing numbers. (I.) The most simple was, for every single letter, according to its place in the alphabet, to denote a number from α 1 to ϡ 9; in which manner the books of Homer's Iliad are distinguished. (II.) Another way was by dividing the alphabet into, (1.) 8 Units: α 1, β 2, &c. (2.) 8 Tens: ι 10, κ 20, &c. (3.) 8 Hundreds: ρ 100, σ 200, &c. N. B. Thousands they expressed by a point, or accent under a letter, e.g. α 1000, β 2000, &c. (III.) A third way was by six capital letters, thus Γ (as for ΠΕΝΤΕ) 5, Δ (Δεκα) 10, Η (Ηεκατον) 100, Χ (Χιλιοι) 1000, Μ (Μυρια) 10000: and when the letter Π included any of these, except I, it thewed the included letter to be five times its own value, as, [Π] 50, [Η] 500, [Χ] 5000, [Μ] 50000.

N. B. 6,909,960 are expressed by *character* ϡ.

Hebrew numerals. The Hebrew alphabet was divided into 9 Units: א 1, ב 2, &c.—9 Tens: י 10, כ 20, &c.—9 Hundreds: ק 100, ר 200, &c. ך 500, ם 600, ן 700, ף 800, ץ 900.—Thousands, (1.) were sometimes expressed by the units prefixed, to hundreds, as, אתרלה, 1531, &c. and even to tens, as, אצ, 1090, &c. (2.) But generally by the word אלפים, 1000: אלפים, 2000: אלפים, with the other numerals prefixed, to signify the number of thousands: e.g. גאלפים, 3000, &c.

CHARACTER, *French*, so called, because invented, and chiefly used by the French, is more usually denoted, *shorthand*, or *stenography*.

It consists of 80 figures; partly taken from the letters of the usual current hand, and partly invented by the contrivers: the six *characters* are *j*, *k*, *n*, *l*, *c*, *y*. The *j* stood next standing for one, the *k* for five, the *n* for ten, the *l* for fifty, the *c* for a hundred, and the last *character* for a thousand.

This *character* is only an imitation of the Roman *characters* and its use in most respects the same, particularly in what relates to the combination of certain letters which placed before or after others, diminish or increase their value. Indeed it has these things peculiar in it, that when several things occur successively, only the last is expressed. 2dly, That ninety, and the following numbers to one hundred, are expressed, thus, *fifty-ten*, ninety; *fifty-ten ninety-one*; *fifty-ten* 99. &c.

It is principally used in the chambers of accounts, in the accounts given in by treasurers, receivers, farmers, and other persons concerned in management of the revenue.

CHARACTERS, in *Printing*, denote the letters or types, by the various arrangement whereof, are compoled forms; whence impreſſions are taken, by means of a preſs, on paper.

For the method of caſting theſe CHARACTERS, *ſee Letter* FOUNDERY.

CHARACTER is alſo uſed in ſeveral of the arts, for a ſymbol, contrived for a more conciſe, immediate, and artful conveyance of the knowledge of things.

In this ſenſe of the word, Paulus Diaconus refers the invention of *characters* to Eunius; who, he ſays, contrived the firſt eleven hundred. To theſe were many more added by Tyro, Cicero's freedman, and by Philargyrius, Famulus, and Aquila, freedmen of Maecenas. Laſtly, L. Annaeus Senera made a collection of them, reduced them into order, and increaſed their number to five thouſand. Tyro's notes may be ſeen at the end of Gruter's inſcriptions.

Valerius Probus, a grammarian, in the time of Nero, laboured to good purpoſe in explaining the notes of the ancients. P. Diaconus wrote an ample treatiſe of the explication of the *characters* in law, under the reign of the emperor Conrad II. and Goldaſtus another for thoſe of medals.

Characters, or ſymbols, are more chiefly affected in the ſeveral parts of mathematics; particularly in algebra, geometry, trigonometry, and aſtronomy: as alſo in medicine, chemiſtry, muſic, &c. The principal of each kind we ſhall here ſubjoin.

CHARACTERS *uſed in Arithmetic and Algebra*.

a, *b*, *c*, and *d*, the firſt letters of the alphabet, are the ſigns or *characters* that denote given quantities; and *u*, *x*, *y*, &c. the laſt letters, are the *characters* of quantities ſought. Some for the former, are conſonants, or large letters, and vowels, or ſmall ones, for the latter.

Note, Equal quantities are denoted by the ſame *character*.

m, *n*, *r*, *s*, *t*, &c. are *characters* of indeterminate exponents, both of ratios and powers; thus a^m, s^n, x^r, denote indeterminate powers of different kinds: *m*, *n*, *r*, different multiples, or ſubmultiples of the quantities *a*, *s*, *x*, according as *m*, *n*, *r*, are either whole numbers or fractions.

+ Is the ſign of real exiſtence, and is called the *affirmative*, or *poſitive ſign*; importing the quantities to which it is prefixed, to have a real and poſitive nature.

It is alſo the ſign of addition, and is read *plus*, or *more*; thus 9 + 3, is read 9 *plus* 3; or 9 *more* 3: that is, the ſum 9 and 3, equal to 12.

— Before a ſingle quantity, is the ſign of *negative* or *negative* exiſtence: ſhewing the quantity to which it is prefixed to be leſs than nothing.

Between quantities, it is alſo the ſign of ſubtraction, and is read *minus*, or *leſs*; thus 14 — 2, is read 14 *minus*, or abating 2; that is, the remainder of 14, after 2 has been ſubtracted, viz. 12.

= Is the ſign of *equality*: thus, 9 + 3 = 14 — 2 ſignifies 9 *plus* 3, to be *equal* to 14 *minus* 2.

This *character* was firſt introduced by Harriot: Des Cartes in lieu of it uſes ∞. Before Harriot there was no ſign of equality at all.

Wolfius, and ſome other authors, uſe the ſame *character*, ∺ for the identity of ratios; or to denote the terms to be in a geometrical proportion; which moſt authors expreſs thus ::.

× Is the ſign of *multiplication*, denoting the quantities on either ſide to be multiplied into one another: thus 4 × 6, is read 4 multiplied by 6; or the factum, or product of 4 and 6 = 24; or the rectangle between 4 and 6.

Ordinarily, however, in algebra, the ſign is omitted, and the two quantities put together: thus *b d* expreſſes the product of the two numbers denoted by *b* and *d*, which ſuppoſe 2 and 3, the product wherein is 6, ſignified by *b d*.

Wolfius, and others, make the ſign of multiplication a dot (.) between the two factors: thus 6.2 ſignifies the product of 6 and 2 = 12.

Where one or both the factors are compounded of ſeveral letters, they are diſtinguiſhed by a line drawn over them: thus, the factum of *a* + *b* — *c* into *d*, is wrote $\overline{a+b-c}\,d$.

Guido Grandi, and after him Leibnitz, Wolfius, and others, to avoid the perplexity of lines, in lieu thereof, diſtinguiſh the compound factors, by including them in a parentheſis, thus $(a+b-c)\,d$.

— In

$\div$ is the *character* of *division*: thus $a \div b$ denotes the quantity a to be divided by b.

Indeed, ordinarily, in algebra, the quotient is expressed fraction-wise; thus, $\frac{a}{b}$ denotes the quotient of a divided by b.

Wollius, &c. make the sign of division (:) thus $8 : 4$ denotes the quotient of 8 divided by 4 $= 2$.

If either the divisor or dividend, or both, be compound of several letters, *v. gr.* $a+b$, divided by x; instead of writing the quotient fraction-wise, thus $\frac{a+b}{x}$; Wollius, &c. include the compound quantities in a parenthesis, thus, $(a+b) : x$, or $(a+b) : (a+b)$ &c.

$\times$ Is the *character* of *broadwise*, or of producing the square of any quantity, by multiplying it by itself.

$\surd$ The *character* of *radicism*, or of extracting the roots out of the several powers; the reverse of $\times$.

$\neq$ Is the sign of *inequity*, or of the excess of one quantity beyond another: some use this $>$, or this $\neg$.

$\angle$ Is the sign of *inequity*. These two *characters* were first introduced by Harriot, and have since been used by Wallis and Lamy. Other authors use others: some this $\supset$.

$\propto$ The sign of SIMILITUDE commended in the Miscellanea Leibnitiana, and used by Leibnitz, Wollius, and others; though the generality of authors use $::$.

The latter character is used by other authors for the difference between two quantities, while it is yet unknown which is the greater.

$\surd$ Is a character of *radicality*, and shews that the root of the quantity to which it is prefixed, is extracted, or to be extracted: thus, $\surd 25$, or $\surd 25$, denotes the square root of 25, viz. 5; and $\sqrt[3]{25}$ the cube root of 25. See ROOT.

This *character* sometimes affects several quantities distinguished by a line drawn over them, thus, $\surd a+b$, denotes the square root of the sum of a and b.

Wallis, and some few herself, includes the roots compounded of several quantities in a parenthesis, adding its index: thus, $(a+b+c)^{\frac{1}{2}}$ denotes the square of $a+b+c$, continually written $a+b+c^{\frac{1}{2}}$.

$\sim$ Is the *character* of arithmetical proportion disjunct: thus, $2 \sim 3 \sim 4 \sim 5$, intimates 3 to be exceeded by 1, as much as 4 by 3; 2 to 3 by 4 to 5.

This is the *character* of identity of ratio, and geometrical proportion disjunct; thus $2 : 4 :: 30 : 15$, expresses the ratio of 2 to 4, to be the same with that of 30 to 15; or that the four terms are in geometrical proportion, viz. 2 to 4, so 30 to 15.

Wollius, in lieu hereof, uses the *character* of equality $=$, which he prefers to the former, as being more scientifical and expressive.

$\propto$ The *character* of geometrical proportion continued, implying the ratio to be carried on without interruption: thus $2, 4, 8, 16, 32, \propto$ are in the same uninterrupted proportion.

When one or more terms in an equation are wanting, their places are usually marked with one or more asterisms: as, $\left.\begin{matrix} x^3+fx^2+gx \\ -px-lx \\ +q \end{matrix}\right\} = 0 \; x^3+fx^2-px=-gx+lx-q$.

Character of Infinity. See SERIES.

CHARACTERS *used in Astronomy.*

☽ *Character* of Saturn.	♊ *Character* of Gemini.
♃ Jupiter.	♋ Cancer.
♂ Mars.	♌ Leo.
♀ Venus.	♍ Virgo.
☿ Mercury.	♎ Libra.
☉ The Sun.	♏ Scorpio.
☽ The Moon.	♐ Sagittarius.

♈ Aries.	♒ Aquarius.
♉ Taurus.	♓ Pisces.

CHARACTERS *of the Aspects, Nodes, &c.*

☌ Conjunction.	△ Trine.
☍ Semisextile.	⚺ Sesquiquadrate.
⚺ Semisquare.	⚻ Quincunx.
⚹ Sextile.	☍ Opposition.
□ Quadrate.	☊ Scorpion's head.
⚻ Tridecile.	☋ Scorpion's tail.

CHARACTERS *of Time.*

A. M. (*ante meridiem*) or M. morning.

☉ or M. noon.

P. M. (*post meridiem*) or A. afternoon.

CHARACTERS *used in Chemistry, Medicine, and Pharmacy.*

Authors are very redundant, and even tactiful, in pharmaceutical *characters*; but the most usual are exhibited in the *Table of* CHEMICAL, *&c. Characters.*

CHARACTERS *in Commerce.*

D^o *Ditto*, the same.	℔ Pound weight.
N^o *Numero*, or number.	C. or ℔ Hundred weight, of 112 pound.
pa. Folio, or page.	4^to Quarto.
Rx Rotlo, } folio.	8^vo Octavo.
fo Folio, }	*per*, or *by*. At ℔ *ann.* by the year. ℔ *cent.* in the hundred, &c.
l. or £. *sterling*, Pound Sterling.	*Rx* Rixdollar.
s. Shillings.	D^r Ducat.
d. Pence, or Deniers.	P. S. Postscript.

CHARACTERS *in Grammar and Trigonometry.*

|| Is the *character* of parallelism; implying two lines or planes to be equidistant from one another. See PARALLEL.

△ *Character* of a triangle. See TRIANGLE.

□ A square. = Equality or sides.

▭ A rectangle. ∠ An angle.

⊙ A circle. ∟ A right angle.

∠ Equality of angles. ⊥ A perpendicular.

° A degree; thus, 75° implies 75 degrees.

′ A minute, or prime; thus, 50′ implies 50 minutes.

″, ‴, ⁗, &c. the characters of seconds, thirds, fourths, &c. of a degree: thus, 5″, 6‴, 18⁗, 20‴″, denote 5 seconds, 6 thirds, 18 fourths, and 20 fifths.

Note, The same *characters* are sometimes used, where the progression is by tens, as it is here by fifties.

CHARACTERS *in Grammar, Rhetoric, Poetry, &c.*

, *Character* of a Comma.	´ *Emphasis*, or accent.
; *Semicolon.*	˘ *Breve.*
: *Colon.*	¨ *Diæresis.*

A. B. *Artium Baccalaureus*, *Bachelor of Arts.*

F. R. S. *Fellow of the Royal Society.*

F. A. S. *Fellow of the Antiquarian Society.*

CHARACTERS *used in the Arithmetic of Infinites.*

The *character* of an infinitesimal, or fluxion; thus, $\dot{x}$, $\ddot{x}$, &c. express the fluxions or differentials of the variable quantities x and y; two, three, or more dots, denote second, third or higher fluxions.

This method of denoting the fluxions, we owe to Sir Isaac Newton, the inventor of fluxions: it is adhered to by the English; but foreigners, generally, follow M. Leibnitz, and in lieu of a dot prefix the letter d to the variable quantity; on pretence of avoiding the confusion arising from the multiplication of dots, in the differencing of differentials.

d The *character* of a differential of a variable quantity; thus, dx is the differential of x; dy the differential of y. The *character* was first introduced by M. Leibnitz, and is followed by all but the English. See CALCULUS *Differentialis.*

CHARACTERS *among the Ancient Lawyers, and in Ancient Inscriptions.*

A. Antiquitus.	*Bono antiquitus.*
B. Dicebat.	*Scto. Senatusconsulto.*
E. Extra.	*P. P. Pater Patriæ.*

CHARACTERS *used in Music.*

Characters of the Musical notes, with their proportions.

𝅝 *A Large*	8.	
𝅜 *A long*	4.	
𝅗𝅥 *A Breve*	2.	
𝅝 *Semibreve*	1.	
♩ *A Minim*	½.	
♪ *A Crotchet*	¼.	
𝅘𝅥𝅯 *A Quaver*	⅛.	
𝅘𝅥𝅰 or 𝅘𝅥𝅰 *A Semiquaver*	1/16.	
𝅘𝅥𝅱 or 𝅘𝅥𝅱 *A Demisemiquaver*	1/32.	

♯ *Character* of a *sharp note*. This *character* at the beginning of a line or space, denotes all the notes in that line, or space, to be taken a semitone higher than in the natural series. And the same effects all their octaves, above and below, though not marked.

When the *character* is prefixed to any particular note, it shews that note alone to be a semitone higher than it would be without such a *character*.

♭ *Character* of a *flat note*. This *character*, at the beginning of a line, or space, shews, that all the notes on that line, or space, are to be taken a semitone lower than in the natural series; affecting, in like manner, all the octaves, both above and below. When prefixed to any note, it shews that note alone to be a semitone lower than it would otherwise be.

♮ *Character* of a *natural note*. Where, in a line or series of artificial notes, marked at the beginning for either sharps or flats, the natural note happens to be required, it is denoted by this *character*.

𝄞 *Character of a treble clef.*

𝄡 *Mean clef.*

𝄢 *Base clef.*

Rests or Pauses of Time.

CHARACTERS *on Tomb Stones.*

M. S. *Memoriæ Sacrum; Sacred to memory.*

D. M. *Diis Manibus.*

IHS *Jesus.*

XP. A *character* found on ancient monuments; about the meaning of which authors are not agreed. See CATACOMB.

CHARACTER is also used for a certain manner, air, or assemblage of qualities, resulting from several particular marks, which distinguish a thing from any other, so as it may be known thereby.

Thus, we say, the *character* of Achilles; generosity and greatness of mind was the *character* of the Romans; Cicero had a *character* of politeness, which is wanting in Demosthenes; every passion has its peculiar *character*.

The writers of *characters* are, Theophrastus, whose fragments are still extant; Du Moulin, in his Exemplar Morum; Paschal, in his Characteres Virtutum & Vitiorum; M. de la Chambre, in his Characters of the Passions; and De la Bruyere, in his Characters and Manners of the Age.

CHARACTER, in *Poetry*, especially the epopea and drama, is the result of the manners, or that which each person has peculiar and singular in his manners, whereby he is distinguished from others.

The poetical *character*, Bossu observes, is not properly any virtue or quality in particular; but is a composition of several, mixed and combined in various degrees, according to the occasions of the fable, and the unity of the action. All the simple qualities that enter this compound, must not have the same rank, nor be equal to each other; since, in that case, one prevailing on one occasion, and another on another, the *character* will appear changeable; and the poem, as well as the hero, will seem animated with several souls.

There must, therefore, be one to reign over all the rest; and this must be found in some degree in every part: just as the same hero in several paintings, should have the same lines and features, how different soever his posture and passions may be.

This first quality, in Homer's Achilles, is wrath; in Ulysses, dissimulation; and in Virgil's Æneas, mildness; each of which may, by way of eminence, be called the *character* of those heroes.

These are never to go alone, but always are to be accompanied with others, to give them the greater lustre; either by hiding their defects, as in Achilles, whose anger is palliated by great courage; or by making them centre in some fond virtue, as in Ulysses, whose dissimulation makes a part of his prudence; and in Æneas, whose mildness is chiefly employed in a submission to the will of the gods.

These secondary qualities of courage, prudence, and submission, make the goodness of the *characters* of those heroes, and even of the poems.

Bossu adds, that the quality of courage must always have a share in the *character* of a hero, to serve as a support to the rest: the heroic *character*, therefore, he makes a compound of these kinds of qualities. Those of the first kind are necessary and essential to the fable; those of the second are the supplements, or the embellishments of the first; and courage, which fall into the other two, makes the third.

The first, which is the chief, is to be some universal quality, to have place on all occasions, and to distinguish the hero wherever it is found.

For the unity of *character*, we have Horace's express command, *Sit quodvis simplex dumtaxat & unum*. Bossu adds, that the *character* is not less the soul of the hero, and the whole action, than the fable is of the poem: and of consequence the unity must be as exact in the one as the other; which accordingly we find observed both by Homer and Virgil.

The unity of *character* is somewhat different from that of the manners: in the latter, the unity and equality consist in not giving contrary sentiments to the same person; which is not sufficient for the unity of *character*: but to this must be added, that the same spirit must always appear on all occasions, whether contrary, or otherwise: thus, Æneas shewing great goodness in the first part of the poem, and much valour in the second, but without discovering any of his former piety, and gentleness; there had been no offence against the economy of the manners, but much against the unity of the *character*.

So that besides the qualities which have their particular place on different occasions, there must be one to have place throughout, and to reign over all the others. Without this there is no *character*: as would be the case should a poet give his hero the piety of Æneas, and the courage of Achilles, without considering the severity of the one, and the mildness of the other.

A hero, it is true, may be made as brave as Achilles, as mild or pious as Æneas, and, if the action thinks proper, as prudent as Ulysses: but it would be a mere chimera to imagine a hero with the particular courage of Achilles, the piety of Æneas, and the prudence of Ulysses at the same time.

The unity of *character* is not only to be kept in the hero, and the several other persons of the poem; but also in that of the poem itself: that is, all the *characters* bow opposite forces, must centre, and resolve in that of the hero; and be so swayed by it, as that this alone may seem to govern throughout the whole. Thus Homer makes wrath prevail throughout the whole Iliad, and

artifice and dissimulation throughout the Odyssey, the hero's *character* is preserved every where, but in full sway, and is favoured by the similitude of the *characters* of some of the other persons. Virgil had a great difficulty to grapple with to preserve his unity; because of the direct opposition between the humours of his hero, and those of some other of his persons, as Turnus, Mezentius, Dido, &c. He therefore takes care not to carry those opposite *characters* to their full length, but moderates and restrains them: and as that moderation could not flow naturally from the persons themselves, it is produced either by some passion, as in Dido; or some dependence, as in Turnus and Mezentius. To this artifice he adds episodes, accommodated to the general *character*, by which he interrupts the particular actions, which require an opposite *character*.

Claudian's conduct in this respect, is unjustifiable; from the horrible *characters* of Pluto, and the Furies, with all the terrors of hell, he passes to the gaiety and pleasures of the Graces, gilded palaces, flowery fields, &c. He has as many different prevailing *characters* to his three books, as Homer and Virgil in their sixty.

CHARACTER is also used among *Divines*, especially those of the Romish church, for an indelible mark, or impression, which certain sacraments are supposed to leave behind them in those who receive them.

The sacraments that leave this *character* are incapable of being repeated. The *character* is generally supposed to be something physical.

The sacraments of baptism, confirmation, and ordination, in particular, leave such indelible *character*.

CHARACTERS *of fishes*, *characteres piscium*, are those marks by which each particular fish is distinguished from those other species of the same genus to which it belongs, and by which it is to be referred to its genus. These *characters* are the essential foundation of all the natural divisions in this part of history, and by means of these alone the young student is led on the real knowledge of the bodies under consideration, whether according to the works of other authors, or some new system of his own. The naturalists of former ages did not pay a sufficient regard to these marks, and consequently could not but ignore the natural divisions of bodies, but had recourse to the artificial distinctions taken from accidents or variable properties in them, and the general external appearance usually gave rules to them; hence the uncertainty and confusion of the divisions of the old authors, and wicked and irregularity of those of the moderns. *See* GENERICAL *name*.

CHARACTERS *of plants*. *See* GENUS, &c.

CHARACTERISTIC, in the general, is that which *characterises* a thing or person, i. e. constitutes its *character*, whereby it is distinguished from all others.

CHARACTERISTIC is peculiarly used in *Grammar*, for the principal letter of a word; which is preserved in most of its tenses and moods, its derivatives and compounds.

The *characteristic* frequently shews its etymology; and ought constantly to be retained in its orthography: such is the letter *r* in *curro*, *fert*, &c.

The *characteristics* are of great use in the Greek grammar, especially in the formation of the tenses; as being the same in the same tenses of all verbs of the same conjugation, excepting in the present tense, which has several *characteristics* and the future, the aorists primus, the præterperfect, and the pluſquam perfect tense of the fourth conjugation, which have two *characteristics*.

CHARACTERISTIC *of a* LOGARITHM, is its INDEX or exponent.

CHARACTERISTIC *triangle of a curve*. *See* CURVE.

CHARADRIUS, in *Ornithology*, a name by which Gesner and Aldrovandus have called the OEDICNEMUS, a bird very improperly called in English the *stone-curlew*. *Aldrov. lib. xii. cap. 15.*

CHARADRIUS, in the Linnæan system of *Ornithology*, is a distinct genus of birds, of the order of the GRALLÆ: the distinguishing *character* of which is, that the feet have each three toes; the point of the bill is cylindrical and obtuse; and the nostrils linear. There are twelve species. *See Tab. of Birds*, N° 55.

CHARAG, the tribute which Christians and Jews pay to the grand signior.

It consists of ten, twelve, or fifteen francs per cent. according to the estate of the party. Men begin to pay it at nine or at fifteen years old; women are dispensed with, as also priests, rabbins, and religious.

CHARAIMS, a sect of the Jews in Egypt. They live by themselves, and have a separate synagogue; and as the other Jews are remarkable for their eyes, to these are for their large noses, which run through all the families of this sect. These are the ancient Karaites. They strictly observe the five books of Moses, according to the letter, and receive no written traditions. It is said that the other Jews would join the *Charaims*, but their not having observed the exact rules of the law with regard to divorces, these think they live in adultery.

CHARANTIA, in *botany*, a name by which some authors have called the male balsam. *Gers. Emac. Ind.*

CHARAX, in *ichthyology*, a name given by Artedi, Appian, and many other of the Greek writers, to the fish called by the later writers the CHRYSOPHRYS.

It is properly a species of the SPARUS, distinguished by the name of the cyprinus with incurve rays in the back fin, and with the *linea lateralis* straight.

CHARBON, in the *Manege*, signifies that little black spot or mark that remains after a large spot, in the cavity of the corner teeth of a horse. About the fourth or eighth year, when the cavity fills, the tooth being smooth and equal, it is find to be rafted.

CHARCOAL, a sort of artificial coal, or fuel, consisting of wood half burnt; chiefly used where a clear strong fire, without smoke, is required; the humidity of the wood being here mostly dissipated and exhaled in the fire, wherein it was prepared.

The microscope discovers a surprising number of pores in *charcoal*: they are disposed in rows, and traverse it lengthwise; so that there is no piece of *charcoal*, how long soever, but may be easily blown through. If a piece be broken pretty short, it may be seen through with a microscope. In a range the eighteenth part of an inch long Dr. Hook reckoned one hundred and fifty pores; whence he concludes, that in a *charcoal* of an inch diameter, there are no less than five millions three hundred twenty-four thousand pores.

It is to this prodigious number of pores, that the blackness of *charcoal* is owing: for the rays of light, striking on the *charcoal*, are received and absorbed in its pores, instead of being reflected; whence the body must necessarily appear black, blackness in a body being no more than a want of reflection.

Dr. Priestley conjectures, that this is owing to the oil of the wood, made empyreumatic, and burnt to a certain degree; and that it is connected with the phlogiston, united to the earth of the plant, when the vessels are strengthened by an intense heat. The same ingenious philosopher has discovered that *charcoal* is an excellent conductor of electricity; and that the degree of its conducting power depends on the degree of heat with which it is prepared, and he ascribes this power to the phlogiston united with it in the process, estimating that the strength of the conducting power may depend more on the perfect union between the inflammable principle and its base, which results from the degree of heat only, than on the quantity of phlogiston thus united to the earth. He adds, that as *charcoal*, when separated from the external air, will bear a greater degree of heat, without being dissipated into vapour, than silver or gold, it may be possible to make this substance a better conductor of electricity than the most perfect metals. Wood in the process of being reduced to *charcoal* is diminished both in weight and bulk; nevertheless wood and *charcoal*, expanded by a certain degree of heat, but the latter in the greatest proportion; and a greater degree of heat makes them contract.

The noxiousness of air infected with the fumes of burning *charcoal* is well known; the cause of this has been sufficiently explained by Dr. Priestley, &c. who accounts for it by the diminution of the air, in consequence of being overcharged with phlogiston, and the deposition of fixed air. *See* AIR, *fixed*. Priestley's Electricity, vol. ii. p. 103. Exper. and Obs. on Air, vol. i. p. 139. and vol. ii. p. 241. or Phil. Trans. vol. lx. art. 19. p. 812.

Mathematical instrument-makers, engravers, &c. find *charcoal* of great use to polish their brass and copper-plates, after they have been rubbed clean with powdered pumice-stone. Mr. Boyle says, that the most suitable burn it a second time, and quench it in a convenient fluid. Plates of horn are polishable the same way, and a gloss may be afterwards given with tripoly.

Charcoal and sand-stones are the two most durable and useful blocks of the painter, and the varnish maker. Those of the former kind are used both as pigments and pencils; and *charcoal* crayons prepared from the willow are preferred on account of their softness. *See* concerning them Lewis's Commercium Phil. Techn. p. 276.

Charcoal tinges glass in fusion yellow, reddish, &c. and by baking stains it yellow. *See* ibid. p. 278. See also the observations on the differences of different *charcoals*, &c. and of the manner of distinguishing between the vegetable and animal, ibid. p. 330, & 101.

Charcoal

Charcoal was anciently uſed to diſtinguiſh the bounds of eſtates and inheritances; as being ſuppoſed incorruptible, when let very deep within the ground. In effect, it preſerves itſelf ſo long, that there are many pieces found entire in the ancient tombs of the northern nations.

M. Duhamel ſays, there is ſometimes found *charcoal* made of corn, probably as old as the days of Ceſar; he adds, that it has kept ſo well, that the wheat may be ſtill diſtinguiſhed from the rye; which he looks on as a proof of its incorruptibility.

CHARCOAL, *method of making*.—The firſt is that made of oak, cut into lengths of about three feet. The ground whereon the operation is to be performed, is barked of all the turf, and other combuſtible matters; and is in form *circular*, a ſtake being driven in the centre. This area is filled up with wood, eight feet high, placed alternatively lengthwiſe, and perpendicularly; then coped a-top in the form of a ſugar-loaf, and all inequalities filled up with ſmall wood, till it be very ſteep; the whole is then to be covered over moderately thick with turf, and other rubbiſh.

A moveable funnel being then ſet up againſt the wind, the ſtake is pulled up, and fire let to the pile, by pouring into the cavity ſome *charcoal*, and other coal fully kindled; the vent, or funnel a-top, is then covered with turf, and vent-holes are made through the ſtuff that covers the pile, ten or three feet apart quite round, a foot from the top. The next day a new range of holes is made, a foot and a half below the firſt, and thus on to the bottom; obſerving, that as the pile cools, and ſinks to the centre, it muſt be continually fed with ſhort wood, that no part remain unfired; and that if any part chars faſter than other, the vent holes there are to be ſtopped up. A parcel is thus burnt in five or ſix days: as it cools, the ſmoke grows thinner and thinner. The heap requires two or three days to cool; which is promoted by ſtopping the vents, and ſtripping off the covering by degrees, about a yard at a time; at firſt only taking off the conſiſt part, and leaving the reſt, that the pile may neither cool too faſt, nor undergo the reduction of the whole into aſhes. Laſtly, the coals are taken out from round the bottom, by which means the whole maſs, coals and rubbiſh, ſinks down, and extinguiſhes the fire at once.

Charcoal, for powder-mills, is uſually made of elder-wood; the proceſs is the ſame; but is finiſhed in two days.

CHARDS, in *Gardening*.—The *chards* of artichokes are the leaves of good artichoke-plants, tied and wrapped up all over but the top, in ſtraw, during the autumn and winter; this makes them grow whiter, and loſe ſome of their bitterneſs.

CHARDY *of beets* are white beets, covered with dry dung during the winter ſeaſon, when they produce large tops with a ſlowny cotton ſhoot; which is the true *chard*, to be uſed in pottages, intermeſſes, &c.

CHARGE, in *Electricity*, in a thick ſenſe, denotes the accumulation of the electric matter on one ſurface of an electric, as a pane of glaſs, Leyden phial, &c. whilſt an equal quantity paſſes off from the oppoſite ſurface: or, more generally, electrics are ſaid to be *charged*, when the equilibrium of the electric matter on the oppoſite ſurfaces is deſtroyed, by communicating one kind of electricity to one ſide, and the contrary kind to the oppoſite ſide: ſince the equilibrium be reſtored till a communication be made by means of conducting ſubſtances between the two oppoſite ſurfaces. And when this is done, the electric is ſaid to be diſcharged. The *charge* properly refers to one ſide, in conſiderdiſtinction from the other; ſince the whole quantity in the electric is the ſame before and after the operation of *charging*; and the operation cannot ſucceed, unleſs what is gained on one ſide be loſt by the other, by means of conducters applied to it, and communicating either with the earth, or with a ſufficient number of non electrics. In order to facilitate the communication of the electricity to an electric plate, &c. the oppoſite ſurfaces are coated with ſome conducting ſubſtance, uſually with tin foil, within ſome diſtance from the edges; in conſequence of which the electricity communicated to one part of the coating is readily diffuſed through all parts of the ſurface of the electric in contact with it: and a *diſcharge* is eaſily made by forming a communication with any conductor from one coating to the other. If the oppoſite coatings approach too near each other, the electric matter forces a paſſage from one ſurface to the other before the *charge* is complete. And ſome kinds of glaſs have the property of conducting the electricity over the ſurface, ſo that they are altogether unfit for the operation of *charging* and *diſcharging*. If indeed the *charge* is too high, and the glaſs plate or phial too thin, the attraction between the two oppoſite electricities forces a paſſage through the glaſs and makes a ſpontaneous *diſcharge*, and the glaſs becomes unfit for farther uſe. See CONDUCTOR, ELECTRICS, LEYDEN *Phial*, &c.

CHARGE, in *Gunnery*, the load of a piece; or the quantity of powder and ball, or ſhot, wherewith it is to be prepared for execution.

The rules for *charging* large pieces in war, are, that the piece be firſt cleaned or ſcowered, within ſide; that the proper quantity of gunpowder be then driven in, and rammed down; care, however, being taken, that the powder be not bruiſed in ramming, for that weakens its effect; that a little quantity of paper, hay, or the like, be rammed over it, and that then the ball of ſhot be introduced.

If the ball be red-hot, a tampion, or trencher of green wood, is to be driven in before it.

The weight of gun-powder neceſſary for a *charge*, is commonly in a ſubduple proportion to that of the ball. See CANNON.

In the Britiſh navy, the allowance for thirty-two-pounders is but ſeven-twentieths of the weight of the baller. But a late author is of opinion, that if the powder in all ſhip-cannon whatever was reduced to one-third weight of the ball, or even leſs, it would be a conſiderable advantage, not only by ſaving ammunition, but by keeping the guns cooler and quieter, and at the ſame time more effectually injuring the veſſels of the enemy. With the ſparing allowance of powder, the guns are bored, and their tackle and furniture ſtrained, and the only to render the bullet leſs efficacious. For a bullet which is but juſt paſs through a piece of timber, and loſes almoſt all its motion thereby, has much leſs force of penetrating and fracturing it, than it is puſhed through with a much greater velocity. See Robins's Tracts, vol. i. p. 290, 291.

Profeſſor Euler obſerves, in his inveſtigation of this ſubject, that in every caſe there is a certain *charge* which will communicate the greateſt velocity to the ball; ſo that by increaſing or diminiſhing it, the motion of the ball will be diminiſhed: and he concludes, by a fluxionary calculus, that an iron ball will go moſt even-ſwiftly a pounder with the greateſt velocity when the piece is charged ſo that the powder expands to ſeven times its baſis. Since this is about $\frac{1}{3}$ of the weight of the ball and the common *charge* half its weight, one-ſixth, or greateſt *charge*, will be thrice the common charge. He has alſo computed the following table, repreſenting the *charges* for the greateſt velocity:

Length of a ſingle inch in inches.	Length of the *charge* in inches.	Weight of the powder for the greateſt *charge* in pounds.
2	0.82	16
4	1.56	31
6	2.28	45
8	2.98	60
10	3.35	67
12	3.68	73
14	4.30	86
16	4.77	95
18	5.20	104
20	5.59	112
22	5.96	119
24	6.32	126
26	6.66	133
28	6.99	140
30	7.31	146
32	7.61	152
34	7.90	158
36	8.18	163
38	8.44	169
40	8.80	174
42	8.93	179
44	9.18	184
46	9.43	188
48	9.66	193
50	9.89	198
52	10.11	202
54	10.32	206
56	10.53	210
58	10.73	214
60	10.90	218

From the calculations by which this table is formed, Euler concludes, that the *charges* aſſigned by Mr. Robins for the greateſt velocity are much too great. See Euler's Principles of Gunnery inveſtigated and explained, 8vo. 1777. p. 129, 206.

Mr. Robins obſerves, that the *charge* is not to be determined by the greateſt velocity that may be produced; but that it ſhould be ſuch a quantity of powder as will produce the leaſt velocity neceſſary for the purpoſe in view; and if the velocities be equal, he obſerves, he ſhould ever be loaded with more than a quarter of the utmoſt $\frac{1}{3}$ of the weight of his bullet in powder; howſhould

the *charge* of any battering piece exceed ¼ of the weight of its bullet. Tracta, &c. vol. i. p. 266, &c.

CHARGE, in *Heraldry*, is applied to any figure or thing, borne or represented in an escutcheon, or coat of arms; whether it be animal, vegetable, or other matter.

Too many *charges* are not deemed so honourable as fewer. *Charges* peculiar to the art and usage of armory, as the cross, chief, pale, fesse, &c. are called *proper charges*; and frequently ordinaries.

Bloom restrains the term *charges* to these additions, or rewards of honours, frequently placed on escutcheons as cantons, quarters, gimels, flaspers, &c.

CHARGE, in *Law*, denotes the instructions given to the grand jury, with respect to the articles of their inquiry, by the judge who presides at the assizes.

CHARGE, in *Law*, also signifies a thing done that bindeth him who doth it; or that which is his to the performance of it; and DISCHARGE is the removal of that *charge*. Land may be *charged* to various ways; as, by grant of rent out of it, by statutes, judgments, conditions, warranties, &c.

CHARGE, in the *Manege*, a sort of unguent made of oil, honey, grease, turpentine, and sometimes of lees of wine, and other matters, applied externally to a horse, &c. for the cure of strains, bruises, and swellings.

CHARGE, or rather OVERCHARGE, in *Painting*, is an exaggerated representation of any person; wherein the likeness is preserved, but at the same time ridiculed.

Few painters have the genius necessary to succeed in these *charges*: the method is, to select and heighten something already amiss in the face, whether by way of defect, or redundancy: thus, v. g. if nature have given a man a nose a little larger than ordinary, the painter falls in with her, and makes the nose extravagantly long; or if the nose be naturally too short, in the painting it will be a mere stump; and thus of the other parts.

CHARGE *of lead*, is thirty-six pigs. See LEAD, PIG, &c.

CHARGE, in *Sea Language*, is sometimes used for burden: thus a *ship of charge* is such as draws much water, or forms deep in the sea; though sometimes an unwieldy ship, that will not wear nor steer, is called a ship of *charge*.

CHARGED, in *Heraldry*, A shield, carrying on it some figure or impress, is said to be *charged* therewith.

So, also, when one bearing, or *charge*, has another figure added upon it, it is properly said to be *charged*.

CHARGER *of a gun*, is that part of the chase of a gun where the powder and ball are contained.

CHARIENTISMUS, in *Rhetoric*, a figure wherein a taunting expression is softened by a jest.

CHAR. See CHARR.

CHARIOT. See COACH.

The curious may see various representations of *chariots*, and accounts of improvements on *chariots*, and of different constructions, Mag. tom. ii. p. 39. tom. iii. p. 33. p. 41. p. 197. and p. 31. And in the Mem. of the A. D. S. an. 1701. Hist. 161. and an. 1719. Hist 81.

The ancients made use of *chariots* in war. These were of different kinds; but the most terrible were those armed with pikes and scythes, thus; the beam to which the horses were fastened was armed with pikes, having iron points to them which projected forward; the yokes of the horses had likewise two long points of three cubits; to the axle-tree also were fixed iron spits, armed at their extremities with scythes; between the spokes of the wheels were placed javelins, and the very felloes of the wheels were furnished with scythes, which tore every thing they met with to pieces.

The axle-tree was longer than usual, and the wheels stronger, that they might be able to resist the shock of the motion, and the *chariot* be less subject to overturn. The driver's seat was a kind of little tower, made of very solid wood, and raised breast-high. The charioteer was armed all over, and covered with iron. Sometimes several men, well armed, were put in those *chariots*, who fought with darts and arrows. Diodor. Sicul. lib. xvii. Q. Curt. lib. iv. Xenoph. Cyropæd. lib. vi. See a Dissertation on the Ancient *Chariot* by Mr. Fownall, in Bezenger's Art of Horsemanship, vol. i. p. 271, &c.

CHARIOTS, in *Mythology*, were sometimes consecrated to the sun: and the Scripture observes, that Josiah burnt those which had been offered to the sun by the kings his predecessors. This superstitious custom was an imitation of the heathens, and principally of the Persians, who had horses and *chariots* consecrated in honour of the sun. Herodotus, Xenophon, and Quintus Curtius, speak of white *chariots*, crowned, which were consecrated to the sun, among the Persians; and in their ceremonies were drawn with white horses, consecrated to the same luminary.

CHARISIA, in *Pagan Theology*, a wake or night festival instituted in honour of the Graces. It continued the whole night, most of which time was spent in dancing; after which, cakes made of yellow flour, mixed with honey, and other sweet-meats, were distributed among the assistants. The word is also used to signify the sweet-meats distributed on such occasions.

CHARISIUS, in *Pagan Theology*, a surname given to Jupiter.

The word is derived from χαρις, *favour*; he being the god by whose influence men obtain the favour and affection of one another. On which account the Greeks used at their meals, to make a libation of a cup to JUPITER *Charisius*.

CHARISTIA, a family-feast celebrated among the Romans, on the eleventh of the calends of March; i. e. on the nineteenth of February, in honour of the goddess *Concord*.

The word comes from χαρις, *grace, favour*; q. d. day of reconciliation, or of restoring into favour. It was also called *dies charorum cognitionis*. Vigenere, on Livy, calls it *the day of good cheer*.

The *charistia* were instituted to re-establish peace and amity, in families embroiled, or at variance among themselves. It consisted in a great entertainment made in each family, to which no strangers were admitted, but only relations and kindred. The joy and freedom inspired by the repast, were looked upon as a proper means to re-unite divided minds; to which the good offices of so many friends would greatly contribute.

CHARISTICARY, *Commendatary*, or *Donatary*, a person to whom is given the enjoyment of the revenues of a monastery, hospital, or benefice.

The *charisticaries*, among the Greeks, were a kind of donataries, or commendatories, who enjoyed all the revenues of hospitals and monasteries, without giving an account thereof to any person.—The original of this abuse is referred to the iconoclasts, particularly Constantine Copronymus, the avowed enemy of the monks, whose monasteries he gave away to strangers.

In after-times, the emperors and patriarchs gave many to people of quality, not by way of gift to reap any temporal advantage from them; but to repair, beautify, and patronize them. At length avarice crept in, and those in good condition were given, especially such as were rich; and at last they were all given away, rich and poor, those of men and of women; and that to laymen, and married men.

M. Courtier, in his Ecclesiæ Græcæ Monumenta, gives us the forms of these donations: they were granted for life, and sometimes for two lives. See ABBOT.

CHARITABLE *Uses*, in *Law*. See COMMISSION and MORTMAIN.

CHARITATIVE, in the *Canon Law*. *A charitative aid*, or *subsidy*, is a moderate allowance, which a council grants a bishop upon any urgent occasion; e. g. when his revenues will not bear his expences to a council, &c.

CHARITY, one of the three grand theological virtues; consisting in the love of God and our neighbour.

Charity is the habit or disposition of loving God with all our heart, and our neighbour as ourselves. It has two material objects, therefore, as the schools expresse it; viz. God and our neighbour.

CHARITY is also used for the effect of a moral virtue, which consists in supplying the necessities of others, whether with money, counsel, assistance, or the like.

CHARITY, *brief*. See BRIEF.

CHARITY, *feasts of*. See AGAPÆ.

CHARITY-*schools*, are schools erected and maintained in various parishes, by the voluntary contributions of the inhabitants for teaching poor children to read, write, and other necessary parts of education.

In most *charity-schools* the children are likewise clothed, and put out to trades, services, &c. on the same charitable foundation.

Charity-schools have spread throughout most of the considerable towns of England and Wales.

In London we had likewise a CHARITABLE *Corporation* for the relief of the industrious poor, erected under queen Anne; for enabling indigent manufacturers and traders to take up money at common and legal interest; there being a sum of 30,000*l.* raised for that end.

CHARITY, *order of*. There are several religious orders which bear this title: one instituted by St. John de Dieu, for the assistance of the sick; this institute was approved of in 1520, by Leo X. and confirmed by Paul V. in 1617. The religious of this order apply themselves wholly to the service of the diseased.

CHARITY *of the Holy Virgin*, an religious order established in the diocese of Chalons, by Guy lord Joinville, &c. towards the close of the thirteenth century, approved under the rule of St. Augustine, by the popes Boniface VIII. and Clement VI.

In each parish of Paris, there is a society of women, who

who apply themselves to find out and relieve the wants of the poor of the parish; and on this account called, *Domus & in Christi*, and *Servi & in Christi*.

CHARKING, or CHARRING, the burning of wood to make CHARCOAL.

CHARKS, pit-coal charked, or charred. See COAL.

CHARLATAN, or CHARLETAN, an EMPIRIC, or quack, who retails his medicines on a public stage, and draws the people about him with his buffooneries, feats of activity, &c.

The word, according to Calepine, comes from the Italian *ceretano*, of *Cereton*, a town near Spoletto in Italy, where these impostors are said to have first risen. Menage derives it from *ciurlatore*, and that from *circulatorius*, of *circulator*, a quack.

CHARLES'S WAIN, in *Astronomy*, seven stars in the constellation Ursa Majoi.

CHARLOCK, in *Husbandry*; (for the botanical characters, see MUSTARD;) a very troublesome weed among corn, being more frequent than almost any other. There are two principal kinds of it; the one with a yellow flower, the other with a white. Some fields are particularly subject to be over-run with it, especially those which have been manured with cow-dung alone, that being a manure very favourable to the growth of it. The farmers in some places are so sensible of this, that they always mix horse-dung with their cow-dung, when they use it for arable land.

When barley, as is often the case, is infested with this weed to such a degree as to endanger the crop, it is a very good method to mow down the *charlock* in May, when it is in flower, cutting so low as just to take off the tops of the leaves of the barley with it: by this means the barley will get up above the weed: and people have got four quarters of grain from an acre of such land, as would have yielded them scarce any thing without this expedient. Where any land is particularly subject to this weed, the best method is to sow it with grass-seed, and make a pasture of it; for then this plant will not be troublesome, as it does not grow where there is a coat of grass upon the ground.

CHARM, a magic power, or spell, by which, with the assistance of the devil, sorcerers and witches are supposed to do wondrous things, far surpassing the powers of nature. See MAGIC.

The word comes from the latin, *carmen*, *verse*.

Physicians, figurators, &c. are all kinds of *charms*.

CHARNEL, a portico, or gallery, anciently near the church-yard, where were disposed the bones of the dead, when the flesh was consumed.

The *charnels*, or *charnel-houses*, are now usually contiguous to the church.

CHARNUB, in the *Materia Medica*, a name given by some of the ancient writers to the *siliqua dulcis*, or carob-tree. The Arabian physicians mention two kinds of this; the Syrian, and Nabuthean: the first they call *affarmon*, and the other *alnatrun*. Avicenna tells us, that the first of these was a purge, and was given with success in pains of the bowels; and that other an astringent, given in profusion of the menses.

CHARONIUS, *Charonian*, is used as an epithet for caves, some of which are found in Italy, and in other parts of the world, where the air is so loaded with a poisonous vapour, that animals cannot live in them, even a few moments.

CHARON, in *Mythology*. See STYX.

CHARR, in *Ichthyology*, a name given to a fish of the trutaceous kind, of which there are two species, distinguished by the *red charre*, and the *gilt charre*; the former of which is called by some of the ichthyographists, SALMA *minor*, and by Linnæus *salmo alpinus*; and the latter, the CARPIO *lacus Benaci*.

CHARR, *red*, is a large fish, longer and slenderer in its general shape than the trout, caught in the lakes of Wales, Westmoreland, and of the mountainous parts of Europe: and is esteemed a very fine fish; but its flesh does not boil so red as that of the trout.

The *red charr* is called by the Welch *torgoch*; a compound of *tor*, *the lower part of the belly*, and *goch*, *red*: *Arctic*, *redbelly*. In one respect, the *charr* seems nearly allied to the eel and tench, being very slimy; and the curing and potting them well, depend on dressing them properly of this mucilaginous quality. See an account of the Welch *charrs*, in Phil. Trans. vol. xlix. part 1. N° 32. p. 214.

The Westmoreland *charrs*, called *red charrs*, spawn about Michaelmas; and at this time will take a bait, and at no other. They are supposed to be in the highest perfection about May, and in the summer, though rarely caught after April. The *charrs* of Wales are rather smaller, and of a paler colour than those of Westmoreland.

CHARR, *gilt*, or *barren*, is one which had not spawned the preceding season, and on that account reckoned to be in greatest perfection.

CHARR, *gilt*, is something like the trout in figure: but it is broader, and its belly is prominent, especially when the fish is large: the usual size is about a foot in length, which it rarely exceeds. This is very common in some of the lakes of Italy, but is not peculiar to that kingdom, as has by some been imagined, being frequent in some foreign, and in some of the northern lakes; and there is no doubt, but that the fish there caught, and called the *gilt charr*, and the CARPIO *lacus Benaci*, are entirely the same fish. It is a very finely flavoured fish, and much valued at the tables of the great.

This species spawns from the beginning of January to the end of March: and they are taken in greatest plenty from the end of September to the end of November.

CHART, or *Sea-CHART*, a hydrographical map, or a projection of some part of the sea, *in plano*: for the use of navigation.

The invention of *sea-charts*, Fournier refers to Henry, son of John king of Portugal. They differ very considerably from geographical, or land maps, which are of no use in navigation. Nor are *sea-charts* all of the same kind; some being what we call *plain charts*, others *reduced*, or *Mercator's charts*, and others *globular charts*.

CHARTS, *plain*, are those wherein the meridians and parallels are exhibited by right lines, parallel to each other.

These Ptolemy, in his Geography, rejects for the following faults, though their inventor judged them of good use: and experience has confirmed his judgment, especially in those voyages. Their defects are, 1. That these in reality all the meridians meet in the poles, it is absurd to represent them, especially in large *charts*, by parallel right lines. 2. That *plain charts* exhibit the degrees of the several parallels, equal to those of the equator; and of consequence the distances of places lying east and west, much larger than they should be. And, 3. In a *plain chart*, while the same rhumb is kept, the vessel appears to fail in a great circle which is yet falle.

But notwithstanding these defects in the *plain chart*, yet the easiness of its application has so reconciled it to the mariners, that it is used almost alone; to exclusion of the more accurate ones.

Construction of a plain CHART.—1. Draw a right line, as AB (*Sea Navigation*, *fig.* 9.), and divide it into as many equal parts, as there are degrees of latitude in the portion of the sea to be represented. 2. Add another right angles BC, divided into as many parts, and those equal to one another, and to the former, as there are degrees of longitude in the portion of the sea to be represented. 3. Complete the parallelogram ABCD, and resolve the area into little squares; then right lines, parallel to AB and CD, will be meridians; and those parallel to AD and BC parallels. 4. The coasts, islands, bays, sands, rocks, &c. infert from a table of longitudes and latitudes, in the same manner as is laid down under MAP.

Hence, 1. The latitude and longitude of a ship being given, her place is easily exhibited in the *chart*. 2. The places F and G, to and from which the ship sails, being given in a map, the right line FG, drawn from the one to the other, makes, with the meridian AB, an angle AFG, equal to the inclination of the rhumb: and since the parts F 1, 12, 2 G, intercepted between equidistant parallels, are equal; and the inclination of the right line FG, to all the meridians or right lines parallel to AB, is the same; the right line FG truly represents the rhumb. After the same manner it may be shewn, that this *chart* exhibits *latus meridionum*, or miles of longitude, truly. It follows, that *plain charts* may be used to very good purpose in directing a ship; provided care be taken these escape no error in the distances of the places F and G.

Confutation of a fcale to correct the errors of diſtance in a plain CHART.—1. Upon the right line AB (*fig.* 10.), from the map transfer five degrees, and divide them into 300 equal parts, or geographical miles. 2. On this describe a ſmall circle ACD, to be divided into 60 equal parts; if then it be deſired to know how many miles make five degrees in the parallel BH; in the compaſſes take the interval BH, and tranſfer it on to the diameter AB; the number of miles required will here be ſhewn. It follows, that if a ſhip ſail on an eaſterly or weſterly rhumb, out of the equator; the miles anſwering to the degrees of longitude will be found as in the preceding article. If it ſail on any collateral rhumb, ſtill the ſailing is ſuppoſed to be an eaſtern or weſtern rhumb, in an intermediate parallel, between the parallel of the place whence the ſhip proceeds, and parallel of the place at which ſhe arrives.

It is true, this reduction, by an arithmetically mean parallel, is not accurate; yet it is frequently uſed in practice, as being accommodated to the apprehenſions of the generality of mariners. In effect, it does not err conſiderably, if the whole courſe be divided into

parts

parts, whereof each does not exceed one degree; whence it appears advisable, not to take the diameter of the semicircle AB above one degree, and to divide it at most into geographical miles.

For the application of the plain CHART *in sailing*, see *Plain* SAILING.

CHART, *reduced*, or CHART of *Reduction*, is that wherein the meridians are represented by right lines converging towards the poles; and the parallels by right lines parallel to one another, but unequal. These, therefore, it appears by their construction, muſt correct the errors of the *plain charts*.

But since the parallels ſhould cut the meridians at right angles; theſe charts are defective, inaſmuch as they exhibit the parallels inclined to the meridians.

Hence, another kind of *reduced charts* has been invented, wherein the meridians are parallel, but the degrees thereof unequal; theſe are called *Mercator's charts*.

CHART, *Mercator's*, is that wherein the meridians and parallels are represented by parallel right lines; but the degrees of the meridians are unequal; ſtill increaſing, as they approach the pole, in the ſame proportion as thoſe of the parallels decreaſe: by means whereof the ſame proportion is preſerved between them, as on the globe.

This *chart* has its name from that of the author who firſt propoſed it for uſe, about the year 1556, and made the firſt *chart* of this projection, in 1569, Gerardus Mercator: but neither was the thought originally his own, as having been hinted (according to Wright) by Cortes, about the year 1545; and even by Ptolemy near two thouſand years ago; nor is the perfection of it owing to him, our countryman Mr. Wright being the firſt who demonſtrated it, about the year 1590, and ſhewed a ready way of conſtructing it, by enlarging the meridian line by the continual addition of ſecants. See his Correction of Errors in Navigation, publiſhed in 1599. The claims, aſcribed by Wright to Cortes and Ptolemy, are examined and refuted in the elaborate Diſſertation on the Riſe, &c. of Navigation, prefixed to Robertſon's Elements of Navigation, p. 20, &c.

For a further account of Mr. Wright's method, and the conſtruction of a table of meridional parts, ſee MERIDIONAL *parts*.

Conſtruction of Mercator's CHART.—1. Draw a right line, and divide it into equal parts, repreſenting degrees of longitude either in the equator, or in the parallel wherein the *chart* is to terminate. From the ſeveral points of diviſion erect perpendiculars to repreſent meridians; ſo as right lines may cut them all under the ſame angle, and therefore repreſent rhumbs; thus far as in the *plain chart*. That the degrees of the meridians may have their juſt proportion to thoſe of the parallels, the former are to be increaſed; in regard the latter continue the ſame, becauſe of the parallelism of the meridians.

With the interval therefore of one degree in the equator CD (*Tab. Navig. fig.* 11), deſcribe the quadrant CDE. and in D erect a perpendicular DG; make the arch DL equal to the parallel of latitude, and through L draw CG: this CG will be the enlarged degree of the meridian, to be tranſferred to the meridian of the *chart*: the reſt as in *plain charts*.

In practice: ſuppoſe it is required to draw a *Mercator's chart* from the fortieth degree of north latitude, to the ſixtieth, and from the ſixth degree of longitude to the eighteenth. Firſt draw a right line repreſenting the fortieth parallel of the equator; which diride into twelve parts, for the twelve degrees of longitude the *chart* is to contain. Then take a line of equal parts, on a ſcale whereof a hundred parts are equal to each of theſe degrees of longitude; and at each extreme of the line raiſe two perpendiculars, to repreſent two parallel meridians to be divided by the continual addition of ſecants, which are proved to increaſe in the ſame proportion, as the degrees of longitude ſhould decreaſe.

Thus, for the diſtance from forty degrees of latitude, take 1313 equal parts, from the ſcale which is the ſecant of forty degrees thirty minutes. For the diſtance from forty-one degrees to forty-two degrees, take 1338 equal parts, from the ſcale, which is the ſecant of forty-one degrees thirty minutes; and ſo on to the laſt degree of your *chart*, which will be 154 equal parts, viz. the ſecant of forty-nine degrees thirty minutes, and will give the diſtance from forty-nine degrees of latitude to ſixty degrees. By this means the degrees of latitude will be augmented, in the ſame proportion as the degrees of longitude on the globe decreaſe.

The meridians being divided, add the card, or compaſs; chooſing ſome convenient place near the middle thereof: from this draw a line parallel to the divided meridians, which will be the north rhumb; and from this the other thirty-one points of the compaſs are to be ſet off.

Laſtly, Lay down the towns, ports, iſlands, coaſts, &c. from a table of longitudes and latitudes; and the *chart* is complete. In *Mercator's chart*, the ſcale changes as the latitude is changed: if then, v. g. a ſhip ſails between the fortieth and fiftieth parallels of latitude, the degrees of the meridians between thoſe two parallels are to be the ſcale for meaſuring the ſhip's way: whence it follows, that though the degrees of longitude be equal in extent on the *chart*, yet they muſt contain unequal numbers of miles, or leagues; and that they will decreaſe as they approach nearer the pole, becauſe meaſured by a magnitude continually increaſing. This *chart* is demonſtratively true, though to appearance falſe: it is found by experience very accurate, and withal very eaſy of application. In effect, it has all the qualifications required to render it of ſervice in navigation; yet do the generality of mariners decline the uſe of it, and rather chooſe to keep the old erroneous *plain chart*.

For the uſe of Mercator's CHART *in ſailing*, ſee *Mercator's* SAILING.

CHART, *gheſtlin*, is a projection ſo called, from the conformity it bears to the globe itſelf: this has been, ſince the others, propoſed to the world by Meſſrs. Senex, Willſon, and Harris; wherein the meridians are inclined: the parallels equidiſtant, and curvilinear; and the rhumbs real ſpirals, as on the ſurface of the globe.

We might be allowed to expect ſomething from this, as it came out under the protection of his majeſty's patent, and with the recommendation of ſeveral able navigators, and among others, that of Dr. Halley; and as it has now ſtood the teſt of a pretty ſevere inquiſition. We ſhall only add, that the projection is perfectly agreeable to nature, and therefore eaſily conceivable; and that it has been found to anſwer very exactly, even in very large diſtances; where its failure, if it hath any, muſt needs be moſt conſpicuous.

CHARTS *compoſed by rhumbs and diſtances*, are thoſe wherein there are no meridians or parallels: but all is effected by the rhumbs, and the ſcale of miles.

Theſe are chiefly uſed by the French, and eſpecially in the Mediterranean.

They are patched up, without any great art, from the obſervations of the mariners: any regular account, therefore, how to make them, would be needleſs. They are only uſed in ſhort voyages.

See a Diſſertation on *Charts*, by Dr. Murdoch, in the Phil. Tranſ. vol. I. art. 73. with remarks upon it by Mr. Mountaine, art. 74.

CHARTA primarily ſignifies a ſort of PAPER made of the plant *papyrus*, or *biblus*.

CHARTA *emporetica*, in *Pharmacy*, *&c.* a kind of PAPER made very ſoft and porous, and uſed for ſtraining.

CHARTA is alſo uſed in *Ancient Cuſtoms* for a CHARTER, or deed in writing.

CHARTA *de Foreſta*. See CHARTER *of the foreſt*.

CHARTA *Magna*, the Great *Charter*, is an ancient inſtrument, containing ſeveral privileges, and liberties, granted to the church and ſtate, by Edward the Confeſſor, together with others relating to the feudal laws of William the Conqueror, granted by Henry I. all confirmed by the ſucceeding princes about thirty times. See MAGNA *Charta*.

CHARTA *pardonationis ſe defendendo*, is the form of a pardon for a perſon's killing another man in his own defence.

CHARTA *pardonationis utlagariæ*, is the form of a pardon of a man who is outlawed.

CHARTA *ſimplex*, is a ſingle DEED, or deed-poll.

CHARTARIUS, the ſame with CHARTOPHYLAX.

CHARTEL. See CARTEL, CHAMPION, COMBAT, DUEL, *&c.*

CHARTER, *Charta*, an inſtrument, or written evidence of a thing under the ſeal of a prince, lord, church, chapter, or community.

The word *charter* comes from the Latin *charta*, anciently uſed for a public or authentic act; from *papyrus*, *liber papyr*, or *pellebard*, whereon public acts were uſed to be written.

Bracton ſays, donations are ſometimes made in *charters*, in *perpetuum rei memoriam*. He adds, that of *charters*, ſome are *equal*, others of *private perſons*.

Of *equal*, ſome are private, ſome common, ſome univerſal.

Of *private charters*, ſome are *de puro feoffamento*, others *de conditionali feoffamento*, others of recognition, pure or conditional, others of confirmation, &c.

CHARTERS *of community*, were certain privileges firſt obtained by violence, or purchaſe, and afterwards freely beſtowed by emperors, kings, and barons; whereby the inhabitants of towns and cities were enfranchiſed, all marks of ſervitude aboliſhed, and theſe cities, &c. were formed into corporations and bodies politic, to be governed by a council and magiſtrates of their own nomination. The firſt perſon who conferred theſe privileges, was Lewis the Groſs, in France, about the beginning of the twelfth century; and his example was ſoon very generally followed. See CITY.

CHARTER *of the Forest*, is that wherein the laws of the forest are comprised and established.

CHARTER, *Great*, *Magna charta*. See MAGNA *charta*.

CHARTERS *of the king*, are those whereby a king makes a grant to a person, or community; v. gr. *a charter of exemption*, that a person should not be impanelled on a jury, &c. See LETTERS *patent*.

CHARTER *of pardon*, is that whereby a person is forgiven a felony, or other offence against the king's crown and dignity. See PARDON.

CHARTER *governments in America*, are in the nature of civil corporations, with the power of making bye-laws for their own interior regulation, not contrary to the laws of England; and with such rites and authorities as are specially given them in their several *charters* of incorporation. The form of government is borrowed from that of England. They have a governor, named by the king (or in some proprietary colonies by the proprietor), who is his representative or deputy. They have courts of justice of their own, from whose decision an appeal (as some say in the nature of a reference by way of arbitration) lies to the king in council here in England. Their general assemblies, which are their house of commons, together with their council of state, being their upper house, with the concurrence of the king, or his representative the governor, make laws suited to their own emergencies. But it is particularly declared, by stat. 7 and 8 W. III. c. 22. that all laws, bye-laws, usages, and customs, which shall be in practice in any of the plantations, repugnant to any law, made or to be made in this kingdom, relative to the said plantations, shall be utterly void and of none effect. These are called *charter governments*, by way of distinction from the *provincial establishments*, the constitutions of which depend on the respective commissions issued by the crown to the governors, and the instructions attending them; under the authority of which, provincial assemblies are constituted, with the power of making local ordinances, not repugnant to the laws of England; and also from *proprietary governments*, granted out by the crown to individuals, in the nature of feudatory principalities, with all the inferior regalities, and subordinate powers of legislation, which formerly belonged to the owners of counties palatine. See further Blackstone's Comm. vol. i. p. 108.

CHARTER-HOUSE. See CHARTREUX.

CHARTER-LAND, in *Law*, is such as a man holds by *charter*, that is, by evidence in writing; otherwise called FREEHOLD.

This the Saxons called BOCK-LAND; which Lambard renders, *terra ex scripto*.

It was held on more easy conditions than the folk-land, or *terra non scripta*, held without writing: the former being *hereditaria libera & immunis*; whereas the latter *censum tenuissimum annuum, atque officiorum quodam servitutæ erat obligatus*.

CHARTERER is in some places, as Cheshire, used for a FREEHOLDER.

CHARTERPARTY, in *Commerce*, denotes the instrument of freightage, or articles of agreement for the hire of a vessel.

The *charterparty* is to be in writing; and is to be signed both by the proprietor, or the master of the ship, and the merchant who freights it.

The *charterparty* is to contain the name and the burden of the vessel; those of the master and the freighter; the price, or rate of freight; the time of loading, and unloading; and the other conditions agreed on.

It is properly a deed, or policy, whereby the master, or proprietor of the vessel, engages to furnish immediately a tight found vessel, well equipped, caulked and stopped, provided with anchors, sails, cordage, and all other furniture to make the voyage required, as equipage, hands, victuals, and other munitions; in consideration of a certain sum to be paid by the merchant for the freight. Lastly, the ship with all its furniture, and the cargo, are respectively subjected to the conditions of the *charterparty*.

The *charterparty* differs from a *bill of lading*, in that the first is for the entire freight, or lading, and that both for going and returning; whereas the latter is only for a part of the freight, and at most only for the voyage one way.

The common law construes *charterparties*, as near as may be, according to the intention of them, and not according to the literal sense of trackers, or those that merchantize by sea; but they must be regularly pleaded.

The president Boyer says, the word comes from hence, that *per medium charta incidebatur, & sic fiebat charta partita*; because in the time when notaries were less common, there was only one instrument made for both parties: this they cut in two, and gave each his portion, and joined them together at their return, to know if each had done his part. This he observes to have been practised in his time; agreeable to the method of the Romans, who, in their stipulations, used to break a straw, each party retaining a moiety thereof as a mark.

CHARTIS *reddendis*, a writ which lies against him that has charters of feoffment intrusted to his keeping, and refuseth to deliver them to the owner.

CHARTOPHYLACIUM, a place where records were kept.

CHARTOPHYLAX, an officer in the church of Constantinople, intrusted with the custody of the archives.

The word is formed from χαρτης, and φυλαττω, *custodio*; and signifies *charter-keeper*.

Codin calls the *grand chartophylax* the judge of all causes, and the right arm of the patriarch. He adds, that he was the depository or keeper of all the *charters* relating to the ecclesiastical rights; and that he presided over matrimonial causes, and was judge of all the clergy. He drew up all sentences and decisions of the patriarch, who signed and sealed them: he presided in the grand council of the patriarch: he took cognizance of all matters and causes ecclesiastical and civil, whether among the clergy, the monks, or the people.

He took place of all the bishops, though himself only a deacon; and, on occasion, discharged the functions of the priests: he had twelve notaries under him.

The *chartophylax* was much the same at Constantinople with the *chartulary* at Rome.

There were, in reality, two officers who bore this title; the one for the court, the other for the patriarch; the first was called also *registrator*, and the latter *scrinarius*: though the two are usually confounded together. Leunclavius, and others, confound *chartophylax* with *chartulary*.

CHARTREUSE, a celebrated monastery of Carthusians; so called from the name of a steep rocky place, in a frightful defart, five leagues from Grenoble in France; where St. Bruno retired from the world, and first instituted the order of Carthusians.

The name has since passed to all houses of Carthusians; and that near Grenoble, is now distinguished by the name of the *Great Chartreuse*.

That of London, corruptly called *Charter-house*, is now converted into a college, called also from its founder *Sutton's Hospital*; first endowed with 4000*l. per ann.* since improved to 6000*l.*

It is to consist of decayed gentlemen, soldiers, and merchants; eighty of whom have a plentiful maintenance of diet, lodging, cloaths, physic, &c. living together in a collegiate manner: and of scholars, or youths, forty-four of whom are taught, and supplied with necessaries; and such of them as are fit for the university sent thither, with an exhibition of 20*l. per ann.* for eight years; the rest are put to trades.

For the superintendency of this hospital there are sixteen governors, generally of the prime quality; vacancies being supplied by the election of the remaining governors.

The ordinary officers are, a master, preacher, register, treasurer, schoolmaster, &c.

CHARTREUX, religious of the order of St. Bruno, called also CARTHUSIANS.

CHARTULARY, *Chartularius*, a title given to an ancient officer in the Latin church, who had the care of charters and papers relating to public affairs.

The *chartulary* presided in ecclesiastical judgments, in lieu of the pope.

In the Greek church, the *chartulary* was called *chartophylax*; but his office was there much more considerable; and some even distinguish the *chartulary* from the CHARTOPHYLAX in the Greek church.

CHARVIL, in *Botany*. See CHERVIL.

CHARYBDIS, in *Geography*, originally the name of a rock in the Streights of Messina, between Italy and Sicily; much celebrated in the writings of the ancient poets.

CHARYBDIS also a word used by Dr. Plott to express certain openings which he supposes in the bottom of the sea, by which its waters are received and conveyed by a subterranean circulation to the origin of fountains and springs. The *fauces insidiosæ*, or *maelstrom* on the coast of Norway, is supposed to be owing to some such subterranean hidrought; and it is advanced also, that the Mediterranean sea could not be emptied of the vast quantities of water which it receives, but must overflow the land of Egypt, unless swallowed by some such *charybdis*, which is either in some part of the bason of that sea; or near the mouth of it; in which case, it may be the occasion of that strong under-current, described by all those who have treated of this sea. An immense *charybdis*, placed near the Streight's mouth, may be hid under the immensity of waters there; but as it would absorb the deep waters continually, and that in large

quantities, it would neceſſarily cauſe ſuch an under-current there. See VAPOUR.

CHASCUSA, or CASCUSA, in the *Botanical Writings of the Ancients*, a name given by the Greeks to the *anterrhinum* of the Latin writers. It has been ſuppoſed by ſome, that the *chaſcuſa*, or *caſcuſa*, was the ſame with the *phyteuma* of Dioſcorides; but that author tells us the *phyteuma* was prickly, and had leaves like the *ſtruthium*, which was a kind of thiſtle uſed in the dying of wool; whereas Pliny tells us, that the *chaſcuſa*, or *antirrhinum*, has leaves like thoſe of flax, that is, ſmooth, narrow, and oblong.

CHASE, or CHACE, in *Law*, is uſed for a driving of cattle to or from any place; as to a diſtreſs, a fortlet, &c.

CHASE, or CHACE, is alſo a place of retreat for deer and wild beaſts; of a middle kind, between a foreſt and a park; being uſually leſs than a foreſt, and not poſſeſſed of ſo many privileges; but wanting, v. gr. courts of attachment, ſwainmote, and juſtice-ſeat.

Yet it is of a larger extent, and ſtocked both with a greater diverſity of wild beaſts, or game, and more keepers, than a park. Crompton obſerves, that a foreſt cannot be in the hands of a ſubject, but it forthwith loſes its name, and becomes a *chaſe*: in regard, all thoſe courts loſe their nature when they come into the hands of a ſubject; and that none but the king can make a lord chief juſtice in eyre of the foreſt.

By the common law, no perſon is at liberty to take or kill any beaſts of *chaſe*, but ſuch as hath an ancient *chaſe* or park; unleſs they be alſo beaſts of prey.

Yet the ſame author adds, that a foreſt may be granted by the king to a ſubject, in ſo ample a manner, as that there may be courts equivalent to a court of attachment, ſwainmote, and juſtice-ſeat.

CHASE, *wild-geeſe*, a term uſed to expreſs a ſort of racing on horſeback, uſed formerly, which reſembled the flying of wild-geeſe, thoſe birds generally going in a train one after another, not in confuſed flocks as other fowls do. In this ſort of race the two horſes after running twelve ſcore yards had liberty, which horſe ſoever could get the leading, to ride what ground the jockey pleaſed, the hindmoſt horſe being bound to follow him within a certain diſtance agreed on by articles, or elſe to be whipped in by the tryers and judges who rode by; and which ever horſe could diſtance the other, won the race. This ſort of racing was not long in common uſe, for it was found inhuman and deſtructive to good horſes, when two ſuch horſes were matched together. For in this caſe neither was able to diſtance the other, until they were both ready to ſink under their riders, and often two very good horſes were both ſpoiled, and the wagers forced to be drawn at laſt. The miſchief of this ſort of racing ſoon introduced the method now in uſe of running only a certain quantity of ground, and determining the plate or wager, by the coming in firſt at the poſt.

CHASE, in *Sea-language*, ſignifies a veſſel purſued by another, apprehended or known to be an enemy. Hence, to *chaſe* is to purſue a ſhip; which is called alſo *giving chaſe*.

In *chaſing* at ſea, theſe rules are generally obſerved: if the *chaſed* be ſound any thing to the windward, the *chaſer* is to bring all his tacks aboard, and to ſhape his courſe to meet her at the neareſt angle. If the chaſed be to the leeward, then the *chaſer* may come in with her, except ſhe bear upright before the wind, and ſo outſail her; or that ſhe bring herſelf cloſe by the wind, and the *chaſer* prove the more leeward ſhip, and ſo loſe her that way. If the *chaſe* be found right a-head, and in the *chaſer* be put to a ſtern-*chaſe*, then the beſt ſailor ſhall carry it, if there be ſea-room and day-light. Being come up cloſe with the *chaſe*, endeavour to croſs her fore-foot; and by that means you will both hinder her way, and avoid the fury of her ordnance (except thoſe in her *chaſe*), and uſe your own if required, to more advantage; and that as well your *chaſe*-pieces, at your firſt getting up within reach, as your breaſt-hole and quarter-pieces, as you paſs thwart her hawſe, and ſcour her deck from ſtem to ſtern. If ſhe make away from you, ply your guns, as many as poſſible, at her ſails, yards, maſts, and general tackling; and, being near, ſpare not your caſe-ſhot, or croſs-bar-ſhot, to make the greater damage.

CHASE, *ſtern*, is when the chaſer follows the chaſed aſtern, directly upon the ſame point of the compaſs.

To lie with a ſhip's fore-foot in a chaſe, is to ſail, and meet with her by the neareſt diſtance, and ſo to croſs her in her way, or to come acroſs her fore-foot.

A ſhip is ſaid to have a *good chaſe*, when ſhe is ſo built forward on, or a-ſtern, that ſhe can carry many guns to ſhoot forwards, or backwards; according to which ſhe is ſaid to have a *good forward*, or *good ſtern-chaſe*.

CHASE-*guns*, are ſuch whoſe ports are either in the head, called *bow-chaſes* (and then they are uſed in chaſing of others); or in the ſtern, called *ſtern-chaſes*, which are only uſeful when they are purſued or chaſed by any other ſhip.

CHASE *of a gun*, is that part of the bore, which begins at the ſame circle where the ſecond reinforce ends, and terminates at the extremity of the muzzle: or it is the part denoted by F B, *fig.* 1. *Tab. Gunnery.* If the length of a gun be divided into ſeven equal parts, the *chaſe* is four of theſe parts, wanting the diameter of the bore. Some have called the whole length of the bore the *chaſe*. See CANNON.

CHASE-*girdle*, is the part under F I in the ſame figure; and the CHASE-*aſtragal* and *fillet* is repreſented at *a*.

CHASING, a method of working, or enriching gold, ſilver, &c. properly called ENCHASING.

CHASLEU. See CHALEU.

CHASM, Χασμα. See GROTTO and HIATUS.

CHASME, or CHASMOS, among the *Ancient Phyſicians*, denotes oſcitation, or gaping. Hippocrates informs us, that long reſpiration is a cure for continual oscitation.

CHASTE-*tree*. See AGNUS *caſtus*, and VITEX.

CHASTISEMENTS, or CORRECTIONS, in the *Manege*, are the ſevere and rigorous effects of the aids; for when the aids are given with ſeverity, they become puniſhments.

CHASTITY. The Roman law juſtifies homicide in defence of the *chaſtity* either of one's ſelf or relations; and according to Selden (De Leg. Heb. lib. iv. cap. 3.) the law in the Jewiſh republic had the ſame latitude. The Engliſh law alſo juſtifies a woman in killing one who attempts to ravith her. Bac. Elem. 34. 1 Hawk. P. c. 72. And the father or huſband may juſtify killing a man, who attempts a rape upon his wife or daughter: and the forcible attempt of a more deteſtable crime may be equally reſiſted by the death of the unnatural aggreſſor. Blackſt. Com. vol. iv. p. 181.

CHATE, in *Botany*, a name given by ſome authors to a ſpecies of wild CUCUMBER; called by others *cucumis Ægyptius rotundo-ſolius*, the round leaved cucumber of Egypt.

CHATELET, anciently ſignified a little CASTLE, or fortreſs, wherein the *caſtellain*, or governor, lodged.

The word is a diminutive of *chateau*, formed from *caſtellum*, a diminutive of *caſtrum*; or from *caſtellatum*, a diminutive of *caſtellum*, *caſtle*.

At preſent, the term is uſed for certain courts of juſtice eſtabliſhed in ſeveral cities in France: the *grand chatelet* in Paris, v. gr. is the place where the preſidial, or ordinary court of juſtice of the prevot of Paris is kept; conſiſting of a preſidial, a civil chamber, criminal chamber, and a chamber of policy. The term ſignifies the ſame at Montpelier, Orleans, &c.

The *little chatelet* at Paris is an ancient fort, now ſerving as a priſon.

CHAT-PARD, in *Natural Hiſtory*, a creature of the LEOPARD kind. See PARDUS.

The French academicians, who diſſected this creature with great care, found a deſect of ſpermatic veſſels, and other parts abſolutely neceſſary to generation; and this not proceeding from caſtration, but from ſome other cauſe.

CHATTELS, *Catalli*, *Catalla*, a Norman term, under which were anciently comprehended all moveable goods; thoſe immobeable being termed *fief*, or, as we now ſay, *fee*.

Speiman defines *chattels* to be *bona quatenuscunque mobilia & immobilia; proprie tamen ea bona intelligi, quæ in animalibus conſiſtunt, à quorum capitibus res ipſæ, adhuc capita, chori capitalia, dicta ſunt.*

CHATTELS, in the modern ſenſe of the word, are all ſorts of goods, moveable or immoveable, except ſuch as are in the nature of freeholds, or paſſed thereof.

Chattels are either *perſonal*, or *real*.

CHATTELS *perſonal*, are ſuch as do either belong immediately to the perſon of a man, as his horſe, ſword, &c. or ſuch things as being injuriouſly with-held from him, a man has no way to recover but by PERSONAL action: or, ſtrictly ſpeaking, they are things *moveable*, which the owner may carry with him from one place to another; ſuch are animals, houſhold furniture, money, jewels, corn, garments, and every thing that is capable of being removed.

Chattels perſonal are, immediately upon the death of the teſtator, in the actual poſſeſſion of the executors; whereas *chattels real* are not in his poſſeſſion till he hath made an entry, or recovered them. An owner of *chattels* is ſaid to be *poſſeſſed* of them; but a perſon is ſaid to be *ſeiſed* of a freehold.

CHATTELS *real*, are either ſuch as do not appertain immediately to the perſon, but to ſome other thing, by way of dependence; as charters of land, apples upon a

tree, &c. or such as necessarily issue out of some immoveable thing to a person, as a lease, or rent for years. They are called *chattels*, because their duration is limited to a certain time; and *real*, because they are interests annexed to, and issuing out of *real* estates.

CHATTERER, in *Ornithology*. See AMPELIS and GARRULUS.

CHATUS, in *Middle Age Writers*, a kind of gold coin.

CHATUS was also called, by some French writers, *mailles cuchat*.

Du-Cange makes it a question, whether the *chatus* was the same coin as the *chaptonsis*, and supposes that the latter might be formed from *chati Pictavensis*, in French, *chat de Poitou*.

CHAVARICHITS, a sect of Mahometans, who deny that God ever sent a prophet that was infallible; and who had a commission to give a law to mankind: they pretend likewise that if such an office should ever become necessary, it would not be confined to a single family, but that every man of probity and virtue would be capable of that honour.

CHAUD-*Medley*, in *Law*, and according to its proper etymology, denotes an affray that happens in the *heat* of blood, or passion. See CHANCE-*Medley*.

CHAULIODONTA, from χαυω, *I put forth*, and οδους, *tooth*; among *Ancient Naturalists*, is applied to those animals, the teeth of which grow to a great length out of their mouths; as the boar, and the elephant.

CHAUMPERT. See CHAMPART.

CHAUNTOR, CHAUNTER. See CHANTOR.

CHAUNTRY, or CHANTRY, was anciently a church, or chapel endowed with lands, or other yearly revenue, for the maintenance of one or more priests, daily saying or singing mass for the souls of the donors, and such others as they appointed. These *chauntries* were dissolved by 1 Ed. VI. *cap.* 14.

Hence, *chauntry-rents*, are rents paid to the crown by the tenants, or purchasers of *chauntry-lands*.

CHAUFFE-WAX. See CHAFFE-WAX.

CHAURUS, or CHORUS, among the Romans, the north west wind, or that which blow between the wind called *favonius* and the north.

CHAUSSE *Trappes*. See CALTROP, and CROW'S-FEET.

CHAUSSE *trop-haut*, in the *Manege*. A white-footed horse is said to be such, when the white marks run too high upon the legs.

CHAYQUARONA, in *Ichthyology*, a name given by the Portuguese to a fish of the TURDUS kind, caught on the Brasilian shores, and more frequently called by authors by its Brasilian name, PIRAMBU.

CHAZINZARIANS, or CHAYZINZARIANS, a sect in Armenia in the seventh century.

They are also called *Sauarlotræ*, which, in Greek, signifies the same as *Chazinzarians* in Armenian, viz. *adorers of the cross*; they being charged with paying adoration to the cross alone.

In other respects they were Nestorians; and admitted two persons in Jesus Christ. Nicephorus, lib. xviii. cap. 54. ascribes other singularities to them, particularly their holding an annual feast, in memory of the dog of their false prophet Sergius; which they called *Artzikortzer*.

CHEATS, in *Law*, are deceitful practises in defrauding, or endeavouring to defraud another of his known right by some artful and dishonest device, as by playing with false dice, by fraudulently obtaining the execution of deeds and trusts, by suppressing wills, by raising money under false pretences, &c. Any deceitful practice, whether in trade or otherwise, is punishable with fine, imprisonment and pillory. And by the statutes 33 Hen. VIII. cap. 1. and 30 Geo. II. cap. 24. if any man defraud another of any valuable chattels by any false token, counterfeit letter, or false pretences, or pawns or disposes of another's goods without the consent of the owner, he shall suffer such punishment by imprisonment, fines, pillory, transportation, whipping, or other corporal pains, as the court shall direct. And by 9 Anne, cap. 14. if any person cheats at play, and at one time wins more than 10*l.* or any valuable thing, he may be indicted thereupon, and shall forfeit five times the value, shall be deemed infamous, and suffer such corporal punishment, as in case of wilful perjury. Blackst. Com. vol. iv. p. 138, and 172.

CHECAYA, in *Turkish Affairs*, is the second officer in the janizaries, and synonymous with lieutenant, or the second in any office.

CHECK-*roll*, a roll, or book, containing the names of such as are attendants, and in pay to the king, or other great persons; as their household servants.

It is otherwise called the *clerque-roll*. See ROLL.

CHECK, *clerk of the*, in the king's household, has the check and controulment of the yeomen of the guard, and all the ushers belonging to the royal family; allowing their absence or defects in attendance, or diminishing their wages for same, &c.—He also, by himself, or deputy takes the view of those that are to watchin the court and has the setting of the watch. 33 Hen. VIII. c. 12.

CHECK, *clerk of the*, in the kings dock-yards, is also the name of an officer, who keeps a muster or register of all the men employed aboard his majesty's ships and vessels and of the artificers and others in the service of the navy, in the port to which he belongs.

CHECK, in *Falconry*, is where a hawk forsakes her proper game, to follow rooks, pies, or other birds that cross her in her flight.

CHECKER. See EXCHEQUER.

CHECKER-*work*, in *Brick-making*. See BRICK.

CHEQUY, in *Heraldry*, is where the shield, or a part thereof, as a bordure, &c. is chequered, or divided into chequers, or squares. See *Tab. Heraldry. fig.* 14.

Where there is but one row of squares, it is not properly called *chequy*, but *counterchequy*.

Chequy, according to Columbiere, is one of the most noble and ancient figures in all armory; and ought never to be given, but to persons who have distinguished themselves in war: for it represents a chess-board, which itself is a representation of a field of battle. The pawns and men placed on both sides, represent the soldiers of the two armies; which move, attack, advance, or retire, according to the will of the two gamesters, who are the generals.

Chequy is always composed of metal, and colour. Some authors, however, would have it ranked among the furs of furs.

When the whole escutcheon is chequered, it should ordinarily contain six ranges: there is no need of blazoning to express them; only it must be observed, to begin to blazon by the first square in chief on the dexter side. So that if that be *ar*, and the next *gules*, the house, or family, is said to bear *chequy*, *ar*, and *gules*.

When the whole shield is not chequered, but only the chief, a bend, cross, or the like, the number of ranges should be expressed.

CHEEK, in *Anatomy*, that part of the face situated below the eyes on either side.

Wounds of the *cheeks*, if small, may be cured by means of the dry future; but, if very large, will require the bloody one, to bring their lips together: they are then easily healed with vulnerary balsams. But if it happen that one of Steno's salivary ducts is wounded in its passage across the *cheek* from the parotid gland, the continual discharge of saliva into the wound will prevent the cure, till the duct is perforated in the internal part of the *cheek* to make a passage for the saliva into the mouth. This method is proposed by Cheselden in his anatomy.

CHEEKS, a general name among *Mechanics*, for almost all those pieces of their machines and instruments, that are double, and perfectly alike.

The *cheeks of a printing-press*, are its two principal pieces: they are placed perpendicular, and parallel to each other; serving to sustain the three formers, viz. the head, shelves, and winter, and to bear the spindle, and other parts of the machine.

The *cheeks of a turner's lathe*, are two long pieces of wood between which are placed the *poppets*, which are either pointed, or otherwise, serving to support the work, and the mandrills of the workman. These two pieces are placed parallel to the horizon, separated from one another by the thickness of the tail of the poppets, and joined with unions to two other pieces of wood, placed perpendicularly, called the *legs of the lathe*.

Cheeks of the glazier's vice, are two pieces of iron joined parallel at top and bottom; in which are the axis, or spindles, little wheel, cuthions, &c. whereof the machine is composed.

CHEEKS *of a mortar*, or BRACKETS, in *Artillery*, are made of strong planks of wood, bound with thick plates of iron, and are fixed to the bed by four bolts; they rise on each side of the mortar, and serve to keep her at what elevation is given her, by the help of strong bolts of iron which go through both *cheeks*, both under and behind the mortar, between which are driven coins of wood; these bolts are called the bracket-bolts, and the bolts which are put one in each end of the bed, are the traverse-bolts, because with hand-spikes the mortar is by these traversed to the right or left.

CHEEKS, in *Ship-building*, are two pieces of timber, fitted on each side of the mast, at the top, serving to strengthen the masts there. The uppermost bail or piece of timber in the beak of a ship, is called the *cheek*. The knees which fasten the beak-head to the bow of the ship, are called

called *cheeks*; and the sides of any block, or the sides of a ship's carriage of a gun, are called *cheeks*.

CHEEKS, *upper and lower*, are those pieces of timber on each side of the TRAIL-*board*.

CHEESE, a kind of food; being a preparation of milk curdled by means of rennet, and afterwards dried, and hardened.

Cheese is nothing but milk purged of its serum, or whey; and sometimes too of the cream, or butyrous part of the milk.

Cheese, when new, is found to load the stomach, by reason of its moisture and viscidity; and when too old, it heats and inflames it by its salts. The physicians advise it to be eat in small quantities: hence that Latin verse,

Caseus ille bonus, quem dat avara manus.

Dr. Quincy says, it cannot be too old: it is certain, the more it abounds with salts, the more will it contribute to digestion, and the clearing of the stomach of other food. Indeed some condemn all use of *cheese*; sheltering themselves under that ancient maxim, *Caseus est mensam, quia concoquit omnia si quem.*

The Laplanders make a sort of *cheese* of the milk of their rein-deer, which is not only of great service to them as food, but on many other occasions. Scheffer's Hist. of Lapl.

CHEESE *Rennet*, in *Botany*. See LADY'S *Bedstraw*.

CHEEVANCE. See CHEVISANCE.

CHEF. See CHIEF.

CHEF *d'œuvre*. See MASTERPIECE.

CHEGGIO, in *Botany*, a name given to a sort of lasciferent plant, common in Cambaya. It is reported by authors, and by the people of the country, that those knobs and beards of this plant which grow facing the north, are a very noble medicine in the cure of apoplexies and other nervous disorders, but that those knots and beards of the same plant which look southward are poisonous. Redi proved some of this famous plant, and gave it several fair trials, but found the history of its nature and effects wholly false.

CHEILOCACE, among *Physicians*, literary signifies the *lipsoi*. It is a swelling of the lips, to which the inhabitants of northern countries, especially children, are said to be very subject; particularly those in England and Ireland, if we may credit Cattelius.

CHEIRANTHUS, in *Botany*. See STOCK *Gilly-flower*.

CHEKAO, in *Natural History*, the name of an earth found in many parts of the East Indies, and sometimes used by the Chinese in their porcelain manufactures. It is a hard and stony earth, and the manner of using it is this: they first calcine it in an open furnace, and then beat it to a fine powder. This powder they mix with large quantities of water, and stirring the whole together, they let the coarser part subside, and pouring off the rest, yet thick as cream, they leave it to settle, and use the matter at the bottom, which is found in form of soft paste, and will retain that humidity a long time. This supplies the place of the earth called *bucchu*, in the making that elegant sort of china-ware which is all white, and has flowers which seem formed by a mere vapour within its surface. The manner of their using it is this: they first make the vessel of the common matter of the manufacture; when this is almost dry, they paint upon it the flowers, or whatever other figures they please, with a pencil dipt in this preparation of the *chekao*; when this is thoroughly dry, they cover the whole vessel with the varnish, in the common way, and bake it as usual. The consequence is, that the whole is white; but the body of the vessel, the figures, and the varnish, being three different substances, each has its own particular white; and the flowers, being painted in the finest white of all, are distinctly seen through the varnish upon the vessel, and seem as if traced by a fine vapour only. The *bucchu* does this as well as the *chekao*, and has beside this the quality of serving for the making the porcelain ware, either alone, or in the place of the *kaolin*: the *chekao* has not this property, nor any other substance beside this *bucchu* which appears to be the same with our steatites or soap-rock.

CHELA, in *Medicine*, has several significations. It imports a forked probe, mentioned by Hippocrates, lib. ii. De Morbis, used in extracting a polypus of the nose. But in Rufus Ephesius, cap. 4. *chelæ* implies the extremities of the *ossa*, which touch each other when the eyes are shut. But the most frequent signification of *chelæ* is claws, particularly those of the crab.

Chelæ farther signifies fissures in the heels, feet, or pudends.

CHELANDIUM, in *Middle Age Writers*, is used for a kind of vessel or ship. It is also called *chelandrium*, *chelonarus*, *chelonarius*, *solandrio*, and *solandria*, and, by the Byzantine writers, χελανδιον. It is mentioned by Dimar as a vessel of great length, carrying oars, and a hundred and fifty seamen. It seems to have resembled an Italian galley.

CHELANDURUS, in *Middle Age Writers*, a small kind of CHELANDIUM.

CHELAZIUM, a name used by some authors for a moveable tubercle in the eye-lid, commonly called in English a *stythe* or *sye*.

CHELIDON, in *Ichthyology*, the name given by many of the old Greek writers to a kind of flying-fish, called by some authors *milvus* and *hirundo*, and by some *aspidus*, or the HAWK-*fish*. It is properly a species of *trigla*, and is distinguished by Artedi by the name of the *trigla* with the head a little awakened, and with a singular fin near the pectoral fins. This method of reducing the fish to their true *genera*, and distinguishing them by their proper specific names is the only method of truly knowing them. The arbitrary names of *milvus* and *hirundo* carry to little idea of the peculiar fish with them, that they may be as well applied to one species as another, and accordingly we find two or three different species of the *trigla* called *milvus*, &c. by different authors.

CHELIDONIA, among the Romans, a name given to the wind more properly called FAVONIUS.

It was only called *chelidonia* for a fortnight in the middle of February, because at that time the swallow makes its first appearance.

CHELIDONIUM, in *Botany*. See CELANDINE.

CHELIDONIUS, in *Botany*, a name given by some writers to the ANEMONE. The reason seems to have been its flowering about the time of the swallows coming from their winter retreats.

CHELIDONIUS, in *Ichthyology*, the name of a fly called the swallow-fly, by reason of its swift flight. It is in most parts of a brown colour, and has black prominent shoulders, a black head, and short black *antennæ*. The wings are silvery, and edged with black. It often sits a long time together on the leaves of plants; but is very quick-sighted, and when any person comes near it, it is gone in a moment, and usually takes such long flights, that it is not easily caught after a-rds.

CHELIDONIUS, in *Natural History*, a stone pretended to be found in the stomachs of young swallows; much esteemed by some for the falling sickness.

The word is formed from χελιδων, a *swallow*. See SWALLOW-*stone*.

CHELON, in *Ichthyology*, the name of a fish of the mullet kind, and much resembling the common mullet in its general shape, but its eyes are more prominent, and its head smaller. It has also its side-lines, which run from the head to the tail, very evenly ranged, and placed at equal distances, and its lips are remarkably thick and prominent. It is of the size of the common MULLET.

CHELONE, in *Botany*, a genus of the *didynamia angiospermia* class. Its characters are these: the flower is of the ringent kind, having a short cylindrical tube, which is swelled at the chaps, where it is ribbed, convex above, and plain below; the mouth almost shut. It hath four stamina, the two side ones being a little longer than the other. It hath an oval germen, which afterward becomes an oval capsule, having two cells which are filled with flat, roundish seeds, having a border. There are three species, which grow naturally in North America.

CHELONITES, a stone said to be found in the Indian tortoises, and to have the faculty of resisting poison.

The word is formed from χελωνη, a *tortoise*.

Some confound the *chelonites* with the *bufonites*, or toad-stones.

CHELSEA *College*. See HOSPITAL.

CHELYDRUS, in *Natural History*, a species of serpent, the same with the CHERSYDRUS.

CHELYS, among the *Ancients*, a musical instrument of the pulsative kind, said to be invented by Mercury, and formed of a shell found in the river Nile, at the time of low water.

CHELYSMA, in *Antiquity*, a thick piece of wood which the Greeks fixed to the keels of their ships, to save them from being worn or broken. It was also called *cunæus*.

CHEMA, according to Blancard, is the name of a certain measure sometimes mentioned by the Greek physicians, and which he thinks contained two small spoonfuls.

The determined weight of this quantity cannot be accurately ascertained, in consequence of the different specific gravities of different substances: just as, at present, the word *spoonful* is used in a vague and undetermined sense, especially with respect to substances, of which it is a matter of indifference whether a little more or a little less be used.

CHEME, among the Romans, was a liquid measure, containing the fifth part of a CYATHUS.

CHEMICAL *glasses*, how to cement when cracked, see CEMENT.

CHEMIN,

CHEMIN *des rondes*, in *Fortification*. See WAY *of the rounds*.

CHEMISE, in *Fortification*, a wall wherewith a baſtion, or ditch, is lined, for its greater ſupport and ſtrength.

CHEMISE, *fire*, is a piece of linen cloth, ſteeped in a compoſition of oil of peril, camphor, and other combuſtible matters; uſed at ſea, to ſet fire to an enemy's veſſel.

CHEMISTRY. See CHYMISTRY.

CHEMOSIS, in *Medicine*, a diſeaſe of the eye, proceeding from an inflammation, when the white of the eye ſwells above the black, and overtops it to ſuch a degree, that there appears a ſort of χασμα, *chaſm*, or gap between them, whence it takes its name. Galen calls it a red and carneous inflammation of the *cornea tunica*.

Dr. Burghart, in a *chemiſt* where the *cornea* was already burſt, dilated the opening, and extracted the cryſtalline *lens*, which had come forward before the *iris*. The *lens* was ſo changed and ſuppurated, that it reſembled a piece of white amber: after extracting it, the pain of the eye became milder.

CHENCE, in *Old Cuſtoms*, ſeems to be much the ſame as AMAERE.

CHENILLES, *fauſſe, baſtard caterpillars*. See FAUSSE.

CHENISCUS, from χην, a *goſe*; among the *Ancients*, an ornament in the form of little geeſe, uſed on the prows and ſterns of the ſhips.

CHENOCORPUS, *Goſe-dung*, in *Medicine*, is accounted very autumnous and reſolvent, and therefore preſcribed with ſucceſs in the jaundice. The greeniſh dung is eſteemed the beſt. It is gathered in the meadows in ſpring time, and being dried with a moderate heat, and pulveriſed, is given from half a dram to a full dram at a doſe. It is recommended alſo in the ſcurvy, and other diſeaſes.

CHENOPODIUM, *in Botany*. See GOOSE-*foot*.

CHENSERS, in our *Statutes*, is uſed for ſuch as pay tribute or *cenſe*, quit-rent, or chief-rent.

CHEQ, or CHERIF, the prince, or high prieſt of Mecca; ſovereign pontiff of the Muſſulmans; and owned as ſuch by all the ſects into which they are divided.

The grand ſignior, Sophies, mogols, khans of Tartary, &c. ſend him yearly preſents; eſpecially tapeſtry, to cover Mahomet's tomb, and tents for himſelf: for the *cheq* has a tent near the moſque of Mecca, wherein he lives during the ſeventeen days of devotion in pilgrimage to Mecca. The tapeſtry and tent are changed each year, and pieces thereof are ſent to the princes who ſurniſh new ones.

His revenue is very conſiderable, conſiſting of preſents made by the Mahometan princes, and pilgrims, to the moſque of Mecca and Medina.

The *cheq* ſubſiſts all the pilgrims during the ſeventeen days of devotion; on which account he is every year furniſhed with a very conſiderable ſum of money from the grand ſignior: the better to obtain this, he makes him believe, that there are conſtantly, during this time, ſeventy thouſand pilgrims; and that, ſhould the number fall ſhort, the angels, in form of men, would make it up.

CHERAMIS, in *Antiquity*, a medical meaſure. According to Erotian in Hippocrates, it was the hollow of a ſhell-fiſh called *myax*, and took that name from χηραινω, which ſignifies a *hollow place*. It frequently occurs in Hippocrates, and ſeems not much different from the *chous*, which in Galen's Exegeſis is expounded by it. Cornarius alſo explains *cheramis* by the meaſure of a CHOUS; and Calvus on another paſſage expounds it by a *pint*.

CHEREF, a title aſſumed by the emperors of Morocco. See CALIPHATE.

CHEREM, among the Jews, is uſed to ſignify a ſpecies of ANNIHILATION.

The Hebrew word *cherem* ſignifies properly to *deſtroy*, *exterminate*, *devote*, *anathematize*.

CHEREM is ſometimes likewiſe taken for that which is conſecrated, vowed, or offered to the Lord, ſo that it may no longer be employed in the common or profane uſes. There are ſome who aſſert, that perſons thus devoted were put to death; whereof, they ſay, Jephtha's daughter is a memorable example. Judg. xi. 29, &c.

CHEREM is alſo uſed for a kind of excommunication in uſe among the Jews. See NIDDUI.

CHERLERIA, in *Botany*, a name given by Haller and Linnæus to a genus of plants of the *monandria trygynia* claſs, the characters of which are theſe: the perianthium is compoſed of five equal lanceolated leaves: there are no petals: but there ſtand within the cup five very ſmall, roundiſh, and emarginated *nectaria*, diſpoſed in a circular order. The ſtamina are ten ſubulated filaments, five of which are affixed to the *nectaria*; the *anthera* are ſimple: the germen of the piſtil is of an oval figure: the ſtyles are three, and ſtand open: the ſtigmata are ſimple. The fruit is an oval capſule, compoſed of three valves, and divided into three cells. The ſeeds are numerous, convex on one ſide, and angular on the other.

The *nectaria* of this genus ſhew, that they are of kin to the *ſedum* or houſeleeks; but in the fruit it differs altogether from the *ſedums*, and rather approaches to the nature of the *lychnis*; it would therefore be very improper to confound it with either of thoſe *genera*.

CHERMES, in *Zoology*, a genus of four-winged inſects, the characters of which are theſe: its *roſtrum*, or trunk, is ſituated under its breaſt; the abdomen is mucronated, or pointed, at the hinder extremity; and the legs are formed for leaping.

Theſe inſects, which in Engliſh are called bugs, take particular denominations from the trees or plants on which they feed: as the *fir*-BUG, the *ſpruce*-BUG, the *maple*-BUG, the *willow*-BUG, the *nettle*-BUG, &c.

CHERMITES, or CHERNITES, in the *Natural Hiſtory of the Ancients*, a name given by many to a ſpecies of very bright and white marble or alabaſter, which ſeems to have been the ſame with that called afterwards LYCHNITES *marmor*.

CHERNIBS, in *Antiquity*, a veſſel wherein people uſed to waſh their hands before they went to attend religious ſervice.

The word is derived from χειρ, the *hand*, and νιπτω, *to waſh*.

CHERRY-*Tree*, *Ceraſus*, in *Botany*, the name of a genus of trees, according to ſome writers, but a ſpecies of the PRUNUS in the Linnæan ſyſtem. For the botanical characters, ſee PLUM-*Tree*.

This tree is called *ceraſus*, according to Servius, from the name of a city in Pontus, which Lucullus deſtroyed; and the fruit of it was brought by him to Rome, in the year of the city 680, and into Britain about a hundred and twenty years afterwards, or A. D. 55. Soon after it was ſpread through moſt parts of Europe. The ſpecies of the *cherry-tree* enumerated by Miller are five, viz. 1. the common or Kentiſh *cherry*, from which many modern botaniſts ſuppoſe that moſt of the varieties cultivated in the Engliſh gardens are derived; ſuch as the early May *cherry*, the May-duke *cherry*, the arch-duke *cherry*, the Flemiſh-*cherry*, the red-heart, the white-heart, the black-heart, the amber-heart, the ox-heart, the lukeward, the carnation, the Herefordſhire-heart, the morello, the bleeding-heart, and the yellow Spaniſh *cherry*, beſides two ſorts with double flowers, which are propagated for ornament. 2. The *cherry-tree* with ſpear-ſhaped ſawed leaves, or the greater wild *cherry-tree* with a ſweetiſh fruit, whoſe juice yields a black colour. This is a black *cherry*, ſuppoſed to be a native of England. This tree grows to a large ſize, produces beautiful flowers, affords good food for birds, and the wood of it is uſeful for turners. The French plant them for avenues to their houſes, where other trees will not thrive, and cultivate them for the manufacture of hoops. The varieties raiſed by ſeeds from this tree are the black corniſh, which is a good bearer, and yields excellent fruit, and the ſmall wild *cherry*. 3. The *cherry-tree* with oval ſpear-ſhaped leaves, and flowers growing in cluſters, commonly called the cluſter *cherry*. 4. The *cherry-tree* with flowers growing in round branches, and oval-leaves, called the *Mahaleb*, or perfumed *cherry*. The wood of this ſort is eſteemed by the French for cabinet-making, on account of its agreeable colour. 5. The *cherry-tree* with ſmooth, ſpear-ſhaped, entire leaves, of a bluiſh green on their under-ſides, and ſpreading branches, called the dwarf *Canada cherry*.

The ſeveral ſorts of *cherry-trees* are propagated by binding or grafting the ſeveral kinds into ſtocks of the black or wild red *cherries*, which are ſtrong ſtooters, and of a longer duration than any of the garden kinds. The ſtones of theſe two kinds are ſown in a bed of light ſandy earth in autumn, and the young ſtocks produced from them are to remain where they riſe till the ſecond autumn after their ſowing, when in October they ſhould be planted out into a rich earth, at three feet diſtance from row to row, and at about ten inches diſtance in the rows. The ſecond year after the planting out, they will be fit to bud, if they are intended for dwarfs; but if they are intended for ſtandards, they will not be tall enough till the fourth year; for they ſhould be budded or grafted near ſix feet from the ground. The grafting is uſually performed in ſummer, and the bead of the ſtock is to be cut off in the beginning of the March following, about ſix inches above the bud; and if the bud has ſhot well, and there is any fear of its being diſplaced by winds, it muſt be gently tied up to the part of the ſtock left above it. The autumn afterwards, theſe trees will be fit to remove, and be ſet where they are to remain; or they may be left two years. Many, when they plant theſe trees in their places, lop off a great part of their

heads,

heads, but this is an injury that often kills them; and when they escape, they seldom get well over it for four or five years. If the trees are intended for walls, it is advisable to plant dwarfs between the standards, that these may cover the lower part of the wall, while the others spread over the upper part; and when the dwarfs rise to fill the whole wall, the standards should be taken entirely away. When these trees are taken up from the nursery, the dead fibres of the roots must be carefully taken off, and the upper part of the shock which is above the bud must be cut off close down to the back part of it, the bud must be placed directly from the wall.

Cherry-tree thrives best on a dry loamy loam, and in a gravelly soil are very subject to blights, and seldom stand long good. They should be placed at fourteen or fifteen yards, with a standard tree between each two. In pruning these trees, their shoots should never be shortened, for they usually produce their fruit from their extreme part. All the forward fine shoots are to be espaliered, and the others trained horizontally; and where there is a vacancy in the wall, the branches must be shortened, will throw up a shoot or two to fill it.

CHERRY, *Barbadoes*, *Malpighia*, in *Botany*, a genus of the *decandria trigynia* class. Its characters are these; the flower hath five kidney-shaped petals, which are concave, and spread open; and ten awl-shaped stamina, with two oblong glands adhering to the emplacement. It has a small roundish germen, supporting three slender styles. The germen turns to a large, furrowed, globular berry, with one cell, including three rough, angular, stony seeds. There are eight species, natives of the West Indies, where the fruit is eaten by the natives.

CHERRY, *Carolina*, *Corna*, in *Botany*, a genus of the *tetrandria monogynia* class. Its characters are these; it hath many flowers, which are included in one common four-leaved cuticular involucrum; the flowers have four plain petals, and four short stamina, which are longer than the petals. The round germen is placed below the emplacement becomes an oval or roundish berry, inclosing a nut with two cells, having an oblong kernel. There are six species. Miller's Gard. Dict.

The fruit of this tree is cooling, drying, and astringent; therefore the inhabitants, both of Indies of Guiana, and is good in fevers, especially if accompanied with a flux of the belly. The only officinal preparation of this fruit is the *rob de cornis*.

CHERRY, *Dwarf*, and CHERRY *of the Alps*, *Loniceras*. See *Dwarf* HONEY-SUCKLE.

CHERRY, *Winter*, *Physalis*, in *Botany*, a genus of the *pentandria monogynia* class. Its characters are these; the flower hath a swelling permanent emplacement, which is five-cornered, and cut at the top into five acute points. The flower hath one wheel-shaped petal, with a short tube, and a large brim, which is five-cornered, and plaited. It has five small awl-shaped stamina, which join together, and a roundish germen supporting a slender style, crowned by an obtuse stigma. The germen afterwards turns to an almost globular berry, with two cells included in the large inflated emplacement, filled with compressed kidney-shaped seeds. There are fifteen species.

This plant is easily propagated, either by seed, or by parting the roots. Its only beauty is in the autumn, when the fruit is ripe, at which time their red bladders, opening and shedding the *cherry*-shaped fruit, make a pretty appearance.

The leaves are cooling, and of the nature of common nightshade. The berries are a singular good diuretic, and useful against the gravel and stone; being boiled in milk, and sweetened with sugar, they cure the heat of urine, making bloody water, and ulcers in the kidneys and bladder. They relieve the jaundice, by opening obstructions of the liver and gall-bladder; and the dropsy, by carrying off the water through the urinary passages.

The only officinal preparation is the *tincture alkekengi*.

CHERRY-*brandy*, a debile spirit of brandy, with the addition of *cherries*.

The *cherries* commonly used therein, are of the black kinds with these a bottle being half filled, is filled up with brandy, or spirits. The whole is to be shaken up now-and-then; and in a month's time it becomes fit for use.

To sweeten it, and improve the flavour, some chemists to put in sugar, with a quantity of raisins.

CHERRY *wine* is made by adding two pounds of sugar to every two gallons of the juice of *cherries*. The liquor is afterwards put into a vessel to ferment, and after standing about two months in the cask, is bottled off with a little sugar for use.

CHERSA, called also *scuda*, in some medical writers, signifies a root reduced to a farinaceous powder. This way of preparation some condemn, as exhausting the virtues of the drug, and rendering it good for nothing; others defend it.

CHERSÆA, *earthy*, from χερσος, *earth*; an epithet of the three species of ASPS, mentioned by Galen and Dioscorides.

CHERSETUM, *in Old Customs*, is used for *chersefist*. See CHERSEFIST.

CHERSONESUS, in *Geography*, a peninsula, or a continent almost encompassed round with the sea, only joining to the main land by a narrow neck or isthmus. The word is Greek, χερσονησος, of χερσος, *land*, and νησος, *island*, which signifies the same.

This term is used by the moderns, in compliance to the ancients, who called all their peninsulas by this name: accordingly, such places as were hereby distinguished among them, retain the name among us, as the *Chersonese* of Peloponnesus, of Thrace, Khersonesus Cimbrica, Aurea, &c.

CHERSYDRUS, χερσυδρος, an amphibious serpent so called, because it lives first in watery places, whence it is called *hydrus*; after which it lives in habitations, and lives on dry ground, and thence has its compound appellation *chersydrus*.

CHERT, or CHERR, *in Natural History*, a name given by some of our miners to a peculiar stone found in flints, but not the hardness and smoothness of flint. It is called *ashs* in some places *ashern*, and by some authors *asmus*.

Dr. Merret, who has examined the mines of Derbyshire, found great quantities of this stone, and in some places varying from its common colours and manner of appearance: in some places, instead of the thin flints which this usually forms, he found it in beds of three or four yards thick, and sometimes much more. Such thick strata of it he also found in the peak of Derbyshire. He observed, that they were always found among strata of lime-stone; and that sometimes the inner part was form regular flints, but lay in large loose nodules. In many places the core was black, and in others of a dark, greenish colour; the workmen hence call them *black cherts*, and green *cherts*. Phil. Trans. N° 297.

Cherts are used as grinding stones for calcined flints, and other hard substances; but are of too smooth and close a texture for grinding corn.

CHERUB, or CHERUBIM, a celestial spirit, which, in the HIERARCHY, is placed next to *seraphim* to the seraphim. The word is formed of the Hebrew כרוב, *cherub*; the plural whereof is *cherubim*.

The figure of the *cherubim* was not always uniform, since they are differently described in the shapes of men, eagles, oxen, lions, and in a composition of all these figures put together. Nodes likewise, calls those symbolical or hieroglyphical representations, which were represented in embroideries upon the veils of the tabernacle, *cherubim* of curious work. Such were the symbolical figures which the Egyptians placed at the gates of their temples, and the images of the generality of their gods, which were commonly nothing but statues compounded of men and animals.

CHERUBIM was also the name of an ancient military order in Sweden, otherwise called the *order of Seraphs*. It was instituted by Magnus IV. in 1334, and abolished by Charles IX. It took its denomination from the golden figures of *cherubim*, wherewith the collar of the order was enriched.

CHERVIL, *Chærophyllum*, in *Botany*, a genus of the *pentandria digynia* class. Its characters are these; it is a plant with umbellated flowers; the principal umbel is spreading, and compofed of several small ones called rays; the flowers have five heart-shaped inflexed petals, and five stamina. The germen is situated below the flower, supporting two reflexed styles, which afterward becomes an oblong pointed fruit, dividing in two parts, each having one seed, which is convex on one side, and plain on the other. There are five species.

The first sort grows naturally on the sides of highways, and the borders of the fields in most parts of England, so is never cultivated in gardens. It is frequently called cow-parsley, but for what reason does not appear, because few animals care to eat it, except the ass: it having in a less degree something of the quality of hemlock. It is a weed which should be rooted out of all pastures early in the spring, for it is one of the most early plants

in shooting; and by the beginning of April, the leaves are near two feet high.

The fourth sort is the common garden *chervil*, and flowers in May and June. Its leaves and seeds are used in medicine; the seed contains the principal virtue of the plant, and is esteemed a great medicine in jaundices and dropsies. It is very certain that it is a powerful diuretic, and therefore recommended in the gravel and stone; and likewise is prooper of the menses. It opens and attenuates gross blood, and generally disposes the person to sleep. It is used also externally in fomentation in colicky pains and retention of urine.

The leaves of the plant are what the good women call *sweet fern*, from which they distil a water, and esteem it a very great remedy for colics.

This will thrive on any soil, and in any situation.

CHESS, an ingenious game, performed with little round pieces of wood, on a board divided into sixty-four squares, where skill and address are indispensibly requisite, that chance has no place; and a person never loses but by his own fault.

Sarazin has a peculiar treatise on the different opinions of the origin of the name *échecs*, whence the French *echecs*, and our *chess*, or *Trumpe*. Menage is also very full *de hac lanæ lite*. Leonclavius takes it to come from the Persian famous Turkish robbers. P. Simonini from the German *schach*, *theft*; and that from *calcular*. He takes *check* to be the same with *hasta*, or *assaltus* of the Romans, but mistakenly. This opinion is commented by Vossius and Salmasius, who derive it from *sachen*, *to subject*, or *overcome*. Some derive it from the Hebrew שחק *shaque*, *play*, whence *sachaq*, *subject*; of שחה, *sahe*, *overcome*; and others again from שחק *shak*, *play*, and שח *sach*, whence *chess* and *checkmate*. Salmasius says, a Carthaginian Parliament-man, one Schachmenides, invented the game of *chess*, and gave it his own name, which it still bears in their country. Bisset derives it from *schaeg*, or Lycian Moabitish word for *king*, *dux*, and *prince*. Bochart says, that *schach* is originally Persian, and that Schachmen, or that language, signifies the *king is slain*.

But the learned Hyde has shewn from undoubted authorities, that this game was first invented in India, and passed from thence to Persia before the year of Christ 570, and from Persia to Arabia. He adds, that the antiquity of this game is traced much higher, one to the middle of the second century, in an Indian chronicle, the authenticity of which is doubtful. And he shews, that *Ashi*, i. e. *ten*, was a term much in use among the orientals, whilst engaged in this play, and that they used it to caution the king against any danger; and hence the Europeans and others have denominated the game *jeu d'echecs* and *schaakspel*, and in English *chess*, from this circumstance. He also derives the word *mat* from the Persic word, *ispatar*, *it is lost*; says that it was used in play, when any of the men was fixed in its place, or taken captive. See Historia Shahiludii apud Syntagma Dissertationum, &c. Hyde, edition 2. Doctors Sharpe, vol. iii. p. 251.

Damianus, in Leonclavius's Eunuch, observes, that Pyrrhus, the most knowing and expert prince of his age, ranging a battle, made use of the pieces at *chess* to form his designs; and to shew the secrets thereof to others. Vopiscus, in his life of Probus, informs us, that one of the Roman emperors had the title Augustus given him, because of his gaining ten games at *chess* successively.

Tamerlane is also recorded as a very expert gameller at *chess*.

Chess is doubtless a most ancient and universal game; the common opinion is, that it was invented by Palamedes at the siege of Troy. Others attribute the invention to Diomedes, who lived in the time of Alexander; the romance of the Rose ascribes it to one Ariadus; but the truth is, the game is so very ancient, there is no tracing its author.

In China, it makes a considerable part of the education of their females, and seems to take the place of dancing among us. In Spain, whole cities challenge each other at *chess*, and it has been much in use in most parts of Europe.

John of Salisbury relates, that in a battle between the French and English in 1117, an English knight seizing the bridle of Louis le Gros, and crying to his comrades, *the king is taken*, that prince struck him to the ground with his fauchion, crying, *No, sir knight, you were to say, I put you check!* *Dic sic non capitur rex, sed, Rex mihi cedit, vel vincit.* The reason is, that when the king is reduced to such a pass, that there is no way for him to escape, the game ends, without capturing the royal piece by further advance.

Lydgate, a monk of St. Edmund's Bury, calls it the game royal. It was anciently of such repute in Ireland, that some of their best estates depended upon it; and it was a condition whereby two noble families enjoy their lands, that the one engages the other every year in this game: and the Italians have been so much addicted to it, that a father, who has died before the conclusion of a game at *chess*, has bound his son to finish it; and the same custom is said to obtain among the Germans. See Hyde, ubi supra, sect. 3. page 8.

Cardinal Cajetan, and other casuists, rank *chess* in the number of prohibited games, as requiring too much application; and Montaigne blames it as too serious for a game.

In this game each player has eight gradated pieces, viz. a king, a queen, two bishops, two knights, and two rooks, and also eight pawns, which are commonly called *pieces*, q. d. *minor*, and reside in different stations, and of various materials, chiefly of wood in these. Their pieces are distinguished by being painted in white and black colours.

As to their disposition on the board, the white king is to be placed on the fourth black house from the corner of the board, in the left and lowermost rank; and the black king is to be placed on the fourth white house on the opposite, or adverse's side of the board. The queens are placed next to the kings, on houses of their own colour. Next to the king and queen, on each hand, place the two bishops, next to them, the two knights, and last of all, on the corners of the board, the two rooks. As to the pawns, they are placed, without distinction, on the second rank of the board, one before each of the dignified pieces.

Having thus disposed the men, the order is commonly begun by the pawns, which at each throw are moved in their own file, one house at a time, except the first move, when they may advance two houses, but they never move backwards: the manner of their taking the adverse's men is figurative, in the next house forward where having captivated the enemy, they move forward to it. The rook goes forward or retrograde through the whole file, and back again. The knight hops backward and forward to the next house, two one, of a different colour, with a riding march, or gallop, and thus kills his enemies that fall in his way, or guards his friends that may be exposed on that side. The bishop is always in the same colour of the field which he was placed in at first, forward or backward, about in diagonal lines, as far as he pleases. The queen's walk is more universal, as she takes all the steps of the five mentioned pieces, excepting that of the knight; and as to the king's motion, it is one house at a time, and that in any direction. As to the value of the different pieces, next to the king is the queen, after her the rooks, then the bishops, and last of all the knights. The difference of the worth of powers is not so great as that all noblemen, however, the king's bishop's pawn is the best, and therefore particular care is taken of him. It ought also to be observed, that, whereas any man may be taken, when he hops into the house of any of the adversary's pieces, it is otherwise with the king, for when a check is given to him, he is obliged with the word *check* (*echec*) to remove himself to another, out of which he must move, and if he cannot move without exposing himself to a similar inconvenience, it is *check-mate*, and the game is lost.

CHESS-*trees*, in *Ship-Building*, are two small pieces of timber with a hole in them, placed on each side of the ship, and placed as far before the main-mast as the length of the main-beam; their use is to confine the clue of the main-sail, and for this purpose a rope goes through, that usually extends the clue of the sail to the yard-arm.

CHEST, in *Medicine*, that part of the body which contains the heart and lungs. See Breast and Thorax.

CHEST, in *Commerce*, a kind of measure, containing an uncertain quantity of several commodities.

A *chest of sugar*, e. g. contains from ten to fifteen hundred weight; a *chest of soap*, from 400 to 800 lbs.; of *Castile soap*, from two and a half to three hundred weight; *of indigo*, from one and a half to two hundred weight; five *chests* to the hundred.

CHEST *at Chatham* was established in 1588, for the benefit of maimed and superannuated English mariners, out of which pensions are paid to such for their lives. This fund was at first raised by a voluntary monthly contribution of the mariners out of their pay, and afterwards made perpetual by queen Elizabeth.

CHESTNUT, *Castanea*, from *Castana*, a city in Thessaly, where this tree anciently grew in great plenty; in *Botany*, is ranged by Linnæus in the class of *monoecia polyandria*, and places it in the genus of *fagus* or BEECH. Its characters are these: it hath male and female flowers on the same tree, sometimes in separate stillaments, at other times near each other. The male flowers form a sort of catkin, have no petals, but instead about five or twelve

bristly

thrifty manner. The female flowers grow one leaf, divided into four parts, having no petals, but a germen fixed to the embolmentum, which becomes a roundish fruit armed with soft spines, including one or more nuts. There are three species.

The *chestnut tree* is a tree which deserves our care as much as any of the trees which are propagated in this country, either for its ufe or beauty; being one of the best trees of timber, and affording a good fhade. It will grow to a great fize, and fpread its branches finely, on every fide, where it has room. The leaves are large, of a bright green, nor are they fo liable to be eaten by inſects as thoſe of the oak. There is no better food for deer, and many other animals, than the nuts, which moſt of them prefer to acorns; yet they ſhould not be planted near habitations, becauſe when they are in flower they emit a diſagreeable odour, very offenſive to moſt people. Some remains of old decayed *chestnuts* in Enfield chaſe plainly prove that this tree is not ſo great a ſtranger to this climate as many people believe. Dr. Ducarel maintains, in his Anglo-Norman Antiquities, that they are indigenous, or native trees of this iſland: for this purpoſe he alledges, that many of our old buildings in London, and other places, contain a great quantity of this timber; that ſeveral trees were familiarly known to the Saxons, and that they are very common ſtill in ſeveral parts of England, particularly in the ſouth-eaſt part of Kent; and that remains of them are ſeen in the foreſt of Dean and elſewhere. The Hon. Mr. Daines Barrington has controverted this opinion. See on this ſubject, Phil. Tranſ. vol. lxx. N° 5. and vol. lxi. N° 17, 18, 19, and 20.

Chestnut trees may be cultivated in England, to afford good profit with any of the large timber trees; the wood being of equal value with the beſt oak, and for many purpoſes far exceeding it. It is particularly good for timber in all cases of ſtrain, having a property, when under the moſt violent preſſure, of unbending its bulk conſiderably, without ſnapping or ſwelling, as other timbers are apt to do; and is poſſeſſed of the large cells or pores which, in a leſſer degree, are the cauſe of the toughneſs of the aſh, and many other purpoſes. In genuine ſituations for timber, the trees may remain timber wherever they ſtand. It is alſo a very valuable tree for coppice wood under proper circumſtances, being long-lived, and a moſt excellent ſhoot. The trees are propagated by planting the nuts in February, in beds of freſh mellow earth. The beſt nuts for planting are thoſe that are brought from France or Spain, which are commonly ſold in winter for eating; becauſe they are not ſo liable to be killed, which is frequently done by forcing them, to prevent their ſprouting in the ſhell. The nuts ſhould be ſown ſoon in the ſpring, about ſix inches aſunder, and the ſeedlings may remain two years in the ſeed-bed, the ſtronger they are tranſplanted, the better they will ſucceed.

See an ingenious and effectual method of preſerving *chestnut*, delivered by Mr. Ellis. Phil. Tranſ. vol. li. part 1. p. 213. an. 1759.

CHESTNUT, *horſe*, *Hippocaſtanum*, MOCELLA, *in Botany*. Its characters are theſe: the embalmentum of the flower is ſlightly cut into five ſegments, the flower is compoſed of five unequal petals, folded at their border, and waved; and it has ſeven ſtamina. The embalmentum becomes a thick, roundiſh, echinated capſule, opening into three cells, in one or two of which are lodged globular ſeeds. We have but one ſpecies.

The *horſe chestnut* was brought from the northern parts of Aſia about the year 1550, and ſent to Vienna about the year 1588.

As this tree is quick in its growth, ſo in a few years it will arrive to a ſize large enough to afford a good ſhade in ſummer, as alſo to produce plenty of flowers. Trees raiſed from nuts, have in twelve or fourteen years become large enough to ſhade two or three chairs under the ſpread of the branches; and have been covered with flowers in the ſeaſon. But the wood is of little value. In Turkey the nuts of this tree are ground, and mixed with the proviſion of their horſes, eſpecially thoſe which are troubled with coughs, or are broken winded: in both which diſorders they are ſaid to be counted very good.

M. Bauman, a gentleman of Anjou, gave them, mixed with other food, to his cows; and they increaſed the quantity of milk, without injuring its quality: and he aſſureth us, that if they were blanched and roaſted, or otherwiſe prepared, they might be given to hogs and poultry. Memoirs of the Royal Society of Agriculture at Turin, vol. i. p. 121.

Dr. Jac. Cunichelli aſſures, that after a great many trials he has found the bark of *hippocaſtanum* to have the ſame effect as the PERUVIAN *bark*.

The *horſe chestnut* is employed for the purpoſe of bleaching yarn in France and Switzerland; and it is recommended in the Memoirs of the Society of Berne, vol. ii. part 2, as capable of exceſſive uſe in whitening not only flax and hemp, but alſo ſilk and wool. It contains an aſtringent ſaponaceous juice, which is obtained by grating the nuts, and grinding or raſping them. They are then mixed with hot rain or running water, in the proportion of twenty nuts to ten or twelve quarts of water. Woollen cuts and ſtockings were boiled in this water, and took the dye extremely well; and ſucceſsful trials were made of it in fulling ſtuffs and cloths. Linen waſhed in this water takes a pleaſing fine blue colour: and the ſtatement of hemp ſteeped in it for ſome days, were eaſily ſeparated. The author of the memoir above referred to, imagines, that if the meal of the *chestnut* could be made into cakes or balls, it would anſwer the purpoſes of ſoap in waſhing and fulling. This ſediment, after infuſion, lies in bitter paſte, and becomes good food for horſes when mixed with bran. The Edinburgh College have admitted the *horſe chestnut* into the pharmacopœia, upon the recommendation of Dr. Grainger, who ſays that the eye or inner grains of the powder ſnuffed up the noſtrils in the evening, operate next morning as an excellent ſternutatory, and thereby gave very little pain to obſtinate inflammations of the eyes.

CHESTNUT, *Xanthe ſhrubby horſe*, *Pavia*, in *Botany*. This genus is joined to *æſculus* in the Linnæan diſtribution. Its characters are theſe: the flower has a ſmall empalement of one leaf, indented in five parts at the edge: it has five roundiſh petals, erect and placed by their baſes, and narrow at their baſe, which are inſerted in the empalement. It hath eight ſtamina, which are reflexed, as long as the petals; terminated by oblong antheræ, and a roundiſh germen ſtanding upon an awl-ſhaped ſtyle, crowned by an acuminated ſtigma. The germen afterward becomes an oval, pear-ſhaped, leathery capſule, with three cells, in which is ſometimes one, and at others two, almoſt globular ſeeds.

This plant grows naturally in Carolina, and the Braſils; from the firſt, the ſeeds were brought to England, where the plants have been of late years much cultivated in the gardens. The tree may be propagated by layings, ingrafting it upon the common *horſe chestnut*, which is the uſual method practiſed by the nurſerymen; but the trees, thus raiſed, produce but a good appearance longer for the ſtock of the common *horſe chestnut* will be more than twice the ſize of the other, and frequently put out ſhoots below the graft; and ſometimes the grain are blown out of the ſtocks, after the trees grow to a conſiderable ſize. Theſe ſtocks render the trees hardy, and of large growth.

CHESTNUT, *Indian red*. See MEDIA.

CHEST-ROPE, in a ſhip, is the ſame with the gueſs or gilt rope, and is added to the baſs rope, when the beaſt is towed at the ſtern of the ſhip, to keep her from *theering*, *i. e.* from ſwinging to and fro.

CHEVAGE, or CHIEVAGE, according to Bracton, ſignifies attribute by the head; or a kind of poll-money, anciently paid by ſuch as held lands in villainage, or otherwiſe, to their lords, in acknowledgment.

The word is formed of the French, *chef*, head.

The word ſeems alſo to have been uſed for a ſum of money given to a man of power, for his patronage and protection, as to a chief, head, or leader.

In the laſt ſenſe, Coke obſerves, there is ſtill a kind of *chevage* ſubſiſting in Wales, called *wardſ*; paid to the prince of Wales for the marriage of his daughters anciently by all, now only by ſome. Lambard writes it *chevage*. The Jews allowed to live in England, long paid *chevage* or poll-money, *viz.* three-pence per head: it was paid in Kaine.

CHEVAL *de friſe*, in *Fortification*, a large piece of timber, either round or cut into ſeveral faces, pierced, and traverſed with wooden ſpokes, armed or pointed with iron like a ſpear or ſword-blade. See *Plate Fortification*.

The term of French origin, ſignifies a *friſeland horſe*, as having been firſt invented in that country. It is alſo called a *turnpike*, or *tarnpike*.

Its uſe is to defend a paſſage, ſtop a breach, or make a retrenchment to ſtop the cavalry.

It is ſometimes alſo mounted on wheels, with artificial fires, as muſkets in an affault.

Errard obſerves, that the prince of Orange uſed to incloſe his camp with *chevaux de friſe*, placing them over one another.

On a medal of Licinius, is found a kind of *cheval de friſe*, made with ſpikes interpoſed; ſerving to expreſs a fortified camp.

CHEVALER, in the *Manege*. A horſe is ſaid to *chevale*, when, in paſſaging upon a walk, or a trot, his fat fore-leg croſſes or overlaps the other fore-leg every ſecond time or motion.

CHEVALIER, a French term, ordinarily ſignifying a *knight*.

The word is formed of the French, *cheval*, *horſe*, and that of the Latin *caballus*.

It

It is *used*, in *Heraldry*, to signify any *cavalier*, or horseman armed at all points; by the Romans called *cataphractus equus*, now out of use, and only to be seen in coat armour.

CHEVAN. See CHEUN.

CHEVANTIA, in our *Old Law Writers*, is used for a loan, or advance of money upon credit.

CHEVAUX *de frise*. See CHEVAL *de frise*.

CHEVELLE, a term used by the *French Heralds* to express a head where the hair is of a different colour from the rest of the head.

CHEVILS, or KEVELS, *in Ship-building*. See KEVELS.

CHEVIN, a name used in some parts of England for the CHUB. See CAPITO, and FISHING.

CHEVISANCE, in the *Law of England*, is said to be an agreement, or composition, or bargain between a creditor and debtor; but it seems chiefly to denote an indirect gain, in point of usury, &c. In our statutes it is often mentioned, and most commonly used for an unlawful bargain or contract. See the statutes against usury, anno 12 Anne.

The word is said to be derived from the law French *chevir, to come to the end, or finish any thing*; in the same sense as the modern French use *achever*.

CHEVRETTE, in *Artillery*, an engine to raise guns or mortars in their carriages: it is made of two pieces of wood of about four feet long, standing upright upon a third, which is square: they are about a foot asunder, and pierced with holes exactly opposite to one another, having a bolt of iron, which being put through these holes, higher or lower as occasion requires, with a hand-spike, which takes in pole over this bolt, to raise any thing to force.

CHEVRON, or CHEVERON, in *Heraldry*, one of the honourable ordinaries of a shield; representing two rafters of a house joined together, without any division.

It descends from the chief toward the extremities of the coat, in form of a pair of compasses half open. This, he bears gules, a *chevron* argent. See *Tab. Heraldry*, *fig.* 10.

The *chevron* is the symbol of protection, say some; or of constancy, according to others: some say it represents the knight's spurs; others, the head attire of priestesses; others, a piece of the bit, or the barriers or fence of a park.

When it is alone, it should take up the fifth part of the field, according to Leigh; and according to others, a third part: when it is accompanied with any other bearings, its breadth must be adjusted thereby.

It is borne divers ways; sometimes in chief, sometimes in bale, sometimes enarched, sometimes reverted, &c. The *chevron* is sometimes charged with another *chevron*, one third of its own height.

Two *chevrons* are allowed in the same field and no more: when they exceed that number, they are called *chevronels*, or *chevronels*. There are *chevrons* of several pieces. A *chevron* is said to be *abased*, when its point does not approach the head of the chief, nor reach farther than the middle of the coat: *maimed*, when it does not touch the extremes of the coat: *clouen*, when the upper point is taken off, so that the pieces only touch at one of the angles: *broken*, when one branch is separated into two pieces: *couched*, when the point is turned towards one side of the escutcheon: *divided*, when the branches are of several metals, or when metal is opposed to colour: and *inverted*, when the point is towards the point of the coat, and its branches towards the chief.

A coat is said to be *chevronned*, when it is filled with an equal number of *chevrons*, of colour and metal.

Counter-chevroned, is when it is so divided, as that colour is opposed to metal, and *vice versâ*.

Per CHEVRON, or *Party per* CHEVRON, is when the field is divided by only two single lines, rising from the two base points, and meeting in a point above, as the *chevron* does.

CHEVRONEL, a diminutive of *chevron*; and, as such, only containing half a *chevron*.

CHEVRONNE, or CHEVRONNY, signifies the parting of the shield, several times *chevronwise*: Gibbon says, *chevronwise of six*.

CHEWING-*balls*, a sort of balls contrived for horses to chew, not to swallow at once; not intended as food, but as incentives to appetite; and on other medicinal occasions very useful to the creature. The receipt now most esteemed for these balls is this: take liver of antimony, and of all spirits, of each one pound; wood of the baytree and juniper wood, of each half a pound; pellitory of Spain, two ounces: let all these be powdered together; then add as much fine grape-sugar as is necessary to make the whole into a paste. This is to be formed into balls of about an ounce and a half weight, which are to be dried in the air. These are the *chewing-balls*, and are to be used, one at a time, in the following manner. The ball is to be wrapped up in a linen rag, and a thread is to be fastened to this, in such a manner that it may be tied to the bit of the bridle; and kept in the mouth: when the bridle is taken off, the horse will immediately eat; and when one ball is consumed, another is to be tied up, and put in its place, till the intent is answered.

CHIA *terra*. See TERRA *chia*.

CHIAN *marble*. See MARBLE.

CHIAOUS, an officer in the grand signior's court, doing the business of an usher.

The word, in the original Turkish, signifies *envy*.

He bears arms offensive and defensive, and has the care of prisoners of distinction. His badge is a staff covered with silver; and he is armed with a scimiter, bow, and arrows.

The emperor usually chooses one of this rank to send as ambassador to other princes.

The *chiaous* are under the direction of the *capidgi-bachi*, an officer who assists at the divan, and introduces those who have business there.

CHIARO *scuro*, or *obscuro*, among *Painters*. See CLAIR-*obscure*.

CHIASMUS, in *Ancient Greek Medical Writers*, is the concourse or meeting of any two things under the form and figure of a croſs, or the letter X, which it is named. The adverbs *across*, and *crosswise*, signify the same thing: thus the optic nerves are laid to meet *crosswise*, so as to cross each other.

CHIASTON, the name of a bandage in *Chirurgery*, so called from its resembling a cross, or the letter X.

CHIASTOS, in *Rhetoric*, the same with what is otherwise called HISTERON.

CHIAUSI, among the *Turks*, officers employed in executing the vizirs, bashaws, and other great men's orders for doing which the grand signior sends them wrapped up in a black cloth, on the reception of which they immediately perform their office.

CHICANE, or CHICANERY, in *Law*, an abuse of judiciary proceeding, tending to delay the cause, and deceive or impose on the judge, or the parties.

Some derive the word from *cicinia*, *the fun of a common-mother*; whence the Spaniards form their *cicio*, *cicla*, *fimbre*; *thinking* being convenient about trifles.

The French call solicitors, attorneys, &c. *gens de chicane*.

CHICANE is also applied, in the schools, to vain sophisms, distinctions, and subtilties, which immortalize disputers, and obscure the truth: as the arcana of courts does justice.

CHICH *pea*. See *Chick*-PEA.

CHICHLING *vetch*. See VETCH.

CHICKEN, in *Ornithology*, the young of the gallinaceous order of birds, and especially of the common hen.

Chickens require no meat for two days after they are hatched; and they are first fed with bread crumbled very fine, or steeped in milk, and the crumbs of white bread and barley acquire strength, with curds, cheese-parings, &c. Grits or groats, chopped with their food will prevent them from the rot; and other additions of the kind, as one should be taken to furnish them with a proper supply of clean water. In order to have fat capon'd *chickens*, they should be cooped up when the hen hatches them, and fed with wheat-meal mixed with milk, and made into a paste: this diet will fatten them in about a fortnight. See COCK, FOWL, and HATCHING.

CHICKEN-*pox*. See POX.

CHICKWEED, *Alsine*, in *Botany*, the name of a very large genus of plants; for the characters of which, see ALSINE.

The *alsine* is a medicinal plant, called also *morsus gallinæ*, *pellitory sauvage*, on account of its being much covered by poultry.

The word is *saxon*, formed of *weoxan*, a weed, or grass, on account of this plant's delighting chiefly to grow in shady places.

Alsine is also called *myosoton*, q.d. *mouse-ear*, on account of the resemblance its leaves bear to the ears of that animal.

It is held a cooler, calmer, thickener, &c. in most respects resembling pellitory of the wall; though now little used in medicine.

Some commend its distilled waters against fevors of the blood, and consumptions of the body, arising from heat, &c. The herb bruised in linseed oil, and externally applied to the belly, is said to relieve the iliac pain.

CHICKEN-WEED, *African*. See MOLLUGO.

CHICKWEED, *berry-bearing*, *Canadense*, in *Botany*, a genus of the *decandria trigynia* class. Its characters are these: the flower has five petals, with nails as long as the empalement, but spread open at the top, and two stamina, five of which are alternately inserted in the tail of the petals,

petals, in the centre is situated an oblong germen supporting three styles. The empalement becomes a pointed close capsule with three cells, opening at top into five parts, and filled with many roundish seeds. According to Miller, there are thirteen species; but according to Tournefort, only one. Linnæus enumerates fifteen species.

CHICKWEED, *great*, *Stellaria*, in *Botany*, a genus of the *decandria trigynia* class; having a five-leaved patent calyx, five bipartite petals, and a single-celled polyspermous capsule. There are eight species.

CHICKWEED, *mountain*, *Alsine virgin*, in *Botany*. See MOUSE-*ear*.

CHICKWEED, *mouse-ear*, *Cerastium*. See MOUSE-*ear*.

CHICKWEED, *yellow*, *Alsine*, in *Botany*, a genus of the *decandria trigynia* class: the characters of which are, that the calyx consists of five patent leaves; the corolla, of five entire petals; and the fruit is a capsule containing one cell with several seeds. There are twenty species.

CHICKWEED, *water*. See MONTIA.

CHICORACEOUS, in *Botany*. M. Vaillant divides plants with compound flowers into three classes or families; the *semiflosculosa*, the *scyphiferous*, and the *discoideous*.

CHICUATLI, in *Ornithology*, the Indian name of a bird described by Nieremberg, and by him called *nothus canoris*. Its beak is long, black, and slender; its head is marked with undulated streaks of yellow near the eyes. Its breast and belly are of a whitish colour, and it has some black feathers intermixed with white ones on the throat: its back is variegated with black, yellow, and grey. It is found principally among the mountains; where it generally runs about the ground; it is easily bred in cages, and feeds on any thing that is offered it. It is most frequent in the hotter climates, and is usually fat and nourishing.

CHIEF, a term denoting head, or a principal thing or person. The word is formed of the French *chef*, *head*.

We say the *chief* of a party; the *chief* of a family, &c. Agamemnon was the *chief* of the Greeks who besieged Troy. The Romans sometimes refused triumphs to their victorious generals, because the conduct of the *chief* was not answerable to his success. The abbeys that are *chiefs* of their order are all regular; and it is there the general chapters are held.

CHIEF *baron*. See BARONS and COURT *of exchequer*.

CHIEF, in *Heraldry*, is the upper part of the escutcheon, reaching quite across, from side to side.

The arms of France are, three golden flowers de lys, in a field azure, two in *chief*, and one in point.

CHIEF is more particularly used for one of the honourable ordinaries, placed athwart the top of the coat, and containing one third part of its height. *Tab. I. Heraldry fig.* 41.

When the escutcheon is cut in three, or is reticed, the *chief* stands out prominent beyond the rest; and is supposed to represent the diadem of the ancient kings and princes; or the cusque of the knights.

It is frequently without any ornament; sometimes it is charged with other bearings; sometimes it is of a colour of metal different from that of the coat.

The line that bounds it at the bottom is sometimes straight, sometimes indented, engrailed, embattled, lozenged, &c. Thus, say they, the field is gules, a *chief* argent, &c. Again, he bears, gules, a *chief*, crenelle, or embattled, argent.

Sometimes one *chief* is borne on another; expressed by a line drawn along the upper part of the *chief*: when the line is along the under part, it is called a *fillet*. The first is an addition of honour, the second a diminution.

The *chief* is said to be *abased*, when it is detached from the upper edge of the coat, by the colour of the field which is over it, and which retrenches from it one third of its height. We also say, a *chief* is *chevroned*, *paled*, or *bended*, when it has a chevron, pale, or bend, contiguous to it, and of the same colour with itself. A *chief* is said to be *supported*, when the two thirds at top are of the colour of the field, and that at bottom of a different colour.

In CHIEF. By this is understood any thing borne in the *chief* part, or top of the escutcheon.

CHIEF *justice*, in *Law*. See JUSTICE.

CHIEF *justiciary of England*. See JUSTICIARY.

CHIEF *lord*, denotes the feudal lord, or LORD of an HONOUR, on whom others depend.

CHIEF, *holding in*. See CAPITE, and TENURE.

CHIEF *pledge*, in the time of HEADBOROUGH.

CHIEF *point*. See POINT.

CHIEF *rents*, *Redditus capitales*, in *Law*, denote the rents of freeholders of manors. See QUIT-*rents*.

CHIEFTAIN, the chief leader, or general of an army; or the like.

CHIEPA, in *Ichthyology*, a name used by some authors for the fish more usually known by the name of the *alausa*, and called in English the SHAD, or the mother of herrings. See ALOSA.

CHIFFIR, or CHIFFE, according to Libavius, in the preparation of the philosophers stone, is called *lapis animalis*; as the mineral is called *lapis minerale*. Johnson says, that *the lapis minerale* is by some interpreted *gold*, but that he rather takes it to be any sulphur of the mineraline kind.

CHIFUNG, among the Chinese, the name of an herb found about Canton, by which the fishers pretend to know how many storms will happen every year. This they compute from the number of knots or joints, and from the distances of the knots from the root, they determine what month the storms will fall in.

CHILBLAIN, *Pernio*, in *Medicine*, a tumor affecting the feet and hands; accompanied with an inflammation, pain, and sometimes an ulcer, or solution of continuity: in which case it takes the denomination of *chaps*, on the hands; and *ulcers* on the heels.

Chilblains is compounded of *chill* and *blain*; q. d. a blain, or sore, contracted by cold.

Chilblains are occasioned by excessive cold stopping the motion of the blood in the capillary arteries and superficial veins.

The tumor from white, generally inclines to blueness. For the prevention of *chilblains*, the skin should be rendered firmer by frequent washing and bathing in cold water; the vicious quality of the temperaments or humours which contributes to this disorder, should be corrected by the milder preparations of antimony, and moderate purges. For the cure of *chilblains*, it is usual to wash them with warm brine, spirit &c. but *persoleum*, or warm Hungary water, with spirit of wine camphorated, used with a sponge, are much better. For chaps and ulcers, nothing exceeds the *unguentum diapalmæ rubrum*, or *diapompholigos* mixed with a little camphor; and used, for the dressings, with *emplastrum de minio*, or *ustulatio spodios*, let down with oil of roses.

When these tumors tend to suppuration, it is proper to treat them like other recent abscesses: the best method is still to cleanse the wound with some digestive ointment, then to dress it with balsam of Peru, or other similar application; and, lastly, to apply some of the lead or litharge plasters. Oil of myrrh *per deliquium* is also found of great service in these cases; as is also the applying a compress, dipped in a mixture of equal parts of lime-water, and camphorated spirit of wine over the other remedies.

In people who have been used to be afflicted with *chilblains* at the return of a certain season, it will be found a great preservative against those troublesome tumors, to anoint the parts where they are expected to appear, both before and during the access of the severe cold, with oil of turpentine or petroleum; and, when the disorder first begins to shew itself, it is a very good method to wrap round the affected part a piece of a hog's bladder, well wetted with one or other of those oils: and care must be taken to keep off the cold.

CHILD, a term of relation to parent.

We say, NATURAL *child*, LEGITIMATE *child*, PUTATIVE *child*, BASTARD *child*, ADOPTIVE *child*, POSTHUMOUS *child*, &c.

Dr. Derham computes, that marriages, one with another, produce four *children*, not only in England, but in other parts also. See MARRIAGE.

It is well known that *children*, for some time after they are born, see but very imperfectly; and the best, after taking a great deal of pains to investigate the cause of it, found it to be owing in part to the thickness of their CORNEA, and the small quantity of their aqueous humour. Not that the mere thickness of the cornea could have this effect; but because the thickness is owing to its not being well stretched, and consequently having wrinkles and inequalities on its surface, which occasion an irregular refraction of the light. On the same account also the *cornea* has not a sufficient degree of convexity, to bring the PENCILS of rays to a focus soon enough. All these defects, he shews, are remedied by the encrease of the aqueous humour. See Dr. Priestley's History of Vision, &c. 4to. p. 187.

Dr. Harris has an express treatise Of the Acute Diseases of Children, De Morbis Acutis Infantum. He takes them all to arise from the humours in the *primæ viæ* growing sour, and degenerating into acidities, which is continued from their food, beliches and dejections. Hence, all that is required to cure them, is to combat this acidity; which is to be effected two ways, by supplying it to be evacuated, and by actual evacuation by absorbents, and other gentle purgatives.

To dispel the peccant acid for evacuation, no subsidies or cordials are to be used, those remedies being the vitriolated tartar, magnesia, crabs-eyes and claws, oyster-shells, cuttle-fish bones, egg-shells, chalk, coral, pearls, bezoar, burnt ivory, scrapings of the unicorn's horn, Armenian bole, *terra sigillata*, and *lapis lazuli*; the Gossampine, and the confection of hyacinth: but of all these, he prefers old shells that have lain long on the edge of the sea, exposed to the sun, which is better than any chemical furnace.

Bartholine, Paré, Liceetus, and many other writers, give

an account of a *petrified child*, which has seemed wholly incredible to some people. The *child*, however, which they describe, is still in being, and is kept as a great rarity in the king of Denmark's museum at Copenhagen. The woman who went big with this, lived at Sens in Champaign in the year 1582; it was cut out of her belly, and was universally supposed to have lain there about twenty years. That it is a real human *foetus*, and not artificial, is evident to the eye of any observer: and the upper part of it when examined, is found to be of a substance resembling the gypsum or stone of which they make the plaister of Paris: the lower part is much harder: the thighs and buttocks being perfect stone, of a reddish colour, and as hard as common quarry stone: the grain and surface of this part appear exactly like that of the calculi, or stones taken out of human bladders; and the whole substance examined were so neatly, and felt ever so carefully, appears to be absolute stone. It was carried from Sens to Paris, and there purchased by a goldsmith of Venice; and Frederick the Third, king of Denmark, purchased it at Venice of this man for a very large sum, and added it to his collection of rarities. Phil. Trans. N° 285, p. 2400. See INFANTS.

Children, besides the honour and reverence which they owe to their parents, ought likewise to contribute to their support, when they need assistance. The Athenian laws obliged all *children* to provide for their *father*, when reduced to poverty; with an exception to spurious *children*, to those whose chastity had been defiled by consent of the father, and to those who had not been put into any way of gaining a livelihood. Our laws agree with those of Athens in the first particular; but in the other cases, a *child* is compellable by *stat.* 43 Eliz. c. 2. if able, to provide for a wicked and unnatural progenitor. Blackst. Comm. vol. i. p. 453. See PARENT, &c.

CHILD-*bed*. } See DELIVERY.
CHILD-*birth*. }

CHILDREN, *exposing of*. See EXPOSING.

CHILDREN, *naming of*. See NAME.

CHILDREN, *overlying of*. This is a misfortune which frequently happens; to prevent which, the Florentines have contrived an instrument called ARCUTIO.

CHILD-*wite*, a power to take a fine of a bond-woman unlawfully gotten with *child*; that is, without consent of her lord.

Every reputed father of a *base* child, got within the manor of Writtel in Essex, pays to the lord, for a fine, 3*s.* 4*d.* where, it seems, *child-wite* extends to free, as well as bond-women.—*Quicunque fecerit* child-wite, *archiepiscopus aut vicus, aut similiter emendationis partem habebit, quicunque ejus de* child-wite. Du Cange.

CHILDREN, *charity*. See CHARITY-*school*, and HOSPITAL.

CHILDERMASS *Day*, called also *Innocents-Day*, an anniversary feast of the church, held on the 28th of December, in memory of the *children* of Bethlehem, massacred by order of Herod.

CHILIAD, an assemblage of several things ranged by thousand.

The word is formed of χιλιας, *mille*, *a thousand*.

CHILIAGON, in *Geometry*, a regular plane figure of 1000 sides and angles. We can easily demonstrate, that the sum of all its angles is equal to 1996 right ones: for the internal angles of every plane figure are equal to twice as many right angles as the figure hath sides, except those four, which are about the centre of the figure, from whence it may be resolved into as many triangles as it has sides. The author of L'Art de Penser, p. 44. 45. brings this instance to shew the diffinction between imagining and conceiving. See NOTION.

CHILIARCHA, or CHILIARCHUS, an officer in the armies of the ancients, who had the command of a thousand men. The word comes from χιλιοι, *a thousand*, and αρχω, *command*.

CHILIARTA, in *Church-History*, the fame with MILLENARII.

CHILIASTS. See MILLENARII.

CHILMINAR, CHELMINAR, or TCHELMINAR, the noblest and most beatiful piece of architecture remaining of all antiquity: being the ruins of the famous palace of Perfepolis, to which Alexander the Great, being drunk, fet fire, at the perfuafion of the courtezan Thais.

Authors and travellers are exceedingly minute in their defcriptions of the *Chilminar*; particularly Gracias de Silva Figueroa, Pietro de la Valle, Chardin, and Le Brun. A general idea thereof may be conceived as follows:

There appear the remains of near fourfcore columns; the fragments whereof are at leaft fix feet high: but there are only nineteen that can be called entire: with a twentieth all alone, 150 paces from the reft.

A rock of black hard marble ferves for the foundation of the edifice. The afcent to the firft plan of the building is by fourfcore and fifteen fteps, cut in the rock. The gate of the palace is twenty feet wide; on one fide is the figure of an elephant, and on the other of a rhinoceros, each thirty feet high, and of a fhining marble; near thefe animals are two columns; and not far off the figure of a Pegafus.

After this gate is paffed, there are found a great number of columns of white marble; the remains whereof fhew the magnificence of the work: the fmalleft of thefe columns is fifteen cubits high, the largeft eighteen; each has forty flutings, three inches broad; whence the height of the whole may be guefſed at, with the other proportions. Near the gate is an inſcription on a fquare piece of marble, fmooth as glafs, containing about *twelve lines*: the characters are of a very extraordinary figure, refembling *triangles* and *pyramids*.

Thefe noble ruins are now the fhelter of beafts, and birds of prey. Befides the inſcription above mentioned, there are others in Arabic, Perfian, and Greek. Dr. Hyde obſerves, that the inſcriptions are very rude and inartful; and that fome, if not all of them, are in praiſe of Alexander the Great; and therefore are later than that conqueror.

M. Le Brun took his voyage to the Eaſt Indies, merely for the ſake of viewing the *Chilminar*.

CHILON, among the *Greek Phyſiologers*, one who has great *lips*, called by the Latins *labeo*. Thus alſo among the ſpecies of ſiſhes, under the claſs of *cepiformes*, ſome are called *chilones*, that is, *labeones*.

CHILTENHAM *water*, contains a neutral purgative ſalt, ſomewhat reſembling Glauber's *ſal mirabile*. It contains no alcaline or acid ſalt, no iron, copperas, or ſulphur. Theſe waters are thought uſeful in lax conſtitutions, where the humours are alcaleſcent, but hurtful when acefcent. See Phil. Tranſ. N° 461. ſect. 21. and the remarks. See WATER.

CHIMALATH, in *Botany*, a name given by ſome authors to the great *ſtramonia ſolis*, or ſun-flower.

CHIMERA, or CHIMERA, a fabulous monſter, which the poets feign to have the head or breaſt of a lion, the belly of a goat, and the tail of a dragon; and to have been killed by Bellerophon, mounted on the horſe Pegaſus.

The foundation of the fable is this: that anciently in Lycia, there was a volcano, or burning mountain, of this name; the top whereof, which was deſert, only inhabited by lions: the middle, having good paſtures, was frequented by goats; and the foot, being marſhy, by ſerpents. Thus Ovid:

——medio in partibus hircus,
Pectus & ora leæ, caudam ſerpentis habebat.

Bellerophon being the firſt who cauſed this mountain to be inhabited, it was feigned he ſlew *Chimera*. Pliny ſays, the fire thereof would burn in water, and could be extinguiſhed with nothing but earth, or dung.

CHIMERA is uſed in *Writers of the Middle Age*, for a kind of veſſel or ſhip. It ſeems to have been leſs than the chelandium.

CHIMES *of a clock*, a kind of periodical muſic, produced at certain hours of the day, by a particular apparatus added to a clock; ſuch as a *chime*-barrel, bells and hammers, &c.

To calculate numbers for the *chimes*, and to fit and divide the *chime*-barrel, it muſt be obſerved, that the barrel muſt be as long in turning round, as you are in ſinging the tune it is to play.

As for the *chime*-barrel, it may be made up of certain bars which run athwart it, with a convenient number of holes punched in them, to put in the pins that are to draw each hammer: by this means, the tune may be changed, without changing the barrel. In this caſe, the pins, or nuts, which draw the hammers, muſt hang down from the bar, ſome more, ſome leſs; and ſome muſt ſtand upright in the bar: the reaſon whereof is, to play the time of the tune rightly. For the diſtance of each of theſe bars may be a ſemibreve; but the uſual way is, to have the pins, which draw the hammers, fixed on the barrel.

For the placing of theſe pins, you may proceed by the way of changes on bells; viz. 1, 2, 3, 4, &c. or rather, make uſe of the muſical notes: where it muſt be obſerved, what is the compaſs of the tune, or how many notes, or bells, there are from the higheſt to the loweſt; and accordingly, the barrel muſt be divided from end to end.

Thus, in the following example, each of the tunes is eight notes in compaſs; and, accordingly, the barrel is divided into eight parts: theſe diviſions are ſtruck round the barrel; oppoſite to which are the hammer-tails.

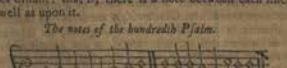
We ſpeak here as if there were only one hammer to each bell, that it may be more clearly apprehended; but when two notes of the ſame ſound come together in a tune, there muſt be two hammers to the bell to ſtrike it; ſo that if in all the tunes you intend to *chime* of eight notes compaſs, there ſhould happen to be ſuch double notes,

holes on *every* bell; instead of eight, you must have fixteen hammers; and, accordingly, you muſt divide the barrel, and ſtrike fixteen ſtrokes round it, oppoſite to each hammer-tail: then you are to divide it round about, into as many diviſions as there are muſical bars, ſemibreves, minims, &c. in the tune.

Thus, the hundredth pſalm tune has twenty ſemibreves, and each diviſion of it is a ſemibreve: the firſt note of it, alſo, is a ſemibreve; and therefore on the *chime*-barrel there muſt be a whole diviſion, from five to five; as you may underſtand plainly, if you conceive the ſurface of a *chime*-barrel to be repreſented by the following tables; as if the cylindrical ſuperficies of the barrel were ſtretched out at length, or extended on a plane: and then ſuch a table, ſo divided, if it were to be wrapped round the barrel, would ſhew the places where all the pins are to ſtand in the barrel: for the dots running about the table, are the places of the pins that play the tune.

Indeed, if the *chimes* are to be complete, you ought to have a ſet of bells to the gamut notes; ſo as that each bell, having the true ſound of *ſol, la, mi, fa*, you may play any tune with its flats and ſharps: nay, you may, by this means, play both the baſs and treble with one barrel: and by ſetting the names of your bells at the head of any tune, that tune may eaſily be tranſferred to the *chime*-barrel, without any ſkill in muſic. But it muſt be obſerved, that each line in the muſic is three notes diſtant: that is, there is a note between each line, as well as upon it.

The notes of the hundredth Pſalm.



A Table for dividing the Chime-barrel *of the hundredth Pſalm.*

CHIMIN, or **CHEMIN**, in *Law*, a road, or way. *See* HIGHWAY and ROAD.

CHIMINAGE, a toll for wayfarage, or paſſage through a foreſt. The ſcotiſts call it *pedagium*.

CHIMNEY, in *Architecture*, a part of a houſe, or lodging, wherein the fire is made.

The word *chimney* comes from the French *cheminée*; and that from the Latin *caminata, a chamber wherein is a chimney: caminata*, again, comes from *caminus*; and that from the Greek καμινος, *a chimney*: cf. καω, κρ, *I burn*.

The parts of a *chimney* are, the jambs, or ſides; the back, or hood; the mantle-tree, reſting on the jambs: the tube, or funnel, which conveys away the ſmoke; the *chimney*-piece, or moulding, on the fore-ſide of the jambs over the mantle-tree; and the hearth, or fire-place.

Palladio ſettles the proportions of a chamber-*chimney* thus: breadth on the inſide, five and a half, ſix, or ſeven feet: height to the mantle-tree, four, or four and a half: depth, two, or two and a half feet.

According to Weliius, the breadth of the aperture, at bottom, ſhould be to the height, as three to two; to the depth, as four to two. In ſmall apartments, the breadth is three feet; in larger, five; in bed-chambers, four; in ſmall banqueting-rooms, five and a half; in large, ſix: but the height is never to exceed two and a half; leſt, there being too much room for the air and wind, the ſmoke be driven down into the room. Nor muſt the height be too little; leſt the ſmoke miſs its way, and be checked at firſt ſetting out. The ſame author adviſes, to have an aperture, through which the external air may, on occaſion, be let into the flame, to drive up the ſmoke; which the internal air would otherwiſe be unable to do.

The mouth of the tube, or that part joined to the *chimney*-back, Felibien owns to be a little narrower than the reſt; that the ſmoke coming to be repelled downwards, meeting with this obſtacle, may be prevented from getting into the room.

Some make the funnel twiſted, to prevent the ſmoke's deſcending too eaſily; but the better expedient is, to make the funnel narrower at bottom than at top; the fire impelling it upward more eaſily when contracted at bottom; and in mounting, it finds more ſpace to diſengage itſelf, and therefore has leſs occaſion to return into the chamber.

To prevent ſmoking CHIMNEYS, M. Locar adviſes two holes, or two pipes, one over the billet, to be left in each ſide of the *chimney*; one ſloping upwards, the other downwards: through one of theſe, he ſays, the ſmoke will paſs in any poſition.

De l'Orme orders a braſs ball full of water, with one ſmall aperture, to be hung up in the *chimney*, at a height a little above the greateſt flame: here, as the water grows hot, it will rarefy, and drive through the aperture in a vapory ſteam, which will drive up the ſmoke that would otherwiſe linger in the funnel.

Others place a kind of moveable vane, or weathercock, on the top of the *chimneys* ſo that what way ſoever the wind comes, the aperture of the *chimney* will be ſcreened, and the ſmoke have free egreſs: but, in truth, the beſt prevention of a ſmoking *chimney* ſeems to lie in the proper ſituation of the doors of the room, and the air falling back of the back, and convenient gathering of the wings and breaſt of the *chimney*. The following general regulations relate to the conſtruction of *chimneys*. No *chimney* is to be built on the timbers of the floors, but on brick or ſtone, or on ſtone corbels or iron brackets, or iron bores ſupported by brick, or ſtone foundations. No breaſt of any *chimney* is to be turned over on wood, but to be ſupported by an iron bar, or brick or ſtone arch. All *chimneys* muſt have brick trimmers before them at leaſt eighteen inches broad, with flabs or foot-paces on them of the ſame breadth, and ſix inches longer at each end, than the opening of the *chimney* when finiſhed. No timber ſhall be laid in any wall nearer than nine inches to any *chimney*, or than five inches to any flue, or than eighteen inches to the ſurface of the hearth. The outſide of *chimneys* and flues in PARTY-walls next to vacant ground muſt be lime-whited, or otherwiſe diſtinguiſhed, as ſoon as any building is erected againſt the ſame.

Chimneys are uſually ſuppoſed a modern invention; the ancients only making uſe of ſtoves: but Octavio Ferrari endeavours to prove *chimneys* in uſe among the ancients. To this end, he cites the authority of Virgil:

Et jam ſumma procul villarum culmina fumant.

And that of Appian, who ſays, "That of thoſe perſons "proſcribed by the triumvirate, ſome hid themſelves in "wells, *cloacæ*, and common-ſewers; ſome in the tops of "houſes, and *chimneys*:" for ſo we underſtand κατυπερθε καπνοδοκης. *ſumaria ſub tecta poſita*. Alſo, that Ariſtophanes in one of his comedies, introduces his old man, Polycrion, that up in a chamber; whence he endeavours to make his eſcape by the *chimney*. However, the few inſtances remaining among the ancients, together with the obſcurity of the rules of Vitruvius on this head, make us rather conclude the uſe of ſtoves, whereof the ancients had entire apartments, induced them to neglect this part of building, which the coldneſs of our climates obliges us to have a principal regard to.

In the year 1709, there appeared a French book, entitled La Mechanique du Feu, or the art of augmenting the effects, and diminiſhing the expence, of fire, by M. Gauger; ſince publiſhed in Engliſh, by D. Defaguiers: wherein the author examines what diſpoſition of *chimneys* is moſt proper to augment the heat; and proves geometrically, that the diſpoſition of parallel jambs, with the back inclined as in the common *chimney*, is leſs fitted for reflecting heat into the room, than parabolical jambs, with the bottom of the tablet horizontal.

He gives ſeven leveral conſtructions of his new *chimneys*, in which there are hollow cavities made by iron plates in the back, jambs, and hearth, through which plates the heat paſſing, warms the air in thoſe cavities, which is continually coming into the room freſh and warm; and the manner of executing them.

M. Gauger, however, does not appear to be the firſt inventor of the *chimney* he deſcribes; the deſcription of a like *chimney* being found in a German book, printed at Leipſick in 1699. See FIRE-PLACES and STOVES.

CHIMNEY-*jambs*, are the ſides of a *chimney*, uſually ſtanding out perpendicularly, ſometimes circularly, from the back; on the extremities whereof the mantle-tree reſts.

CHIMNEY-*money*, or *hearth-money*, a tax impoſed by ſtatute 13 and 14 Car. II. c. 10. expreſſing, that every fire-hearth, and ſtove of every dwelling, or other houſe, within England and Wales, except ſuch as pay not to church and poor, ſhall be chargeable with two ſhillings *per ann.* payable at Michaelmas and Lady-day, to the king and his heirs. But this tax was declared to be an oppreſſion and badge of ſlavery, and accordingly abolliſhed by ſtat. 1 W. and M. c. 10. and the window-tax eſtabliſhed in its room. See FUAGE and WINDOW-TAX.

CHIMNEY-*piece*, in *Building*, a compoſition of certain mouldings, of wood or ſtone, ſtanding on the fore-ſide of the jambs, and coming over the mantle-tree.

CHIMPANZEE, in *Natural Hiſtory*, the name of an Angolan animal, very much approaching to the human figure; but of a fierce diſpoſition, and remarkably miſchievous. In the year 1738, we had one of theſe crea-

tures brought over into England, by the captain of a ship in the Guinea trade; it was of the female sex, and was two feet four inches high: it naturally walked erect, and was hairy on some part of the body and limbs, and of a strong muscular make. It would eat very coarse food, and was very fond of tea, which it drank out of a cup with milk and sugar, as we do; it slept in the manner of the human species, and in its voice made some imitation of the human speech, when people speak very hastily, but without any articulate sounds. The males of this species are very bold, and will fight a man, though they see him armed. It is said that they often set upon, and ravish the negro women, when they meet them in the woods. The creature we saw here was but about twenty months old, and very tame; the parent had it in her arms in the country, and did not part with it till she was killed with a spear by one of the Moors: she was five feet high. Act. Eruditor. Germ. ann. 1739. See Orang-outang.

CHINA, China-ware, a fine sort of earthen ware, properly called porcelain.

China, gilding on. See Gilding on China.

China, paste. See Paste.

China, broken, a cement for. See Cement.

China-China, a name sometimes given to the quinquina, or Peruvian bark. See Cortex Peruvianus, and Quinquina.

China-root, a medicinal root, brought from the East Indies; and lately also from Peru, and New Spain.

It is of a ruddy brown colour, bordering on black, without-side; and white, or reddish, within. It grows chiefly in fenny places, usually covered with the sea; which, upon its withdrawing, leaves great quantities thereof on the shore. The best is that which is firm, ruddy, and fresh.

It is supposed to be the root of a rough sort of smilax, called lampatam in China, where it grows plentifully; and being exported thence, is called China.

It is esteemed a sweetner of the blood; and used as such in decoction, in venereal and scorbutic cases.

It has indeed been a generally received opinion for a considerable time past, that China-root is of service in the gout, sciatica, oedematous tumors, struma, imbecility of the stomach, hemicranias, and in ulcers of the veins and bladder; but to be of little effect in the lues: or if it be perhaps of any use, yet to be far inferior in virtue to guaiacum.

CHIN-COUGH, a disease which children are chiefly subject to. It consists in a violent and immoderate coughing, to a danger of suffocation.

In the chin-cough, Dr. Huxham uses the common evacuations, and proposes to correct the ferror of the blood, and to strengthen the nerves and stomach by mercurials, the cortex, and proper stomachics.

Dr. Burton declares against bleeding, vomiting, and purging in the chin-cough, except in very urgent cases; the medicine which he says has had great success, is a scruple of fine powder of cantharides, and as much camphor, mixed with three drams of the extract of Jesuits bark. Of this mixture he gives eight or nine grains to children every third or fourth hour, in a spoonful of some simple water, or some julep, in which a little balsam of capivi had been dissolved. He says this method is not proper in such chin-coughs as proceed from thin sharp rheum; but, he believes, that in the chin-cough from a tough viscid phlegm, it will scarce ever fail, at least it has not failed yet. Med. Ess. Edinb.

As this disease arises from obstructed perspiration, and a relaxation of the solids, its cure must depend on cleansing and strengthening the stomach, bracing the solids, and, at the same time, promoting perspiration and the different secretions. The diet, therefore, should be light, and easy of digestion: the drink should be hyssop or penny-royal tea, sweetened with honey or sugar-candy; or small wine whey. One of the most effectual remedies is change of air. When the disease is violent, and there is any danger of an inflammation of the lungs, or suffocation, repeated bleeding may be proper. Small doses of ipecacuanha should be administered in this disorder. The preparations of rhubarb should also be used, in order to keep the body open. Oily and balsamic medicines, though often exhibited, should be avoided. Millepedes, bruised and infused in small white wine, have been much recommended. Two ounces of these should be allowed to a pint of wine, and a table-spoonful taken three or four times a day. Opiates, as a little of the syrup of poppies, or five, six, or seven drops of laudanum, may be occasionally repeated, to allay the violence of the cough. The feet should be occasionally bathed in luke-warm water, and a Burgundy pitch plaster kept between the shoulders. If the disease continues, unattended with a fever, the bark and other bitters are proper medicines. Buchan's Domestic Medicine, ed. 5. p. 303, &c.

CHINE, in the *Manege*, is used for the back-bone, or the ridge of the back of a horse. The French call it *échine*; and the ancient Italian masters *espine*.

CHINESE *Chronology*. See Chronology.

Chinese *Stones*. See Kang.

Chinese or Chinese *Tongue*, the language of the people of China. P. le Comte observes, that the *Chinese* has no analogy to any other language in the world. It only consists of 330 words, which are all monosyllables; at least, they are pronounced so short, that there is no distinguishing above one syllable, or sound, in them. Yet they have four accents, which, by an inflexion of voice, multiply almost every word into four, and give also a harmony and pointed cadence to the most ordinary phrases. Their characters are divided into six sorts: the first exhibiting the shape or image of sensible things; the second indicating the object by some visible addition to the shape or symbol; the third associating two characters to express an object, which neither would denote separately; the fourth expressing the sound, in order to supply the defect of the figure, as *ya* adjoined to the figure of a bird, to represent a duck, &c.; the fifth being a metaphorical application of their characters, whereby their language acquires a force and vivacity of colouring peculiar to itself, but at the same time rendering it extremely obscure; the sixth extending the primitive sense of a character, so that the same character may denote a verb or adverb, an adjective or substantive. From these sources their various characters are derived, and increased from 300 to 80,000.

Some learned men have imagined, particularly Mr. Torbeville Needham, F. R. S. that the *Chinese* characters are the same in many respects as the Egyptian hieroglyphics; and that the sense of the latter may be discovered by the comparative and appropriated signification of the former. But it has been urged, that there is not the least trace now remaining of any communion, since the confusion of tongues, between the *Chinese* and Egyptians: nor can there be discerned any connection between the two modes of writing at this day. Nevertheless, it has been maintained, that the *Chinese* language is one of the most ancient; and perhaps the only one that has been spoken without interruption; and yet remains as a living language, to which it is apprehended the small number and shortness of its words have greatly contributed. The *Chinese* characters have been represented as images for sensible things, and symbols for mental objects, which are tied to no sound, and may be read in every tongue; and this seems to have been the case in the most remote antiquity, when their characters, words are now abbreviated and disfigured, might have been more simple and natural. See farther on this subject, Phil Transf. vol. lix. N° 66. p. 409, &c. See also Writing.

CHINNOR, an instrument of music among the Hebrews, consisting of thirty-two chords. Kircher has given a figure of it; for which, see Tab. *Music. fig.* 1.

CHINSE, in *Sea Language*, is used for thrusting oakum into a seam or chink, with the point of a knife or chisel.

CHIO *pear*, a name given to a small species of pear, called also by some the bastard musk pear, from its resembling the little musk pear in its sweet flavour. Its fruit is yellow streaked with red; it is of a roundish shape, and does not hang in clusters, but single on the tree.

CHIOCOCCA, in *Botany*, a genus of the *pentandria monogynia* class, having a funnel-shaped flower, and a single-celled berry containing two seeds.

CHIONANTHUS, in *Botany*. See Snow-drop tree.

CHIPPING, a phrase used by the potters and china-men to express that common accident both of our own stone and earthen ware, and the porcelain of China, the flying off of small pieces, or breaking at the edges. Our earthen wares are particularly subject to this, and are always spelled by it before any other flaw appears in them. Our stone wares escape it better than these, but less than the porcelain of China, which is less subject to it than any other manufacture in the world. The method by which the Chinese defend their wares from this accident, is this: they carefully burn some small bamboot canes to a sort of charcoal, which is very light, and very black: this they reduce to a fine powder, and then mix it into a thin paste, with some of the varnish which they use for their ware: they next take the vessels when dried, and not yet baked, to the wheel, and turning them softly round, they, with a pencil dipt in this paste, cover the whole circumference with a thin coat of it: after this, the vessel is again dried; and the border made with this paste appears of a pale greyish colour when it is thoroughly dried. They work on it afterwards in the common way, covering both this edge and the rest of the vessel with the common varnish. When the whole is baked on, the colour given by the ashes disappears, and the edges are as white as any other part; only when the baking has not been sufficient, or the edges have not been

been covered with the fecond tarniſhing, we ſometimes find a duſky edge, as in ſome of the ordinary thick tea-cups. It may be a great advantage to our Engliſh manufactures to attempt ſomething of this kind. The willow is known to make a very light and black charcoal; but the elder, though a thing ſeldom uſed, greatly exceeds it. The young green ſhoots of this ſhrub, which are almoſt all pith, make the lighteſt and the blackeſt of all charcoal; this readily mixes with any liquid, and might be eaſily uſed in the ſame way that the Chineſe uſe the charcoal of the bamboo cane, which is a light hollow vegetable, more reſembling the elder ſhoots than any other Engliſh plant. It is no wonder that the fixed ſalt and oil contained in this charcoal ſhould be able to penetrate the yet raw edges of the ware, and to give them in the ſubſequent baking a ſomewhat different degree of vitrification from the other parts of the veſſel, which, though if given to the whole, it might take off from the true ſemivitrified ſtate of that ware; yet at the edges is not to be regarded, and only ſerves to defend them from common accidents, and keep them entire.

The Chineſe uſe two cautions in this application: the firſt in the preparation; the ſecond in the laying it on. They prepare the bamboo canes for burning into charcoal, by peeling off the rind. This might eaſily be done with our elder ſhoots, which are ſo ſucculent, that the bark ſtrips off with a touch. The Chineſe ſay, that if this is not done with their bamboo, the edges touched with the paſte will burſt in the baking: this does not ſeem indeed very probable; but the charcoal will certainly be lighter made from the peeled ſticks, and this is a known advantage. The other caution is, never to touch the veſſel with hands that have any greaſy or fatty ſubſtance about them; for if this is done, they always find the veſſel crack in that place. Obſ. ſur les Cout. de l'Aſie.

CHIPPINGAVEL, or CHEAPINGAVEL, in our *Old Writers*, toll paid for buying and ſelling.

CHIRAGRA, in *Medicine*, the gout in the hands.

The word comes from χειρ, *manus*, *hand*, and αγρα, *captura*, *ſeizing*.

The *chiragra* has its ſeat in the *carpus*, or extreme part of the hand, or the ligaments and junctures of the fingers.

CHIRAMAXIUM, in *Antiquity*, a kind of chariot or conveyance, which was drawn by men inſtead of horſes.

The word is derived from χειρ, *the hand*, and αμαξα, *a chariot*.

CHIRCHSED. See CHURCH-SCOT.

CHIRITES, in *Natural Hiſtory*, a name given by authors to a ſtone reſembling the human hand. The accounts we have of it ſay, that it is of a white colour, and of the nature of gypſum, or plaſter-ſtone; and that it repreſents the palm of the hand, with the fingers, and their nails on the other ſide. This ſeems to have been a name given to ſome ſingle ſpecimen in a cabinet of ſome collector; for it is certainly no diſtinct ſpecies of foſſil, but a mere *luſus naturæ*, in the configuration of ſome accidental piece of gypſum.

CHIROGRAPH, *Chirographum*, was anciently a deed which, requiring a counterpart, was engroſſed twice on the ſame piece of parchment, counterwiſe; leaving a ſpace between, wherein was wrote CHIROGRAPH; through the middle whereof the parchment was cut, ſometimes ſtrait, ſometimes indentedly: and a moiety given to each of the parties.

The word is compounded of χειρ, *hand*, and γραφω, *ſcribo*, *I write*: q. d. *hand-writing*.

This was afterwards called *dividenda*, and *chartæ diviſæ*; and was the ſame with what we now call CHARTER-PARTY.

The firſt uſe of theſe *chirographs* with us, was in the time of king Henry III.

According to ſome, a deed was properly a *chirograph*, when it was ſubſcribed by the hand-writing of the vendor, or creditor, and delivered to the buyer, or debtor. Theſe authors make the *chirograph* differ from a *ſyngraph*, in this; that in the latter, the word *ſyngraph* was wrote in the middle, and cut through, in the manner juſt obſerved of *chirograph*. Thoſe authors, therefore, make the *ſyngraph* and the *chirograph* a different thing.

CHIROGRAPH was alſo anciently uſed for a fine: the manner of ingroſſing the fines, and cutting the parchment in two pieces, is ſtill retained in the office called the *Chirographer's Office*.

CHIROGRAPHER *of fines*, an officer in the common pleas, who ingroſſes fines, acknowledged in that court, into a perpetual record (after they have been examined and paſſed by other officers); and writes and delivers the indentures thereof to the party.

He makes two indentures; one for the buyer, the other for the ſeller; and a third indented piece, containing the effect of the fine, and called the *foot of the fine*; and delivers it to the *cuſtos brevium*.

The ſame officer alſo, or his deputy, proclaims all fines in court every term, and endorſes the proclamations on the back ſide of the foot; keeping, withal, the writ of covenant, and the note of the fine.

CHIROMANCY, the art of divining the fate, temperament, and diſpoſition of a perſon, by the lines and lineaments of the hand: this is otherwiſe called *palmiſtry*.

The word comes from χειρ, *hand*, and μαντεια, *divination*.

We have a great number of authors on this vain and trifling art: as Artemidorus, Fludd, and Johannes de Indagine. Taiſnerus, and M. de la Chambre, are eſteemed the beſt.

CHIRONIA, in *Botany*, a name by which ſome have called the black beyony. In the Linnæan ſyſtem it is a genus of the *pentandria monogynia* claſs: the characters are; the flower hath a permanent empalement of one leaf, cut into five oblong ſegments: it hath one petal, with a roundiſh tube divided above into five equal parts, which ſpread open: it hath five ſhort broad ſtamina, terminated by large oblong ſummits, which, when the flowers drop, are ſpirally twiſted: it hath an oval germen, ſupporting a declining ſtyle, which becomes an oval capſule with two cells, filled with ſmall ſeeds. There are eight ſpecies.

CHIRONIUM, in *Medicine*, is ſometimes uſed to ſignify a great ulcer, and of difficult cure.

CHIRONOMI, on the *Grecian Stage*, were thoſe actors who performed without uſing words, by the motions of the hand.

CHIRONOMIA, in *Antiquity*, the art of repreſenting, by the motions of the hand, and other geſtures of the body, any paſt tranſaction, whether of true or fabulous hiſtory. This made a part of a liberal education among the ancients: it had the approbation of Socrates, and was ranked by Plato among the political virtues.

CHIROTHECA. See GLOVE.

CHIROTHESIA, the impoſition of hands in conferring any prieſtly orders.

The word comes from χειρ, *manus*, and τιθημι, *pono*, which ſignifies the laying hands upon another.

CHIROTONIA, the ſtretching forth, or holding up of hands, in electing any magiſtrate, &c.

The word comes from χειρ, *manus*, and τεινω, *tendo*, *the action of ſtretching out the hands*; and becauſe the ancients gave their ſuffrages by ſtretching out the hands, they gave the name *chirotonia* to the election of magiſtrates.

This cuſtom was firſt eſtabliſhed in Greece; as appears from an oration of Demoſthenes againſt Neæra, and that of Æſchines againſt Cteſiphon: thence it paſſed to the Romans. From prophane authors it paſſed to eccleſiaſtical ones; and was uſed by them not only in ſpeaking of elections, but alſo of ordinations. See IMPOSITION and ORDINATION.

For the difference between *chirothoſia*, and *chirotonia*, ſee Harrington's Prer. of popular Government.

CHIRURGERY, popularly called *Surgery*, the third branch of medicine, conſiſting in operations performed by the hand, for the cure of wounds, and other diſorders.

The word *chirurgery* is formed from χειρ, *manus*, *hand*; and εργον, *opus*, *operation*.

Chirurgery is divided into *ſpeculative* and *practical*; one whereof does that in effect, which the other teaches to do.

All the operations of *chirurgery* are reduced under four kinds: the firſt whereof rejoins what has been ſeparated, and is called *ſynthoſis*.

The ſecond divides, with diſcernment, thoſe parts whoſe union is prejudicial to health; and is called *diæreſis*.

The third extracts, with art, foreign bodies; called *exæreſis*.

And the fourth, called *proſthoſis*, adds and applies what is wanting.

The principal things that come under the conſideration of *chirurgery* are, tumors, ulcers, wounds, diſlocations and fractures.

Chirurgery has the advantage of medicine, in the ſolidity of its foundation, the certainty of its operations, and the ſenſibility of its effects; inſomuch that thoſe who deny medicine to be of any ſignificancy, yet allow the uſefulneſs of *chirurgery*.

Chirurgery is very ancient; and even much more ſo than medicine, whereof it now makes a branch. It was, in effect, the ſole medicine of the firſt ages; they betaking themſelves to the cure of external diſorders, before they came to examine or diſcover what related to the cure of internal ones.

Apis, king of Egypt, is ſaid to be the firſt inventor of *chirurgery*; after him, Æſculapius compoſed a treatiſe of wounds and ulcers: he was ſucceeded by the philoſophers

of the following ages, in whose hands *chirurgery* wholly lay: such were Pythagoras, Empedocles, Parmenides, Democritus, Chiron, Peon, Cleombrotus, who cured king Antiochus, &c.

Pliny tells us, upon the authority of Cassius Hemina, that Archagathus was the first of the profession that settled at Rome; that the Romans were wonderfully pleased with this *Vulnerarius*, as they called him, at his first coming, and showed him some extraordinary marks of their esteem, but that they were disgusted at him afterwards, and nick-named him *Carnifex*, for his cruelty in cutting off limbs. Some pretend, that he was even stoned by them to death in the Campus Martius; but if he really came to such an unlucky end, it is strange Pliny should take no notice of it. Plin. Hist. Nat. lib. xxix. cap. 1.

Chirurgery was cultivated with much more earnestness by Hippocrates, than by any of the preceding physicians: it is said to have been perfected in Egypt by Philoxenus, who wrote several volumes on that subject. Among the Greeks, Gorgias, Softrates, Heron, the two Apollonii, Ammonius of Alexandria; and at Rome, Trypho, the father, Eucipillus, and Meges, made it flourish, each in their time.

The more modern authors, who have contributed most to the perfection of *chirurgery*, are Paræus, Fab. ab Aquapendente, Harvey, Wharton, Glisson, Du Laurence, Diemerbroeck, Vieussens, Barbette, Dionis, Charriere, Heister, &c.

Scultetus has published a description of all the instruments used in *chirurgery*, under the title of Armamentarium Chirurgicum; and our countryman, Mr. Wiseman, serjeant-*chirurgeon* to king Charles II. a folio volume of *chirurgical* treatises, containing practical observations, both in respect to the internals and externals, of a number of cases in each branch of the art, from his own experience, under the title of Several chirurgical Treatises. This work has been made use of ever since, by many of our *English chirurgeons*: and has been the foundation of various *chirurgical* treatises since its publication, anno 1676.

In England there are two distinct companies now occupying the science or faculty of *surgery*; the one company called *barbers*, the other *surgeons*; which latter were not till very lately incorporated. The two were united to sue and be sued, by the name of masters or governors and commonalty of the mystery of Barbers and Surgeons of London, 32 Hen. VIII. cap. 42.

No person using any barbery, or shaving, in London, was to occupy any surgery, letting of blood, or other matter, drawing of teeth only excepted. And no person using the mystery or craft of *surgery* was to occupy or exercise the feal or craft of barbery, or shaving; neither by himself, nor any other for his use. 32 Hen. VIII. cap. 42. See COMPANY.

By the same statute, *surgeons* were obliged to have signs at their doors.

The French *chirurgeons* being refused to be admitted into the universities, notwithstanding that their art makes a branch of medicine, one of the four faculties, on pretence of its bordering a little on butchery, or cruelty, associated themselves into a brotherhood, under the protection of St. Cosmus, and St. Damian; on which account, according to the laws of their institution, they are obliged to dress and look to wounds *gratis*, the first Monday of each month.

They distinguish between a *chirurgeon of the long robe*, and a *barber chirurgeon*: the first has studied physic, and is allowed to wear a gown.

The skill of the other, besides what relates to the management of the beard, is supposed to be confined to the more simple and easy operations in *chirurgery*; as bleeding, toothdrawing, &c. They were formerly distinguished by badges: those of the long gown bore a case of instruments; and the barber's bason.

CHISSEL, an instrument much used in sculpture, masonry, joinery, carpentry, &c.

There are *chissels* of different kinds; though their chief difference lies in their different size and strength, as being all made of steel well sharpened and tempered; but they have different names, according to the different uses to which they are applied.

The *chissels* used in carpentry and joinery are, 1. The *former*, which is used first of all before the *paring-chissel*, and just after the work is scribed. 2. The *paring-chissel*, which has a fine smooth edge, and is used to pare off, or smooth the irregularities which the *former* makes. This is not struck with a mallet, as the *former* is, but is prefled with the shoulder of the workman. 3. *Slen-former*: this is used for cleansing acute angles with the point, or corner of its narrow edge. 4. The *mortise-chissel*, which is narrow, but very thick and strong, to endure hard blows; and it is cut to a very broad bafil: its use is, to cut deep square holes in the wood, for mortises. 5. The *gouge*, which is a *chissel* with a round edge; one side whereof serves to prepare the way for an augre, and the other to cut such wood as is to be rounded, hollowed, &c. 6. *Socket-chissels*, which are chiefly used by carpenters, &c. have their shank made with a hollow socket at top, to receive a strong wooden sprig, fitted into it with a shoulder. These *chissels* are distinguished, according to the breadth of the blade, into half inch *chissels*, three quarters of an inch *chissels*, &c. 7. *Ripping chissel*, which is a socket *chissel* of an inch broad; having a blunt edge, with no bafil to it; its use is to rip, or tear two pieces of wood asunder, by forcing in the blunt edge between them.

CHISELY *land*, in *Agriculture*, a term appropriated to that sort of land which breaks, when it is turned up by the plough, into pieces like the chips made by the stone-cutter's chissel in the hewing of stones. It is of a middle nature, between the sandy land that falls off from the plough-share, like bran or saw-dust, and the clayey, that is raised in large glebes.

It is of several colours, grey, brown, reddish, and blackish, and usually contains a large quantity of sand, and no small number of pebbles.

CHIT is the name of an instrument used in cleaving laths.

CHITSEE, in *Botany*, the name of a Chinese tree, called also SETSE.

CHITTING, in *Gardening*. A seed is said to *chit*, when it first shoots its small roots into the earth.

CHI-TUA, in the *Materia Medica*, a name used by some authors for a kind of *lignum aloes*, which is reddish, and of a very fine scent.

CHIVAGE. See CHEVAGE.

CHIVALRY, in *Antiquity*, an institution which succeeded the CRUSADES, and which, though founded in caprice, and productive of extravagance, had a very considerable influence in refining the manners of the European nations, during the twelfth, thirteenth, fourteenth, and fifteenth centuries. The objects of this institution were, to check the insolence of overgrown oppressors, to succour the distressed, to rescue the helpless from captivity, to protect or to avenge women, orphans, and ecclesiastics, who could not bear arms in their own defence, to redress wrongs, and to remove grievances. Valour, gallantry, and religion, were blended in this institution; men were trained to knighthood by long previous discipline; they were admitted into the order by solemnities no less devout than pompous; every person of noble birth courted the honour: it was deemed a distinction superior to royalty, and monarchs were found to receive it from the hands of private gentlemen. These various circumstances contributed to render a whimsical institution of substantial benefit to mankind. See Robertson's Hist. of Charles V. vol. i. p. 82. &c. ed. 2. 8vo.

Dr. Hurd, in his Letters on *Chivalry* and Romance, traces the origin of this institution immediately to the feudal constitution; and he supposes that the spirit of *chivalry* had considerably prevailed before the rise of the CRUSADES.

CHIVALRY, or CHEVALRY, in *Law*, a tenure of land by knight-service; whereby the tenant was anciently bound to perform service in war, to the king, or to the mesne lord of whom he held, by that tenure.

By a statute of 12 Car. II. cap. 24. all tenures by *chivalry, in capite*, &c. are abolished. See COURT and GUARDIAN.

CHIUDENDO, in *Italian Music*, *to conclude*; as *chiudendo col ritornello, col Tutta*, signifies to end with a RITORNELLO, or some paffage which has been before sung in some parts of the piece.

CHIVEN, in *Zoology*, a name given by many to the MUSCICAPA, or *fly-catcher*, a small bird little bigger than the wren.

CHIVES, or CHIVES, in *Botany*, the small knobs growing on the ends of the fine threads, or ftamina of flowers: by Ray, and others, called also *apices*. See ANTHERÆ.

Dr. Grew calls the *ftamina*, or threads themselves, on which the *apices* are fixed, the *chives*.

CHIVES, in *Botany*, a very small species of the ONION kind, called by this name.

CHIUM *Marmor*. See MARBLE.

CHIUM *vinum*, *Chian wine*, or wine of the growth of the island of Chios, now Scio, is commended by Dioscorides, as affording a good nourishment, fit to drink, less disposed to intoxicate, endued with the virtue of restraining defluxions, and a proper ingredient in opthalmic medicines. Hence Scribonius Largus directs the dry ingredients in *collyria* for the eyes, to be made up with *Chian* wine.

CHIUN, or CHEVAN, in *Hebrew Antiquity*. We meet with this word in the prophet Amos, cited in the acts of the Apostles. St. Luke reads the paffage thus: *Ye took*

took up the tabernacle of Moloch, and the ſtar of your god Remphan, figures which ye made to worſhip them. The import of the Hebrew is as follows: *Ye have born the tabernacle of your kings, and the pedeſtal* (the chiun) *of your images, the ſtar of your gods, which ye made to your ſelves.*

The Septuagint in all probability read *Rephaan* or *Renan*, inſtead of *Chiun* or *Chevun*, and took the pedeſtal for a god.

Some ſay that the Septuagint, which was a tranſlation made in Egypt, changed the word *Chiun* into that of *Remphan*, becauſe they had the ſame ſignification. Mr. Baſnage, in his book entitled Jewiſh Antiquities, after having diſcourſed a good deal upon *Chiun* or *Remphan*, concludes that Moloch was the ſun, and *Chiun*, *Chevun*, or *Remphan*, the moon.

CHIUREA, in *Natural Hiſtory*, a name given by Cardan, Oviedo, and ſome others, to the OPOSSUM.

CHLÆNA, in *Antiquity*, a kind of thick, ſhaggy, upper garment: its uſe was very ancient; for we find Homer makes his heroes firſt put off their *chlænæ*, and afterwards their tunics, or coats.

CHLAMYDULA, in *Antiquity*, a ſmall upper garment worn by children. See CHLAMYS.

CHLAMYS, in *Antiquity*, a military habit, worn by the ancients over the *tunica*.

Chlamys was the ſame, in time of war, that the *toga* was in time of peace; each belonged to the patricians. It did not cover the whole body, but chiefly the hind-part; though it alſo came over the ſhoulders, and was faſtened with a buckle on the breaſt. There were four or five kinds of *chlamys*; that of children, that of women, and that of men; which laſt was divided into that of the people, and that of the emperor.

CHLASMA, in *Medicine*, a warm fomentation of the moiſt kind; as pyria is of the dry kind.

CHLOEIA, in *Antiquity*, a feſtival celebrated at Athens, in honour of Ceres, to whom, under the name Χλοη, i. e. *Groſs*, they ſacrificed a ram.

CHLORA, in *Botany*, a genus of the *octandria monogynia* claſs: the calyx is compoſed of eight leaves; the corolla has a ſingle petal, and is divided into eight ſections; and the capſule conſiſts of a ſingle cell, with two valves, containing many ſeeds.

CHLOREUS, in *Ornithology*, a name by which Turner, and ſome others, have called the common YELLOW-*hammer*, or *emberiza auto*.

CHLOREUS, in *Ornithology*, is alſo a name by which ſeveral authors, and particularly many of the earlieſt writers, have called the GALBULA, a very elegant and beautiful bird of the thruſh kind, almoſt all over yellow.

CHLORIS, in *Ornithology*, the name of the bird commonly called in Engliſh the greenfinch, a well-known bird of the ſize of a common ſparrow, and remarkable for its green colour, whence it has its name, and for the largeneſs of its beak, in which it approaches to the *coccothrauſtes*; it builds in our hedges, and feeds on the ſeeds of vegetables.

CHLORITES, in *Natural Hiſtory*, a name given by the ancients to a green ſtone ſeeming to have been a jaſper, but ſo pellucid as to approach to the nature of the coarſer emeralds.

CHLOROSIS, in *Medicine*, a feminine diſeaſe, vulgarly called the *green-ſickneſs*, *white jaundice*, &c.

The word *chlorоſis* ſignifies *greenneſs*, *verdure*; formed from χλοη, *groſs*.

Its uſual ſubjects are, girls, maids, and widows: or even wives whoſe huſbands are deficient, &c. It gives a pale, yellow, or greeniſh tincture to the complexion, with a circle of violet under the eyes. The patient is melancholy and uneaſy; has frequently a low wandering fever, with an unequal pulſe, vomiting, heavineſs, liſtleſſneſs, drowſineſs, difficulty of breathing, longing for abſurd foods, &c.

It comes on, commonly, antecedent to, or about the time of the eruption of the menſes. Though the ſtoppage of the menſes is not always the cauſe of this diſtemper: for they ſometimes, though but ſeldom, flow regularly, in the progreſs thereof. According to Etmuller, the ſuppreſſion of the *menſes* is rather the effect than the cauſe of this diſeaſe.

The cure is chiefly to be attempted by chalybeats and bitters. In the colder conſtitutions, decoctions of guaiacum are found of uſe.

CHNUS, in Hippocrate, is fine ſoft wool, to which he compares an aqueous ſpleen, on account of its ſoftneſs.

CHOANA, in *Ancient Anatomiſts*, a cavity in the brain like a funnel, called alſo *pelvis*.

CHOASPITES, a name given by the ancients to a ſpecies of the *chryſoprаſus*, a gem of a mixed colour between yellow and green. It was called *choaſpites* from the name of a river in which it was frequently found.

CHOCK, in *Sea Language*, a wedge uſed to confine a caſk, or other heavy body, to prevent it from fetching away when the ſhip is in motion.

CHOCOLATE, a kind of cake, or confection, prepared of certain drugs; the *baſis*, or principal whereof, is the *cacao-nut*.

The name *chocolate* is alſo given to a drink prepared from this cake, of a duſky colour, ſoft, and oily; uſually drunk hot, and eſteemed not only an excellent food, as being very nouriſhing, but alſo a good medicine; at leaſt a diet, for keeping up the warmth of the ſtomach, and aſſiſting digeſtion.

The Spaniards were the firſt who brought *chocolate* into uſe in Europe; and that, perhaps, as much out of intereſt, to have the better market for their cacao-nuts, vanilla, and other drugs which their Weſt Indies furniſh, and which enter the compoſition of *chocolate*, as out of regard to thoſe extraordinary virtues which their authors ſo amply enumerate in it. The qualities above mentioned are all that the generality of phyſicians, and others, allow it.

For the ſtatutes relating to the manufacture and trade of *chocolate* in Great Britain, ſee 10 Geo. I. cap. 10. § 1. 2. 18. 19. 22. 24. 11 Geo. I. cap. 10. § 13. 23. 25. 11 Geo. I. cap. 30. § 14. 15.

CHOCOLATE, *original manner of making*. The method firſt uſed by the Spaniards was very ſimple, and the ſame with that in uſe among the Indians: they only uſed cacao-nut, maize, and raw ſugar, as expreſſed from the canes, with a little achiott, or rocou, to give it a colour: of theſe four drugs, ground between two ſtones, and mixed together in a certain proportion, they made a kind of bread, which ſerved them equally for ſolid food and for drink; eating it dry when hungry, and ſteeping it in hot water when thirſty.

This drink the Mexicans called *chocolate*, from *chocoa*, *ſound*; and *alle*, or *atte*, *water*; q. d. *water that makes a noiſe*: from the noiſe which the inſtrument, uſed to mix and prepare the liquor, made in the water.

But the Spaniards, and other nations, afterwards added a great number of other ingredients to the compoſition of *chocolate*; all of which, however, vanilla alone excepted, ſpoil rather than mend it.

CHOCOLATE, *method of making, now in uſe among the Spaniards of Mexico*. The fruit being gathered from the cacao tree, is dried in the ſun, and the kernel taken out, and roaſted at the fire, in an iron pan pierced full of holes; then pounded in a mortar; then ground on a marble ſtone, with a grinder of the ſame matter, till it be brought into the conſiſtence of a paſte; mixing with it more or leſs ſugar, as it is to be more or leſs ſweet. In proportion as the paſte advances, they add ſome long pepper, a little achiott, and, laſtly, vanilla: ſome add, cinnamon, cloves, and aniſe; and thoſe who love perfumes, muſk and ambergris.

There is alſo a kind of Mexican *chocolate*, in the compoſition whereof there enter almonds and filberts; but it is rather to ſpare the cacao than to render the *chocolate* better: and, accordingly, this is looked on as ſophiſticated *chocolate*.

CHOCOLATE, *the, made in Spain*, differs ſomewhat from that made in Mexico; for, beſides the drugs uſed in this laſt, they had two or three kinds of flowers, pods of campeche, and generally almonds and hazel nuts. The uſual proportion, at Madrid, is to an hundred kernels of cacao, to add two grains of *chile*, or Mexican pepper; or, in lieu thereof, Indian pepper; a handful of aniſe: as many flowers, called by the natives *vinanetlhoit*, or little ears; ſix white roſes in powder; a little machuſta; a pod of campeche; two drachms of cinnamon; a dozen almonds, and as many hazel nuts; with achiott enough to give it a reddiſh tincture; the ſugar and vanilla are mixed at diſcretion; as alſo the muſk and ambergris. They frequently work their paſte with orange water, which they think gives it a greater conſiſtence and firmneſs.

The paſte is uſually made up into cakes, ſometimes into large rolls; and ſometimes the cakes are made up of pure *chocolate*, without any admixture; thoſe who uſe it being to add what quantity they pleaſe of ſugar, cinnamon, and vanilla, when in the water.

Among us, in England, the *chocolate* is chiefly made thus ſimple and unmixed, though (perhaps not unadviſedly) of the kernel of the cacao; excepting that ſometimes ſugar, and ſometimes vanilla, is added: any other ingredients being ſcarce known among us.

The neweſt *chocolate* is eſteemed the beſt; the drug never keeping well above two years, but uſually degenerating much before that time.

It is to be kept in brown paper, put up in a box; and that in another, in a dry place.

Mr. Henly, an ingenious electrician, has lately diſcovered that *chocolate*, freſh from the mill, as it cools in the

tin pans into which it is received, becomes ſtrongly electrical; and that it retains this property for ſome time after it has been turned out of the pans, but ſoon loſes it by handling. The power may be once or twice renewed by melting it again in an iron ladle, and pouring it into the tin pans as at firſt; but when it becomes dry and powdery, the power is not capable of being revived by ſimple melting: but if a ſmall quantity of olive-oil be added, and well mixed with the *chocolate* in the ladle, its electricity will be completely reſtored by cooling it in the tin pan as before. From this experiment he conjectures that there is a great affinity between phlogiſton and the electric fluid, if indeed they be not the ſame thing. Phil. Tranſ. vol. lxvii. part 1. p. 94, &c.

The manners of preparing the maſs into a liquor, with the proportions, are various: ordinarily, the *chocolate* is boiled in water, ſometimes in milk; and ſometimes, by good œconomiſts, in water-gruel: when boiled, it is miſſed, or agitated with a wooden machine for the purpoſe, and boiled again, till it be of the proper conſiſtence for drinking; then ſugared, if the maſs were pure; then miſſed afreſh, and poured off.

Note, the beſt *chocolate* is that which diſſolves entirely in the water; leaving no grounds or ſediment at the bottom of the pot.

The Spaniards eſteem it the laſt miſfortune that can befall a man, to be reduced to want *chocolate*: they are never known to leave it, excepting for ſome other liquor that will intoxicate.

CHOCOLATE-*tree*. See CACAO.

CHOENICIS, in the *Ancient Surgery*, the trepan, ſo called by Galen and Ægineta, and mentioned by Celſus, where he calls it *modiolus*.

CHOENIX, an Attic dry meaſure, containing three *cotylæ*, or one ſextarius and an half, which is two pounds and a quarter. Its mark was χ with a ν over it.

The *chœnix* likewiſe contained the forty-eighth part of a medimnus, and was otherwiſe called HEMEROTROPHIS.

CHOERINÆ, in *Antiquity*, a kind of ſea-ſhells, with which the ancient Greeks uſed to give their ſuffrage, or vote.

CHOEROGRYLLUS. See *Hedge-Hog*.

CHOES, in *Antiquity*, an Athenian feſtival in honour of Bacchus, celebrated in the month Anthellerion.

CHOIR, that part of a church, cathedral, &c. where the clergy, choriſters, or ſingers, are placed.

The word, according to Iſidore, is derived *à ceramis circumſtantium*; becauſe, anciently, the choriſters were diſpoſed round the altar to ſing; which is ſtill the manner of building altars among the Greeks.

The *choir* with us is diſtinguiſhed from the chancel, or ſanctuary, where the communion is celebrated: as alſo from the nave, or body of the church, where the people are placed.

The patron is ſaid to be obliged to repair the *choir* of a church; and the pariſhioners the nave.

The *choir* was not ſeparated from the nave, till the time of Conſtantine: from that time the *choir* was railed in with a baluſtrade, with curtains drawn over, not to be opened till after the conſecration.

In the twelfth century they began to incloſe the *choir* with walls; but the ancient baluſtrades have been ſince reſtored: out of a view to the beauty of the architecture.

The chanter is maſter of the *choir*.

In numeries, the *choir* is a large hall adjoining to the body of the church, ſeparated by a grate, where the religious ſing the office.

CHOIR *muſic*, muſic ſung in a chorus, as in churches. It is ſometimes uſed for *muſica picna*, *canto formo*, or what we call *plain chant*, or *ſong*.

CHOIROS, in *Ichthyology*, a name given by Ariſtotle and others of the old Greek writers to the *cernua* or *acarina* of the Latins, called by us the RUFFE. This fiſh has been called by a great variety of names, but it is properly a ſpecies of pearch, or PERCA, and is diſtinguiſhed from the others of that genus by Artedi under the name of the pearch with only one fin on the back, and with a cancellous head.

CHOLAGOGUE, a medicine which purges the bile downward.

The word comes from χολη, *bile*, and αγω, *to lead*, or *draw*.

Of theſe ſome are ſimple, others compound; and both the one and the other are diſtinguiſhed into three kinds, with regard to their activity; the *benign*, the *moderate*, and the *violent*.

Of the firſt kind are, MANNA, CASSIA, roſes, tamarinds, *oleum ricini*, &c.

Of the ſecond are SENA, RHUBARB, ALOES, &c.

Of the third, JALAP, SCAMMONY, &c.

CHOLEDOCHUS, in *Anatomy*, a term applied to a canal, or duct, called alſo *ductus communis*; formed of the union of the *porus biliarius* and *ductus cyſticus*.

The word comes from χολη, *choler*; and δεχομαι, *I receive*, or *contain*.

The *choledochus ductus*, paſſing obliquely to the lower end of the *duodenum*, ſerves to convey the BILE from the LIVER to the inteſtines. Some have imagined, that it conveyed the bile from the liver to the GALL-*bladder*: but it being obſerved, that it is the *duodenum*, not the gall-bladder, that ſwells, upon blowing through this duct, it is evident, the bile contained therein is conveyed no where elſe but to the *duodenum*.

CHOLER. See BILE.

CHOLERA MORBUS, a ſudden overflowing or eruption of the BILE, or bilious matters, both upwards and downwards.

It is ſuppoſed to have its riſe from the great abundance of bilious humours; which, being very acrimonious, vellicate the membranes of the ſtomach and inteſtines; and, by that means, occaſion unuſual and violent contractions.

It is very dangerous; whence the French anciently called it *trouſſe-galand*.

It has its name, either from the great quantity of *choler* it evacuates; or becauſe the matter is inceſſantly expelled at the inteſtines, which they anciently called *choledes*.

Dr. Sydenham obſerves, it generally attacks people about the latter end of ſummer; and proceeds, not unfrequently, from ſurfeits: that the cure depends upon large quantities of chicken-broth, drank ſo as to excite vomiting plentifully; and that the broth is alſo to be injected clyſterwiſe: after which, he ſays, the cure is to be completed by laudanum, given at proper intervals, and in proper doſes.

The remedy in the Indies for the *cholera morbus*, or *mandechin*, is, to keep the patient from drinking; and to burn the ſoles of his feet.

The free uſe of the columbo root has been found an excellent remedy in this diſeaſe.

CHOLOBAPHIS, in *Natural Hiſtory*, a name given by ſome of the ancient Greeks to a peculiar kind of emerald which was inferior to many others, and was of a colour tending to yellow.

It is plain that the Romans called all the green cryſtals found in copper-mines by the name of emeralds; for they expreſs in their deſcriptions all the defects we find in theſe cryſtals, ſuch as their having hairs, or ſubſtances like hairs, within, as alſo falts, and the like.

CHOLOMA, or CHOLOSIS, ſignifies, according to Galen, any diſtortion of a member, or depravation of it with reſpect to motion. It is taken alſo, in a particular ſenſe, for halting or lameneſs of a leg, ariſing from luxation.

CHOMER. See CORUS.

CHONDRILLA, in *Botany*. See GUM-*ſucory*.

CHONDROGLOSSUM, in *Anatomy*, a very ſmall muſcle of the tongue, mentioned by Veſtheyen, and ſeveral other authors, exceedingly ſhort and narrow; ariſing from the cartilaginous proceſſes of the *os hyoides*, and meeting in the middle of the baſis of the tongue, where it is inſerted, forming an arch under it.

This pair of muſcles is not found in all ſubjects; whence ſome have queſtioned its exiſtence.

CHONDROPTERYGII, in *Natural Hiſtory*, a name given by Artedi and Linnæus to one of the great claſſes or families of the fiſhes: the characters of which are, that the rays of the fins are not bony, but cartilaginous.

The bones of the body of theſe fiſhes are alſo cartilaginous, and the mouth in moſt of the ſpecies is placed in the lower part of the body.

The word is derived from χονδρος, a *cartilage*, and πτερυξ, a *wing* or *fin*. Of this order are the *ſcate*, *ſturgeon*, *lamprey*, &c.

CHONDROS, in *Ancient Medical Writers*, the ſame as ALICA.

It ſignifies alſo ſome grumous concretion, as of maſtich, or frankincenſe.

It is, beſides, the Greek word for a cartilage.

CHONDROSYNDESMUS, in *Ancient Medical Writers*, ſignifies a cartilaginous ligament.

The word is derived from χονδρος, a *cartilage*, and συνδεσμος, a *ligament*.

CHOP-CHURCH, or CHURCH-CHOPPER, a name, or rather a nick-name, given to parſons, who make a practice of exchanging benefices.

Chop-church occurs in an ancient ſtatute as a lawful trade, or occupation; and ſome of the judges ſay, it was a good addition. Brook holds, that it was no occupation, but only a thing permiſſible by law.

CHOPIN, or CHOPINE, a French and Scotch liquid meaſure, containing half the PINT.

CHORAGIUM, in *Antiquity*, was uſed to denote the funeral of a young unmarried woman.

Some think it ſhould be writ *eraguium*, from ὑγρὸς, *puella*, and ἀγω, *duco*. But Piriſcus chooſes rather to derive it from *chorus*; becauſe a chorus or company of virgins always attended ſuch funerals.

CHORAGIUM ſignified alſo the tiring or dreſſing-room belonging to the ſtage; and ſometimes was taken for the dreſs itſelf.

CHORAGUS, in *Antiquity*, he who had the ſuperintendence of the chorus, whoſe buſineſs it was to take care they obſerved the rules of the muſic, and performed their parts with decorum.

CHORAGI were likewiſe certain Athenian citizens choſen annually, who were obliged to be at the expence of players, ſingers, dancers, and muſicians, as often as there was occaſion, at the celebration of their public feſtivals.

CHORAIC *meaſe*, a ſort of muſic proper for dancing, by the variety of its different motions.

CHORAL, ſignifies any perſon that, by virtue of any of the orders of the clergy, was in ancient times admitted to ſit and ſerve God in the choir.

Dugdale, in his Hiſtory of St. Paul's Church, ſays, that there were with the chorus formerly ſix vicars *choral* belonging to that church.

CHORAL *Service*. See SERVICE and SINGING.

CHORD, or CORD, primarily denotes a ſlender rope, or cordage.

The word is formed of *chorda*, and that from χορδὴ, a *gut*; whereof ſtrings may be made.

CHORD, CHORDA, in *Anatomy*, a little nerve extended over the *membrana tympani*, or drum of the ear. See TYMPANUM.

Anatomiſts are not agreed about the uſe of the *chorda tympani*: ſome ſay, it ſerves to vary and modify the ſound of the tympanum, in the ſame manner as the ſtrings, or braces, ſtretched over the war-drum: others will have it to be no more than a branch of the fifth pair.

CHORD, CHORDA, in *Geometry*, a right line connecting the two extremes of an arch.

Or, it is a right line, terminated at each extreme in the circumference of a circle, without paſſing through the centre; and dividing the circle into two unequal parts, called *ſegments*. Such is the line AB, *Tab. Geometry, fig.* 6.

CHORD *of the complement of an arch* is the *chord* that ſubtends the reſt of the arch; or ſo much as makes up the arch a ſemicircle.

The *chord* is perpendicular to a line drawn from the centre of the circle to the middle of the arch, as CE; and has the ſame diſpoſition thereto, as the *cord*, or ſtring of a bow, has to the arrow; which occaſioned the ancient geometricians to call this line the *chord* of the arch, and the other the *ſagitta*, or *arrow*; the former of which names is ſtill continued, though the latter is diſuſed. What the ancients called *ſagitta*, is now termed the *verſed ſine*.

Half the *chord* of the double arch BD, is what we now call the *right ſine*; and the exceſs of the radius beyond the *chord* DE, *the verſed ſine*.

The *chord* of an angle, and the *chord* of its complement to a whole circle, are the ſame thing: the chord of fifty degrees is alſo the *chord* of 310.

It is demonſtrated, in geometry, that the radius CE, biſecting the *chord* BA in D, does alſo biſect the arch in E, and is perpendicular to the *chord* AB, and *vice verſa*: and again, if the right line NE biſect the *chord* AB, and be perpendicular thereto; that it paſſes through the centre, and does biſect both the arch AEB, and the circle ANB.

Hence we derive ſeveral uſeful corollaries: as, 1. To divide a given arch AB into two equal parts; draw a perpendicular to the middle point D of the *chord* AB; this biſects the given arch AB.

2. To deſcribe a circle, that ſhall paſs through any three points, A, B, C, *fig.* 7. From A and C deſcribe arches interſecting in D and E; and alſo others, G and H, from C and B: draw the right lines DE and GH; the point of interſection I, is the centre of the circle to be deſcribed through A, B, and C.

Demonſtration. For the points A, B, and C, are in the periphery of ſome circle; and therefore the lines AC and CB are *chords*: but ED is perpendicular to AC, and GH to BC; ED biſects AC, and GH biſects BC; wherefore each paſſes through the centre. Now as DE and GH only interſect in I, it will be the centre of a circle, paſſing through the given points, A, C, and B.

Hence, aſſuming three points in the periphery, or arch, of any circle, the centre may be found, and the given arch completed: hence, alſo, if three points of one periphery do agree or coincide with three points of another; the whole peripheries agree, and therefore the circles are equal.

And hence, laſtly, every triangle may be inſcribed in a circle.

The chord *of an arch* AB (*fig.* 6.) *and the radius* CE, *being given; to find the* chord *of the half-arch* AE. From the ſquare of the radius CE, ſubtract the ſquare of half the given *chord* AD, the remainder is the ſquare of DC; from which, extract the ſquare root, and then DC ſubtracted from the radius EC, leaves DE. Add the ſquares of AD, and EO; the ſum is the ſquare of AE: whence, the root being extracted, we have the *chord* of the half-arch AE.

CHORDS, *line of*, is one of the lines of the ſector and plain ſcale. See its deſcription and uſe under SECTOR and PLAIN SCALE. See alſo SINE.

CHORDS, or CORDS, in *Muſic*, denote the ſtrings, or lines, by whoſe vibrations the ſenſation of ſound is excited; and by whoſe diviſions the ſeveral degrees of tune are determined. They are called *cords*, or *chords*, from the Greek χορδὴ, a name which the phyſicians give to the inteſtines; in regard the ſtrings of muſical inſtruments are ordinarily made of gut: though others are made of braſs or iron wire; as thoſe of ſpinets, harpſichords, &c.

Chords of gold wire, in harpſichords, yield a ſound almoſt twice as ſtrong as thoſe of braſs: *chords*, or ſtrings, of ſteel, yield a feebler ſound than thoſe of braſs; as being both leſs heavy, and leſs ductile.

Mr. Perrault obſerves, that of late they have inverted a way of changing the *chords*, to render the ſound ſtronger, without altering the tone.

The ſixth *chord* of baſs-viols, and the tenth of large theorbos, conſiſt of fifty threads, or guts: there are ſome of them a hundred feet long twiſted and poliſhed with equiſetum, or horſe-tail.

CHORDS, *for the diviſion of, ſo as to conſtitute any given interval*, the rules are as follow: 1. *To aſſign ſuch part of a* chord AB, *as ſhall conſtitute any concord*, v. g. a fifth, or any other interval, with the whole.

Divide AB into as many parts, as the greateſt number of the interval has units; v. g. the fifth being 2 : 3, the line is divided into 3. Of thoſe take as many of the leſſer number, v. g. 2 = AC; then is AC the part ſought: that is, two lines, whoſe length are to each other as AB to AC, make a fifth.

Hence, if it be required to find ſeveral different ſections of the line AB, v. g. ſuch as ſhall be 5ve, fifth, and 3d: reduce the given ratios 1 : 2, 2 : 3, and 4 : 5, to one fundamental; the ſeries becomes 30 : 24, 20, 15. The fundamental is 30; and the ſections ſought are 24, the third; 20 the fifth; and 15, the octave.

2. *To find ſeveral ſections of a line* AB, *that from the laſt, gradually to the whole, ſhall contain a given ſeries of intervals in any given order*; viz. ſo that the leaſt to the next greater contains a third; that to the next greater, a fifth; and that to the whole, an octave.

Reduce the three ratios 4 : 5, 2 : 3, 1 : 2, to one ſeries; hence we have 8 : 10 : 15 : 30 divide the line into the number of parts of the greateſt extreme of the ſeries; viz. 30. we have the ſections ſought at the points of diviſion, anſwering to the ſeveral numbers of the ſeries, viz. at the points C, D, and E; ſo that AC to AD is a third, AD to AE a fifth, and AE to AB octave.

3. *To divide a line* AB *into two parts, to contain betwixt them any interval*, v. g. a fourth.

Add together the numbers containing the ratio of the interval, v. g. 3 : 4; and the line divided into as many parts as the ſum contains, v. g. 7; taken to any of the ſeven numbers, v. g. 4, or C, gives the thing ſought.

4. *For the harmonical diviſion of* CHORDS. *To find two ſections of a line, which with the whole ſhall be in harmonical proportion, with regard to their quantity.*

Take any three numbers in harmonical proportion, as 3, 4, 6; and divide the whole line into as many parts as the greateſt of theſe three numbers, v. g. 6; and at the points of diviſion anſwering to the other two numbers, v. g. 3 and 4, you have the ſections ſought.

5. *To find two ſections of a line, which together with the whole ſhall be harmonical, with reſpect to quality, or tune.*

Take any three numbers concords with each other, v. g. 2, 3, and 8, and divide the line by the greateſt; the points of diviſion anſwering to the other two, give the ſections ſought.

6. *To divide a* CHORD AB, *in the moſt ſimple manner, ſo as to exhibit all the original concords*

Divide the line into two equal parts at C, and subdivide the part CB into equal parts at D; and again, the part CD into two equal parts at E. Here AC to AB is an

octave; AC to AD a fifth; AD to AB a fourth; AC to AE a third *g*; AE to AD a third *l*; AE to EB a fixth *g*; and AE to AB a fixth *l*. Malcolm's Treat. of Muſic, ch. 6. ſect. 1, 2, 3.

To find the number of vibrations made by a muſical *chord* or ſtring, in a given time, its weight, length, and tenſion being given. Let N repreſent the weight of the *chord*; L its length; P the tenſion, or weight equivalent to it, by which the *chord* is extended; and D the length of a given pendulum; *p* the circumference of a circle, the diameter of which is 1: then will the number of vibrations made by the given *chord*, while the pendulum vibrates once, be expreſſed by $p\sqrt{\frac{DP}{LN}}$. If we take L for the number of inches and decimals contained in the length of the *chord*, and the proportion of the tenſion to the weight of the *chord* as *n* to 1, then will the number of vibrations of the *chord* in one ſecond be $\frac{355}{113}\sqrt{\frac{39.2n}{L}}$. Where $\frac{355}{113}$ denotes the proportion of the circumference to the diameter of the circle; and 39.2 the length of a pendulum vibrating ſeconds, in inches and decimals of an inch, Engliſh meaſure. This laſt expreſſion coincides with Mr. Euler's rule, only we here expreſs in Engliſh what he gives in Rhinland meaſure. To illuſtrate this rule by an example: ſuppoſe the length of the *chord* to be 18.7 inches, its weight 65 grains, and the tenſion or weight extending this *chord* to be 8lb. troy, or 46080 grains. Then $L=18.7$, and $n=\frac{46080}{6.2}=7432$. The number of vibrations therefore by the rule will be $\frac{355}{113}\sqrt{\frac{39.2\times7432}{18.7}}=392$. Taylor's Method. Increm. Prop. 23. Tentam. Nov. Theor. Muſ. p. 6, 7. See alſo Mac Laurin's Fluxions, ſect. 919.

By logarithms the rule may be thus expreſſed, $\frac{L+W}{2}+C=V$. Where L is the logarithm of the ratio of a pendulum, vibrating ſeconds, to the length of the given ſtring; W the logarithm of the ratio of the tenſion to the weight of the ſtring; C the logarithm of the ratio of the circumference of a circle to its diameter, or 0.4971500; and laſtly, V=logarithm of the required number of vibrations in one ſecond. *In every chord*, the number of vibrations in a given time will be as $\sqrt{\frac{n}{a}}$, that is, the ſquare root of the extending weight divided by the weight of the *chord*, and its length. If therefore *chords* be of the ſame length, their vibrations in a given time will be as the ſquare roots of the extending weights, divided by the weights of the *chords*. If *chords* be equal in length and weight, their vibrations will be as the ſquare roots of their lengths, multiplied by their weight: that is, reciprocally as the lengths of the *chords*, becauſe the weight of the *chords* will in this caſe be proportional to their lengths. Euler, ibid. p. 7. See alſo Smith's Harmonics, prop. 23 and 24.

Mr. Euler informs us, that he found the *chord*, making 392 vibrations in a ſecond, to be at uniſon with the key called *a* in inſtruments, that is, an octave and ſixth major above the loweſt C in our harpſichords or violoncellos. Conſequently the note C, being to *a* as 3 to 10, will make 118 vibrations in one ſecond. And the higheſt C, or c''', as Mr. Euler calls it, being four octaves above the loweſt c, will vibrate 1888 times in one ſecond of time. Mr. Euler ſuppoſes the limits of the human ear to be, with reſpect to gravity, two octaves lower than C; and with reſpect to acuteneſs, two octaves higher than c'''. See INTERVAL and VIBRATION.

CHORD is ſometimes alſo uſed for accord. Thus we ſay the common *chords* to ſuch a baſs note, meaning its third, fifth, and octave.

CHORD is alſo uſed in *Muſic*, for the note or ſtring to be touched, or ſounded; in which ſenſe it is applicable to all the intervals of muſic.

CHORDAPSUS, in *Medicine*, a diſeaſe of the inteſtines, otherwiſe called *volvulus*, the *iliac paſſion*, and *miſerere mei*: though others make it a diſtinct ſpecies of the *miſerere*.

The word comes from χορδη, *gut*; and απτω, *necto*, *I bind*, or *tye*.

Galen defines it, a tumidity, or inflation of the ſmall inteſtines, which makes them appear filled, and ſtretched like a *chord*. Arcligenes makes it a kind of *miſerere*; conſiſting in a tumor in a certain place of the ſmall inteſtines, which ſinks in, and gives way to the hand, when preſſed: he adds, that it is exceeding dangerous, and ordinarily kills in three or four hours, unleſs it comes to ſuppuration; which, however, does not remove all the danger.

It is probable, however, that the *chordapſus* is, in reality, nothing elſe but the *miſerere* not well underſtood. Celſus informs us, that in his time they were eſteemed the ſame thing.

CHORDEE, in *Medicine*, an inflammation and contraction of the *frænum*, and under part of the *penis*; ſo as to render erection painful.

It happens in *gonorrhœas*, and is generally proportional to the degree of the *virus* received; ſo that in violent *gonorrhœas*, it is uſually a very troubleſome ſymptom.

It proceeds from the acrimony of the matter which runs from the *urethra*, irritating the under-part of the *penis*; by which it is, as it were, tied or held forcibly downwards in erection, eſpecially its *frænum*. Dr. Rutherford of Edinburgh, in his Clinical Lectures, attributes it to the inflammation and ſwelling of the *corpus cavernoſum urethræ*. When the acrimony is conſiderable, it ſometimes gives riſe to unnatural erections, or the ſymptom called a *priapiſm*.

If the *chordee* be violent, or does not decreaſe proportionally to the other ſymptoms in *gonorrhœas*, an emetic of turbith mineral is uſually given with ſucceſs; it cauſing a revulſion from the part.

Though women have no glans or *frænum* to be affected with the ſharp running, yet the ſphincter of the *vagina*, *clitoris*, and lips themſelves, are inflamed after the ſame manner; and therefore the method of their cure muſt be the ſame; which is by ſuch medicines as allay the preſſing inflammation, and ſecure the parts againſt their being corroded by the ſharpneſs of the corruption.

CHOREA *ſancti Viti*, in *Medicine*. See VITUS's *Dance*.

CHOREPISCOPUS, an officer in the ancient church, about whoſe function the learned are extremely divided. The word comes from χωρος, a *region*, or *little country*, and επισκοπος, a *biſhop*, or *overſeer*.

The *chorepiſcopi* were ſuffragan or local biſhops, holding a middle rank between biſhops and preſbyters, and delegated to exerciſe epiſcopal juriſdiction within certain diſtricts, when the boundaries of particular churches, over which ſeparate biſhops preſided, were conſiderably enlarged.

It is not certain when this office was firſt introduced: ſome trace it to the cloſe of the firſt century; others tell us, that *chorepiſcopi* were not known in the Eaſt till the beginning of the fourth century; and in the Weſt, about the year 430. They ceaſed, both in the Eaſt and Weſt, in the tenth century.

CHOREPISCOPUS is alſo the name of a dignity ſtill ſubſiſting in ſome cathedrals, particularly in Germany; ſignifying the ſame with *chori epiſcopus*, or biſhop of the choir.

The word, in this ſenſe, does not come from χωρος, *place*, but χορος, *choir*, &c.

In the church of Cologne, &c. the firſt chantor is called *chorepiſcopus*.

CHOREUS, a foot in the ancient poetry, more commonly called *trochæus*, or TROCHEE.

CHORIAMBUS, in the *Latin Poetry*, a foot compounded of a *chorius*, or *trochæus*, and an *iambus*.

It conſiſts of four ſyllables; of which the firſt and laſt are long, and the two middle ones ſhort: as *ſilicum*.

CHORION, the exterior membrane which inveſts the *fœtus* in the womb.

The word comes from the Greek χωριον, *capere*, *to contain*.

It is very thick and ſtrong; on the inſide, where it joins another membrane, called *amnion*, very ſmooth; but rough and uneven without-ſide; interſperſed with a great number of veſſels, and faſtened to the *matrix*, or womb, by means of the *placenta*, which adheres very cloſely to it.

This membrane is found in all animals.

The *chorion*, with the *amnion* and *placenta*, make what we call the FECUNDINE, or after-birth.

CHORIST, or CHORISTER, a chantor or ſinger in the choir.

CHORIZANTES, the name of a ſect in Germany, ann. 1374, ſaid to be demoniacs that aſſembled in ſtreets and churches.

We may ſuppoſe their enemies called them demoniacs. Du Cange does not mention any of their tenets.

CHORO *ſervente*, in the *Italian Muſic*, a *chorus*, in which are employed the beſt voices and inſtruments to ſing the recitatives, play the ritornellos, &c. It is otherwiſe called the little *chorus*, or *choro recitante*.

CHORO *ſpezzato*, in the *Italian Muſic*, a compoſition of two, three, or more choruſes. It is often met with inſtead of *tutti* or *da capella*, which mean the grand chorus. *A doi, a tre, a quatre choris*, is for two, three, or four choruſes. When after the name of a part we find *primo*,

prima, 1st *chora*, we muſt underſtand that it is to be played in the firſt chorus; if 2^d^, II^da^, or *ſecunda chora*, the part muſt be ſung or played in the ſecond chorus. And conſequently it ſhews, that the compoſition is for eight voices or different parts.

CHOROBATES, a kind of water-level, uſed among the ancients; compoſed of a double ſquare, in form of a T, deſcribed by Vitruvius.

The word comes from *χωροβατεω*, *to over-run a country*.

CHOROGRAPHY, the art of making a MAP, or deſcription of ſome country or province.

The word comes from *χωρος*, *region*, and *γραφω*, *I deſcribe*. *Chorography* is diſtinguiſhed from GEOGRAPHY, as the deſcription of a particular country is from that of the whole earth. And from *topography*, as the deſcription of the ſame country is from that of a ſingle place, town, or diſtrict in it.

CHOROIDES, or CHOROEIDES, in *Anatomy*, a term applied to ſeveral parts of the body; bearing ſome reſemblance to the chorion.

The word is formed from *χοριον*, *chorion*, and *ειδος*, *likeneſs*.

CHOROIDES is particularly uſed for the inner membrane which immediately inveſts the brain; ſo called as being intermingled with a great number of blood-veſſels, like the *chorion*; but more uſually denominated the *pia mater*, or MENINX *tenuis*.

Plexus, or *Lacis* CHOROIDES, is a knot of veins and arteries in the anterior ventricle of the brain, woven out of the branches of the carotid.

CHOROIDES is alſo applied to the inner, and poſterior tunic of the eye, immediately under the ſclerotica.

It is ſoft, thin, and black; and its inner, or concave ſurface, is very ſmooth and poliſhed. It has its name from its being interſperſed with veſſels. Its anterior part is called the *uvea*; or rather the *iris*, as the internal ſurface is called the *Ruyſchian* coat.

Next under the *choroides* is the *retina*. Ruyſch, indeed, ſays, he has found another tunic between the *choroides* and *retina*; and denominates it from himſelf, *tunica Ruyſchiana*. He adds, that it grows ſo firmly to the *choroides*, that it is over-looked in the common diſſections.

But Verheyen, though he found the *choroides* of a bird diviſible into two membranes, could never ſeparate thoſe of the human eyes; and therefore he thinks there needed not any new name. The *choroides* is, for the moſt part, black in men; though it appears often, as M. Pecquet has obſerved, in very different ſhades; in lions, camels, bears, ſheep, cattle, dogs, cats, and moſt fiſhes, it is of a ſhining colour, like the brilliance of ſilver, or the luſtre of oriental pearl; and makes what naturaliſts call the *tapis*, or colour of the eye.

M. Mariotte maintains, that viſion is performed rather in the *choroides* than the *retina*; in which he agrees with Bar. Torinus, and is ſeconded by M. Mery; but moſt other authors are of a different ſentiment.

He was led to this hypotheſis by obſerving, that part of the *retina*, at the inſertion of the optic nerve, is inſenſible to the impreſſion of light, and that in this part the *choroides* is wanting.

He was confirmed in opinion, that the *retina* could not be the ſeat of viſion, becauſe of its tranſparency; though M. Pecquet obſerves in reply, that it is very imperfectly tranſparent, only reſembling oiled paper. He urges likewiſe the greater ſenſibility of the *choroides* than that of the *retina*, as is evident by the alternate contraction and dilatation of the *iris*, which is a continuation of the *choroides*, in light and ſhade.

It has been replied, that ſome creatures, ſuch as the porcupine and ſea-calf, have the optic nerves inſerted into the axis of their eyes. This fact, according to Dr. Porterfield, overturns Mariotte's hypotheſis of the *choroides* being the principal and immediate organ of ſight.

Mr. Le Cat ſtrenuouſly defends Mariotte's opinion, that the *choroid* coat, which is the production of the *pia mater*, and not the *retina*, is the immediate organ of viſion.

The *retina*, according to him, is to the *choroid* what the *epidermis* is to the ſkin; receiving the impreſſion of light, and preparing it for its proper organ. Mr. Michell has likewiſe urged ſome farther conſiderations in favour of the *choroides*, as the proper ſeat of viſion, deduced from its greater ſenſibility, and from the variety of its colours in different animals, according to their ſituation and neceſſity. He adds, that the *choroides* is in no caſe tranſparent, and has no reflecting ſurface beyond it, and that it is better formed as an organ of diſtinct viſion than the *retina*. M. de la Hire has advanced another hypotheſis; alleging, that the *choroides* receives the impreſſions of images, in order to tranſmit them to the *retina*. Againſt which hypotheſis, Mr. Michell objects, that the impulſions which are thus *ſecondarily* communicated to the nerves muſt be fainter, and that it is more natural to ſuppoſe, that the impreſſion firſt made upon the *choroides* ſhould be conveyed to the brain by its own proper nerves. Prieſtley's Hiſtory of Viſion, chap. ii. p. 189, &c. See VISION.

It had been long obſerved that the *choroides* in men is black; but no obſervation had been made on the change it ſuffers by age, before M. Petit, who perceived that it appears quite brown under the *retina* in children, and grows conſiderably brighter as they advance in age.

CHORUS, in *Dramatic Poetry*, one, or more perſons, preſent on the ſtage during the repreſentation, and ſuppoſed to be by-ſtanders thereto, without any particular ſhare or intereſt in the action.

Tragedy, in its origin, M. Dacier obſerves, was no more than a ſingle *chorus*, who trod the ſtage alone, and without any other actors; ſinging dithyrambics, or hymns, in honour of Bacchus. Theſpis, to relieve the *chorus*, added an actor, who rehearſed the adventures of ſome of their heroes. Æſchylus, finding a ſingle perſon too dry an entertainment, added a ſecond; and at the ſame time greatly reduced the ſinging of the *chorus*, to make more room for the recitation.

Every thing introduced between the four ſongs of the *chorus*, they called by the term *epiſode*; and thoſe four ſongs made the four intervals, or acts of the piece.

But when once tragedy began to be formed, thoſe recitatives, or epiſodes, which at firſt were only intended as acceſſory parts, to give the *chorus* a breathing time, became now the principal parts of the performance: and whereas, before, they were taken from various ſubjects, they were now all drawn from one and the ſame.

The *chorus*, by degrees, became inſerted and incorporated into the action, to which at firſt it was only intended as an addition or ornament. Sometimes the *chorus* was to ſpeak, and then their chief, whom they called *Coryphæus*, ſpoke in behalf of all the reſt: the ſinging was performed by the whole company; ſo that when the *Coryphæus* ſtruck into a ſong, the *chorus* immediately joined him.

Beſides the four ſongs, which made the diviſion of the piece, and which were managed by the *chorus*, the *chorus* ſometimes alſo joined the actors in the courſe of the repreſentation, with their plaints and lamentations; on occaſion of any unhappy accidents that befel them.

But the proper function of the *chorus*, when tragedy was formed, and that for which it ſeemed chiefly retained, was to ſhew the intervals of the acts: while the actors were behind the ſcenes, the *chorus* engaged the ſpectators; their ſongs uſually turned on what was juſt exhibited; and were not to contain any thing but what was ſuited to the ſubject, and had a natural connexion with it; ſo that the *chorus* concurred with the actors for adorning the action.

It is a fault obſerved in Euripides's tragedies, that his *choruſes* are detached from the action, and not taken from the ſame ſubject. There were ſome other poets, who, to ſave the *pains* of compoſing *choruſes*, and adapting them to the piece, contented themſelves with inſerted ſongs, which had no relation at all to the action. Theſe foreign *choruſes* were the leſs pardonable, as the *chorus* was eſteemed to act a part in the piece: and to repreſent the ſpectators, who were looked on as intereſted therein; inſomuch that the *chorus* was not always to be mute, even in the courſe of the acts. In the modern tragedies, the *chorus* is laid aſide, and the muſic ſupplies its place.

That which occaſioned the ſuppreſſion of the *chorus*, was its being incompatible with certain complots, and ſecret deliberations of the actors. For it is in no-wiſe probable, that ſuch machinations ſhould be carried on in the eyes of perſons intereſted in the action. As the *chorus*, therefore, never went off the ſtage, there ſeemed a neceſſity of laying it aſide, to give the greater probability to thoſe kinds of intrigues, which require ſecrecy.

M. Dacier obſerves, there was a *chorus*, or gree, alſo in the ancient comedy; but this too is ſuppreſſed in the new: chiefly becauſe it was made uſe of to reprove vices, by attacking particular perſons.

The *chorus* in comedy was at firſt no more than a ſingle perſon, who ſpoke in the ancient compoſures for the ſtage; the poets, by degrees, added to him another; then two, afterwards three, and at laſt more: ſo that the moſt ancient comedies had nothing but the *chorus*, and were only ſo many lectures of virtue.

CHORUS, *to give the*, among the Greeks, was to purchaſe a dramatic piece of the poet, and defray the expences of its repreſentation.

The perſon who did this was called *choragus*. At Athens, the office of *choragus* was impoſed on the *archon*; and at Rome on the *ædiles*.

CHORUS is likewiſe uſed in muſic, where, at certain periods of a ſong, the whole company are to join the ſinger in repeating certain couplets, verſes, or clauſes.

CHOSE, *thing*. This word, in *Law*, is uſed in various circumſtances, and with various epithets; as,

CHOSE *in action*, is not any thing corporeal, but only a right, v. g. an annuity, obligation, covenant, &c.

Chose in action, may alſo be called *chose in ſuſpenſe*, as having no real exiſtence, and not being properly in poſſeſſion: being a thing, as it is expreſſed, rather *in potentia* than in *eſſe*.

No *chose in action* could, by the ancient common law, be transferred or aſſigned; but this is now allowed; and the form of doing it is in the nature of a declaration of truſt, and an agreement to permit the aſſignee to make uſe of the name of the aſſignor, in order to recover the poſſeſſion: and when a debt or bond is aſſigned over, it muſt ſtill be ſued in the original creditor's name.

CHOSE *local*, is ſomething annexed to a place, v. g. a mill.

CHOSE *tranſitory*, ſomething moveable, and which may be tranſported from place to place.

CHOUAN, in the *Materia Medica*, the name of a ſmall ſeed, called by ſome alſo carmine ſeed. It is a very light and chaffy ſeed, in a great meaſure reſembling worm ſeed, of an acid taſte, and a yellowiſh green colour, but is larger than worm-ſeed. It is brought into Europe from Turky, and many parts of the Eaſt, and the choice ſhou'd be made of ſuch as is largeſt, cleaneſt, of the greeneſt colour, and leaſt marked with ſpecks or holes. It is not uſed in medicine, but is of ſome value among the people who make CARMINE for the painters. It is called *ſantonium viride*, or the green worm-ſeed, in our catalogues of the *Materia Medica*, but is unknown in the ſhops. Lemery.

CHOUGH, *Cornix*, in *Zoology*. See CORACIAS.

CHOUS, in the *Eaſtern Military Orders*, the title of the meſſengers of the divan of janiſaries. There are ſeveral degrees of honour in this poſt. When a perſon is firſt advanced to it, he is called a *cachuch*, or little *chous*; after this he is advanced to be the *alley chous*, that is, the meſſenger of the ceremonies; and from this, having paſſed through the office of *peſchna*, or procurator of the effects of the body, he is advanced to be the *bas chous*.

CHOUX, in *Natural Hiſtory*, a name given by the French to a ſpecies of ſhell-fiſh of the *cordiform* or *bucardium* kind. Fabius Columna has elegantly deſcribed it, and Liſter has given a figure of it twice over, in two different parts of his book. There is another ſpecies leſs elegant, and wanting the hollowed ribs. See CORDIFORMIS.

CHOWDER-*Beer*, a provincial phraſe of Devonſhire, denoting a cheap and eaſy prepared drink, highly commended for preventing the ſcurvy in long voyages, or for the cure of it where it may have been contracted. It is prepared in the following manner: take twelve gallons of water, in which put three pounds and a half of black ſpruce; boil it for three hours, and having taken out the fir or ſpruce, mix with the liquor ſeven pounds of meaſſes, and juſt boil it up; ſtrain it through a ſieve, and, when milk warm, put to it about four ſpoonfuls of yeaſt to work it. In two or three days ſtop the bung of the caſk, and in five or ſix days, when fine, bottle it for drinking. Two gallons of meaſſes are ſufficient for an hogſhead of liquor; but if meaſſes cannot be procured, treacle or courſe ſugar will anſwer the purpoſe.

CHRABRATE, in *Natural Hiſtory*, a name given by the writers of the middle ages to a pellucid ſtone, ſaid to have great virtues againſt diſorders of the liver and ſpleen, and many other imaginary qualities. It appears by their deſcriptions to have been no other than the common pebble cryſtal.

CHREMPS, in *Ichthyology*, a name given by the eldeſt Greek writers to the fiſh ſince called *chromis*. It is a ſpecies of the *ſpari*, and is diſtinguiſhed by Artedi by the name of the *ſparus* with the ſecond ray of the belly-fins very long.

CHRENECRUDA, a term occurring in *Writers of the Middle Age*, and expreſſing a cuſtom of thoſe times, but its ſignification is doubtful. It is mentioned in Lege Saxica, 71. 61. which ſays, he who kills a man, and hath not wherewithal to ſatisfy the law, or pay the fine, makes oath that he has delivered up every thing he was poſſeſſed of; the truth of which muſt be confirmed by the oaths of twelve other perſons. Then he invites his next relations by the father's ſide to pay off the remainder of the fine, having firſt made over to them all his effects by the following ceremony. He goes into his houſe, and taking in his hand a ſmall quantity of duſt from each of the four corners, he returns to the door, and with his face inward throws the duſt with his left hand over his ſhoulders upon his neareſt of kin. Which done, he ſtrips to his ſhirt, and coming out with a pole in his hand jumps over the hedge. His relations, whether one or ſeveral, are upon this obliged to pay off the compoſition for the murder. And if theſe (or any one of them) are not able to pay, *iterum ſuper illum* chrenecruda *tot pauperior eſt, ſolvat, & ille totum legem componat.* Whence it appears, that *chrenecruda ſuſtare*, is the ſame with throwing the duſt, gathered from the four corners of the houſe. Goldaſtus and Spelman tranſlate it *viridem herbam, green-graſſe*, from the German *gruen kraut*, or from the Dutch *groen, green*, and *gruid, graſſe*. Wendelinus is of a contrary opinion, who thinks that by this word *denotari purificationis approbationem*, from *chrein, purs, choiſſe, clean*, and *kewren, to prove*; ſo that it muſt refer to the oaths of the twelve jurors. Be this as it will, king Childebert reformed this law by a decree, chap. 15. both becauſe it favoured of pagan ceremonies, and becauſe ſeveral perſons were thereby obliged to make over all their effects: *De chrenecruda lex quam paganorum tempore obſervabant, deinceps nunquam valeat, quia per ipſam accidit multorum pereſſus.*

CHRISM, from χρίω, *I anoint*, oil conſecrated by the biſhop, and uſed in the Romiſh and Greek churches, in the adminiſtration of baptiſm, confirmation, ordination, and extreme unction, which is prepared on Holy Thurſday with much ceremony. In Spain, it was anciently the cuſtom for the biſhop to take one third of a ſol for the *chriſm* diſtributed to each church, on account of the balſam that entered its compoſition.

Du-Cange obſerves, there are two kinds of *chriſm*; the one prepared of oil of balſam, uſed in baptiſm, confirmation, and ordination; the other of oil alone, conſecrated by the biſhop, uſed anciently for the catechumens, and ſtill in extreme unction.

The Maronites, before their reconciliation with Rome, beſides oil of balſam, uſed muſk, ſaffron, cinnamon, roſes, white frankincenſe, and ſeveral other drugs mentioned by Rynaldus, in 1441, with the doſes of each. The Jeſuit Dandini, who went to mount Libanus in quality of the pope's nuncio, ordained, in a ſynod held there in 1596, that *chriſme* for the future, ſhould be made only of two ingredients, oil and balſam; the one repreſenting the human nature of Jeſus Chriſt, the other his divine nature.

The action of impoſing the *chriſm*, is called *chriſmation*: this the generality of the Romiſh divines hold to be the next matter of the ſacrament of confirmation.

The *chriſmation* in baptiſm is performed by the prieſt; that in confirmation by the biſhop; that in ordination, &c. is more uſually ſtiled *unction*.

CHRISM *pence*, CHRISMATIS *denarii*, or CHRISMALES *denarii*, a tribute anciently paid to the biſhop by the pariſh-clergy, for their *chriſm*, conſecrated at Eaſter for the enſuing year: this was afterwards condemned as ſimoniacal.

CHRISOM, CHRISMALE, was anciently the face-cloth, or piece of linen laid over the child's head when it was baptized.

Whence, in our bills of mortality, children who die in the month, are called *chriſoms*.—The time between the child's birth and baptiſm, was alſo called *chriſomus*.

CHRIST, an appellation ſynonymous with MESSIAH, uſually added to Jeſus: and, together therewith, denominating the Saviour of the world.

The word χριστὸς ſignifies *anointed*, from χρίω, *inungo, I anoint*.

Sometimes the word *Chriſt* is uſed ſingly, by way of *antonomaſia*, to denote a perſon ſent from God, as an anointed prophet, king, or prieſt.

CHRIST, *Order of*, a military order, founded in 1318, by Dionyſius I. king of Portugal, to animate his nobles againſt the Moors.

Pope John XXII. confirmed it in 1320, and appointed the knights the rule of St. Benner. Alexander VI. permitted them to marry. The order became afterwards inſenſibly reunited to the crown of Portugal; and the king took upon him the adminiſtration of it.

The arms of the order are, gules, a patriarchal croſs, charged with another croſs *argent*. They had their reſidence, at firſt, at Caſtromarin; afterwards they removed to the city of Thomar, as being nearer to the Moors of Andaluſia and Eſtramadura.

CHRIST is alſo the name of a military order in Livonia, inſtituted in 1205, by Albert biſhop of Riga. The end of their inſtitution was to defend the new Chriſtians who were ſucceſſively converted in Livonia, but were perſecuted by the heathens.

They wore on their cloaks a ſword with a croſs over it; whence they were alſo denominated *Brothers of the Sword*.

CHRIST-*thorn*, in *Botany, Paliurus*. See *Chriſt*-THORN.

CHRISTENING. See BAPTISM.

CHRISTIAN, ſomething that relates to CHRIST.

The king of France bears the title, or ſurname, of the *moſt Chriſtian king*. The French antiquaries trace the origin of the appellation up to Gregory the Great; who, writing a letter to Charles Martel, occaſionally gave him that title, which his ſucceſſors have ſince retained.

Lambecius,

Lambecius, in the third tome of his Catalogue of the emperor's library, holds, that the quality of *moſt Chriſtian* was not aſcribed to the ancient French kings, Louis le Debonair, &c. as kings of France, but as emperors of Germany: but the French hiſtorians endeavour to refute this plea.

CHRISTIAN *Church*. See CHURCH.

CHRISTIAN *Court*. See COURT *Chriſtian*.

CHRISTIAN *Name*, that given at baptiſm. See NAME.

CHRISTIAN *Religion*, or CHRISTIANITY, that inſtituted by Jeſus Chriſt, comprehending doctrines of faith, and rules of practice; all of which are contained in the New Teſtament, and are deſigned to recover mankind from ignorance and vice, from guilt and death, to true knowlege and virtue, to the divine favour and everlaſting life.

Its aptitude to this end, its conformity to reaſon, and to the ſtate of man, the ſublimity and excellence of its doctrines, the equally venerable and lovely character of its author, the purity of its precepts, its benign tendency and ſalutary effects, concur, with the external evidence of PROPHECY and MIRACLES, to eſtabliſh its divine origin and truth.

CHRISTIAN is peculiarly and abſolutely uſed for a perſon who believes in Chriſt, and is baptized in his name.

The name *Chriſtian* was firſt given at Antioch, in the year 42, to ſuch as believed in Chriſt, as we read in the Acts: till that time they were called *diſciples*.

CHRISTIANS *of St. John*, a corrupt ſect of *Chriſtians*, very numerous in Baſſora, and the neighbouring towns.

They formerly inhabited along the river Jordan, where St. John baptized; and it was thence they had their name. But after the Mahometans became maſters of Paleſtine, they retired into Meſopotamia and Chaldea.

They hold an anniverſary feaſt of five days; during which, they all go to their biſhops, who baptize them with the baptiſm of St. John; their baptiſm is always performed in rivers, and that only on Sundays.

They have no notion of the third perſon in the Trinity; nor have they any canonical books, but ſeveral which are full of charms, &c. Their biſhopricks deſcend by inheritance, as our eſtates do; though they have the ceremony of an election. There is no ſatisfactory account of the origin or principles of this ſect. See SABBANS.

CHRISTIANS *of St. Thomas*, or *San Tooma*, a ſect of ancient *Chriſtians* found in the Eaſt Indies, when the Europeans touched at the port of Calicut; who pretend to be deſcended from thoſe St. Thomas converted in the Eaſt Indies; whence the name.

The natives *call* them, by way of contempt, *Nazarenes*; their more honourable appellation is *Mappuleymar*. See THOMANITES.

Some learned men in Europe ſay, it was not St. Thomas the apoſtle that converted that country, but another St. Thomas: others ſay, it was a Neſtorian merchant, called Thomas. It is certain they are Neſtorians, and have been ſo a long time; inſomuch that *Chriſtians of St. Thomas* now paſſes for the name of a ſect.

They have a patriarch, who reſides at Moſul. The pope has made ſeveral attempts to reduce them under his obedience, but to no purpoſe.

CHRISTMAS, the feaſt of the nativity of Jeſus Chriſt.

It appears from St. Chryſoſtom, that in the primitive times, *Chriſtmas* and Epiphany were celebrated at one and the ſame feaſt: that father obſerves, it was but of a little while that *Chriſtmas* had been celebrated at Antioch on the twenty-fifth of December, as a diſtinct feaſt; and that the uſe thereof came from the Weſt. The Armenians made but one feaſt of them, as low as the twelfth century.

It is commonly maintained, that pope Teleſphorus was the firſt who ordered the feaſt of the Nativity to be held on the twenty-fifth of December. John, archbiſhop of Nice, in an epiſtle upon this ſubject, relates that at the inſtance of St. Cyril of Jeruſalem, pope Julius procured a ſtrict enquiry to be made into the day of our Saviour's nativity, which being found to be on the twenty-fifth of December, they began thenceforth to celebrate the feaſt on that day. However, the preciſe day, or even the month, in which our Saviour was born, is extremely uncertain. Some, as Clemens Alexandrinus informs us, aſſixed it to the twenty-fifth of the month Pachon, correſponding to the ſixteenth of May. But there are ſome circumſtances which ſhould rather lead us to conclude, that he was born in autumn; as this was, in every reſpect, the moſt proper ſeaſon of the year for a general aſſeſſment, which took place at the birth of Chriſt, and which required perſonal attendance; and as there were ſhepherds watching their flocks by night at the time when Chriſt was born; and therefore it is probable, that the æra of the Nativity was either in September or October, A. U. 748 or 749. See EPOCHA.

CHRISTMAS *Roſe*. See HELLEBORE.

CHRISTOGENON, from Χριστος, *Chriſt*, and γινομαι, *I am born*; in the *Greek Church*, a faſt of forty days, immediately preceding the ſuppoſed time of Chriſt's nativity.

CHRISTOLYTI, a ſect mentioned by Damaſcenus; ſo called, becauſe they maintained that Chriſt deſcended into hell, body and ſoul; and that he left both there; aſcending to heaven with his divinity alone.

The words come from Χριστος, *Chriſt*, and λυω, *I diſſolve*.

CHRISTOMACHI, Χριστομαχοι, in *Church Hiſtory*, a denomination given to all ſorts of heretics who deny the divinity of our Saviour, or hold heterodox opinions concerning his incarnation.

The word comes from the Greek Χριστος, *Chriſt*, and μαχομαι, *I fight*, or *oppoſe*.

CHRISTOPHORIANA, called by ſome *aſtræa*. See HERB *Chriſtopher*.

CHRISTOPHORUS *piſcis*, a name by which ſome have called the *faber*, or as we call it the *dore*, or *jaune* DORÉE, the gilded fiſh.

CHROÆ, in the *Medicine of the Ancients*. See COLOURS, GENUS, and SPECIES.

CHROASTACES, in *Natural Hiſtory*, a genus of pellucid gems, comprehending all thoſe of variable colours, as viewed in different lights: of which kind are the opal and the ASTERIA, or the *cati oculus*.

CHROMA, in the *Botanical Writings of the Ancients*, a word uſed to expreſs a famous root brought from Syria into Greece, and uſed by the women of that country to paint their cheeks red. It was alſo called *rhizium* and *fucus*, and by the Latins *radicula*.

CHROMA, in *Rhetoric*, a colour, or fair pretence.

The word is Greek, and literally denotes *colour*.

CHROMA, in the *Italian Muſic*. The Italians take this term from the Greeks, but uſe it to ſignify a note or character of time, by us called a quaver, and when the word ſemi is added thereto, it means our ſemiquaver. Eight of the former are contained in a bar, and ſixteen of the latter in common time.

CHROMA is alſo a graceful way of ſinging, or playing with quavers and trilloes.

CHROMA alſo ſometimes ſignifies the ſame as the chromatic DIESIS or ſemitone minor.

CHROMA is alſo uſed to ſignify the *genus chromaticum*. In this ſenſe we find it uſed by Ariſtoxenus, and in Ptolemy's Harmonics.

CHROMATIC, in the *Ancient Muſic*, the ſecond of the three *genera*, or kinds, in which the conſonant intervals were ſubdivided into their concinnous parts.

The other two kinds were, the *enharmonic*, and the *diatonic*. The chromatic conſiſted of ſemitones, and minor thirds: it had its name, either becauſe the Greeks marked it with the character of colour, which they call χρωμα; or, as P. Parran ſuggeſts, becauſe the *chromatic* kind is a medium between the other two, as colour is between black and white; or elſe becauſe the *chromatic* kind varies and embelliſhes the diatonic kind, by its ſemitones; which have the ſame effect in MUSIC, with variety of colours in painting. M. Rouſſeau ſays, that this ſpecies of muſic was written in coloured notes. Ariſtoxenus divides the *chromatic genus* into three ſpecies: the *molle*, *hemiolium*, and *tonicum*: Ptolemy, into *molle* or *antiquum*, and *intenſum*.

Theſe ſpecies were alſo called *chroiai*, or colours of the *genera*: the *molle* expreſſes a progreſſion by ſmall intervals, the *intenſum* by greater.

The *chromatic* and enharmonic kinds only contain the ſmalleſt of the diatonic degrees; ſo that they have the ſame proportion to the diatonic, as fractions have to integers.

Boethius, and after him Zarlin, attribute the invention of the *chromatic* genus to Timotheus a Mileſian, in the time of Alexander the Great. The Spartans baniſhed it their city, on account of its ſoftneſs. The character of this genus, according to Ariſtides Quintilianus, were ſweetneſs and pathos.

Mr. Malcolm obſerves, that we are at a loſs what uſe the ancients could make of theſe diviſions and ſubdiviſions into *genera* and *ſpecies*. All acknowleged the diatonic to be the true melody; the others ſeem only humorous irregularities, calculated to pleaſe the fancy by their novelty and oddneſs; and were beſides ſo very difficult, that few, if any, are ſaid to have ever practiſed them accurately.

The moderns have been much perplexed to underſtand the different ſpecies of the *chromatic* muſic in uſe among the ancient Greeks. Moſt of our muſicians have no other notion of the *chromatic* than of a melody proceeding by ſemitones, major and minor. This is what Broſſard ſays of it. But this is not ſufficient to convey a true notion of the *chromatic*. Dr. Pepuſch has given us a clearer light in this affair: his doctrine is as follows.

The ancients diſtinguiſhed three ſorts of *chromatic*, which were denoted by the names, *molle*, *ſeſquialterum*, and *tenuiorum*.

The *chromaticum molle* was a diviſion of the diateſſaron, or fourth, into three intervals, which were two ſubſequent ſemitones minor, and the interval, which is the complement of theſe two to the fourth; and this interval will be found equal to a third minor added to an enharmonic dieſis. This ſpecies is not to be met with among the moderns.

The *chromaticum ſeſquialterum*, or *hemiolium*, was a diviſion of the fourth into a ſemitone major, a ſemitone minor, and a third minor. This is mentioned by Ptolemy as the *chromatic* of Didymus. It occurs in modern compoſitions.

The *chromaticum tonicum*, or *tenicum*, was a diviſion of the fourth into a ſemitone major ſucceded by another ſemitone major, and the complement of theſe two to the fourth, which is the interval commonly called a ſuperfluous tone. This often occurs in modern muſic. Diſſert. de Muſique, p. 19. Phil. Tranſ. N° 481. p. 272. Wallis, Append. Ptolem. Harm. p. 264.

CHROMATIC is alſo applied by ſome to he ſcience of colours; and in painting, it is uſed to ſignify the colouring.

CHROMIS, in *Ichthyology*, the name of a little fiſh caught frequently in the Mediterranean, which ſeldom exceeds three inches in length, is moderately thick, and of a duſky brown colour.

Artedi, who very accurately examined this fiſh, does not allow it a diſtinct generical name, but makes it only a ſpecies of his *genus* of the *ſpari*, calling it the SPARUS with the ſecond ray of each belly-fin carried to a great length.

CHROMIS is alſo the name by which Bellonius, and ſome others, have called a large fiſh caught in the Mediterranean, more uſually known by the name of UMBRA, and brought to market in Italy while young and ſmall.

CHRONIC, CHRONICAL, in *Medicine*, is applied to a ſlow DISEASE, which laſts a long time: at leaſt upwards of forty days: ſuch are the gout, dropſy, aſthma, &c.

The word comes from χρονος, *time*.

Chronic diſeaſes ſtand in oppoſition to acute diſeaſes, which are ſpeedy, and haſten to a criſis; as fevers, ſmall-pox, &c.
